Agilent
PNA Series Network Analyzer
Printed Version of PNA Help User’s and Programming Guide

Supports Firmware A.09.42
Sept. 16, 2011
Warranty Statement

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED “AS IS,” AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, AGILENT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. AGILENT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR ANY INFORMATION CONTAINED HEREIN. SHOULD AGILENT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT WILL CONTROL.

DFARS/Restricted Rights Notice

If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as “Commercial computer software” as defined in DFAR 252.227-7014 (June 1995), or as a “commercial item” as defined in FAR 2.101(a) or as “Restricted computer software” as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies’ standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

Certification

Agilent Technologies, Inc. certifies that this product met its published specifications at the time of shipment from the factory. Agilent Technologies, Inc. further certifies that its calibration measurements are traceable to the United States National Institute of Standards and Technology, to the extent allowed by the Institute's calibration facility, and to the calibration facilities of other International Standards Organization members.

Contacting Agilent

Assistance with test and measurements needs and information on finding a local Agilent office are available on the Web at: http://www.agilent.com/find/assist

If you do not have access to the Internet, please contact your Agilent field engineer.

In any correspondence or telephone conversation, refer to the Agilent product by its model number and full serial number. With this information, the Agilent representative can determine whether your product is still within its warranty period.

What's New in PNA Code Version A.09.42

- New N522x Models

**Standard Measurements** - available on all Models / Options

- Drag a trace to another window

**Application Enhancements**

- Noise Figure Cal using a Power Meter
- Copy Channels on all Applications
- **"Src 2 out Port 2"** factory configuration on PNA-X Opt 423.
- IMD f2 Tone using External Source / Combiner
- IMD and IM Spectrum Tone Power Leveling settings
- IMD, IMDx, and IM Spectrum "Min" and "Max" parameters
- Use a Power Table with mmWave SMC Measurements
- mmWave; Mixer mode - 2-port test set on 4-port PNA
- Guided Power Cal for SMC
- ESG and PSG Sources for Phase Control

*See New 9.42 Programming Commands*

This version includes features from all versions listed below.

To check your PNA code version, click **Help**, then **About Network Analyzer**

---

What's New in PNA Code Version A.09.33

**New Options**

- Source Phase Control - Opt 088

**Application Enhancements**

- FCA Update - Opt 082, and 083

**Standard Measurements** - available on all Models / Options
- Security for External Sources
- 2-Port and 4-Port Fixture Extrapolation and Reverse Ports.
- Phase Coherent “R over R” measurements
- Use Multiple Power Sensors for Guided Power Cal
- Perform Source Power Cal with PMAR Device

**Tip - Do you access the same PNA dialog often?**
Your Favorites are always two keystrokes away. [Learn how.](#)

---

**What's New in PNA Code Version A.09.31**

- Support for N1913A and N1914A Power Meters

---

**What's New in PNA Code Version A.09.30**

- N5247A - 67 GHz PNA-X

**Application Enhancements**

- Gain Compression on Converters (GCX)
- Support for Dual-Stage Converters in all Apps

**Standard Measurements** - available on all Models / Options

- Enhanced S-parameter Power Cal
- Marker Display enhancements
- Perform Source Power Cal at multiple power levels
- IF Gain Setting
- Receiver Overload/Compression Warning and Power OFF Preferences
- Confirm changes on Meas Class dialog
- DSP Version 5

---

**What's New in PNA Code Version A.09.22**
• Use any PNA-X Ports with Noise Figure Opt 028.

What's New in PNA Code Version A.09.20

Application Enhancements

• Integrated Pulse Measurements (Opt 008)
• Noise Figure using Standard PNA Receiver (Opt 028)
• Noise Figure on N5244A/45A (Opt H29)
• Edge and Level Trigger in Pulse
• Exclude SC12 Sweep for SMC (Opt 082/083)
• Include Phase with SMC (PNA-X with Opt 083)
• Fixturing in Apps
• Max Output Power for GCA (Opt 086)

Standard Measurements - available on all Models / Options

• Mechanical Device conflicts cause Channel Block (NOT Channel Hold)
• PSAT Marker and Power Normal Operating Point Marker
• Group Delay Aperture Setting
• Active Background Display Color
• Solid or Dotted Grid Lines
• Point Sweep on PNA “C” Models
• Fixture Power Compensation
• Sweep Delay
• Uncertainty equations using RSS Computations
• Preset Power Preference Setting
• Use Last Receiver Leveling Correction for SPC
• Data Save Enhancements
  • Recall .SNP files to view as trace
• "Save Data As" Dialog
• Save Balanced Data as SNP files
• Characterize Adaptor Macro Rev. A.02.10
• Reverse S2P
• Load the PNA Power Loss Table from an existing S2P file

What's New in PNA Code Version A.09.10

• Noise Figure on Converters (NFX)
• AgileUpdate for Customer Releases
• New Help, About Capabilities

What's New in PNA Code Version A.09.00

• External Device Configuration
• Power Meter as Receiver (PMAR)
• Power Offsets and Limits
• Display and Print Colors
• Scale Coupling
• Mechanical Device Settings
• Device side USB
• Increased Number of Channels to 200
• ECal User Chars Saved to PNA Disk Memory

Application Enhancements

• GCA Compression Analysis
• GCA Compression from Saturation
• Receiver Leveling on IMD, FCA, and GCA
• Embedded LO on SMC and IMDx
• Limited Port Mapping on IMD
- Point Averaging on FCA and IMD
- SMC Measurements with mmWave Modules
- mmWave Measurements with no Test Set

---

**What's New in PNA Code Version A.08.60**

- New 40 GHz and 50 GHz PNA-X Models

---

**What's New in PNA Code Version A.08.55**

- IMDx (Swept and Spectrum) for Converters
- ADC Measurements in a Gain Compression channel.
- New 13.5 GHz PNA-X Model

---

**What's New in PNA Code Version A.08.50**

- Fast Antenna Features for the PNA-X
- Receiver Leveling
- Phase Sweep in iTMSA
- Up to 25 User Macros
- Gain Compression Marker
- Port Extensions enhancements
- Electrical Delay enhancements
- Extra Security enhancement
- Save *.CSV and *.MDF File Types
- Noise Figure App enhancements:
  - Scalar Noise Figure measurement
  - Incident Noise Power parameters
- MM Module enhancements:
- **Power Level Control**
- Supports **iTMSA**
- **Max point count to 32,001**
- **Faster Power Sweeps**

### What's New in PNA Code Version A.08.35
- **New N5264A model**

### What's New in PNA Code Version A.08.33
- **IMD Application** (Opt 087)
- **Fast Sweep Mode**
- **New Equation Editor functions**
- **20001 Segments in Power Loss Table**
- **Data Format Units**
- **Marker=>CW Freq Function**

END-USER LICENSE AGREEMENT FOR MICROSOFT SOFTWARE
MICROSOFT WINDOWS XP PROFESSIONAL EDITION SERVICE PACK 3

IMPORTANT-READ CAREFULLY: This End-User License Agreement ("EULA") is a legal agreement between you (either an individual or a single entity) and Microsoft Corporation or one of its affiliates ("Microsoft") for the Microsoft software that accompanies this EULA, which includes computer software and may include associated media, printed materials, "online" or electronic documentation, and Internet-based services ("Software"). An amendment or addendum to this EULA may accompany the Software. YOU AGREE TO BE BOUND BY THE TERMS OF THIS EULA BY INSTALLING, COPYING, OR OTHERWISE USING THE SOFTWARE. IF YOU DO NOT AGREE, DO NOT INSTALL, COPY, OR USE THE SOFTWARE; YOU MAY RETURN IT TO YOUR PLACE OF PURCHASE FOR A FULL REFUND, IF APPLICABLE.

1. GRANT OF LICENSE. Microsoft grants you the following rights provided that you comply with all terms and conditions of this EULA:

1.1 Installation and use. You may install, use, access, display and run one copy of the Software on a single computer, such as a workstation, terminal or other device ("Workstation Computer"). The Software may not be used by more than two (2) processors at any one time on any single Workstation Computer.

1.2 Mandatory Activation. The license rights granted under this EULA are limited to the first thirty (30) days after you first install the Software unless you supply information required to activate your licensed copy in the manner described during the setup sequence of the Software. You can activate the Software through the use of the Internet or telephone; toll charges may apply. You may also need to reactivate the Software if you modify your computer hardware or alter the Software. There are technological measures in this Software that are designed to prevent unlicensed use of the Software. Microsoft will use those measures to confirm you have a legally licensed copy of the Software. If you are not using a licensed copy of the Software, you are not allowed to install the Software or future Software updates. Microsoft will not collect any personally identifiable information from your Workstation Computer during this process.

1.3 Device Connections. You may permit a maximum of ten (10) computers or other electronic devices (each a "Device") to connect to the Workstation Computer to utilize one or more of the following services of the Software: File Services, Print Services, Internet Information Services, Internet Connection Sharing and telephony services. The ten connection maximum includes any indirect connections made through "multiplexing" or other software or hardware which pools or aggregates connections. This ten connection maximum does not apply to other uses of the Software, such as synchronizing data between a Device and the Workstation Computer, provided only one user uses, accesses, displays or runs the Software at any one time. This Section 1.3 does not grant you rights to access a Workstation Computer Session from any Device. A "Session" means any use of the Software that enables functionality similar to that available to an end user who is interacting with the Workstation Computer through any combination of input, output and display peripherals.

1.4 Remote Desktop/Remote Assistance/NetMeeting. The Software contains Remote Desktop, Remote Assistance, and NetMeeting technologies that enable the Software or applications installed on the Workstation Computer (sometimes referred to as a host device) to be accessed remotely from other Devices. You may use the Software’s Remote Desktop feature (or other software which provides similar functionality for a similar purpose) to access a Workstation Computer Session from any Device provided you acquire a separate Software license for that Device. As an exception to this rule, the person who is the single primary user of the Workstation Computer may access a Workstation Computer Session from any Device without acquiring an additional Software license for that Device. When you are using Remote Assistance or NetMeeting (or other software which provides similar functionality for a similar purpose) you may share a Session with other users without any limit on the number of Device connections and without acquiring additional licenses for the Software. For Microsoft and non-Microsoft applications, you should consult the license agreement accompanying the applicable software or contact the applicable licensor to determine whether use of the software with Remote Desktop, Remote Assistance, or NetMeeting is permitted without an additional license.

1.5 Storage/Network Use. You may also store or install a copy of the Software on a storage device, such as a
network server, used only to install or run the Software on your other Workstation Computers over an internal network; however, you must acquire and dedicate an additional license for each separate Workstation Computer on or from which the Software is installed, used, accessed, displayed or run. Except as otherwise permitted by the NetMeeting and Remote Assistance features described above, a license for the Software may not be shared or used concurrently on different Workstation Computers.

2. AUTOMATIC INTERNET-BASED SERVICES. The Software features described below are enabled by default to connect via the Internet to Microsoft computer systems automatically, without separate notice to you. You consent to the operation of these features, unless you choose to switch them off or not use them. Microsoft does not obtain personal information through any of these features. For more information about these features, please see your Software documentation, the Microsoft online support site, or the privacy statement at http://go.microsoft.com/fwlink/?LinkId=25243.

2.1 Windows Update Features. If you connect hardware to your Workstation Computer, it may not have the drivers needed to communicate with that hardware. The Software’s update feature can obtain the correct drivers from Microsoft and install them on your device. You can switch this update feature off.

2.2 Web Content Features. Under the Software’s default configuration, if you are connected to the Internet, several features of the Software are enabled by default to retrieve content from Microsoft computer systems and display it to you. When you activate such a feature, it uses standard Internet protocols, which transmit the type of operating system, browser and language code of your Workstation Computer to the Microsoft computer system so that the content can be viewed properly from your Workstation Computer. These features only operate when you activate them, and you may choose to switch them off or not use them. Examples of these features include Windows Catalog, Search Assistant, and the Headlines and Search features of Help and Support Center.

2.3 Digital Certificates. The Software uses digital certificates based on the x.509 standard. These digital certificates confirm the identity of Internet users sending x.509 standard encrypted information. The software retrieves certificates and updates certificate revocation lists. These security features operate only when you use the Internet.

2.4 Auto Root Update. The Auto Root Update feature updates the list of trusted certificate authorities. You can switch off the Auto Root Update feature.

2.5 Windows Media Player. Some features of Windows Media Player automatically contact Microsoft computer systems if you use Windows Media Player or specific features of it: features that (A) check for new codecs if your Workstation Computer does not have the correct ones for content you attempt to play (this feature may be switched off), and (B) check for new versions of Windows Media Player (this feature will operate only when you are using Windows Media Player).

2.6 Windows Media Digital Rights Management. Content providers are using the digital rights management technology for Windows Media contained in this Software (“WM-DRM”) to protect the integrity of their content (“Secure Content”) so that their intellectual property, including copyright, in such content is not misappropriated. Portions of this Software and third party applications such as media players use WM-DRM to play Secure Content (“WM-DRM Software”). If the WM-DRM Software’s security has been compromised, owners of Secure Content (“Secure Content Owners”) may request that Microsoft revoke the WM-DRM Software’s right to copy, display and/or play Secure Content. Revocation does not alter the WM-DRM Software’s ability to play unprotected content. A list of revoked WM-DRM Software is sent to your Workstation Computer whenever you download a license for Secure Content from the Internet. Microsoft may, in conjunction with such license, also download revocation lists onto your Workstation Computer on behalf of Secure Content Owners. Secure Content Owners may also require you to upgrade some of the WMDRM components in this Software (“WM-DRM Upgrades”) before accessing their content. When you attempt to play such content, WM-DRM Software built by Microsoft will notify you that a WM-DRM Upgrade is required and then ask for your consent before the WM-DRM Upgrade is downloaded. WM-DRM Software built by third parties may do the same. If you decline the upgrade, you will not be able to access content that requires the WM-DRM Upgrade; however, you will still be able to access unprotected content and Secure Content that does not require the upgrade. WM-DRM features that access the Internet, such as acquiring new licenses and/or performing a required WM-DRM Upgrade, can be switched off. When these features are switched off, you will still be able to play Secure Content if you have a valid license for such content already stored on your
3. RESERVATION OF RIGHTS AND OWNERSHIP. Microsoft reserves all rights not expressly granted to you in this EULA. The Software is protected by copyright and other intellectual property laws and treaties. Microsoft or its suppliers own the title, copyright, and other intellectual property rights in the Software. The Software is licensed, not sold.

4. LIMITATIONS ON REVERSE ENGINEERING, DECOMPILATION, AND DISASSEMBLY. You may not reverse engineer, decompile, or disassemble the Software, except and only to the extent that such activity is expressly permitted by applicable law notwithstanding this limitation.

5. NO RENTAL/COMMERCIAL HOSTING. You may not rent, lease, lend or provide commercial hosting services with the Software.

6. LINKS TO THIRD PARTY SITES. You may link to third party sites through the use of the Software. The third party sites are not under the control of Microsoft, and Microsoft is not responsible for the contents of any third party sites, any links contained in third party sites, or any changes or updates to third party sites. Microsoft is not responsible for webcasting or any other form of transmission received from any third party sites. Microsoft is providing these links to third party sites to you only as a convenience, and the inclusion of any link does not imply an endorsement by Microsoft of the third party site.

7. ADDITIONAL SOFTWARE/SERVICES. This EULA applies to updates, supplements, add-on components, product support services, or Internet-based services components, of the Software that you may obtain from Microsoft after the date you obtain your initial copy of the Software, unless you accept updated terms or another agreement governs. Microsoft reserves the right to discontinue any Internet-based services provided to you or made available to you through the use of the Software.

8. UPGRADES. To use Software identified as an upgrade, you must first be licensed for the software identified by Microsoft as eligible for the upgrade. After upgrading, you may no longer use the software that formed the basis for your upgrade eligibility.

9. NOT FOR RESALE SOFTWARE. Software identified as “Not For Resale” or “NFR,” may not be sold or otherwise transferred for value, or used for any purpose other than demonstration, test or evaluation.

10. ACADEMIC EDITION SOFTWARE. To use Software identified as “Academic Edition” or “AE,” you must be a “Qualified Educational User.” For qualification-related questions, please contact the Microsoft Sales Information Center/One Microsoft Way/Redmond, WA 98052-6399 or the Microsoft subsidiary serving your country.

11. NOTICES REGARDING THE MPEG-4 VISUAL STANDARD. The Software includes MPEG-4 visual decoding technology. This technology is a format for data compression of video information. For this technology, MPEG LA, L.L.C. requires this notice: USE OF THIS PRODUCT IN ANY MANNER THAT COMPLIES WITH THE MPEG-4 VISUAL STANDARD IS PROHIBITED, EXCEPT FOR USE DIRECTLY RELATED TO (A) DATA OR INFORMATION (i) GENERATED BY AND OBTAINED WITHOUT CHARGE FROM A CONSUMER NOT THEREBY ENGAGED IN A BUSINESS ENTERPRISE, AND (ii) FOR PERSONAL USE ONLY; AND (B) OTHER USES SPECIFICALLY AND SEPARATELY LICENSED BY MPEG LA, L.L.C. If you have questions regarding this notice, please contact MPEG LA, L.L.C., 250 Steele Street, Suite 300, Denver, Colorado 80206; Telephone 303 331.1880; FAX 303 331.1879; http://www.mpegla.com.

12. EXPORT RESTRICTIONS. You acknowledge that the Software is subject to U.S. export jurisdiction. You agree to comply with all applicable international and national laws that apply to the Software, including the U.S. Export Administration Regulations, as well as end-user, enduse, and destination restrictions issued by U.S. and other governments. For additional information see http://www.microsoft.com/exporting.

13. END USER PROOF OF LICENSE. If you acquired the Software on a compact disc or other media, a genuine Microsoft “Proof of License” label with a genuine copy of the software identifies a licensed copy of the Software. To be valid, the label must appear on Microsoft software packaging. If you receive the label separately, it is invalid. You should keep the packaging that has the label on it to prove that you are licensed to use the Software.

14. SOFTWARE TRANSFER. Internal. You may move the Software to a different Workstation Computer. After the
transfer, you must completely remove the Software from the former Workstation Computer. Transfer to Third Party.
The initial user of the Software may make a one-time permanent transfer of this EULA and Software to another end
user, provided the initial user retains no copies of the Software. This transfer must include the Software and the
Proof of License label. The transfer may not be an indirect transfer, such as a consignment. Prior to the transfer,
the end user receiving the Software must agree to all the EULA terms.

15. TERMINATION. Without prejudice to any other rights, Microsoft may terminate this EULA if you fail to comply
with the terms and conditions of this EULA. In such event, you must destroy all copies of the Software and all of its
component parts.

16. NOTICE REGARDING SECURITY. To help protect against breaches of security and malicious software,
periodically back up your data and system information, use security features such as firewalls, and install and use
security updates.

17. LIMITED WARRANTY FOR SOFTWARE ACQUIRED IN THE US AND CANADA. Microsoft warrants that the
Software will perform substantially in accordance with the accompanying materials for a period of ninety (90) days
from the date of receipt. If an implied warranty or condition is created by your state/jurisdiction and federal or
state/provincial law prohibits disclaimer of it, you also have an implied warranty or condition, BUT ONLY AS TO
DEFECTS DISCOVERED DURING THE PERIOD OF THIS LIMITED WARRANTY (NINETY DAYS). AS TO ANY
DEFECTS DISCOVERED AFTER THE NINETY-DAY PERIOD, THERE IS NO WARRANTY OR CONDITION OF
ANY KIND. Some states/jurisdictions do not allow limitations on how long an implied warranty or condition lasts, so
the above limitation may not apply to you. Any supplements or updates to the Software, including without limitation,
you (if any) service packs or hot fixes provided to you after the expiration of the ninety day Limited Warranty period
are not covered by any warranty or condition, express, implied or statutory. LIMITATION ON REMEDIES; NO
CONSEQUENTIAL OR OTHER DAMAGES. Your exclusive remedy for any breach of this Limited Warranty is as
set forth below. Except for any refund elected by Microsoft, YOU ARE NOT ENTITLED TO ANY DAMAGES,
INCLUDING BUT NOT LIMITED TO CONSEQUENTIAL DAMAGES, if the Software does not meet Microsoft’s
Limited Warranty, and, to the maximum extent allowed by applicable law, even if any remedy fails of its essential
purpose. The terms of Section 19 ("Exclusion of Incidental, Consequential and Certain Other Damages") are also
incorporated into this Limited Warranty. Some states/jurisdictions do not allow the exclusion or limitation of
incidental or consequential damages, so the above limitation or exclusion may not apply to you. This Limited
Warranty gives you specific legal rights. You may have other rights which vary from state/jurisdiction to
state/jurisdiction. YOUR EXCLUSIVE REMEDY. Microsoft’s and its suppliers’ entire liability and your exclusive
remedy for any breach of this Limited Warranty or for any other breach of this EULA or for any other liability relating
to the Software shall be, at Microsoft’s option from time to time exercised subject to applicable law, (a) return of the
amount paid (if any) for the Software, or (b) repair or replacement of the Software, that does not meet this Limited
Warranty and that is returned to Microsoft with a copy of your receipt. You will receive the remedy elected by
Microsoft without charge, except that you are responsible for any expenses you may incur (e.g. cost of shipping the
Software to Microsoft). This Limited Warranty is void if failure of the Software has resulted from accident, abuse,
misapplication, abnormal use or a virus. Any replacement Software will be warranted for the remainder of the
original warranty period or thirty (30) days, whichever is longer, and Microsoft will use commercially reasonable
efforts to provide your remedy within a commercially reasonable time of your compliance with Microsoft’s warranty
remedy procedures. Outside the United States or Canada, neither these remedies nor any product support services
offered by Microsoft are available without proof of purchase from an authorized international source. To exercise
your remedy, contact: Microsoft, Attn. Microsoft Sales Information Center/One Microsoft Way/Redmond, WA
98052-6399, or the Microsoft subsidiary serving your country.

18. DISCLAIMER OF WARRANTIES. The Limited Warranty that appears above is the only express warranty made
to you and is provided in lieu of any other express warranties or similar obligations (if any) created by any
advertising, documentation, packaging, or other communications. Except for the Limited Warranty and to the
maximum extent permitted by applicable law, Microsoft and its suppliers provide the Software and support services
(if any) AS IS AND WITH ALL FAULTS, and hereby disclaim all other warranties and conditions, whether express,
IMPLIED OR STATUTORY, INCLUDING, BUT NOT LIMITED TO, ANY (IF ANY) IMPLIED WARRANTIES, DUTIES OR Conditions OF
MERCHANTABILITY, OF FITNESS FOR A PARTICULAR PURPOSE, OF RELIABILITY OR AVAILABILITY, OF ACCURACY OR COMPLETENESS OF
responses, of results, of workmanlike effort, of lack of viruses, and of lack of negligence, all with regard to the Software, and the provision of or failure to provide support or other services, information, software, and related content through the Software or otherwise arising out of the use of the Software. ALSO, THERE IS NO WARRANTY OR CONDITION OF TITLE, QUIET ENJOYMENT, QUIET POSSESSION, CORRESPONDENCE TO DESCRIPTION OR NONINFRINGEMENT WITH REGARD TO THE SOFTWARE.

19. EXCLUSION OF INCIDENTAL, CONSEQUENTIAL AND CERTAIN OTHER DAMAGES. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT SHALL MICROSOFT OR ITS SUPPLIERS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, PUNITIVE, INDIRECT, OR CONSEQUENTIAL DAMAGES WHATSOEVER (INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFITS OR CONFIDENTIAL OR OTHER INFORMATION, FOR BUSINESS INTERRUPTION, FOR PERSONAL INJURY, FOR LOSS OF PRIVACY, FOR FAILURE TO MEET ANY DUTY INCLUDING OF GOOD FAITH OR OF REASONABLE CARE, FOR NEGLIGENCE, AND FOR ANY OTHER PECUNIARY OR OTHER LOSS WHATSOEVER) ARISING OUT OF OR IN ANY WAY RELATED TO THE USE OF OR INABILITY TO USE THE SOFTWARE, THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT OR OTHER SERVICES, INFORMATION, SOFTWARE, AND RELATED CONTENT THROUGH THE SOFTWARE OR OTHERWISE ARISING OUT OF THE USE OF THE SOFTWARE, OR OTHERWISE UNDER OR IN CONNECTION WITH ANY PROVISION OF THIS EULA, EVEN IF MICROSOFT OR ANY SUPPLIER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

20. LIMITATION OF LIABILITY AND REMEDIES. Notwithstanding any damages that you might incur for any reason whatsoever (including, without limitation, all damages referenced herein and all direct or general damages in contract or anything else), the entire liability of Microsoft and any of its suppliers under any provision of this EULA and your exclusive remedy hereunder (except for any remedy of repair or replacement elected by Microsoft with respect to any breach of the Limited Warranty) shall be limited to the greater of the actual damages you incur in reasonable reliance on the Software up to the amount actually paid by you for the Software or US$5.00. The foregoing limitations, exclusions and disclaimers (including Sections 17, 18, and 19) shall continue in full force and effect even if any remedy fails its essential purpose.

21. U.S. GOVERNMENT LICENSE RIGHTS. All Software provided to the U.S. Government pursuant to solicitations issued on or after December 1, 1995 is provided with the commercial license rights and restrictions described elsewhere herein. All Software provided to the U.S. Government pursuant to solicitations issued prior to December 1, 1995 is provided with "Restricted Rights" as provided for in FAR, 48 CFR 52.227-14 (JUNE 1987) or DFAR, 48 CFR 252.227-7013 (OCT 1988), as applicable.

22. APPLICABLE LAW. If you acquired this Software in the United States, this EULA is governed by the laws of the State of Washington. If you acquired this Software in Canada, unless expressly prohibited by local law, this EULA is governed by the laws in force in the Province of Ontario, Canada; and, in respect of any dispute which may arise hereunder, you consent to the jurisdiction of the federal and provincial courts sitting in Toronto, Ontario. If you acquired this Software in the European Union, Iceland, Norway, or Switzerland, then local law applies. If you acquired this Software in any other country, then local law may apply.

23. ENTIRE AGREEMENT; SEVERABILITY. This EULA (including any addendum or amendment to this EULA which is included with the Software) is the entire agreement between you and Microsoft relating to the Software and the support services (if any) and they supersede all prior or contemporaneous oral or written communications, proposals and representations with respect to the Software or any other subject matter covered by this EULA. To the extent the terms of any Microsoft policies or programs for support services conflict with the terms of this EULA, the terms of this EULA shall control. If any provision of this EULA is held to be void, invalid, unenforceable or illegal, the other provisions shall continue in full force and effect.

Si vous avez acquis votre produit Microsoft au CANADA, la garantie limitée suivante vous concerne :

GARANTIE LIMITÉE

Microsoft garantit que le Logiciel fonctionnera conformément aux documents inclus pendant une période de 90
jours suivant la date de réception. Si une garantie ou condition implicite est créée par votre État ou votre territoire et qu'une loi fédérale ou provinciale ou État en interdit le déni, vous jouissez également d'une garantie ou condition implicite, MAIS UNIQUEMENT POUR LES DÉFAUTS DÉCOUVERTS DURANT LA PÉRIODE DE LA PRÉSENTE GARANTIE LIMITÉE (QUATRE-VINGT-DIX JOURS). IL N'Y A AUCUNE GARANTIE OU CONDITION DE QUELQUE NATURE QUE CE SOIT QUANT AUX DÉFAUTS DÉCOUVERTS APRÈS CETTE PÉRIODE DE QUATRE-VINGTDIX JOURS. Certains États ou territoires ne permettent pas de limiter la durée d'une garantie ou condition implicite de sorte que la limitation ci-dessus peut ne pas s'appliquer à vous. Tous les suppléments ou toutes les mises à jour relatifs au Logiciel, notamment, les ensembles de services ou les réparations à chaud (le cas échéant) qui vous sont fournis après l'expiration de la période de quatre-vingt-dix jours de la garantie limitée ne sont pas couverts par quelque garantie ou condition que ce soit, expresse ou implicite. LIMITATION DES RECURS; ABSENCE DE DOMMAGES INDIRECTS OU AUTRES. Votre recours exclusif pour toute violation de la présente garantie limitée est décrit ci-après. Sauf pour tout remboursement au choix de Microsoft, si le Logiciel ne respecte pas la garantie limitée de Microsoft et, dans la mesure maximale permise par les lois applicables, même si tout recours n'atteint pas son but essentiel, VOUS N'AVEZ DROIT À AUCUNS DOMMAGES, NOTAMMENT DES DOMMAGES INDIRECTS. Les modalités de la clause «Exclusion des dommages accessoires, indirects et de certains autres dommages » sont également intégrées à la présente garantie limitée. Certains États ou territoires ne permettent pas l'exclusion ou la limitation des dommages indirects ou accessoires de sorte que la limitation ou l'exclusion ci-dessus peut ne pas s'appliquer à vous. La présente garantie limitée vous donne des droits légaux spécifiques. Vous pouvez avoir d'autres droits qui peuvent varier d'un territoire ou d'un État à un autre. VOTRE RECURS EXCLUSIF. L'obligation intégrale de Microsoft et de ses fournisseurs et votre recours exclusif seront, selon le choix de Microsoft de temps à autre sous réserve de toute loi applicable, a) le remboursement du prix payé, le cas échéant, pour le Logiciel ou b) la réparation ou le remplacement du Logiciel qui ne respecte pas la présente garantie limitée et qui est retourné à Microsoft avec une copie de votre reçu. Vous recevrez la compensation choisie par Microsoft, sans frais, sauf que vous êtes responsable des dépenses que vous pourriez engager (p. ex., les frais d'envoi du Logiciel à Microsoft). La présente garantie limitée est nulle si la défectuosité du Logiciel est causée par un accident, un usage abusif, une mauvaise application, un usage anormal ou un virus. Tout Logiciel de remplacement sera garanti pour le reste de la période de garantie initiale ou pendant trente (30) jours, selon la plus longue entre ces deux périodes. À l'extérieur des États-Unis ou du Canada, ces recours ou l'un quelconque des services de soutien technique offerts par Microsoft ne sont pas disponibles sans preuve d'achat d'une source internationale autorisée. Pour exercer votre recours, vous devez communiquer avec Microsoft et vous adresser au Microsoft Sales Information Center/One Microsoft Way/Redmond, WA 98052-6399, ou à la filiale de Microsoft de votre pays.

DÉNI DE GARANTIES. La garantie limitée mentionnée ci-dessus constitue la seule garantie expresse qui vous est donnée et remplace toutes autres garanties expressées (s’il en est) mentionnées dans un document ou sur un emballage. Sauf en ce qui a trait à la garantie limitée et dans la mesure maximale permise par les lois applicables, le Logiciel et les services de soutien technique (le cas échéant) sont fournis TELS QUELS ET AVEC TOUS LES DÉFAUTS par Microsoft et ses fournisseurs, lesquels par les présentes dénient toutes autres garanties et conditions expressées, implicites ou en vertu de la loi, notamment (le cas échéant) les garanties, devoirs ou conditions implicites de qualité marchande, d'adaptation à un usage particulier, d'exactitude ou d'exhaustivité des réponses, des résultats, des efforts déployés selon les règles de l'art, d'absence de virus et de négligence, le tout à l'égard du Logiciel et de la prestation des services de soutien technique ou de l’omission d’une telle prestation. PAR AILLEURS, IL N'Y A AUCUNE GARANTIE OU CONDITION QUANT AU TITRE DE PROPRIÉTÉ, À LA JOUSSOUTÉ OU LA POSSESSION PAISIBLE, À LA CONCORDANCE À UNE DESCRIPTION NI QUANT À UNE ABSENCE DE CONTREFAÇON CONCERNANT LE LOGICIEL. EXCLUSION DES DOMMAGES ACCESSOIRES, INDIRECTS ET DE CERTAINS AUTRES DOMMAGES. DANS LA MESURE MAXIMALE PERMISE PAR LES LOIS APPLICABLES, EN AUCUN CAS MICROSOFT OU SES FOURNISSEURS NE SERONT RESPONSABLES DES DOMMAGES SPÉCIAUX, CONSÉCUTIFS, ACCESSOIRES OU INDIRECTS DE QUELQUE NATURE QUE CE SOIT (NOTAMMENT, LES DOMMAGES À L'ÉGAR DU MANQUE À GAGNER OU DE LA DIVULGATION DE RENSEIGNEMENTS CONFIDENTIELS OU AUTRES, DE LA PERTE D'EXPLOITATION, DE BLESSURES CORPORELLES, DE LA VIOLATION DE LA VIE PRIVÉE, DE L'OMISSION DE REMPLIR TOUT DEVOR, Y COMPRIS D'AGIR DE BONNE FOI OU D'EXERCER UN SOIN RAISONNABLE, DE LA NÉGLIGENCE ET DE
TOUTE AUTRE PERTE PÉCUNIAIRE OU AUTRE PERTE DE QUELQUE NATURE QUE CE SOIT) SE RAPPORTANT DE QUELQUE MANIÈRE QUE CE SOIT À L’UTILISATION DU LOGICIEL OU À L’INCAPACITÉ DE S’EN SERVIR, À LA PRESTATION OU À L’OMISSION D’UNE TELLE PRESTATION DE SERVICES DE SOUTIEN TECHNIQUE OU AUTREMENT AUX TERMES DE TOUTE DISPOSITION DU PRÉSENT EULA OU RELATIVEMENT À UNE TELLE DISPOSITION, MÊME EN CAS DE FAUTE, DE DÉLIT CIVIL (Y COMPRIS LA NÉGLIGENCE), DE RESPONSABILITÉ STRICTE, DE VIOLATION DE CONTRAT OU DE VIOLATION DE GARANTIE DE MICROSOFT OU DE TOUT FOURNISSEUR ET MÊME SI MICROSOFT OU TOUT FOURNISSEUR A ÊTÉ AVISÉ DE LA POSSIBILITÉ DE TELS DOMMAGES. LIMITATION DE RESPONSABILITÉ ET RECOURS. Malgré les dommages que vous puissiez subir pour quelque motif que ce soit (notamment, tous les dommages susmentionnés et tous les dommages directs ou généraux), l’obligation intégrale de Microsoft et de l’un ou l’autre de ses fournisseurs aux termes de toute disposition du présent EULA et votre recours exclusif à l’égard de tout ce qui précède (sauf en ce qui concerne tout recours de réparation ou de remplacement choisi par Microsoft à l’égard de tout manquement à la garantie limitée) se limite au plus élevé entre les montants suivants : le montant que vous avez réellement payé pour le Logiciel ou 5,00 $US. Les limites, exclusions et dénis qui précèdent (y compris les clauses cidessus), s’appliquent dans la mesure maximale permise par les lois applicables, même si tout recours n’atteint pas son but essentiel. La présente Convention est régie par les lois de la province d’Ontario, Canada. Chacune des parties à la présente reconnaît irrévocablement la compétence des tribunaux de la province d’Ontario et consent à instituer tout litige qui pourrait découler de la présente auprès des tribunaux situés dans le district judiciaire de York, province d’Ontario. Au cas où vous auriez des questions concernant cette licence ou que vous désiriez vous mettre en rapport avec Microsoft pour quelque raison que ce soit, veuillez contacter la succursale Microsoft desservant votre pays, dont l’adresse est fournie dans ce produit, ou écrivez à : Microsoft Sales Information Center, One Microsoft Way, Redmond, Washington 98052-6399.

The following MICROSOFT GUARANTEE applies to you if you acquired this Software in any other country:

Statutory rights not affected - The following guarantee is not restricted to any territory and does not affect any statutory rights that you may have from your reseller or from Microsoft if you acquired the Software directly from Microsoft. If you acquired the Software or any support services in Australia, New Zealand or Malaysia, please see the “Consumer rights” section below.

The guarantee - The Software is designed and offered as a general-purpose software, not for any user’s particular purpose. You accept that no Software is error free and you are strongly advised to back-up your files regularly. Provided that you have a valid license, Microsoft guarantees that a) for a period of 90 days from the date of receipt of your license to use the Software or the shortest period permitted by applicable law it will perform substantially in accordance with the written materials that accompany the Software; and b) any support services provided by Microsoft shall be substantially as described in applicable written materials provided to you by Microsoft and Microsoft support engineers will use reasonable efforts, care and skill to solve any problem issues. In the event that the Software fails to comply with this guarantee, Microsoft will either (a) repair or replace the Software or (b) return the price you paid. This guarantee is void if failure of the Software results from accident, abuse or misapplication. Any replacement Software will be guaranteed for the remainder of the original guarantee period or 30 days, whichever period is longer. You agree that the above guarantee is your sole guarantee in relation to the Software and any support services.

Exclusion of All Other Terms - To the maximum extent permitted by applicable law and subject to the guarantee above, Microsoft disclaims all warranties, conditions and other terms, either express or implied (whether by statute, common law, collaterally or otherwise) including but not limited to implied warranties of satisfactory quality and fitness for particular purpose with respect to the Software and the written materials that accompany the Software. Any implied warranties that cannot be excluded are limited to 90 days or to the shortest period permitted by applicable law, whichever is greater.

Limitation of Liability - To the maximum extent permitted by applicable law and except as provided in the Microsoft Guarantee, Microsoft and its suppliers shall not be liable for any damages whatsoever (including without limitation, damages for loss of business profits, business interruption, loss of business information or other pecuniary loss) arising out of the use or inability to use the Software, even if Microsoft has been advised of the possibility of such damages. In any case Microsoft’s entire liability under any provision of this Agreement shall be limited to the
amount actually paid by you for the Software. These limitations do not apply to any liabilities that cannot be excluded or limited by applicable laws.

Consumer rights - Consumers in Australia, New Zealand or Malaysia may have the benefit of certain rights and remedies by reason of the Trade Practices Act and similar state and territory laws in Australia, the Consumer Guarantees Act in New Zealand and the Consumer Protection Act in Malaysia in respect of which liability cannot lawfully be modified or excluded. If you acquired the Software in New Zealand for the purposes of a business, you confirm that the Consumer Guarantees Act does not apply. If you acquired the Software in Australia and if Microsoft breaches a condition or warranty implied under any law which cannot lawfully be modified or excluded by this agreement then, to the extent permitted by law, Microsoft's liability is limited, at Microsoft's option, to: (i) in the case of the Software: a) repairing or replacing the Software; or b) the cost of such repair or replacement; and (ii) in the case of support services: a) re-supply of the services; or b) the cost of having the services supplied again.

Should you have any questions concerning this EULA, or if you desire to contact Microsoft for any reason, please use the address information enclosed in this Software to contact the Microsoft subsidiary serving your country or visit Microsoft on the World Wide Web at http://www.microsoft.com.
PNA User Accounts and Passwords

Important: When the PNA power is switched on, it AUTOMATICALLY logs into Windows using the default user name and password. You do NOT need to log on. This gives anyone full access to the analyzer. The following steps can be taken to increase security of your PNA.

- Require users to logon when the PNA computer is turned ON - Learn how to enable this feature
- Setup individual accounts on the PNA with varying level of access - Learn how to Add or Change User Accounts and Passwords

Please read about Anti-virus protection for your PNA

Existing User Accounts

The following user accounts already exist on new PNAs.

- **Default User Account** The Default User Account is created by Windows and cannot be deleted. We recommend you change the password and, if desired, the user name. DO NOT FORGET YOUR NEW PASSWORD. If you choose to require users to logon when the PNA is turned ON, you will not be able to start your PNA without it.
  - Beginning in Sept. 2010, PNAs are shipped from the factory with the default:
    - User name (not case sensitive): A-<model number>-<last 5 digits of the serial number> (for example: A-N5242A-12345)
    - Password (case sensitive): agilent<last 5 digits of the serial number> (for example: agilent12345)
  - Beginning in April 2004, PNAs were shipped from the factory with the default:
    - User name (not case sensitive): PNA-Admin
    - Password (case sensitive): agilent
  - Before April 2004, PNAs were shipped from the factory with the default:
    - User name: Administrator
    - Password: either tsunami or left blank.

- **Agilent Account** This Administrator account is created by Agilent for service purposes. Each PNA has a unique password for this account. Although allowed by Windows, please do not delete this account.

- **Guest Account** This account allows anyone to type in any name, without password, and gain limited access to the PNA files. This account is created by Windows and cannot be deleted. It can be renamed. This account is turned OFF when the PNA is shipped.
Notes

- When connecting the PNA to the Internet, do NOT setup an Administrator account without a password. Although allowed by Windows, Internet viruses look for, and exploit, this condition.
- You can create as many user accounts as you like.
- The user name is not case sensitive. The password IS case sensitive.
- The PNA local policies are set so that, if logon is required, you must retype the user name (and password) every time. Do not change the local policies on the PNA.

How to Require Users to Logon when the PNA Computer is turned ON.

How do I know which Operating System I have?

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the Windows taskbar, click Start, then Settings, then Control Panel.</td>
<td>On the Windows taskbar, click Start, then Run.</td>
</tr>
<tr>
<td>Double click Users and Passwords.</td>
<td>Type control userpasswords2 then click OK.</td>
</tr>
<tr>
<td>Check Users must enter a user name and password to use this computer.</td>
<td>Check Users must enter a user name and password to use this computer.</td>
</tr>
</tbody>
</table>

To turn this function OFF, perform the same procedure, but clear the checkbox. The account that is selected when the checkbox is cleared is the account that is automatically logged on when the PNA is turned ON.

Add or Change User Accounts and Passwords

If the analyzer is in a secure environment, you can setup PNA users by name and grant various levels of access. This is particularly important when the PNA is remotely controlled or accessed over LAN.

You can designate a person as the administrator and then configure the PNA to allow others to use it with reduced permissions. That is, other people can be signed on to use the analyzer but they will not have the ability to perform all of the administrative functions that you can as the administrator.

Note: To connect and install a new ECal module, you must be logged on with an Administrator account. A user account with limited access will NOT allow an ECal module driver to be loaded. Learn more.

How to add or change a user account and password

How do I know which Operating System I have?

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the analyzer System menu, point to Configure, and click Control Panel.</td>
<td>Click Start, then point to Settings, then click Control Panel.</td>
</tr>
</tbody>
</table>
In the **Control Panel** window, scroll down and select the **Users and Passwords** application.

Click **User Accounts**

On the **Users** tab, if the **Add** button appears dimmed, select the **Users must enter a user name and password to use this computer** check box near the top of the window.

Follow the prompts to:
- Change an account
- **Create a new account** (see below)
- Change the way users log on or off (with password)

**CAUTION:** Although allowed by Windows, do NOT allow an Administrator account without a password. Internet viruses look for, and exploit, this condition.

Click **Add** to enter the information for yourself or for another user.

In the **User name** box, enter a user name for the user. In the **Full name** box, enter the full name of the user.

In the **Description** box, enter a description for the user. Then, click **Next**.

In the **Password** box, have the user type a password. Have the user retype the password in the **Confirm password** box. Then, click **Next**.

Select the level of access that you wish to grant this user.

**Note:** Standard users and restricted users are **NOT** able to switch GPIB modes and install firmware.

There are several other levels of security that you may grant in the **Other** list. A description of each of these other levels is displayed beneath the **Other** box when it is selected. Then, click **Finish**.

In the **Users for this computer** box, validate the user name and security level group of the user.

**Note:**
A user account with limited access will **NOT** allow an ECal module driver to be loaded. [Learn more](#).

However, limited access users **ARE** able to switch GPIB modes and install firmware.
<table>
<thead>
<tr>
<th>If you want this user to be able to use the network analyzer without entering their password each use, clear the <strong>Users must enter a user name and password to use this computer</strong> check box. Click <strong>OK</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the <strong>Automatically Log On</strong> window is displayed, have the new user type their password in the <strong>Password</strong> box and have them retype the password in the <strong>Confirm Password</strong> box.</td>
</tr>
<tr>
<td>Click <strong>OK</strong> to complete this user addition.</td>
</tr>
<tr>
<td>In the <strong>File</strong> menu, click <strong>Close</strong> to close the Control Panel.</td>
</tr>
</tbody>
</table>

- **14-Sep-2010**  Updated default account
- **8-Apr-2008**  Added Logon notes
PNA Computer Properties

The PNA uses a personal computer and a Windows operating system. The following are common tasks that you may need to perform on the PNA computer.

- View or change Full Computer Name
- Check IP Address
- Check the amount of RAM
- Check CPU Speed
- Set Time and Date
- Internal and External Speakers

Other Administrative Task Topics

View or change Full Computer Name

Your PNA has a unique computer name that identifies it on a network. To view or change the computer name, you must first minimize the PNA application.

How do I know which Operating System I have?

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, right-click My Computer</td>
<td>On the desktop, right-click My computer Icon</td>
</tr>
<tr>
<td>Click Properties</td>
<td>Click Properties</td>
</tr>
<tr>
<td>Click the Network Identification tab at the top of the dialog box</td>
<td>Click the Computer Name tab at the top of the dialog box</td>
</tr>
<tr>
<td>Click Properties</td>
<td>Click Change next to &quot;..rename this computer..&quot; message</td>
</tr>
<tr>
<td>Type your new Computer Name</td>
<td>Type your new Computer Name</td>
</tr>
</tbody>
</table>

Note: To add your computer to a domain, or to set up the networking configuration, contact your company's I.T. department. This setup is custom for each company.

To restore the PNA application, click PNA Analyzer in the task bar at the bottom of the screen.

Check IP Address

If your PNA is connected to a LAN, you can view the IP address and other networking information.
1. **Minimize the PNA** application

2. Click **Start**, then **Run**

3. Type **cmd**, then click **OK**

4. At a DOS prompt, type **ipconfig /all**

---

**Check the amount of RAM**

Random Access Memory (RAM) is the amount of working memory in your computer. The PNA application can require up to 512 MB of RAM depending on the settings you use. If your PNA is operating slowly when you have more than four windows open or if you routinely use more than 1601 data points, you may need to upgrade to 512 MB.

The amount of RAM in your PNA may limit your ability to upgrade firmware. See [http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc](http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc)

To view the amount of PNA RAM, you must first minimize the PNA application.

---

**How do I know which Operating System I have?**

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, right-click <strong>My Computer</strong></td>
<td>On the desktop, right-click <strong>My computer Icon</strong></td>
</tr>
<tr>
<td>Click <strong>Properties</strong></td>
<td>Click <strong>Properties</strong></td>
</tr>
<tr>
<td>Click the <strong>General</strong> tab at the top of the dialog box</td>
<td>Click the <strong>General</strong> tab at the top of the dialog box</td>
</tr>
<tr>
<td>The amount of RAM appears at the bottom of the window.</td>
<td>The amount of RAM appears at the bottom of the window.</td>
</tr>
</tbody>
</table>

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

---

**Check CPU Speed**

The speed of the PNA processor (CPU) is a factor in determining how quickly the PNA processes data. Also, the CPU speed in your PNA may limit your ability to upgrade firmware. See [http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc](http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc)

You can see which CPU is in your PNA by comparing your PNA rear-panel with the images at [http://na.tm.agilent.com/pna/cputype.html](http://na.tm.agilent.com/pna/cputype.html).

Or, beginning with PNA Rev. A.09.10, on the PNA click **Help**, then **About Network Analyzer**. Learn more.

Or, you can do the following to check your PNA CPU speed:

1. **Minimize the PNA** application.

2. Then do the following:
### How do I know which Operating System I have?

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, right-click <strong>My Computer</strong></td>
<td>On the desktop, right-click <strong>My computer Icon</strong></td>
</tr>
<tr>
<td><strong>Click Manage</strong></td>
<td><strong>Click Properties</strong></td>
</tr>
<tr>
<td>Open <strong>System Tools</strong> folder, then click <strong>System Information</strong>.</td>
<td>Click the <strong>General</strong> tab at the top of the dialog box</td>
</tr>
<tr>
<td><strong>Click System Summary</strong>.</td>
<td>The CPU speed appears near the bottom of the window</td>
</tr>
<tr>
<td>After refreshing, the CPU speed appears at the end of the <strong>Processor</strong> entry.</td>
<td></td>
</tr>
</tbody>
</table>

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

See [PNA configurations](#) to learn if you can upgrade your PNA CPU.

### Set Time and Date

Both Windows 2000 and XP

To set the time and date on your PNA, you must first minimize the PNA application.

1. Move the cursor to the lower corner of the screen
2. When the taskbar appears, double-click on the displayed time. This opens the **Date/Time Properties** dialog box.
3. Change the date, time, and time zone as appropriate.

To restore the PNA application, click **PNA Analyzer** in the task bar at the bottom of the screen.

### Internal Speaker

There is an internal sound card and speaker in the PNA. However, there is no audio output jack.

There may be times when you might want to control the speaker volume or turn the speaker OFF, such as when the PNA is generating errors. See [Learn more about errors](#).

To control the PNA speaker volume:

1. Press **System**, then **Service**, then **Utilities**, then **Speaker Volume**
2. Enter a value between 0 (speaker OFF) and 100 (highest volume)
<table>
<thead>
<tr>
<th>Date</th>
<th>Change Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>17-Jun-2011</td>
<td>Modified speaker volume</td>
</tr>
<tr>
<td>30-Nov-2009</td>
<td>Added Help, About note.</td>
</tr>
<tr>
<td>26-Nov-2008</td>
<td>Added external speaker note</td>
</tr>
<tr>
<td>12-Mar-2008</td>
<td>Added link to support site</td>
</tr>
<tr>
<td>20-Sep-2007</td>
<td>Added speaker OFF</td>
</tr>
</tbody>
</table>
Run Error Check and Disk Defragmenter

When the PNA is shutdown unexpectedly or power is removed without first shutting down, large amounts of Hard Disk Drive space is rendered unusable. If shutdown in this manner enough times, the PNA could become unstable and no longer work.

This Hard Disk Drive space can be recovered by first running Windows Error-checking to find and correct errors on the disk, and then the Disk Defragmenter to recover Hard Disk Drive space. These programs should be run routinely, about every 1 to 4 weeks, depending on how often the PNA is unexpectedly shutdown.

To learn more about Disk Defragmenter, see the Windows Help file.

Follow this procedure to run these programs:

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, double-click My Computer</td>
<td>On the desktop, double-click My Computer</td>
</tr>
<tr>
<td>Select Local Disk (C:)</td>
<td>Select System OS</td>
</tr>
<tr>
<td>Click File, then Properties</td>
<td>Click File, then Properties</td>
</tr>
<tr>
<td>Click the Tools tab</td>
<td>Click the Tools tab</td>
</tr>
</tbody>
</table>

Error-checking

- Click Check Now.
- Check Automatically fix file system errors.
- Click Start.
- Click Yes to run disk check on next restart.
- Manually restart the PNA. The disk check will run before Windows restarts.

Approximately every six months, check the second box in addition to the first box. The error-checking process takes much longer, but performs a more complete check.

Defragmentation

- Click Defragment Now...
- Click Defragment to begin the defragment process.
- Click Close when defragmentation is complete.
Recovering from PNA Hard Drive Problems

The leading cause of PNA failures is problems with the PNA Hard Disk Drive (HDD). These problems are usually preventable (see Preventing PNA HDD Problems), and in many cases, recoverable. The following could save you weeks of downtime and the cost of replacing your PNA HDD.

This document is now on the Agilent PNA Support Website: http://na.tm.agilent.com/pna/. When at this webpage, click the Hard Drive Recovery link.

If your PNA does experience a Hard Disk Drive Problem, you will not be able to access this Help file, but you may be able to access the Internet from another computer.
Wake PNA at Specified Time

Depending on the CPU that is used in your PNA-X, you may be able to start your PNA-X at a specified time every day. This feature allows the PNA-X to be shut down at night (saving energy), then wake the PNA-X at a specified time to allow sufficient warm-up time in the morning before being used.

To use this feature, the PNA-X must have a 2000 MHz CPU board. See how to determine the CPU board.

How to configure the PNA-X to wake at a specified time:

1. Connect a USB keyboard to the PNA-X.
2. **Restart** the PNA-X.
3. During power-up, press F2 on the keyboard at the moment it indicates to do so on the bottom of the PNA-X screen.
4. In the BIOS, go to **Configuration** then **Power Control Configuration**. Set **Resume On Time:** to **ON**, and set the **Resume Time:** to the desired wake-up time.
5. Press **F10** to Save, Exit, and restart the PNA-X.
6. At the end of the day, Shut Down (not hibernate or standby) the PNA-X.
7. The PNA-X will wake-up at the specified time.

**Note:**
A utility can also be set to provide a Wake-on-LAN (WOL) call. This is outside the scope of PNA Help. Search the internet for **WOL utility**.

To configure the PNA-X for WOL, follow the above procedure for accessing the BIOS.

In the BIOS:

1. Go to **Configuration** then **LAN Configuration**. Ensure that **Power Saving when S5** to **Disabled** (default setting).
2. Go to **Configuration** then **Power Control Configuration**. Set **PME Wake From S5** to **Enabled**.
3. Press **F10** to Save, Exit.

Microsoft Windows® XP / 2000 Considerations

In this topic:

- Microsoft Windows on the PNA
- Using USB
- Plug & Play Stability and Security
- LAN Connections
- Single and Double Click option
- Windows XP Theme
- Printing

Microsoft Windows on the PNA

- Beginning in April 2004, the PNA is shipped from the factory with a modified version of Microsoft Windows XP operating system. Previously, the PNA was shipped with Windows 2000. The PNA application performs identically using these two operating systems.

- Beginning in Dec. 2005 with PNA Rev 6.0, firmware cannot be upgraded on PNA models that use Microsoft Windows 2000. For more information, see the PNA support website.

To determine which Operating System is installed on your PNA:

1. Minimize the PNA application

2. On the PNA desktop, click Start.

3. Along the side of the Start menu appears one of the following:
   - Windows 2000 Professional
   - Windows XP Professional

VERY IMPORTANT  Protect your hard drive!
The leading cause of PNA failures is problems with the PNA Hard Disk Drive (HDD). These problems are usually preventable, and in many cases, recoverable. Learn more about protecting your PNA.

Using USB

The PNA has at least two USB ports for connecting devices: one on the front panel and at least one on the rear.
The main advantages of USB are “hot” connects and disconnects and fast data transfer speeds. Electronic Calibration modules are now available with USB connections.

The first time you plug a device into a USB port there is some wait time. Windows reports it is identifying the hardware, then searching for the correct driver, then installing the driver (if it was found).

Connecting that same device back into that same port later is quick and easy, but if you move the device to a different USB port, you will have to wait through the hardware ID and driver search again.

**Learn about USB limitations.**

**Note:** Certain USB devices (such as ECAL modules) require you be logged on with Administrator privileges the first time you plug them into the PNA. This must be done for each serial number. Click **Next** to choose the default settings when installing new USB devices.

**Plug & Play Stability and Security**

Plug & Play capabilities is similar to Win 95 and 98. It provides both a stable and secure operating environment. You may notice also that it greatly reduces the number of required reboots.

**LAN Connections**

Windows supports DHCP and fixed IP addressing. Also, “Hot” connect and disconnect of the LAN cable, as well as a visual indicator of LAN status in system tray area, makes LAN connections more intuitive. In addition, the Hardware Wizard helps users with system hardware configuration.

**Single and Double Click option**

By default, Windows allows a single-click method of launching icons. To revert to double-clicking, click **Start**, then **Settings**, then **Control Panel**, then click **Mouse**. In the Mouse Properties dialog, select **Double-click to open an item**. Then click **OK**.

**Windows XP Theme**

The PNA application is designed for, and best viewed in, **Windows Classic** theme. To change the theme from Windows XP to Windows Classic,

1. Minimize the PNA application.
2. Right-click on the Desktop, then click **Properties**.
3. On the Theme tab, under **Theme** select **Windows Classic**.

**Printing**

Adding a printer should be done outside of the PNA application. **Learn more**.

Familiar Hardkey layout, similar to Agilent 8720 and 8753 Network Analyzers

Back to the familiar layout, significantly different from legacy PNA models. Most measurement settings are made from the Stimulus Block and the Response Block.

Fully functional Hardkey/Softkey selections consistent with Menu (mouse) selections

Access ALL PNA settings from the front panel using hardkey/softkeys or from the Menu using a mouse. Both methods are consistent; learn the menu structure once, and it applies to both methods of UI navigation.
Power Switch
Used for choosing between power-on (|) and standby (O) state.
Learn to power ON and OFF the PNA.

Test Ports
The PNA-X and N522x models are available with 2 or 4 test ports.
See Specs for more information about the Test port connectors and Input damage levels.

Front panel Access Jumpers
These connectors provide direct access to the PNA source and receivers. This allows you to make a wide variety of measurements and improve dynamic range.
See the PNA-X front panel jumpers specifications

<table>
<thead>
<tr>
<th>Port 1</th>
<th>Port 3</th>
<th>Port 4</th>
<th>Port 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="PNA-X jumper panel 1" /></td>
<td><img src="image2.png" alt="PNA-X jumper panel 3" /></td>
<td><img src="image3.png" alt="PNA-X jumper panel 4" /></td>
<td><img src="image4.png" alt="PNA-X jumper panel 2" /></td>
</tr>
</tbody>
</table>

N5247A
Port 1 and Port 3 SW SRC OUT - COMB IN jumpers moved from rear-panel (J8 through J11) to front-panel to minimize path loss.

USB Hub
This USB hub contains four USB ports to power your PNA peripherals. There are also four USB ports on the rear panel.
Limitation: The total power consumption for all eight USB ports is limited to 4.0 amps. If this limit is exceeded, all
USB ports are disabled until a device is removed and power consumption falls below the limit. When first connected, Agilent ECal modules 8509x and N4431 draw significantly more current than other modules.

**Note:**
The **FIRST TIME** each USB device (ECal module, power sensor, and so forth) by serial number is connected to a specific PNA USB port, you must be logged in to the PNA with an **Administrator** account. Learn how.

When a **New Hardware Found** dialog appears, click **OK** to install the device.

After being installed, when that same USB device is connected to that same USB port, you can be logged in to the PNA with a Limited/User account.

**Ground terminal**
Connect a banana-type plug to this terminal for grounding to the PNA chassis.

**No probe power**
Probe power is NOT provided with the PNA-X and N522x models.

**Hardkeys**

**TRACE/CHAN Keys**
Manages the Traces and Channels on the PNA display.

<table>

- 15-Apr-2008  Added ALL front panel jumper images
- 23-Aug-2007  Added front panel jumpers image
Rear Panel Tour

This image includes ALL rear-panel features for all PNA models, excluding the PNA-X. See the PNA-X Rear Panel. Your PNA may not have this capability or look.

Click on a connector for detailed information.

10 MHz Reference IN/OUT

**10 MHz Reference Input** When a 10 MHz external reference signal is detected at this port, it will be used as the instrument frequency reference instead of the internal frequency reference.

**10 MHz Reference Output** This BNC(f) connector outputs a frequency reference signal for use by other test equipment.

See PNA specifications

VGA Connector Learn more

USB Hub

This USB hub contains four Hi-Speed USB 2.0 ports to power your PNA peripherals.

Each USB 2.0 port is capable of providing .5 amps. If this limit is exceeded, all USB ports are disabled until a device is removed and power consumption falls below the limit.

**Note:** When first connected, Agilent ECal modules 8509x and N4431 draw significantly more current than other modules. See PNA specifications
USB Device  Learn more

LAN Connector
This 10/100BaseT Ethernet connection has a standard 8-pin configuration and auto selects between the two data rates.

Line Power
See PNA specifications

GPIB Controller and Talker/Listener Ports
The PNA-X can be a GPIB Controller and Talker/Listener. Learn more.

Test Set I/O
See Details

Bias IN and Fuses
Apply Bias to the PNA ports through these BNC connectors.
See PNA specifications

Material Handler I/O
See details.
Beginning April 2009, PNA-X and N5264A models shipped with this newer CPU board. The major changes include:

- **2 GHz CPU**
- **A** Removable Hard disk drive (Learn more in the Service Guide)
- **B** Relocated GPIB Controller port
- **C** Relocated VGA connector

### 10 MHz Reference IN/OUT

**10 MHz Reference Input** When a 10 MHz external reference signal is detected at this port, it will be used as the instrument frequency reference instead of the internal frequency reference.

**10 MHz Reference Output** This BNC(f) connector outputs a frequency reference signal for use by other test
equipment.

- See **SCPI** command that detects an external reference signal at this connector.
- See **PNA-X specifications**

---

**VGA Connector**  Learn more

---

**USB Hub**

This USB hub contains four USB ports to power your PNA peripherals. There are also four USB ports on the front panel.

**Limitation:** The total power consumption for all eight USB ports is limited to 4.0 amps. If this limit is exceeded, all USB ports are disabled until a device is removed and power consumption falls below the limit. When first connected, Agilent ECal modules 8509x and N4431 draw significantly more current than other modules. See **PNA-X specifications**.

See Important First-time USB connection note.

---

**USB Device**  Learn more

---

**LAN Connector**

This 10/100BaseT Ethernet connection has a standard 8-pin configuration and auto selects between the two data rates.

---

**Line Power**

See **PNA-X specifications**

---

**GPIB Controller and Talker/Listener Ports**

The PNA-X can be a GPIB Controller and Talker/Listener. Learn more.

---

**RF Path Access**

These connectors are NOT available on the **N522x** and **N5264A** models.

These connectors allow **RF Path Configuration**.

Ports 3 and 4 are not available on 2-port models.

N5247A - J8 thru J11 are moved to the **front-panel**.
**RF and LO OUT**

The **RF OUT** connector is NOT available on the **N5264A**.

For the **N5247A** and **N5227A**: Added RF2 OUT (J12) for 4-port 110 GHz single sweep PNA. Enables driving two frequency extenders simultaneously.

*Caution:* **LO OUT** has more power than previous PNA models.  
[See specifications](#)

**IF Path Inputs**

Option 020 adds these connectors, which allow access to the PNA Receiver / IF paths.

These are labeled A, B, C/R1, D/R2, R.

- For 2-port models, use A, B, R1, R2.
- For 4-port models, use A, B, C, D, R.

[See IF Path Configuration settings and block diagram.](#)

**Power I/O**

Has some of the **AUX I/O connector** functionality on the PNA-L and E836xB models.  
[See Details](#)

**28 V (BNC output)**

Used to power a noise source for the **Noise Figure App**.

**External and AUX Trigger I/O**
MEAS TRIG IN - When enabled, PNA is triggered by signals on this connector. [Learn more.](#)

MEAS TRIG RDY - When enabled, PNA outputs a 'READY' signal on this connector to other devices. [Learn more.](#)

AUX TRIG 1&2 IN - When enabled, PNA accepts signals on these connectors which indicates that the external devices is ready to be triggered. [Learn more.](#)

AUX TRIG 1&2 OUT - When enabled, PNA outputs signals on these connectors either before or after a measurement. [Learn more.](#)

**Test Set I/O**

See Details

**Bias IN and Fuses**

Apply Bias to the PNA ports through these BNC connectors.

The PNA will meet all of its RF specifications with bias up to 200 ma. As the DC bias is increased, corrected source match and directivity will degrade at low RF frequencies. Above 100 MHz, with up to 1 A bias, there is very little degradation in corrected source match and directivity.

[See specifications](#)

**Material Handler I/O**

See details.

**Pulse I/O**

See Details

**1.6 GHz CPU**

See [CPU Speed / Performance](#)

Powering the PNA ON and OFF

The following is described in this topic:

- How to...
  - Hibernate
  - ON
  - Shutdown
  - Turn OFF Autostart

**Notes**

During boot up of Windows or of the Network Analyzer application program, do NOT press keys on the front panel, rotate the RPG knob, or connect a USB device. Doing so MAY lead to a front panel lockup state.

If the PNA front-panel keypad or USB ports are not responding, SHUTDOWN or RESTART the PNA; do NOT Hibernate. This causes the PNA drivers to awaken from hibernation in the same corrupt state.

**How to Log off, Shut down, Restart, or Hibernate the PNA.**

1. BRIEFLY press the front-panel PNA power button.
2. In the What do you want the computer to do? list, choose an action:
   - Log off (closes programs)
   - **Shut down**
   - Restart (shutdown and start)
   - **Hibernate** (available ONLY on PNA “C” models)
3. Press OK to perform the action

**Note:** ONLY if the PNA is locked and you cannot operate the mouse or keypad - Press and hold the power button for at least four seconds. **This practice should be avoided!** Repeated shutdowns in this manner WILL damage the hard drive. [Learn more about damaging the PNA hard drive.](#)

**Hibernate Mode**

**Note:** Hibernate is available ONLY on PNA “C” models. [Learn about these model numbers.](#)
In hibernate mode the current instrument state is automatically saved to the hard disk before the PNA is powered OFF.

When the PNA is powered ON, this instrument state is loaded, thus saving time over a full system boot-up.

A password is usually NOT required to resume PNA operation after Hibernate mode.

The hibernation state is the normal OFF state. A small amount of standby power is supplied to the PNA when it is in the hibernation mode. This standby power only supplies the power switch circuits and the 10 MHz reference oscillator; no other CPU-related circuits are powered during hibernation. To guarantee that your measurements meet the PNA specified performance, allow the PNA to warm-up for 90 minutes after the power button light has changed from yellow back to green.

**ON Mode**

- To turn ON the PNA press the power button.
- The power indicator will change to green when power is ON.

**Turn OFF PNA Autostart**

The PNA application (835x.exe) always starts automatically when power is turned ON. To cause the PNA to NOT Autostart, do the following:

1. Minimize the PNA application.
2. From Windows Explorer, navigate to and double-click the following file: C:\Program Files\Agilent\Network Analyzer\Service\Toggle_PNA_Autostart.

The script toggles the PNA Autostart mode ON and OFF.

**Shutdown Mode**

- In shut down mode the current instrument state is NOT automatically saved before the PNA is powered OFF.
- When the PNA is again powered ON, a full system boot-up is performed and the PNA powers-up in the preset settings.
- A password may be required to resume PNA operation after being in Shutdown mode. Learn more.
- To guarantee that your measurements meet the PNA specified performance, allow the PNA to warm-up for 90 minutes after the power indicator has turned green.
- The power indicator will change to yellow when power is OFF.

**Note:** If the PNA is locked and you cannot operate the mouse or keypad, shut down the PNA by pressing and holding the power button for at least four seconds. This practice should be avoided! Repeated shutdowns in this manner WILL damage the hard drive. Learn more.
about damaging the PNA hard drive.

Unplugging the PNA

- Remove the power cord from the PNA ONLY when the power indicator is yellow, in either Hibernate or Shutdown mode. If the power cord is removed while the power indicator is green (PNA ON), damage to the hard drive is possible.

- The indicator will remain yellow for several seconds after the power cord has been removed.

- When plugged back in and the power button is pressed to ON, the PNA starts in the mode it was in when the power cord was unplugged, either Hibernate or Shutdown.

Last Modified:

4-May-2011    Added N522x models

3-Jun-2009    Updated for N5244A and N5245A
Traces, Channels, and Windows on the PNA

It is critical to understand the meaning of the following terms as they are used on the PNA.

- **Traces** - Managing
- **Channels** - Managing
- **Windows** - Managing

**Note:** You may experience a significant decrease in computer processing speed with combinations of the following: increased number of points, number of traces, and calibration error terms (full 2-port or 3-port). If this becomes a problem, you can increase the amount of RAM with PNA Option 022. To monitor the amount of PNA memory usage, press **Ctrl Alt Delete**, select **Task Manager**, then click on the **Performance** tab.

**Other Quick Start topics**

**Traces** are a series of measured **data points**. There is no theoretical limit to the number of traces. However, the practical limit is the **maximum number of windows** * the maximum number of traces per window (24).

In addition, one memory trace can be stored and displayed for every data trace. **Learn more about Math / Memory traces.**

Trace settings affect the presentation and mathematical operations of the measured data.

The following are Trace settings:

- **Parameter**
- **Format and Scale**
- **Smoothing**
- **Correction ON / OFF**
- **Electrical Delay**
- **Phase Offset**
- **Trace Math**
- **Markers**
- **Time Domain** (Opt 010)

**Managing Traces**

- **How to Select a trace**
- **How to Delete a trace**
How to Move a trace
How to Maximize a trace
How to Create a new trace
How to Change the trace parameter.
How to display a custom trace title.
How to display a wide active trace

How to Select a Trace
A trace must be selected (active) before its trace settings can be changed.

How to know which trace is Active?

Using front-panel HARDKEY [softkey] buttons
1. For Traces 1-4, press the corresponding Hard Key
2. For other trace numbers, press TRACES
3. then [Select Traces]
4. Select a trace number in the Entry toolbar.

PNA Menu using a mouse
1. Click the Trace Status label or trace.

How to Delete a Trace

Using front-panel HARDKEY [softkey] buttons
1. For Traces 1-4, press the corresponding Hard Key
2. For other trace numbers, press TRACES
3. then [Select Traces]
4. Select a trace number in the Entry toolbar.

PNA Menu using a mouse
1. Right-click the Trace Status label, then click Delete.
How to Move a trace to a different window

Using front-panel HARDKEY [softkey] buttons

1. Select the trace to move.
2. Press TRACES
3. then [Move Trace]
4. Select a window number in the following dialog.

PNA Menu using a mouse

1. Right-click the Trace Status label, then click Move Trace.

PNA-X ONLY

This dialog is launched by clicking Trace/Chan, then Delete Trace
The Select Trace dialog is launched by clicking Trace/Chan, then Select Trace

Select, Delete, Move Traces dialog box help

Both the Select Trace and Delete Trace dialogs work the same.
Select a trace, then click OK.
Only ONE trace can be Selected or Deleted.

Note:
To EASILY select a trace, click the Trace Status label.
To EASILY delete a trace, right-click the Trace Status label, then click Delete.

Trace Max
Makes the active trace the ONLY trace on the display. All other traces are hidden.

How to do Trace Max

- Select Trace, then Trace Max.
With Trace Max ON, select a different trace from the Traces softkeys to make that trace visible.

To make all traces visible again select Trace Max OFF

**Trace Title**

A Trace Title overwrites the Measurement Parameter in the Trace Status area, the Status Bar, and hardcopy prints.

- This title has priority over Equation Editor titles.
- The practical limit is about 70 characters if there is only one trace.
- Spaces are accepted but not displayed; use underscores.
- The title is annotated as follows:

```
Tr 1 NewTrace LogM 10.00dB/ 0.00dB
```

**How to enter a Trace Title**

1. Click the Trace Status label to select a trace.
2. Click Trace/Chan, then Trace, then Trace Title.
3. Click Enable, then type the trace title. Click Keyboard to type with a mouse.
4. To remove the trace title, clear the Enable checkbox, or delete the text from the dialog entry.

**Channels** contain traces. The PNA can have up to **200 independent channels** (32 before A.09.00)

Channel settings determine how the trace data is measured. All traces that are assigned to a channel share the same channel settings. A channel must be selected (active) to modify its settings. To select a channel, click the Trace Status button of a Trace in that channel. The following are channel settings:

- Frequency range
- Power level
- Calibration
- IF Bandwidth
- **Number of Points**
- **Sweep Settings**
- **Average**
- **Trigger** (some settings are global)

**Managing Channels**

**How to Select a Channel**

A channel must be selected (active) before its settings can be changed.

To make a channel active, select a trace in that channel.

**How to Turn ON or OFF a Channel**

Click **Trace/Chan**, then **Channel**, then **Turn On / Off Channel**.

![Turn ON | OFF Channel dialog box help](image)

Both the Turn ON and Turn OFF dialogs work the same.

Select a channel, then click **OK**. Only ONE channel can be selected.

When turning ON a channel, the new channel is always the Standard Measurement Class with an S11 trace.

**Note:** To create more than one trace in a new channel, click Trace, then New Trace

**Windows** are used for viewing traces.

- The PNA can show an **UNLIMITED** number of windows on the screen (16 windows previous to PNA release 6.2) with the following limitations:
  - The COM property **MaximumNumberOfWindows** returns 1000 ('unlimited' is not a number).
  - The **SCPI status register** can only track the status of up to 576 traces.
  - Each window can contain up to **24 traces** (8 traces previous to PNA release 8.2).
- Windows are completely independent of channels.
- Learn to create and manage windows.

The following is a window containing two traces. Both traces use the same channel 1 settings as indicated by the annotation at the bottom of the window.

PNA-X shows the window number in the lower-left corner of the window. The following shows window 5.

**Managing Windows -**

**How to make various window settings**

New, Close, Tile, Cascade, Minimize, Maximize

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>RESPONSE</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then <strong>[Display]</strong></td>
<td>2. then <strong>Display</strong></td>
</tr>
<tr>
<td>3. then <strong>[Windows]</strong></td>
<td>3. then <strong>Windows</strong></td>
</tr>
</tbody>
</table>

[Programming Commands]
Close Window dialog box help

Select a window, then click OK. The remaining windows are tiled.

Only ONE window can be selected.

Traces contained in a closed window are deleted.

**Note:** To EASILY close a window, click the X in the upper right corner of a window. The X is only visible when Title Bars are enabled. The remaining windows are NOT tiled.

See Customize the PNA screen to learn how to make other window settings

---

Last modified:

- 4-Sep-2008  Removed legacy content
- 1-May-2008  Increased max number of traces per window
- 9/19/06      MQ Modified for unlimited number of windows
Basic Measurement Sequence

The following process can be used to setup all PNA measurements:

**Step 1. Set Up Measurements**
Reset the analyzer, create a measurement state, and adjust the display.

**Step 2. Optimize Measurements**
Improve measurement accuracy and throughput using techniques and functions.

**Step 3. Perform a Measurement Calibration**
Reduce the measurement errors by performing a calibration.

**Step 4. Analyze Data**
Analyze the measurement results using markers, math operations, and limit tests.

**Step 5. Print, Save or Recall Data**
Save or print the measurement data.
# Frequency Blanking

For security reasons, you can prevent frequency information from appearing on the PNA screen and printouts.

## How to set Frequency Blanking

## Security Setting dialog box help

### Notes

- To learn how to erase memory before moving your PNA out of a secure area, see [http://na.tm.agilent.com/pna/security.html](http://na.tm.agilent.com/pna/security.html).

## Security Levels

**None** - All frequency information is displayed on the screen and printouts.

**Low** security level - Frequency information is blanked from the following:

- Display annotation
- Calibration properties
- All tables
• All toolbars

• All printouts

• **External sources** - See Also: *Preference to Deactivate External Devices on Preset*. **Note:** Frequency blanking is fully supported ONLY on Agilent MXG sources with option 006. On MXG models without option 006 and all PSG models, the window state is turned OFF. When the “local” button is clicked on the source, then frequency is re-displayed.

**High** security level - Low security level settings PLUS:

• **GPIB console** is inactive

**Extra** security level - High security level settings PLUS:

• All ASCII **data saving** capability (.snp, .prn, .cti) is saved without frequency information. The X-axis information is replaced with data point numbers. Before A.08.50, saving these file types was NOT allowed.

• **Mixer setup files** (*.mxr) can NOT be saved.

**For ALL security levels:**

Frequency information is **NOT** blanked from the following:

• **Service Adjustment Programs**

• Your COM or SCPI programs.

**Instrument State and Cal Sets**

The security level is always saved and recalled with an instrument state. However, the instrument state may contain a Cal Set or link to a Cal Set. **Learn more.** This may influence the security level when the instrument state is recalled. Here is how.

• When a new Cal Set is created at the end of a calibration, the current system security level is stored with it.

• The only way to change an existing Cal Set’s security level is by writing a new calibration into the Cal Set.

• When later applied to a channel, if the Cal Set has a **higher** security level than the current system security level, the system security level will become upgraded to that of the Cal Set.

• When saving an instrument state to either a *.csa or *.cst file, the security levels of the system and Cal Set are saved separately. When recalled, the higher security level of the two is applied.

• To view the security level of a Cal Set, see **Cal Set Properties**.
**Re-displaying frequency information**

- When in **Low** security level, do any of the following:
  - Revisit this dialog box and select **None**
  - Perform an **instrument preset**
  - Recall an Instrument State/Cal Set with security level of **None**.
- When in **High** or **Extra** security level, do any of the following:
  - Perform an **instrument preset**
  - Recall an Instrument State/Cal Set with security level of **None**.

---

Last Modified:

- 8-Feb-2011 Clarified external sources
- 4-Nov-2010 Added external sources
- 21-Jun-2010 Clarified re-display freq information
- 17-Feb-2009 Added Extra file saving with data point numbers
- 4-Sep-2008 Removed legacy content
- 13-Aug-2008 Added ECal note
- 29-Apr-2008 Fixed hardkey presses
- 17-Jul-2007 Added Extra setting
Internal Second Source

The following PNA models include an internal second source.

<table>
<thead>
<tr>
<th>Model</th>
<th>Total # of Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>N5230A Opt 146</td>
<td>4</td>
</tr>
<tr>
<td>N5230A Opt 246</td>
<td>4</td>
</tr>
<tr>
<td>PNA-X Opt 224</td>
<td>2</td>
</tr>
<tr>
<td>PNA-X and N522x Opt 400's</td>
<td>4</td>
</tr>
</tbody>
</table>

How to use the second source

- Set frequency using the Frequency Offset Opt 080 dialog.
- Set power using the Advanced Power dialog.
- Source power calibration of the second source is performed as usual.
- Using FCA, click the LO button to set frequency and power.
- The specifications of the second source are the same as source 1.

Benefits / Uses of the second source

- Up to five times faster than stepping an external source.
- Measure Mixers with internal swept or fixed LO.
- Measure TOI or Intermodulation distortion.

Internal Second Source Restrictions

Source 1 and Source 2 are available at specific ports as follows:

**N5230A (PNA-L) models:**

- Source 1 power is available at Port 1 OR Port 2; NOT at both ports simultaneously.
- Source 2 power is available at Port 3 OR Port 4; NOT at both ports simultaneously.

**PNA-X and N522x 4-port models**

- Source 1 power is available at Port 1 OR Port 2; NOT at both ports simultaneously.
- Source 2 power is available at Port 3 AND Port 4; BOTH ports simultaneously.
- Other routing configurations are possible using the **RF Path Configurator**.

**PNA-X Opt 224 (PNA-X 2-port model):**

[Image of PNA-X Opt 224]

- Source 1 power is available at **Port 1** OR **Port 2**; NOT at both ports simultaneously.
- Source 2 (**SRC 2**) power is available at **Out 1** AND **Out 2**; BOTH ports simultaneously.
- Other routing configurations are possible using the **RF Path Configurator**.

**Remotely Accessing the Internal Second Source**
See **Remotely Specifying a Source Port**.

Networking and Connecting the PNA

The PNA as a PC

- PNA User Accounts and Passwords
- Drive Mapping
- Connecting the PNA to a PC
- Easy versus Secure Configuration
- Changing Network Client
- Using VNC to Control the PNA User Interface

GPIB / COM Programming

- Configure for COM/DCOM Programming
- Configure for GPIB, SCPI, and SICL

Controlling External Devices

- Configure an External Device
- E5091 TestSet Control
- External Testset Control
- Interface Control Feature
- TestSetIO Connector
- Handler IO Connector
- AuxIO Connector
PNA Preferences

PNA preferences are settings that survive a Preset or PNA Shutdown. PNA Preferences are listed on this page with links to locations that provide more information.

How to set PNA Preferences

Using front-panel HARDKEY [softkey] buttons

1. Press SYSTEM
2. then [Configure]
3. then [More]
4. then [Preferences]

PNA Menu using a mouse

1. Click Utility
2. then System
3. then Configuration
4. then Preferences

Preferences dialog box help

PNA Preferences survive a Preset and a system reboot.

A checked box makes the following statements true unless stated otherwise.

Touchscreen always ON

Active Trace is always wider.

Active Trace is briefly wider.
### Cal: Auto-save to User Cal Set

This setting only affects calibrations performed using SCPI or COM. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

With Rev 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets.

Check the box to revert to always automatically saving completed calibrations to an auto-named User Cal Set. **Caution:** this can cause a lot of save User Cal Sets. Learn more.

The following message appears when both of the two Cal Set choices are selected:

"Cal: Auto-save preferences conflict"

**Auto-save to User Cal Set** (above)- or - **Auto-save to current Cal Set** (below)

Uncheck one of these.

### Cal: Auto-save to current Cal Set

This setting only affects calibrations performed using SCPI or COM. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

Check the box to always automatically save a competed Cal to the Cal Set that is currently selected on the specified channel, which could be the channel Cal Register. If the channel does not yet have a selected Cal Set, the Cal will be saved to a new User Cal Set with an automatically-generated name.

### Cal: For Guided Cal, set external trigger.

With Rev 6.0 we implemented a change that allows the measurement of Cal Standards during a Guided Cal to be externally triggered when trigger source is set to External.

Check the box to revert to NOT allowing the measurement of Cal standard to be externally triggered. All Guided Cal Standard measurements are triggered internally regardless of the trigger source setting. Learn more.

### Cal: For Unguided Cal, set external trigger.

Same as above, except for Unguided Cals.

### Cal: Simulated Cal Behavior

For SCPI behavior only. Learn more.

### Cal: For Frequency Offset, use Primary Frequencies

Use when making mmWave measurements without a test set. Learn more.

### Memory: Data Math 8510 Mode

Check the box to simulate the Agilent 8510 data processing chain as it pertains to Trace Math and Memory. Learn more.

### Meas: Mathematical offset for receiver attenuation

By default, the PNA-X offsets the test port receivers by the amount of receiver attenuation. All other PNA models do **NOT** offset the receiver attenuation.

Check the box to offset the receiver attenuation.
Clear the box to NOT offset the receiver attenuation.

Learn more.

**Meas: Mathematical offset for source attenuation**

By default, the PNA offsets the power at the reference receiver by the amount of source attenuation. Clear the box to NOT offset the source attenuation. Learn more.

**Meas: RF power On during frequency sweep retrace**

By default, the PNA leaves RF power ON during a retrace of single-band frequency or segment sweeps. Clear the box to turn RF power OFF during a retrace of single-band frequency or segment sweeps. Learn more.

**Meas: Power Sweep Retrace**

By default, at the end of a power sweep, while waiting to trigger the next sweep, the PNA maintains source power at the start power level. Clear the box to maintain source power at the STOP power level. Learn more.

**Meas: External Trigger OUT is Global**

By default, the PNA-X trigger output properties follow the main Trigger Scope setting. For example, when a channel is in point sweep mode, the trigger output will automatically be sent per point.

External triggering for all other PNA models defaults to Global. To send external trigger signals for each point, the Trig OUT Per Point setting must also be checked.

Check the box to set to Global. Clear the box to set to Channel. Learn more.

**Meas: Port 1 Noise Tuner Switch state**

By default, the Noise Figure port 1 DPDT switch is set to EXTERNAL. This setting always provides incident power through the front panel loop.

Clear the box to set to Internal, which is one method to make accurate S-parameter measurements when an ECal module is connected as a Noise Tuner. Learn more.

The Noise Figure App will throw the switch as needed. However, External Test Sets (in Multiport mode) rely on this switch being set to External.

**Meas: Draw failed trace segments in red**

By default, failed data points (dots) are drawn in red.

Check the box to draw failed segments in red. Learn more.

**Report source unleveled events as errors**

For SCPI behavior only. Learn more.

**Ext Device: de-activate on PRESET and recall.**

By default, external devices are de-activated when the PNA is Preset or when a Instrument State is recalled. Clear the box to have external devices remain active when the PNA is Preset or when a Instrument State is recalled.
recalled.
Learn more about External Devices.

On PRESET set two-point group delay aperture
By default, group delay aperture is set to 11 points.
Check the box to have group delay aperture set to 2 points. Learn more.

On Preset turn power ON
By default (checked), Instrument Preset always turns source power ON.
Checkbox cleared - When the current source power setting is OFF, leaves power OFF after Preset. When the current power setting is ON, turns power ON after Preset. Learn more.

Turn Source Power Off when receiver is overloaded
By default (cleared) power remains ON when a receiver is overloaded.
Check the System Preference box to turn OFF power to ALL ports when a receiver is overloaded.
A notification dialog appears. Click OK, then lower the power level, then turn power ON. (Click Stimulus, then Power)

Report when receiver is overloaded
By default (checked), a warning message is displayed on the PNA screen indicating that a receiver is overloaded or in compression. The displayed data is probably not accurate. One error per sweep appears and is reported in the Error Log.
Clear the box to NOT show overload warnings on the screen or report these errors in the error log.

The More buttons launch dialogs that contain predefined preferences:

Define Data Saves -
While not explicitly called Preferences, all of these settings survive a shutdown. Learn more.

User Preset
Specify the Instrument State file that the PNA will use when Preset. Learn more.

User Key
Sets softkey preferences. Learn more.

Page Setup
Standard printer settings (Paper, Orientation, and Size) do NOT survive a PNA shutdown.
All other settings DO survive a PNA shutdown. Learn more.

Millimeter settings
Sets MM Wave configurations. Learn more.
**Power Limit**
Sets Power Limits and Offsets. [Learn more.]

**Disp Colors**
Sets PNA display items to custom colors. [Learn more.]

**Print Colors**
Sets PNA print items to custom colors. [Learn more.]

Although they are called preferences, the following settings do NOT survive a PNA shutdown.

<table>
<thead>
<tr>
<th>Calibration</th>

**Last Modified:**

- 10-Sep-2010 Added Cal windows
- 26-Aug-2010 Added overload preferences
- 24-Mar-2010 Removed Error messages button
- 31-Jul-2009 Added External Device, primary FOM, draw failed segments, Power Limit, disp colors, print colors (9.0)
- 6-Feb-2009 Added new Cal set selection
- 22-Apr-2008 Added UI
- 10-Apr-2008 Added RemoteCalStorage and replaced AuxTrigger properties
- 5-Feb-2007 MX New topic
Using VNC to Control the PNA User Interface

VNC (Virtual Network Computing) allows you to control the User Interface of a PNA from any PC. The PNA display appears on the connected PC display. Mouse and keyboard control can occur from both the PNA and PC, although not simultaneously.

Both the PNA and PC must be connected to the internet. The responsiveness of the PNA while using VNC is dependent of the speed of your internet connection.

Every PNA is shipped with VNC installed. However, you must download and install the VNC software onto the PC. The following procedures can help you configure VNC to view and control the PNA application from your PC.

On the PNA, run VNC Server

To do this:

1. Click View, then Minimize Application.

2. Click Start, then Programs, then TightVNC, then Launch VNC Server.

   - When the server is running, the icon is visible in the lower right corner of the display.

   - The first time you run VNC Server, you may be required to set a password to control access from remote PCs.

   - To automatically start VNC when the PNA computer boots, drag a Launch VNC Server shortcut to your User "startup" folder. The following is the Administrator folder: C:/Documents and Settings/Administrator/Start Menu/Programs/Startup.

On the PC, run VNC Viewer

To do this:

1. Download from http://www.tightvnc.com/ and install TightVNC on the PC.

2. From the PC Desktop, click Start, then Programs, then TightVNC, then TightVNC Viewer

3. When prompted for the Hostname, type the full computer name or IP address of the PNA.

4. When prompted for the password, type the password you set when configuring VNC on the PNA.

Last Modified:

15-Apr-2008  Uplighted for DatedVNC
LXI-1.1 and VXI-11.3 Compliance

PNA-X, N522x, and PNA-C models that were shipped with PNA version A.08.20 or higher are LXI-1.1 and VXI-11.3 compliant.

LXI-1.1 Compliance

A PNA is LXI-1.1 compliant if the logo appears on the PNA splash screen when the PNA application starts. Learn more about LXI at http://www.lxistandard.org/

VXI-11.3 Compliance

To be compliant with VXI-11.3, the PNA must have been either:

- Shipped from the factory with PNA version A.08.20 or higher, or
- Had the Hard Disk Drive (HDD) upgraded since about June 2008 when A.08.20 was released and using PNA Rev. A.08.20 or higher.

Learn more about VXI at http://www.vxi.org/

LAN Status

When a LAN connection is used with the PNA, the LAN Status dialog allows you to see the IP address and other LAN connection properties.

How to view LAN Status

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SYSTEM</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then <strong>[Configure]</strong></td>
<td>2. then <strong>System</strong></td>
</tr>
<tr>
<td>3. then <strong>[More]</strong></td>
<td>3. then <strong>Configure</strong></td>
</tr>
<tr>
<td>4. then <strong>[LAN Status]</strong></td>
<td>4. then <strong>More</strong></td>
</tr>
<tr>
<td></td>
<td>5. then <strong>LAN Status</strong></td>
</tr>
</tbody>
</table>

Programmable Commands
**LAN Status** dialog box help

**Indicator**  Shows the current status of the LAN connection.
- **NORMAL** - Indicates that the PNA LAN is ready for communication.
- **IDENTIFY** - Indicates that a remote computer has invoked an LXI identification operation on the PNA using the web-based interface or **LXIDeviceIDState** COM property.
- **FAULT** - Indicates that the PNA LAN interface is not connected to the Internet.

**IP Address**  Shows the current IP address of the PNA

**Computer Name**  Shows the full computer name of the PNA. Learn how to change this. If you see the IP address listed here, that means there is no DNS server specified in the network setup.

**MAC Address**  Shows the unique address of the PNA computer. Also known as HostID.

**LAN Reset**  Provides a LAN Configuration Initialize (LCI) mechanism. Press to return the following settings to factory default conditions:

- **IP Address Configuration (DHCP):**  Enabled
- **ICMP Ping Responder:**  Enabled
- **Web Password for configuration:**  Resets the password for the factory default account (Agilent) to 'agilent'. If the pna-admin account had been renamed by the PNA owner, this function creates a new Administrator account named pna-admin and sets its password to 'agilent'. Learn more about User names and Passwords.

**Web Server Software**

If your PNA is LXI Class C compliant (see above), you can connect to the PNA using a web browser over an internet connection.

To do this, when the above dialog indicates a **NORMAL** condition:

1. From a web browser, type `http://<your_PNA_computer_name>`. For example, to connect to the fictitious PNA in the dialog above, type: `http://pna1-22`
2. Type the log on User Name and Password

3. You will see the following welcome screen with connection links.
Using Help

This topic discusses the following:

- PNA Documentation
- Printing Help
- Copying Help to your PC
- Launching Help
- Navigating Help
- Help Languages
- Glossary
- Dialog Boxes
- Documentation Warranty
- Suggestions Please

See Also
Help, About Network Analyzer

Other Quick Start Topics

PNA Documentation

This Help file, which is embedded in the PNA, is the Users Guide and Programming Manual for the PNA. The help file is automatically updated on the PNA when firmware is updated. Only the PNA Installation and Quick Start Guide is shipped with new PNA instruments.

Hardcopy manuals are no longer available for purchase with the PNA.

All PNA documentation, including the latest online Web Help version of this Help file, and a printable .PDF version of the Help file, are available at http://na.tm.agilent.com/pna/help/index.html.

Printing Help

Beginning with the PNA 5.2 release (March 2005), we once again offer a .pdf version of PNA Help. Download the .pdf file from http://na.tm.agilent.com/pna/help/index.html. You can still print individual PNA Help topics by clicking the Print icon at the top of the PNA Help window.
Copying Help to your PC
With the Help system on your PC, you can read about the PNA while away from it. You can also Copy and Paste programming code from this Help system directly into your programming environment.

The Help file is located on your PNA hard-drive at \C:\Winnt\Help\PNAHelp.chm. If both the PNA and PC are connected to LAN, you can map a drive and copy the file directly.

The Help file can also be downloaded from http://na.tm.agilent.com/pna/help/index.html.

Launching Help
The Help system can be launched in three ways:

1. From the front panel Help button.
2. From the Help drop-down menu
3. From Dialog Box Help

Navigating Help
The Help Window contains 3 panes (regions):

1. Toolbar Pane
2. Topic Pane
3. Navigation Pane

Toolbar Pane
The Toolbar is at the top of all Help windows. It allows you to resize the window, browse and print the selected topic.
1. Hide or show the navigation pane
2. Locate the topic in the table of contents
3. Back to topic visited previously
4. Forward again if Back was clicked
5. Go to the Home page.
6. Print the topic pane.

**Navigation Pane**

Click the following tabs in the Navigation Pane to access information in the Help system:

- **Table of Contents Tab**
- **Index Tab**
- **Search Tab**
- **Favorites Tab**

**Table of Contents Tab**
1. Click tab to select Table of Contents.
2. Click a book to access related topics.
3. Click to display a topic.
4. Right click to access menu.
5. Click to display specifications
6. Click to display glossary

**Index Tab**

The index tab allows you to type a keyword and go to only the most applicable topics.

1. Click tab to select index.
2. Type keyword to find topics of interest.
3. View suggested topics. (Double-click to display topic.)
4. Click to display topic.

**Search Tab**

**TIP:** To Search any topic for a keyword, press Ctrl and F.

The following rules apply for using full-text search:

- Searches are not case-sensitive.
- You can search for any combination of letters (a-z) and numbers (0-9).
- Punctuation marks (period, colon, semicolon, comma, and hyphen) are ignored during a search.
- You can group the words of your search using double quotes or parentheses. Examples: "response calibration" or (response calibration). This requirement makes it impossible to search for quotation marks.
- Use Wildcard expressions:
  - To search for one undefined character use a question mark (?). For example, searching for cal? will find calc and calf.
  - To search for more than one undefined character use an asterisk (*). Searching for Cal* will find calibration and calculate.
- Use Boolean operators to define a relationship between two or more search words.
<table>
<thead>
<tr>
<th>Search for</th>
<th>Example</th>
<th>Results will show topics containing:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two words in the same topic</td>
<td>response AND calibration</td>
<td>Both the words &quot;response&quot; and &quot;calibration&quot;.</td>
</tr>
<tr>
<td>Either of two words in a topic</td>
<td>response OR calibration</td>
<td>Either the word &quot;response&quot; or the word &quot;calibration&quot; or both.</td>
</tr>
<tr>
<td>The first word without the second word in a topic</td>
<td>response NOT calibration</td>
<td>The word &quot;response&quot; but not the word &quot;calibration&quot;.</td>
</tr>
<tr>
<td>Both words in the same topic, close together.</td>
<td>response NEAR calibration</td>
<td>The word &quot;response&quot; within eight words of the word &quot;calibration&quot;.</td>
</tr>
</tbody>
</table>

**Favorites Tab**

The favorites tab allows you to store (bookmark) the topics you refer to most often so that they can be recalled easily.

1. Click tab to view stored topics in Favorites.
2. Remove selected topic.
3. Display selected topic.
4. Add (store) current topic.

**Topic Pane**

The Topic pane allows you to view the contents of the selected topic.
Help Languages
Beginning with PNA Rev A.08.00, PNA Help is offered in English ONLY.

Glossary
The Glossary holds definitions of words, in alphabetical order.

Note: Click on a word in green text throughout Help to see the glossary definition.

Suggestions Please!

Please let us know about your experience using PNA Help. Send your comments to: pna_help@am.exch.agilent.com. Comment about any aspect of the help system. Here are a few areas that you might consider:

- Does anything appear to be broken?
- Did you find what you were looking for?
- Was the information you found helpful?
- Any suggestions as to how we can improve the help system?

Your comments go directly to the help system authors. For help with technical questions, please refer to Technical Support.
Click Help, then About Network Analyzer to learn the following about your PNA:

- Model number (see list of PNA models)
- Frequency range
- Serial number
- Installed options (Learn how to install software options)
- Application Code (firmware) Version
- Hard Disk Drive Version
- System CPU Version - Learn more
- DSP (Digital Signal Processor.) Version. Contact Agilent to upgrade the DSP. See DSP Version changes below.
DSP Version changes

For PNA-X, the DSP board number along with the FPGA version, provides access to the following features or causes the following settings to change:

<table>
<thead>
<tr>
<th>DSP Board</th>
<th>FPGA Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>27</td>
<td>Enabled <strong>FastCW triggering</strong></td>
</tr>
<tr>
<td>4</td>
<td>34</td>
<td>Enabled <strong>configurable (polarity and type) for PulseSyncIn</strong> external trigger signals.</td>
</tr>
</tbody>
</table>
| 5         | xx*          | **IF Frequencies** – The default values are changed.  
**IFAntiAliasFilter** - The Narrow and Wide settings are changed.  
**Note:** Programs that control the following DSP filter settings, or state files that are saved with these settings, will yield different results when run or recalled on PNAs with DSP 4 versions versus DSP 5 versions.  
- **Stage1 frequency** (Max=38 MHz for DSP 5).  
- **Stage2 Coefficient** setting is IGNORED with DSP 5 Versions.  
- **ADC Capture Mode** Max data points increased to PNA Max. |

*With DSP board 5, FPGA version is upgraded with firmware. This requires more time for FW installation.*

Last Modified:

- 25-Aug-2010    Updated for DSP 5.0 (A.09.30)
- 30-Nov-2009    MX New topic
Preset the PNA

When you Preset the PNA, it is set to known, or preset conditions. You can use the factory default preset conditions, or define your own User Preset conditions.

- Preset (Default) Conditions
- User Preset Conditions

See other 'Setup Measurements' topics

Preset Default Conditions

How to Preset the PNA

Tip: Press the Preset button to start the PNA application if it is not already running.

Using front-panel HARDKEY [softkey] buttons

1. Press Preset

PNA Menu using a mouse

1. Click Utility
2. then Preset

Click to view the factory preset conditions.

User Preset Conditions

The analyzer can be preset to either factory default conditions or User Preset conditions.
How to set User Preset

Using front-panel HARDKEY [softkey] buttons

1. Press **Save**
2. then **[User Preset]**

PNA Menu using a mouse

1. Click **Utility**
2. then **User Preset**

User Preset dialog box help

With a User Preset saved and enabled, when the PNA is Preset, the User Preset settings are recalled instead of the factory default settings. Calibration data is NOT recalled with a User Preset. [Learn more about instrument state settings.](#)

**User Preset Enable**

- **Check** - The PNA is preset to **User Preset** conditions when the Preset button is pressed.
- **Clear** - The PNA is preset to **Default** conditions when the Preset button is pressed.

**Save current state as User Preset**

Click to store the current instrument state as the User Preset conditions. File is stored as C:/ Program Files/ Agilent/ Network Analyzer/ Documents/ UserPreset.sta.

**Load existing file as User Preset**

Click to retrieve an instrument state to be used as the User Preset conditions.

Measurement Parameters

This topic contains the following information:

- **S-Parameters** (pre-selected ratios)
- **Ratioed** (choose your own ratio)
- **Unratioed Power** (absolute power)
- **How to Select a Measurement Parameter**

**Learn about Balanced Measurements**

**See other ‘Setup Measurements’ topics**

**S-Parameters**

S-parameters (scattering parameters) are used to describe the way a device modifies a signal. For a 2-port device, there are **four S-Parameters**. The syntax for each parameter is described by the following:

\[
S_{\text{out}-\text{in}}
\]

\[
\text{out} = \text{PNA port number where the device signal output is measured (receiver)}
\]

\[
\text{in} = \text{PNA port number where the signal is applied (incident) to the device (source)}
\]

Move the mouse over each S-parameter to see the signal flow:

**S_{11}**

**Reflection/ Incident**

\[
\text{DUT}
\]

**S_{12}**

**S_{21}**

**S_{22}**

For two-port devices:

- When the source goes into port 1, the measurement is said to be in the **forward** direction.
When the source goes into port 2, the measurement is said to be in the **reverse** direction.

The analyzer automatically switches the source and receiver to make a forward or reverse measurement. Therefore, the analyzer can measure all four S-parameters for a two-port device with a single connection. See the block diagram (including receivers) of your PNA.

### Common Measurements with S-Parameters

#### Reflection Measurements (S11 and S22)
- Return loss
- Standing wave ratio (SWR)
- Reflection coefficient
- **Impedance**
- S11, S22

#### Transmission Measurements (S21 and S12)
- Insertion loss
- Transmission coefficient
- Gain/Loss
- Group delay
- Deviation from linear **phase**
- **Electrical delay**
- S21, S12

### Receiver Measurements

A 2-port PNA typically has four receivers: A, B, R1, and R2. Your PNA may not have 2 reference and 2 test port receivers. See the block diagram of your PNA.

- R1 and R2 are reference receivers. They measure the PNA source signal as it leaves the PNA and is incident on the DUT.
  - R1 measures the signal out of Port 1
  - R2 measures the signal out of Port 2.
- A and B are test port receivers. They measure the signal out (or reflecting off) of the DUT.
  - A measures the signal into PNA Port 1
  - B measures the signal into PNA Port 2

You can specify measurements using one or two of the available receivers.

**Note:** Beginning with PNA Rev. 7.22, you can use the internal ADC (Analog-Digital Converters) as measurement receivers. Learn more.

### Ratioed Measurements

Ratioed measurements allow you to choose your own ratio of any two receivers that are available in your PNA. S-parameters are actually predefined ratio measurements. For example S11 is A/R1.

The following are common uses of ratioed measurements:
Comparing the phase between two paths of a device. An example could be something simple like a power splitter or more complicated like a dual-channel receiver.

Measurements that require a higher dynamic range than the analyzer provides with S-parameters.

Your PNA MAY have front-panel jumper cables that go directly to measurement receivers. Learn about the front-panel jumpers on your PNA.

**Unratioed (Absolute Power) Measurements**

The unratioed power parameter allows you to look at the absolute power going into any of the measurement receivers that are available on your PNA.

The reference receivers are internally configured to measure the source power for a specific PNA port. Performing an absolute power measurement of a reference receiver using a different source port will measure very little power unless the front panel jumpers are removed and signal is applied directly to the receiver. An example of this would be an R1 measurement using port 2 as the source.

- Measuring phase using a single receiver yields meaningless data. Phase measurements must be a comparison of two signals.
- Averaging for Unratioed parameters is computed differently from ratioed parameters.

### How to create a NEW trace

**Balanced** Select a balanced measurement type. (Multiport PNAs ONLY)

**Change** Click to invoke the [Balanced DUT Topology / Logical Port mappings](#) dialog box. [Learn more about Balanced Measurements](#).
Receivers  Select receivers to make Ratioed and Unratioed (absolute power) measurements. Learn more about receiver measurements.

Ratioed  Check Activate to create or change a measurement. Select a receiver for the Numerator, select another receiver for the Denominator, then select a source port for the measurement.

The Source port is ALWAYS interpreted as a logical port number.

For convenience, the table is populated with common choices.

- Learn about External Test Sets and Ratioed Measurements
- Learn more about Ratioed Measurements.

Unratioed  Same as Ratioed, but select 1 as the Denominator.

- Learn More about Unratioed Measurements.
- See the block diagram of receivers in YOUR PNA.
- The internal ADCs (Analog-Digital Converters) can be used as measurement receivers. Learn more.
Logical Receiver Notation

With PNA Rev 6.2, Ratioed and Unratioed measurements can also use logical receiver notation to refer to receivers. This notation makes it easy to refer to receivers with an External Test Set connected to the PNA. You do not need to know which physical receiver is used for each test port.

- aN - Reference receiver for logical port N
- bN - Test port receiver for logical port N

For example:

- **Ratioed**: "b12/a1" refers to the logical test port 12 receiver / the logical port 1 reference receiver.
- **Unratioed**: "b10" refers to the logical test port 10 receiver.

The old style notation (A, B, R1 and so forth) can still be used to refer to the PNA physical receivers. However, ratioed measurements MUST use the same notation to refer to both receivers; either the physical receiver notation (A, R1) or the logical receiver notation (aN, bN). For example, the following mixed notation is NOT allowed: A/b3 and a5/R2.

Programming

When entering receiver letters using programming commands, neither logical or physical receiver notation are case sensitive.

Channel / Window Selections

These selections are NOT AVAILABLE when changing an EXISTING measurement. Learn how to change a measurement.

- **Channel Number** Select the channel for the new traces.
- **Create in New Window**
  - Check to create new traces in a new window.
  - Clear to create new traces in the active window. When the PNA traces per window limitation has been reached, no more traces are added.

- **Auto-Create Windows** Check to create new traces in as many windows as necessary. See PNA number of windows limitation.

About Measurement Parameters (top of page)
See this dialog for **Integrated True Mode Stimulus Application** (iTMSA).

Create or edit DUT Topology and Logical Port Mapping.

A Logical Port is a term used to describe a physical PNA test port that has been remapped to a new port number.

- Any Two physical PNA ports are mapped to **One Balanced** Logical port
- Any One PNA physical port is mapped to **One Single-Ended** Logical port

**Note:** These selections apply to ALL measurements in the channel. If the device topology is changed, any existing measurements in the channel that are incompatible with the new topology will be automatically changed to one that is compatible.

**Topology:** Describes your DUT as you would like it tested. The following device topologies can be measured by a multiport PNA.

- **Balanced / Balanced**
  (2 logical ports - <4 actual ports>)

- **Single-ended / Balanced**
  (2 logical ports - <3 actual ports>)

- **Single-ended - Single-ended / Balanced**
  (3 logical ports - <4 actual ports>)

These topologies can be used in the reverse (⇐⇒) direction to measure:

- **Balanced / Single-ended** topology
- **Balanced / Single-ended - Single-ended** topology

For example, to measure a **Balanced / Single-ended** topology, measure the S12 (reverse direction) of a **Single-ended / Balanced** topology.
- Learn about Logical Port mapping when using an External Test Set.
- Learn more about Balanced Measurements
- Balanced parameters can be saved to SNP files. Learn more.

Measurement Classes

Measurement Classes are categories of measurements that can coexist on a channel.

- What are Measurement Classes
- How to assign a Measurement Class to a Channel
- Measurement Class Dialog Box Help

See other 'Setup Measurements' topics

What are Measurement Classes

The following table shows the Measurement Classes currently available for the PNA. Within each of these classes there are a number of measurements.

Measurement Classes are categories of measurements that can coexist on a channel. A measurement from one class can NOT reside in a channel with a measurement from another class. For example, a Noise Figure measurement can NOT reside in a channel that is currently hosting Scalar Mixer Measurements.

The Measurement Class dialog is accessed in the following ways:

How to assign a Measurement Class to a Channel

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press MEAS</td>
<td>1. Click Trace/Chan</td>
</tr>
<tr>
<td>2. then [Measurement Class]</td>
<td>2. then Measurement Class</td>
</tr>
</tbody>
</table>

Programming Commands
Measurements in a measurement class can NOT coexist in a channel with a measurement of a different measurement class.

Select a measurement class for the active channel or new measurement channel.

- The **Standard** measurement class contains S-Parameters. Balanced parameters, and Receiver measurements.
- All other measurement classes are commonly called "Applications".

**Title Bar** Indicates the active channel to which the measurement class will be assigned.

**Confirm changes**

- Check (default setting) to launch the Confirm Measurement Class Change dialog.
- Clear to perform the 'OK' actions without confirmation. This setting survives a Preset and PNA Shutdown.

**New Channel** Click to create the measurement class in a new channel. A default measurement for that class is created in the channel. To change the measurement, click **Trace**, then select a new measurement.

Choose to do the following:

- **OK** - Delete the existing measurements in the active channel. Create the new measurement class, and
default measurement, in that channel.

- **Cancel** - Do not create the new measurement class. Leave the old measurements (and class) in that channel and return to the Measurement Class dialog box.

Last Modified:

- 6-Aug-2010  Added Confirm changes
- 1-Jul-2010  Added Standard vs Application
- 22-Mar-2010  Updated dialog image
- 3-Sep-2008  Removed legacy content
- 18-Jun-2007  MX New topic
Frequency Range

Frequency range is the span of frequencies you specify for making a device measurement.

- How to Set Frequency Range
- Zoom
- CW Frequencies
- Frequency Resolution
- Frequency Band Crossings

See other 'Setup Measurements' topics

How to set Frequency Range

There are two ways to set the frequency range:

A. Specify the Start and Stop frequencies of the range.
B. Specify the Center frequency and desired Span of the range.

See the frequency ranges of all PNA models

Using front-panel HARDKEY [softkey] buttons

1. Press FREQUENCY

PNA Menu using a mouse

1. Click Stimulus
2. then Frequency

Programming Commands

![Frequency Start/Stop dialog box](image)
**Frequency Start/Stop dialog box help**

**Start**  Specifies the beginning frequency of the swept measurement range.

**Stop**  Specifies the end frequency of the swept measurement range.

---

**Frequency Center/Span dialog box help**

**Center**  Specifies the value at the center of the frequency sweep. This value can be anywhere in the analyzer range.

**Span**  Specifies the span of frequency values measured to either side of the center frequency.

---

**Zoom - PNA-X ONLY**

Zoom allows you to easily change the start and stop frequencies or start and stop power levels in a power sweep. Zoom operates on the Active Trace and all traces in the same channel as the active trace, regardless of the window in which they appear.

---

**How to Zoom in a measurement window**

1. Left-click the mouse or use a finger, then drag across a portion of a trace.

2. Release the mouse or lift the finger and the following menu appears:

3. Select from the following:

   - **Zoom**  - changes the channel stimulus settings to the left and right border values of the Zoom selection
   - **Zoom xy**  - changes the channel stimulus settings as above. In addition, the Y-axis scale of the active trace changes to the approximate scale of the Zoom selection.
   - **Zoom Full Out**  - changes the channel stimulus settings to the full span of the current calibration. If no calibration is ON, then the stimulus settings are changed to the full span of the PNA model.
Notes

- The stimulus settings are changed for **ALL** traces in the active channel, regardless of the window in which they appear.
- If markers are in the selected area, they remain in place.
- If markers are in the unselected area, they are moved to the right or left edge of the new span. When Zoom Full Out is selected, the markers are moved back to their original location.

Zoom is NOT available for the following:

- Smith Chart or Polar display formats
- **CW Time** and Segment sweep type
- Frequency Offset Measurements
- **FCA Opt 083 Measurements**

**CW Frequencies**

Measurements with a **CW Time sweep** or **Power sweep** are made at a single frequency rather than over a range of frequencies.

**How to set CW Frequency**

1. Set **Sweep Type** to **CW Time** or **Power**.

You can also set CW frequency from within the Sweep Type dialog box.

---

**Using front-panel HARDKEY [softkey] buttons**

**For PNA-X and 'C' models**

1. Press **FREQ**
2. then **[CW]**

**PNA Menu using a mouse**

1. Click **Stimulus**
2. then **Frequency**
3. then **CW Frequency**

---

154
Frequency Resolution

The resolution for setting frequency is 1 Hz.

Frequency Band Crossings

The frequency range of the PNA covers several internal frequency bands. The higher the frequency range of the PNA, the larger the number of bands. The source power to your DUT turns off as the stimulus frequency is swept through these band crossings. To learn more, see Power ON and OFF during Sweep and Retrace.

The listed frequencies in the following tables are the stop frequency of the specified band, and the start frequency of the following band.

You can download a PNA Band Structure Readout utility that lists the band crossings for your PNA.

Frequency band crossings are different for the following models:

- 3 GHz, 6 GHz, and 9 GHz Models
- E8362A/B, E8363A/B, E8364A/B
- E8361A
- N5230A (2-port models)
- N5230A (4-port models)
- PNA-X Models

For 3 GHz, 6 GHz, and 9 GHz (discontinued) PNA models:

- **Power ON and OFF during Sweep and Retrace**

### See other 'Setup Measurements' topics

**Power Settings**

The test port output power is specified over frequency (See the [Power Range](#) and [Frequency Range](#) specifications for your PNA)

### How to make Power settings

Use one of the following methods to set port power. Only the menu can be used to launch the Power and Attenuators dialog box.

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
</table>
| 1. Press **POWER**  
2. then [Power] or [Power and Attenuators] | 1. Click **Stimulus**  
2. then **Power** or **Power and Attenuators** |

[Programming Commands](#)
Power dialog box help

Defines and controls the PNA source power and attenuation.

**Power On (All Channels)**  Check to enable source power for all channels. Only turns power ON if channel power setting is ON or Auto. See Advanced Power.

**Port 'n’**  Active source port for which power is being set.

- **Port Power**  Sets the power level for the specified port.
  - To accurately set the power level at any point after the test port, perform a Source Power Calibration.
  - See the specified power range of your PNA model.

**Power Sweep**

- **Start / Stop Power**  Set the start and stop power values of a power sweep.
  - These settings are only available when Sweep Type is set to Power Sweep.
  - Uncoupled power sweep power can be set from the Advanced Power dialog box.
  - You can Zoom to easily change the start and stop power levels in a power sweep. Learn how.
  - Learn more about Power Sweep.

**Power Slope**

Helps compensate for cable and test fixture power losses at increased frequency.

- **Slope**  Select to set the power slope. Clear to set power slope OFF. Learn more about power slope.

Power and Attenuators dialog box help
Defines and controls the PNA source power and attenuation for the active channel.

**Beginning with PNA Rev. 7.21,** external sources can be controlled from this dialog. Learn more.

**Power On (All Channels)** Check to enable source power for all channels. Only turns power ON if channel power setting is ON or Auto.

**Port Powers Coupled**

- **Coupled** (checked) The power levels are the same at each test port. Set power at any test port and all test ports change to the same power level.

- **Uncoupled** (cleared) The power levels are set independently for each test port. Uncouple power, for example, if you want to measure the gain and reverse-isolation of a high-gain amplifier. The power required for the input port of the amplifier is much lower than the power required for the output port. A power sweep can also be performed with uncoupled power. Learn more about Setting Independent Port Power

**Name** Lists the PNA test ports.

**State**

- **Auto** Source power is turned ON at the specified test port when required by the measurement. This is the most common (default) setting. See also Power ON and OFF during Save / Recall, User Preset, and Preset.

- **ON** Source power is ALWAYS ON, regardless of measurements that are in process. Use this setting to supply source power to a DUT port that always requires power, such as an LO port. This could turn OFF power at another test port. Learn about internal second source restrictions.

- **OFF** Source power is never ON, regardless of the measurement requirements. Use this setting to prevent damage to a sensitive DUT test port.

**Port Power** Sets the power level at the output of the source.

- To accurately set the power level at any point after the test port, perform a Source Power Calibration.

- See the specified power range of your PNA model.

- See ECal Module Compression Level
Start / Stop Power  Available ONLY when sweep type is set to Power Sweep. Set the start and stop power values of a power sweep. Learn more about Power Sweep.

- In PNA release 6.04 you can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep. Learn more.
- In PNA release 8.20, a power sweep can be performed with uncoupled power. Different power ranges can be swept in the forward and reverse directions.

Auto Range  Check to allow the PNA to select the optimum attenuation value to achieve the specified test port power. Clear to manually set the attenuation for each port. Type or select the attenuation value in the adjacent Attenuator Control box.

Attenuator Control  When Port Powers are Uncoupled, manual attenuator control allows you to set a wide range of power levels by setting the attenuation. See Setting Independent Port Power. Also use manual attenuation control when a measurement requires a very good impedance match with the source, such as with oscillators or conditionally unstable amplifiers. Choose an attenuation level of 10 dB or more to ensure the best source match.

- The PNA does not allow attenuators or other mechanical switches to switch continuously. Learn more.
- When Port Powers are Coupled, changing one port Attenuation Control value changes all port values.
- Attenuators are located between the source and the test port. Power to the reference receiver is not attenuated and is therefore higher than at the test port by the amount of attenuation. This will make uncalibrated measurements that use a reference receiver appear as though there is added attenuation at the test device. See the PNA Block diagram.

Note:  With PNA release 7.2, a preference can be set to mathematically offset (or NOT) the power at the reference receiver by the amount of source attenuation. Because the reference receiver is not in the attenuation path, there is more power at the reference receiver than at the test port by the amount of source attenuation.

By default, ALL PNA models currently offset the reference receivers. See Block diagram. Learn how to set the preference.

Leveling Mode

- Internal  Standard ALC leveling. Power level within an attenuator setting is limited to the ALC Range. See Source Unleveled.
- Receiver Rx  Select a Reference receiver to use for leveling the source. Learn more.
- Open Loop  (Used during pulse conditions with the internal source modulators). NOT available on PNA-C models. No leveling is used in setting the source power. The lowest settable power, without attenuation, is limited to -30dBm. The source power level accuracy is very compromised. Use a source power calibration to make the source power somewhat more accurate.

Channel Power Slope
Helps compensate for cable and test fixture power losses at increased frequency. With power slope enabled, the port output power increases (enter positive value) or decreases (enter negative value) as the sweep frequency increases.

**Slope** Select to set the power slope. Clear to set power slope OFF.

Power slope is computed and applied from 0 GHz – not from the measurement start frequency. For example, with the following measurement settings:

- Start / Stop Freq: 10 GHz to 20 GHz
- Power level: 0 dBm
- Slope: 1 dB/GHz

The power into the DUT from 10 GHz to 20 GHz is 10 dBm sloping to 20 dBm

**Offset and Limits** Launches the Offset and Limits dialog.

**Receiver Leveling** Launches the Receiver Leveling dialog.

**Receiver Attenuator** Launches the Receiver Attenuator dialog.

**Path Configurator** Launches the Path Configurator dialog.

---

**Source Unleveled**

When the power level that is required at a test port is higher than the PNA can supply, a Source Unleveled error message appears on the screen and the letters LVL appear on the status bar.

To perform a power sweep, the range of power is usually limited to the range of the Automatic Leveling Control (ALC) loop. (The PNA-X allows a very wide power range using Open Loop).

PNA specifications guarantee the ALC power range over which the PNA can supply power without an unleveled indication. However, the actual achievable power range on your PNA is probably greater than the specified range.

**How to calculate the specified achievable power range**

From the specifications for the N5230A Opt 245 for the frequency span from 15 GHz to 20 GHz:

- Max Leveled Power = -8 dBm
- Power Sweep Range (ALC) = -17 dB

For this frequency range the specified power range is calculated as:

- Max = -8 dBm
- Min = (-8)-(-17) = -25 dBm

When using Source Attenuators:

- with 10dB of attenuation, this becomes -18 dBm to -35 dBm
with 20dB of attenuation, this becomes **-28 dBm** to **-45 dBm**, and so forth.

See the output power specs for your PNA.

To resolve an unleveled condition, change either the Test Port Power or Attenuator setting. If an Unleveled condition exists within the specified power range, contact Technical Support.

### Setting Independent Port Power

The PNA allows you to **uncouple port power** and specify different power levels at each test port. There are a few things to consider when setting independent port powers.

- Does your required high and low power levels fall within the specified Min and Max power range of the PNA? See Unleveled Indicator. If they do not, you may need to use the internal Source Attenuators.

- Does the PNA have source attenuators? If so, how many source attenuators? Some PNA models have one attenuator for each port. In most multiport PNA systems, the attenuators are shared by at least two test ports. See PNA Options to see the availability and range of source attenuation on your PNA.

**Note:** To prevent premature wear, the PNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

Learn how to view the settings of all mechanical devices in the PNA.

### Optimum Attenuation Value

The attenuator has different positions, allowing a wide range of power levels. The number of power ranges available is determined by the source attenuation installed in your PNA. See PNA Options to see the availability and range of source attenuation on your PNA.

- Each range has a total specified span (25 dB in the following Attenuation Values graphic).

- The optimum setting is the middle of the range. This range provides the best accuracy and performance of the source leveling system. The optimum ranges are the blue regions in the following graphic.

- An attenuator setting can be selected manually or automatically. If automatic is selected, the blue optimum ranges (shown in the following graphic) are used.

(Attenuator ranges vary, this particular range is 70 dB)
Note: Error correction is fully accurate only for the power level at which a measurement calibration was performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, ratioed measurements can be made with nearly full accuracy (non-ratioed measurements with less accuracy).
Receiver Attenuators dialog box help

Type or select independent attenuation values for each receiver.

Receiver Attenuation, available as option 016 on some PNA models, is used to attenuate the output signal from the device under test to avoid damaging the PNA receivers. The PNA receivers typically start to compress at around +10 dBm. This causes the power level at the receiver to be less than the power at the test port by the specified amount of attenuation.

**Note:** Beginning with PNA release 7.2, a preference can be set to mathematically offset (or NOT) the displayed trace by the amount of receiver attenuation. This causes the display to show the power at the test port.

By default:

- PNA-L and E836xB do NOT offset the display.
- The PNA-X **DOES** offset the display.

Learn how to set the preference.

When an external test set is connected, Receiver Attenuation control is only available for the physical receivers in the PNA. Switching receiver attenuation using **logical receiver notation** is NOT allowed.

**CAUTION!** You can damage the analyzer receivers if the power levels exceed the maximum values. See **Technical Specifications** for the maximum input power to a receiver.

The receiver attenuator characteristics are:

- Range:
  - 0 to 50 dB (E8361A only)
  - 0 to 35 dB (all other applicable PNA models)
- Resolution:
  - 10 dB (E8361A only)
  - 5 dB (all other applicable PNA models)

**Power ON and OFF during Save / Recall, User Preset, and Preset**

To protect your DUT from being inadvertently powered ON, the following RF Power ON/OFF settings occur:

**Instrument State Save/Recall**

If power is OFF when an instrument state is saved, then power will always be OFF after the instrument state is recalled.

If power is ON when an instrument state is saved, and the current power setting is OFF, then power will be OFF after the instrument state is recalled.
**User Preset**

If power is OFF when a User Preset is saved, then power will always be OFF after a User Preset.

If power is ON when a User Preset is saved, and the current power setting is OFF, then power will be OFF after a User Preset.

**Preset**

Instrument Preset sets power ON by default. This can be changed with a Preference setting so that, if the current power setting is OFF, then power will be OFF after Preset.

**Power ON and OFF during Sweep and Retrace**

The frequency range of the PNA covers several internal frequency bands. The higher the frequency range of the PNA, the larger the number of bands. For example, a 9 GHz PNA has 6 frequency bands, a 50 GHz PNA has 25 frequency bands. See the [frequency band crossings](#).

Power to the DUT is turned OFF during band changes to avoid causing power spikes to the DUT.

Retrace occurs when the source gets to the end of your selected frequency span and moves back to the start frequency. Power to the DUT is again turned OFF when retracing across frequency bands.

Therefore, the following occurs for various stimulus settings:

1. **Single band sweep** - The power to the DUT is always ON, even during retrace. Beginning with PNA release 6.04, a preference setting can turn power OFF during a retrace. Only available in single band frequency and segment sweeps.

2. **Multi-band sweep** - The power to the DUT is turned OFF while sweeping across a band crossing. It is turned OFF again during retrace.

3. **Power sweep** - Because power sweep is always done at a single frequency, the frequency is always within a single band and the source power is always ON. At the end of a power sweep, power is immediately set to the start power.
   
   Beginning with PNA release 6.04, this behavior can be changed with a preference setting.

4. **Single sweep:**

   - **Manual trigger mode** - At the end of a multiband sweep, power is turned OFF during retrace, and then power is turned back ON before arming for the next trigger.
   
   - **Hold mode** - Power can be ON or OFF depending on when and how Hold mode is entered. However, power can be immediately turned OFF manually or remotely.

**Caution**: Avoid expensive repairs to your PNA. Read [Electrostatic Discharge Protection](#).
15-Mar-2011  Open Loop Leveling not on C models
10-Mar-2011  Removed ON/OFF restriction
23-Feb-2010  Replaced Hold with Blocked channels
4-Aug-2009  Added Offset and Limits button
9-Feb-2009  Added Receiver Leveling
3-Sep-2008  Removed legacy content
27-Jun-2008  Added link to ECal compression
10-Jun-2008  Clarified power slope
28-May-2008  Updated for uncoupled power sweep
22-Apr-2008  Link to UI preferences
26-Mar-2007  Clarified retrace power OFF
  11/16/06  Added new retrace features
  10/23/06  Modified for new power diag
  10/17/06  Clarified leveling
  9/12/06  Added link to programming commands
Receiver Leveling

Receiver Leveling uses PNA receiver measurements to adjust the source power level across a frequency or power sweep. Before each measurement sweep, a variable number of background sweeps are performed to repeatedly measure power at the receiver for each stimulus point. Those power measurements are then used to adjust the source power level and achieve greater source power level accuracy.

This is similar to a Source Power Calibration, which uses a power meter or PNA receiver to accurately measure source power, but this occurs ONLY during the Source Power Cal. The source power correction values are applied for all subsequent measurement sweeps. Because Receiver Leveling is performed for every measurement sweep, it provides more accurate source power levels, but also takes longer to perform each measurement sweep.

- Receiver Leveling can be used with most sweep types, including Segment sweep and Power sweep. See Wide Power Sweep with Receiver Leveling.
- Receiver Leveling is NOT allowed when Phase Control (Opt 088) is enabled.
- This feature is available for standard S-parameter measurements and with FCA, GCA, and IMD applications.
- Turn ON Receiver Leveling before or after doing a Calibration. When turned ON before calibrating, it is turned OFF during the calibration, then back ON after.

Receiver Leveling can be used for:

- Correcting for short term drift when using an external component, such as a booster amplifier. The booster amplifier must be connected to the front-panel jumpers, in front of the reference receiver. See the Block diagram for your PNA, located at the end of every Specifications document.
- Extending the accuracy of power leveling at very low powers where the internal detector may be too noisy.
- Providing controlled power during Pulsed measurements in an open loop mode.
- Controlling the power at the outputs of MM-Wave heads.

How to make Receiver Leveling settings

Start the Power and Attenuators dialog box as follows:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>

Click **Leveling Mode**, then select a receiver to use for leveling. More choices are available on the Receiver Leveling dialog.

Click the **Receiver Leveling** button to launch the Receiver Leveling dialog.

---

**Receiver Leveling** dialog box help

**Overview**

To understand Receiver Leveling, the term ‘Target’ power is defined here to mean the sum of the ‘Port Power’ as shown on the **Power and Attenuators dialog** plus the ‘Power Offset’ as shown on the Receiver Leveling dialog. When Power Sweep is selected, the ‘Port Power’ is the power level at each step (stimulus point). Learn more about Power Offset.

Target Power = Port Power + Power Offset

The goal of Receiver Leveling is to adjust the source power until the measured receiver power is equal to the Target Power.

Leveling sweeps are performed in the background (not visible) before every measurement sweep to measure and apply source correction data.

**Receiver Leveling process:**

- For each leveling sweep, source power is applied at each data point and measured by the specified receiver.

- The deviation is calculated between the measured power and the target power.
The deviation is applied to the current source power, and the updated source power levels are applied on the following leveling sweep.

This process continues until the receiver power at each data point has achieved the target power within the specified tolerance value, or until the specified number of leveling sweeps (iterations) has been reached. See Leveling Properties below.

Select a (Source) Port
Each source port to be leveled is configured individually. In the box at the left of the dialog, select a source port to be configured for receiver leveling.

Receiver Selection

**Receiver**  Select a receiver to be used to level the specified source. Beginning with A.09.33, ratioed receivers can be selected. Use this in conjunction with the Phase Control feature to provide an active load.

To level power at the source output or DUT input choose the reference receiver for the source port. For example, to level the source power at port 1, then choose "R1/1.0". To level power at the DUT output, choose the receiver that is used to measure the DUT output. If the DUT output is connected to port 2, then select "B/1.0".

**Power Offset**  The ‘Port Power’ in the Power and Attenuators dialog is normally used as the target leveling power. However, when there exists an additional attenuator or booster amplifier in the source path, an offset should be set to improve the leveling speed.

Example: On the PNA-X, a 10dB amplifier is connected in the source path (red line) to the rear-panel J10 and J11.

Port Power is set to 0 dBm (out of Source 1).

Power Offset value is set to +10 dB to compensate for the amplifier.

The target power becomes 0 + 10 = 10 dBm.

Source 1 is set to 0 dBm, but the R1 reference receiver expects to see +10 dBm and applies correction based on that value.

Without the Power Offset setting, it would take several leveling sweeps until power was set to the correct value.

**ALC On**  The PNA leveling hardware can be in either:

- **ALC ON** - (checked) Uses Internal leveling hardware (Recommended)
- **ALC OFF** - (cleared) Uses Open Loop hardware (NOT available on PNA-C models).
**Use Last Result for Source Power Cal** - When checked, the latest correction data is copied to the Source Power Cal correction array. When Leveling Mode is switched back to Internal (on the Power and Attenuators dialog), [Source Power Cal](#) is automatically turned ON using this correction data.

When cleared, Source Power Cal is NOT turned ON when Leveling Mode is switched back to Internal.

**Leveling Properties**

The following settings specify the quality and speed of leveling that is to be achieved.

If the maximum port power out of the PNA is reached at any time during the leveling sweeps, the following message appears: **Power set to user power limit**.

**Apply Settings to All Ports** Check to apply the following three settings to all PNA ports.

**Tolerance** The source is considered leveled when each stimulus data point has achieved the target power level +/- (plus or minus) this tolerance value.

**Max Iterations** If every stimulus data point does NOT achieve the target leveling power after this number of leveling sweeps, the measurement sweep occurs using the correction values obtained from the last leveling sweep. The message: **Not settled, noisy trace** appears when the Max Iterations is reached. If you see this message, you can increase the Max Iterations, reduce the IFBW, or increase the Tolerance setting.

**Leveling IFBW** By default, the IFBW for the leveling sweeps is set to 100 kHz. [Learn more about IFBW](#).

- Increase this value to make faster, but noisier leveling sweeps.
- Decrease this value to make slower, more repeatable leveling sweeps.
- Uncheck the box to use the same IFBW as the measurement sweeps.

**Safe Mode**

To protect your DUT, these settings control the extent to which the source power will be changed to achieve the target power as measured at the reference receiver. These settings could be necessary when using external components with a large variation in frequency response (flatness).

**Max Power Step** Limits the change in source power at each data point from one sweep to the next. For example, assume Safe Mode is enabled, and Max Power Step is set to 1 dB. On the first leveling sweep, the first data point measures 3 dB lower than the target power, then source power for data point 1 will be increased by 1 dB for the next sweep, and likely for the following two sweeps.

**Max Port Power** Limits the maximum power out of the source. The message: **Power set to Max Power** appears when this limit is reached.

**Min Port Power** Limits the minimum power out of the source. The message: **Power set to Min Power** appears when this limit is reached.
12-May-2011  Added before or after cal
15-Mar-2011  Added ratioed receivers (9.33) - Open loop not on C models
16-Sep-2010  Removed note about commands for LSPC.
26-Aug-2010  Added link to wide power sweep topic
11-Mar-2010  Added Use Last checkbox (A.09.20)
10-Feb-2009  MX New topic (A.08.50)
# Sweep Settings

A sweep is a series of consecutive data point measurements taken over a specified sequence of stimulus values. You can make the following sweep settings:

- **Sweep Type**
  - Linear / Log
  - Power Sweep
  - CW Time
  - Segment Sweep
  - Phase
- **Sweep Time**
- **Sweep Setup**
  - Stepped vs Analog
  - Fast Sweep
  - Dwell and Delay
  - Standard vs Point Sweep

See [Triggering and other 'Setup Measurements' topics](#)

## How to set Sweep Type

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Sweep</strong></td>
<td>1. Click <strong>Stimulus</strong></td>
</tr>
<tr>
<td>2. then <strong>[Sweep Type]</strong></td>
<td>2. then <strong>Sweep</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Sweep Type</strong></td>
</tr>
</tbody>
</table>
**Sweep Type dialog box help**

**Note:** Sweep Settings are not applied until either **OK** or **Apply** is pressed.

**Channel** The active channel when Sweep Type was selected. Sweep settings will be applied to this channel.

**Sweep Type**

**Linear Frequency** Sets a linear frequency sweep that is displayed on a standard grid with ten equal horizontal divisions.

- **Start** Sets the beginning value of the frequency sweep.
- **Stop** Sets the end value of the frequency sweep.
- **Points** Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001. (Default is 201).

**Log Frequency** The source is stepped in logarithmic increments and the data is displayed on a logarithmic x-axis. This is usually slower than a continuous sweep with the same number of points.

- **Start** Sets the beginning value of the frequency sweep.
- **Stop** Sets the end value of the frequency sweep.
- **Points** Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001. (Default is 201).

**Power Sweep** Activates a power sweep at a single frequency that you specify. Learn about power sweep

- **Start** Sets the beginning value of the power sweep.
- **Stop** Sets the end value of the power sweep.
- **CW Frequency** Sets the single frequency where the PNA remains during the measurement sweep.

**CW Time** Sets the PNA to a single frequency, and the data is displayed versus time. Learn more.

- **CW Frequency** Sets the frequency where the PNA remains during the measurement.
- **Sweep Time** Sets the duration of the measurement, which is displayed on the X-axis.
Points  Sets the number of data points that the PNA measures during a sweep. Range: 2 to 20001. (Default is 201).

Segment Sweep  Sets the PNA to sweep through user-defined sweep segments. Learn how to make these settings.

- Independent Power Levels  Check to set the source power level for each segment. Test port uncoupling is also allowed.
- Independent IF Bandwidth  Check to set the IF bandwidth for each segment.
- Independent Sweep Time  Check to set the duration of the measurement for each segment.
- X-Axis Point Spacing  Check to scale the X-Axis to include only the segments. Learn more.
- Allow Arbitrary Segments  Check to allow arbitrary frequencies (overlapped or reverse sweeps). Learn more.
- Show Table  Shows the table that allows you to create and edit segments.
- Hide Table  Hides the segment table from the screen.

Phase  Sweep the phase of one or more sources relative to another source. Choose values between -360° and +360°. Learn more.

- Start  Sets the beginning value of the phase sweep.
- Stop  Sets the end value of the phase sweep.
- CW Frequency  Sets the single frequency where the PNA remains during the sweep.

OK  Applies setting changes and closes the dialog box.
Apply  Applies setting changes and leaves the dialog box open to make more setting changes.
Cancel  Closes the dialog. Setting changes that have been made since the last Apply button click are NOT applied.

Power Sweep

A power sweep either increases or decreases source power in discrete steps. Power sweep is used to characterize power-sensitive circuits, with measurements such as gain compression.

In the Sweep Type dialog, specify Start power, Stop power, and CW Frequency. Power can be swept over any attainable range within the PNA ALC range.

Note: If the PNA has source attenuators, and the attenuation must be changed in order to achieve the requested start and stop power, click Stimulus, then Power then Power and Attenuators.

The PNA does NOT allow a single power sweep over a range that requires attenuator switching. However, two power sweeps can be performed in different channels. The attenuators will not be allowed to switch continuously,
but triggering can be performed using single or group triggering. Learn more.

The remaining power settings apply in power sweep mode:

- Test Port Power setting is not available.
- Port Power can be coupled or uncoupled.
- Attenuator Control is always Manual.
- Power Slope (dB/GHz) is ignored (output frequency is CW).
- Click Stimulus then Sweep, then Number of Points to change the step size of the power sweep.

**Notes:**

- Using a preference setting, you can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep.
- Beginning with PNA Rev. A.08.50, Power Sweep has been optimized for speed. For highest measurement accuracy during a power sweep, it may be necessary to increase the Dwell Time to allow the source more time to settle.
- You may be able to perform a 60 dB power sweep with Receiver Leveling. Learn how.

**Segment Sweep**

Segment Sweep activates a sweep which consists of frequency sub-sweeps, called segments. For each segment you can define independent power levels, IF bandwidth, and sweep time.

Once a measurement calibration is performed on the entire sweep or across all segments, you can make calibrated measurements for one or more segments.

In segment sweep type, the analyzer does the following:

- Sorts all the defined segments in order of increasing frequency
- Measures each point
- Displays a single trace that is a composite of all data taken

Restrictions for segment sweep:

- The frequency range of a segment is not allowed to overlap the frequency range of any other segment.
- The number of segments is limited only by the combined number of data points for all segments in a sweep.
- The combined number of data points for all segments in a sweep cannot exceed 20001.
- All segments are FORCED to have power levels within the same attenuator range to avoid premature wear of the mechanical step attenuator. See Power Level.
How to make segment sweep settings

Using front-panel HARDKEY [softkey] buttons

1. Press **Sweep**
2. then **[Sweep Type]**

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Type**

**Insert Segment** - adds a sweep segment before the selected segment. You can also click the “down” arrow on your keyboard to quickly add many segments.

**Delete Segment** - removes the selected segment.

**Delete All Segments** - removes all segments.

**Note**: At least ONE segment must be ON or **Sweep Type** is automatically set to **Linear**.

**To Modify an Existing Segment**

To make the following menu settings available, you must first show the segment table.

Click **View**, point to **Tables**, then click **Segment Table**.

The above graphic shows the Segment table with all independent settings selected, including source power uncoupled (two power settings).

**STATE** Click the box on the segment to be modified. Then use the up / down arrow to turn the segment ON or OFF.

**START** Sets start frequency for the segment. Click the box and type a value and the first letter of a suffix (KHz, Mhz, GHz). Or double-click the box to select a value.

**STOP** Sets stop frequency for the segment. Click the box and type a value and the first letter of a suffix (KHz, Mhz, GHz). Or double-click the box to select a value.

**Note**: The segment table truncates the frequency resolution. To verify the frequency resolution that you input, create a marker at the start or stop frequency settings.

**POINTS** Sets number of data points for this segment. Type a value or double-click the box to select a value.

**To set IFBW, Power, and Sweep Time independently for each segment:**

1. On the **Sweep** menu, click **Sweep Type**, then **Segment Sweep**.
2. Check the appropriate **Sweep Properties** boxes
3. Then click the box and type a value or double-click the box and select a value.

**Note:** If the following are NOT set, the entire sweep uses the channel IFBW, Power, and Time settings.

**IFBW** Sets the IF Bandwidth for the segment.

**POWER** Sets the Power level for the segment. You can also UNCOUPLE the test port power. See Power Coupling.

**TIME** Sets the Sweep time for the segment.

### X-Axis Point Spacing - Segment Sweep ONLY

This feature affects how a segment trace is drawn on the screen.

**How to select X-Axis Point Spacing**

On the **Sweep Type** dialog box, click **Segment Sweep**

Then check **X-Axis Point Spacing**

- **Without X-axis point spacing**, a multi-segment sweep trace can sometimes result in squeezing many measurement points into a narrow portion of the x-axis.

- **With X-axis point spacing**, the x-axis position of each point is chosen so that all measurement points are evenly spaced along the x-axis.

For example, given the following two segments:

<table>
<thead>
<tr>
<th>STATE</th>
<th>START</th>
<th>STOP</th>
<th>POINTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 ON</td>
<td>45.000000 MHz</td>
<td>50.000000 MHz</td>
<td>21</td>
</tr>
<tr>
<td>2 ON</td>
<td>170.000000 MHz</td>
<td>180.000000 MHz</td>
<td>21</td>
</tr>
</tbody>
</table>

**Without X-Axis Point Spacing**
With X-Axis Point Spacing

**Arbitrary Segment Sweep**

This feature allows arbitrary frequencies to be entered into the segment sweep table. With this capability, segments can have:

- overlapping frequencies.
- the stop frequency less than the start frequency (reverse sweep).

**How to enable Arbitrary Segment Sweep**

1. On the [Sweep Type](#) dialog box, click [Segment Sweep](#)
2. Check [Allow Arbitrary Segment Sweep](#)

**Notes:**

- Unusual results may occur when using arbitrary sweep segments with markers, display settings, limit lines, formatting, and some calibration features.
- When Allow Arbitrary Segment is checked, [X-axis point spacing](#) is automatically turned ON.

**Sweep Time**

The PNA automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time to perform a slower sweep.
How to set Sweep Time

Using front-panel HARDKEY [softkey] buttons

1. Press **Sweep**
2. then **[Time]**

PNA Menu using a mouse

1. Click **Stimulus**
2. then **Sweep**
3. then **Sweep Time**

---

**Programming Commands**

---

**Time dialog box help**

**Sweep Time**  Specifies the time the PNA takes to acquire data for a sweep. The maximum sweep time of the PNA is 86400 seconds or 1 day. Learn about other settings that affect sweep speed.

**Note:** If sweep time accuracy is critical, use ONLY the up and down arrows next to the sweep time entry box to select a value that has been calculated by the PNA. Do NOT type a sweep time value as it will probably be rounded up to the closest calculated value. This rounded value will not be updated in the dialog box.

**X-Axis Time**  Set Start and Stop time to be displayed on the X-axis. These settings are ONLY available for Pulse Profile measurements.

- The actual sweep time includes this acquisition time plus some "overhead" time.
- The PNA automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time using this setting.
- Enter 0 seconds to return the analyzer to the fastest possible sweep time.
- The Sweep Time setting is applied to the active channel.
- The sweep time is per sweep. A full 2-port cal requires two sweeps, both using the specified sweep time. Learn more.
- A **Sweep Indicator** appears on the data trace when the Sweep Time is 0.3 seconds or greater, or if trigger is set to **Point**. The indicator is located on the last data point that was measured by the receiver. If the indicator is stopped (point sweep mode) the source has already stepped to the next data point.
Sweep Setup

How to make Sweep Setup settings

Using front-panel HARDKEY [softkey] buttons

1. Press Stimulus
2. then [Sweep]
3. then [Sweep Setup]

PNA Menu using a mouse

1. Click Stimulus
2. then Sweep
3. then Sweep Setup

Sweep Setup dialog box help

**Channel** Specifies the channel that the settings apply to.

**Stepped Sweep** When checked (Stepped Sweep) the PNA source is tuned, then waits the specified Dwell time, then takes response data, then tunes the source to the next frequency point. This is slower than Analog Sweep, but is more accurate when testing electrically-long devices.

When cleared (Analog Sweep) the PNA takes response data AS the source is sweeping. The sweep time is faster than Stepped, but could cause measurement errors when testing electrically-long devices.

When the dialog checkbox is cleared, the PNA could be in either Analog or Step mode. The mode can change from sweep to sweep. There is **NO way** to determine whether the PNA is in Analog or Stepped Sweep. If you want to be sure what the current sweep mode is, then switch it to Stepped.

Stepped sweep is automatically selected for a number of reasons. Here are some of the reasons:

- **IF Bandwidth** is at, or below, 1 kHz.
- **Source Power Correction** is ON unless doing CW measurement.
- When more than one source is turned ON (multisource PNA models).
When step mode is a faster way to take the data.

- For all FOM and FCA measurements.
- For all ADC measurements.
- For all MMwave measurements.

**Dwell Time**  Specifies the time the source stays at each measurement point before the analyzer takes the data. Only applies to stepped sweep. The maximum dwell time is 100 seconds. See also Electrically Long Devices.

**Sweep Delay**  Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to Dwell Time (per point) and External Trigger delay if enabled.

**Fast Sweep**  NOT available on N5264A. When checked, in Analog Sweep mode the PNA source settling times are shortened in both frequency and power-control (ALC) circuits. In Stepped Sweep mode, the settling time at ALL data points are shortened. This nearly doubles the sweep speed at preset conditions, but at the expense of frequency accuracy and a few dB of amplitude variation. For ratioed measurements, such as S-Parameters, these errors substantially ratio out.

- By default, Fast Sweep is always OFF to provide maximum accuracy and stability.
- Fast Sweep is available on the N5230A/C 40 & 50 GHz models, and all PNA-X and N522x models.
- Fast Sweep is NOT allowed with Power Limit enabled.
- **Note:** PNA performance specifications do NOT apply in Fast Sweep.

**Alternate Sweeps**  This selection is longer available from the user interface. The inherent crosstalk on the PNA is sufficient without this feature. Remotely, this setting is still available and sweeps can be performed alternately. However, receivers can NOT be turned off individually on the PNA-L, PNA-X, or N522x models.

**Sweep Sequence**

- **Standard Sweep**  When checked, the PNA sweeps all data points for each source port in turn. For a 2-port PNA, this means that all data points are swept in the forward direction, then all data points are swept in the reverse direction. Even when NO reverse parameters are displayed (S22 or S12), reverse measurements are necessary when a full 2-port calibration is correcting the channel. This is the default behavior. Learn more.

- **Point Sweep**  Available ONLY on standard S-parameter channels. When checked, the PNA measures all parameters at each frequency point before stepping to the next frequency. The display trace is updated as each data point is measured. Point sweep is the same as stepped sweep mode on the 8510 and 8530.
27-Oct-2010  Added Phase Sweep and Time diag (9.30)
26-Aug-2010  Added link to Wide Power Sweep
1-Mar-2010   Sweep Delay and Point sweep now on C models
28-Sep-2009  Added segment frequency resolution note.
6-Apr-2009   Replaced N5242A with PNA-X
5-Mar-2009   Added faster power sweep
17-Feb-2009  Added point sweep availability
26-Jan-2009  Removed ‘band-crossings’ at fast sweep.
10-Oct-2008  Added point sweep (8.35)
3-Sep-2008   Removed legacy content
19-Aug-2008  Added Fast Sweep
6-Jun-2008   Added uncoupled power sweep
15-Apr-2008  Updated again for Step mode
14-Nov-2007  Added Alternate Sweep note
21-Jun-2007  Increased max data points
3-May-2007   Updated Step mode conditions
**Trigger**

A trigger is a signal that causes the PNA to make a measurement sweep. The PNA offers great flexibility in configuring the trigger function.

View the interactive [Trigger Model](#) animation to see how triggering works in the PNA.

- **How to Set Trigger**
- **Source**
- **Scope**
- **Channel Settings**

**See other ‘Setup Measurements’ topics**

### How to set Triggering

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press TRIGGER</td>
<td>1. Click <strong>Stimulus</strong></td>
</tr>
<tr>
<td>2. then [Trigger...]</td>
<td>2. then <strong>Trigger</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Trigger</strong></td>
</tr>
</tbody>
</table>

**Note:** The **Continuous**, **Single**, and **Hold** settings apply ONLY to the active channel. These settings are available from the Trigger menu, Active Entry keys, and softkeys.
**Trigger Setup** dialog box help

View the interactive [Trigger Model](#) animation to see how triggering works in the PNA.

**Trigger Source**

These settings determine where the trigger signals originate for all existing channels. A valid trigger signal can be generated only when the PNA is not sweeping.

- **Internal**  Continuous trigger signals are sent by the PNA as soon as the previous measurement is complete.
- **Manual** One trigger signal is sent when invoked by the Trigger button, the active toolbar, or a programming command.
- **External** Trigger signals sent out or received from various connectors on the rear panel. Learn more about External and AUX Triggering.

**Manual Trigger!** - Manually sends one trigger signal to the PNA. Available ONLY when Manual trigger is selected.

**Trigger Scope**

These settings determine what is triggered.

- **Global** All channels not in Hold receive the trigger signal [Default setting]
- **Channel** Only the next channel that is not in Hold receives the trigger signal. This is not obvious or useful unless Trigger Source is set to Manual. This setting enables Point Sweep mode.

**Channel Trigger State**

These settings determine how many trigger signals the channel will accept.

- **Continuous** The channel accepts an infinite number of trigger signals.
Groups  The channel accepts only the number of trigger signals that is specified in the Number of Groups text box, then goes into Hold. Before selecting groups you must first increment the Number of Groups text box to greater than one.

Number of Groups  Specify the number of triggers the channel accepts before going into Hold. If in Point Sweep, an entire sweep is considered one group.

First increment to desired number, then select 'Groups'.

Single  The channel accepts ONE trigger signal, then goes into Hold.

Another way to trigger a single measurement is to set Trigger Source to Manual, then send a Manual trigger. However, ALL channels are single triggered.

Hold  The channel accepts NO trigger signals.

Trigger Mode

These settings determine what EACH signal will trigger.

Sweep and Point modes are available ONLY when both Trigger Source = MANUAL or EXTERNAL AND Trigger Scope = CHANNEL.

- Channel  Each trigger signal causes ALL traces in that channel to be swept in the order specified below.

- Point  Each Manual or External trigger signal causes one data point to be measured. Subsequent triggers go to the same trace until it is complete, then other traces in the same channel are swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL data points on ALL traces in the channel are measured. See Also, the (point) Sweep Indicator and SCPI Triggering example for use with External.

- Trace  Available ONLY when Point Sweep is selected. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously. Trace triggering is NOT permitted when a channel is using a 2 port (or more) S-Parameter calibration.

- Sweep  Each Manual or External trigger signal causes ALL traces that share a source port to be swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL traces in ALL directions are swept.

When multiport correction is ON, which requires sweeps in more than one direction, traces on the screen will not update until all of the relevant directions have been swept. For example, with all four 2-port S-Parameters displayed:

- When Full 2-port correction is ON, trigger 1 causes NO traces to update; trigger 2 causes ALL S-Parameters to update. Learn more about sweeps with correction ON.

- When correction is OFF, trigger 1 causes S11 and S21 to update; trigger 2 causes S22 and S12 to update.
Trace Sweep Order

For ALL Trigger Modes, trigger signals continue in the same channel until all traces in that channel are complete. Triggering then continues to the next channel that is not in HOLD.

Traces within each channel are always swept in the following order:

- Traces are swept sequentially in source-port order. For example, in a channel with all four 2-port S-parameters, first the source port 1 traces (S11 and S21) are swept simultaneously. Then the source port 2 traces (S22 and S12) are swept simultaneously.

- In addition, when Alternate sweep is selected, traces are swept sequentially in source-port / receiver-port order. In the above example, first the S11 trace is swept, then S21, then S12, then S22.

Restart (Available only from the Trigger menu) Channels in Hold are set to single trigger (the channel accepts a single trigger signal). All other settings are unaffected, including decrementing trigger Groups.

External and Auxiliary Triggering

External and Auxiliary triggering are both used to synchronize the triggering of the PNA with other equipment or events.

- **Overview**
- **Capability Summary for each PNA Model**
- **Dialogs**
  - **Auxiliary Triggering** (PNA-X and N522x only)
  - **External Trig (IN) Dialog** (All models)
  - **I/O2 Trig Out Dialog** (PNA-L and E836x)

**See Also**

- **Controlling a Handler**
- **Synchronizing an External Source**
- **PNA Triggering**
- **Pulse Triggering**

**Note:** The PNA-X and N522x models have identical External Triggering capability.

---

**Overview**

The manner in which External Triggering is performed has evolved throughout the PNA history, with each new model becoming more comprehensive and flexible. Unfortunately, our ability to update the older models is limited as a large part of external triggering is dependent on the PNA hardware. Where possible, we have updated the capability of the older models with software.

**Ready Signals versus Trigger Signals**

A 'Ready for Trigger' signal is different from a Trigger signal. The ready signal indicates that the instrument sending the signal is ready for measurement. The instrument receiving the ready signal would then send a trigger signal, indicating that the measurement will be made, or has been made. Usually the slower instrument sends the trigger signal. The following two scenarios illustrate when the PNA is faster, and slower than the external device:

- A material handler is very mechanical and takes a relatively long time to load and discharge parts. Therefore, the PNA sends a 'Ready' signal when it is setup to measure, and the handler sends a trigger signal to the PNA when it is ready for a measurement. Additional signals are available on the PNA Handler I/O to indicate that the PNA sweep has ended, and that the handler can setup for the next measurement. See a procedure.

- Alternatively, an external source usually sets up for the next measurement much faster than the PNA. This is
because the PNA acquires data, and moves both source and receivers for the next measurement. In this case, the external source sends a ‘Ready’ signal. The PNA then begins the measurement and sends a trigger signal AFTER the measurement has been made. This indicates that the measurement is complete and that the source should setup for the next measurement. See a procedure. Beginning with A.07.22, the PNA can control an external source from within the firmware. Learn more.

**Capability Summary for each PNA Model**

The following describes the capabilities and recommended method of triggering for each PNA model.

### PNA-X and N522x

These models have the most comprehensive, flexible, and easy to understand of all models in the PNA family. The following are two reciprocal pairs that can be used to accomplish efficient triggering.

<table>

**E836xA/B/C**

The I/O (TRIG IN) and I/O TRIG OUT signal pair is the recommended signal pair to synchronize the E836x and external devices. Both signals result in triggering the other instrument; neither of these signals indicate a 'Ready' condition.

See how to access the Trigger Dialog
This reciprocal pair of signals on PNA-X and N522x models offer high flexibility, and robust synchronization with external devices.

- When enabled, the PNA waits indefinitely for a ‘Ready IN’ signal on the AUX IN connector from an external device.
- When received, the PNA is triggered from the usual trigger sources (Internal, External, or Manual).
- The trigger output signal on the AUX OUT connector can be sent BEFORE or AFTER data acquisition.
- Each channel can be configured differently.
- Two pair of AUX TRIG connectors allow two external devices to be controlled simultaneously.

See Also

- See how to use these connectors to synchronize with External Sources.
- To use the opposite reciprocal pair, see Meas Trig IN and Ready OUT pair.
- Pulse Triggering

Dialog Settings

Note: The Aux Trig 1 and Aux Trig 2 tabs are identical.
Enable  Check to use the Aux1 or Aux2 connectors to output signals to an external device.

Channel  All settings on this dialog affect the specified channel ONLY.

**OUT (Trigger)**

After receiving the Aux Trig IN ‘Ready’ signal, the trigger signal comes from any of the following **Trigger Sources**: 

- **Internal** - trigger occurs immediately.
- **Manual** - trigger occurs when the Trigger button is pressed.
- **External** - trigger occurs when Meas Trig In signal is received. This must be configured independently.

The following settings control the properties of the signals sent out the rear panel **AUX TRIG OUT (1&2) connectors**:

**Polarity**

- **Positive Pulse**  Outgoing pulse is positive.
- **Negative Pulse**  Outgoing pulse is negative.

**Position**

- **Before Acquisition**  Pulse is sent immediately before data acquisition begins.
- **After Acquisition**  Pulse is sent immediately after data acquisition is complete.

**Per Point**  Check to cause a trigger output to be sent for each data point. Clear to send a trigger output for each sweep. This setting controls the trigger output signal regardless of the channel **Point trigger** setting, which causes the PNA channel to trigger per point. For example, to trigger the PNA channel per point, and output a trigger signal per point, both this, and the channel setting must be checked ON.

**Pulse Duration**  Specifies the duration of the positive or negative output trigger pulse.

**Ready for Trigger Handshake**

When checked, the PNA waits indefinitely for the input line at the rear panel **AUX TRIG IN (1&2) connectors** to change to the specified level before acquiring data. This signal indicates that the external device is ready for PNA data acquisition. If the signal arrives before the PNA is ready to acquire data, it is latched (remembered). When NOT checked, the PNA does not wait, but outputs trigger signals when the PNA is ready.

This signal does NOT trigger the PNA. The trigger signal is generated from any of the usual sources: Internal, Manual, or External.

**IN (READY)**

- **Ready High**  PNA responds to the leading edge of a pulse on the Aux1 or Aux2 In connector.
- **Ready Low**  PNA responds to the trailing edge of a pulse on the Aux1 or Aux2 In connector.
- **Delay**  Time that the PNA waits after receiving the Handshake input before data acquisition.

See how to access the Trigger Dialog
Dialog box as it appears on a PNA-X and N522x. This tab is labeled **External** on PNA-L and E836x models

### Meas (External) Trigger dialog box help

#### Main Trigger Input

**Global / Channel Trigger Delay** After an external trigger is received, the start of the sweep is held off for this specified amount of time plus any inherent latency.

When **Trigger Scope** = Channel, the delay value is applied to the specified channel.

When **Trigger Scope** = Global, the same delay value is applied to ALL channels.

**Source** The PNA accepts Trigger IN signals through the following rear-panel connectors:

- **Meas Trig IN BNC** (PNA-X and N522x ONLY)
- **Handler I/O Pin 18** (PNA-L, PNA-X, and N522x ONLY)
- **I/O 1 (TRIG IN) BNC** (PNA-L and E836x ONLY)
- **Aux I/O - pin 19** (PNA-L and E836x ONLY)

#### Level / Edge

**High Level** The PNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is HIGH.

**Low Level** The PNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is LOW.

**Positive Edge** After the PNA arms, it will trigger on the next positive edge. If **Accept Trigger Before Armed** is set, PNA will trigger as soon as it arms if a positive edge was received since the last data was taken.
**Negative Edge**  After the PNA arms, it will trigger on the next negative edge. If **Accept Trigger Before Armed** is set, PNA will trigger as soon as it arms if a negative edge was received since the last data was taken.

**Note:** Edge triggering is NOT available on the following PNA models: E835xA, E880xA, N338xA, E8362A, E8363A, E8364A.

**Accept Trigger Before Armed**  When checked, as the PNA becomes armed (ready to be triggered), the PNA will immediately trigger if any triggers were received since the last taking of data. The PNA remembers only one trigger signal. All others are ignored.

- When this checkbox is cleared, any trigger signal received before PNA is armed is ignored.
- This feature is only available when positive or negative EDGE triggering is selected.
- Configure this setting remotely using **CONTrol:SIGNal** (SCPI) or **ExternalTriggerConnectionBehavior** (COM).

**Ready for Trigger Indicator**

On the PNA, when Meas Trig IN is enabled, then Meas Trig Ready (OUT) is also enabled. Choose connector to send the PNA Ready OUT signal:

- **Meas Trig RDY**
- **Handler I/O p21**
- **AUX I/O p18**

Choose Polarity of the 'Ready OUT' signal.

This capability is not available on E836x models.

- **Ready High** - TTL High indicates the PNA is ready for trigger
- **Ready Low** - TTL Low indicates the PNA is ready for trigger (default setting).

**See Also**

- **Pulse Trigger Tab**
- **Learn how to External Trigger during Calibration**

See how to access the Trigger Dialog
**I/O2 Trig Out dialog box help**

**This TAB appears ONLY on E836X and PNA-L models with a Trig I/O rear-panel connector.**

**Enable** When checked, the PNA sends synchronized trigger signals out the rear-panel I/O (TRIG OUT) BNC connector.

**Channel**
- **Global** - Trigger output properties apply for ALL channels. This is the default setting and is consistent with pre-7.2 release behavior. In this mode, the Per Point setting (below) is not allowed, but is coupled to the channel **Point trigger** property. In other words, when a channel is in point sweep mode, the trigger output will be sent per point.
- **Channel** Trigger output properties are channel dependent. To output trigger signals for each point, check Per Point (see below).

**Note:** This Channel / Global setting can be changed ONLY by [setting a Preference](#).

The current setting is annotated at the bottom of the dialog as:

Compatibility Mode on: Aux Trigger Scope = global

---

**AUX (I/O) TRIG OUT (To Device)**

- **Polarity** The trigger pulse output from the PNA is either in the Positive or Negative direction.
- **Position** The trigger pulse output is sent either BEFORE or AFTER data is acquired.
**Per Point** (Channel mode only) Check to cause a trigger output to be sent for each data point. Clear to send a trigger output for each sweep. This setting controls the trigger output signal regardless of the channel Point trigger setting, which causes the PNA channel to trigger per point. For example, to trigger the PNA channel per point, and output a trigger signal per point, both this, and the channel setting must be checked ON.

**Pulse Duration** Specifies the duration of the positive or negative output trigger pulse.

**Note:** Beginning with PNA Rev 6.0, Guided and Unguided Calibration CAN be performed in External Trigger mode. With this optional behavior, while Trigger Source is set to External, trigger signals must be sent for Calibration sweeps. This behavior does not apply to FCA calibrations.

You can set a Preference to revert to pre-6.0 behavior - the PNA calibrates using Internal trigger signals while Trigger Source is set to External.

The following dialog box appears on the PNA screen while the PNA is waiting for an External trigger signal.

Click **Abort** to cancel the wait for a trigger signal.
About the trigger model

Read Text description of triggering behaviors.

This model does not include the new Sweep trigger mode.
Data Format

A data format is the way the PNA presents measurement data graphically. Pick a data format appropriate to the information you want to learn about the test device.

- **How to set Format**
- **Rectangular (Cartesian) Display Formats**
- **Polar**
- **Smith Chart**

**See other ‘Setup Measurements’ topics**

---

**How to set the Display Format**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **FORMAT**

**PNA Menu using a mouse**

1. Click **Response**
2. then **Format**
Rectangular Display Formats

Seven of the nine available data formats use a rectangular display to present measurement data. This display is also known as Cartesian, X/Y, or rectilinear. The rectangular display is especially useful for clearly displaying frequency response information of your test device.

- Stimulus data (frequency, power, or time) appears on the X-axis, scaled linearly
- Measured data appears on the Y-Axis.

Log Mag (Logarithmic Magnitude) Format

- Displays Magnitude (no phase)
- Y-axis: dB
- Typical measurements:
  - Return Loss
  - Insertion Loss or Gain

Phase Format

Measures the phase of a signal relative to the calibration reference plane with a range of +/- 180 degrees.

- Displays Phase (no magnitude)
- Y-axis: Phase (degrees)
- The trace 'wraps' every 180 degrees for easier scaling.
- Typical Measurements:
Deviation from Linear Phase

Unwrapped Phase

- Same as Phase, but without 180 degree wrapping.

**Note:** Phase is unwrapped by comparing the phase from one data point to the next. If the phase difference between two points is greater than 180 degrees, or if the phase of the first data point is greater than 180 degrees from DC, than the phase measurement is probably NOT accurate.

Group Delay Format

- Displays signal transmission (propagation) time through a device
- Y-axis: Time (seconds)
- Typical Measurements:
  - Group Delay

**See Also:**
- Group Delay (Measurement)
- Comparing the PNA Delay Functions.
- Phase Measurement Accuracy

Linear Magnitude Format

- Displays positive values only
- Y-axis: Unitless (U) for ratioed measurements
  Watts (W) for unratioed measurements.
- Typical Measurements:
  - reflection and transmission coefficients (magnitude)
  - time domain transfer

SWR Format

- Displays reflection measurement data calculated from the formula \((1+p)/(1-p)\) where \(p\) is reflection coefficient.
- Valid only for reflection measurements.
- Y axis: Unitless
- Typical Measurements:
  - SWR

Real Format
• Displays only the real (resistive) portion of the measured complex data.
• Can show both positive and negative values.
• Y axis: Unitless
• Typical Measurements:
  o time domain
  o auxiliary input voltage signal for service purposes

**Imaginary Format**

• Displays only the imaginary (reactive) portion of the measured data.
• Y-axis: Unitless
• Typical Measurements:
  o impedance for designing matching network

**Polar Format**

Polar format is used to view the magnitude and phase of the reflection coefficient ($\Gamma$) from your S11 or S22 measurement.

You can use Markers to display the following:

• Linear magnitude (in units) or log magnitude (in dB)
• Phase (in degrees)

- The dashed circles represent reflection coefficient. The outermost circle represents a reflection coefficient ($\Gamma$) of 1, or total reflected signal. The center of the circle represents a reflection coefficient ($\Gamma$) of 0, or no reflected signal.
- The radial lines show the phase angle of reflected signal. The right-most position corresponds to zero phase angle, (that is, the reflected signal is at the same phase as the incident signal). Phase differences of 90°,
±180°, and -90° correspond to the top, left-most, and bottom positions on the polar display, respectively.

**Smith Chart Format**

The Smith chart is a tool that maps the complex reflection coefficient (Γ) to the test device's impedance. In a Smith chart, the rectilinear impedance plane is reshaped to form a circular grid, from which the series resistance and reactance can be read (R + jX).

You can use Markers to display the following:

- Resistance (in units of ohms)
- Reactance as an equivalent capacitance (in units of farads) or inductance (in units of henrys)

**Inverse Smith Chart (also known as Admittance)**

Same as standard Smith Chart, except:

- The plot graticule is reversed right-to-left.
- Admittance (in units of siemens) instead of resistance.

**Interpreting the Smith Chart**
Every point on the Smith Chart represents a complex impedance made up of a real resistance \( r \) and an imaginary reactance \( r + jX \).

- The horizontal axis (the solid line) is the real portion of the impedance - the resistance. The center of the horizontal axis always represents the system impedance. To the far right, the value is infinite ohms (open). To the far left, the value is zero ohms (short).
- The dashed circles that intersect the horizontal axis represent constant resistance.
- The dashed arcs that are tangent to the horizontal axis represent constant reactance.
- The upper half of the Smith chart is the area where the reactive component is positive and therefore inductive.
- The lower half is the area where the reactive component is negative and therefore capacitive.

**Programming Commands**
Scale dialog box help

**Note:** Beginning with PNA Rev. 9.0, the scale settings are set to couple with other traces in each window. The following settings assume that Scale Coupling is set to OFF. Learn more about Scale Coupling.

**Scale**

- **Per Division** Sets the value of the vertical divisions of a rectangular display format. In Polar and Smith Chart formats, scale sets the value of the outer circumference. Range: 0.001dB/div to 500 dB/div

- **Autoscale** - Automatically sets value of the vertical divisions and reference value to fit the ACTIVE data trace within the grid area of the screen. The stimulus values and reference position are not affected.
  
  The analyzer determines the smallest possible scale factor that will allow all the displayed data to fit onto 80 percent of the vertical grid.
  
  The reference value is chosen to center the trace on the screen.

- **Autoscale All** Automatically scales ALL data traces in the ACTIVE WINDOW to fit vertically within the grid area of the screen.

**Reference**

- **Level** In rectangular formats, sets the value of the reference line, denoted by $0.00\,\text{dB}$ on the PNA screen. Range: -500 dB to 500 dB.
  
  In Polar and Smith chart formats, reference level is not applicable.

- **Position** In rectangular formats, sets the position of the reference line. Zero is the bottom line of the screen and ten is the top line. Default position is five (middle).
  
  In Polar and Smith chart formats, reference position is not applicable.

**Scale Coupling**

With Scale Coupling enabled, traces that have the same format will have the same Scale, Reference Level, and Reference Position. You can choose to couple the scale of traces that are in the same window, couple the scale of all traces in all windows, or to have NO coupling.
How to set Scale Coupling

1. Right-click on the Y-axis labels of a window
2. then select Scale Coupling

OR

Using front-panel HARDKEY [softkey] buttons
1. Press SCALE
2. then More
3. then Scale Coupling

PNA Menu using a mouse
1. Click Response
2. then Scale
3. then Scale Coupling
Scale Coupling dialog box help

Allows traces that share the same format to have the same Scale, Reference Level and Reference Position.

Coupling Method

Off - No coupling. Traces are scaled individually. Default setting.

Window - All traces with the same format in each selected window share the same scale settings.

All - All traces in ALL selected windows with the same format share the same scale settings.

- When Window or All coupling is enabled, the scale settings for the active trace are assumed by other coupled traces with the same format.

- When there are traces with a different format present, all traces with that format assume the trace settings of the lowest-numbered trace of that format.

- Once enabled, scale settings for all coupled traces with the same format can be changed with any coupled trace being active.

Selected Windows

Available when either the Window or All method is selected. Selected windows will participate in scale coupling. All windows are selected by default. Clear a checkbox to 'Opt-out' of scale coupling for that window.

About Autoscale and Scale Coupling

Autoscale (not Autoscale All) affects the active trace in the active window. All traces that are coupled to this trace assume the new scale settings of the active trace. This could cause some traces to NOT show on the screen.

Autoscale All with Coupling Method...

- Off - All traces in the active window are autoscaled independently.

- Window - All traces in each selected window are autoscaled to fit within a common set of scaling factors.

- All - All traces in all selected windows are autoscaled to fit within a common set of scaling factors.

Magnitude Offset

Magnitude Offset allows you to offset the magnitude (not phase) data by a fixed and / or sloped value in dB. If the display format is Linear Magnitude or Real (unitless), the conversion from dB is performed and the correct amount of offset is implemented.
How to set Magnitude Offset

Using front-panel HARDKEY [softkey] buttons

1. Press SCALE
2. then [More]
3. then [Magnitude Offset]

PNA Menu using a mouse

1. Click Response
2. then Scale
3. then Magnitude Offset

Magnitude Offset dialog box help

The Magnitude offset setting affects only the active trace.

Offset  Offsets the entire data trace by the specified value.

Slope  Offsets the data trace by a value that changes with frequency. The offset slope begins at 0 Hz.

For your convenience, the offset value at the start frequency is calculated and displayed.

See where this operation is performed in the data processing chain.
Pre-configured Measurement Setups

- Pre-configured setups for NEW measurements
- Pre-configured arrangements for EXISTING measurements

Before reading this topic, it is important to understand Traces, Channels, and Windows in the PNA.

See other 'Setup Measurements' topics

Pre-configured Setups for NEW Measurements

Each of the following setups creates new traces. Existing traces and their settings will be lost, unless you first save them.

How to select a pre-configured measurement setup

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press RESPONSE</td>
<td>1. Click Response</td>
</tr>
<tr>
<td>2. then [Display]</td>
<td>2. then Display</td>
</tr>
<tr>
<td>3. then [Meas Setsups]</td>
<td>3. then Meas Setsups</td>
</tr>
</tbody>
</table>

No programming commands exist for this feature

The following are the four pre-configured measurement setups:

![Setup A](image1.png)  ![Setup B](image2.png)
![Setup C](image3.png)  ![Setup D](image4.png)
Arranging Existing Measurements

The following arrangements place EXISTING measurements into pre-configured Window arrangements using a sort algorithm.

How to select an Existing measurement arrangement

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press Display</td>
<td>1. Click Response</td>
</tr>
<tr>
<td></td>
<td>2. then Display</td>
</tr>
</tbody>
</table>

Overlay Arrangement

This configuration places all existing traces in a single window, all overlaid on each other.

Stack 2 Arrangement

This configuration places all existing traces in two "stacked" windows.

Split 3 Arrangement

This configuration places all existing traces in three windows, two on top and one below.
Quad 4 Arrangement

This configuration places all existing traces in four windows, one window in each screen quadrant.

Sort Algorithm

The sort algorithm for the Arrange Windows feature is designed to:

- Divide traces among windows based on their properties
- Group traces with common properties

The algorithm sorting is based on the following trace properties, in order of priority:

1. Format: circular (polar or Smith) versus rectilinear (log mag, lin mag, group delay, etc.)
2. Channel number
3. Transmission versus reflection

Note: The PNA traces per window limitation overrides this algorithm. An error occurs if the arrange selection cannot be completed with the current number of traces on the screen.

3-Sep-2008   Removed legacy content

9/27/06      MX Added UI

9/12/06      Added link to programming commands
PNA-X RF Path Configurator

Allows you to configure hardware components that are available with selected PNA-X options. N522x models do NOT have the RF Path Configurator.

How to access Path Configurator

Using HARDKEY [softkey] buttons:
1. Press TRACE/CHAN
2. then [Channel]
3. then [Hardware Setup]
4. then [Path Config...]

Using PNA Menu using a mouse:
1. Click Trace/Chan
2. then Channel
3. then Hardware Setup
4. then Path Config...

The following image shows configuration with PNA-X Opt 423 (4-port, internal 2nd source, combiner, and mechanical switches). Your PNA-X may not include these options.

See Also
IF Path Configuration
PNA-X specs for block diagrams
Internal Second Source limitations
PNA Configurations and Options
Path Configuration dialog box help

See Noise Figure tab of the Path Configuration.

**Note:** With selected PNA-X options, pulse modulation is available ONLY on OUT1 of Src 1 and Src 2. See block diagram.

Different paths can be configured for each channel.

**Configuration**

Select, store, and delete factory configurations or user-defined configurations. Configurations are stored on the PNA hard drive.

Any configuration can be saved, and later recalled, from this dialog. Click **Store**, type a configuration name, then click **OK**.

**Text area** Displays text describing the physical connections required to complete the configuration. The text for factory configurations can NOT be edited. Text is saved as part of the configuration.

**Cancel** Closes the dialog and returns the configuration settings to the state they were in when the dialog was opened. Cancel does NOT undo **Store** and **Delete** actions that were performed while the dialog was open.

**Notes**

- Click or touch anywhere within a box on the screen to cycle through the available settings.
- Some switch settings alter graphics in areas other that where the switch is thrown.
- If you don't hear switches clicking, this could be why:
- Electronic switches are **orange** on the path configuration dialog. These switches do not make noise when being thrown. Mechanical switches are **blue**.

- The channel is not sweeping.

- The following selections do NOT throw switches, but simply indicate how to connect jumper cables by drawing red lines on the dialog:
  - Combiner (Normal/Reversed)
  - Port 2 Source (Src2 OUT1/Src1 OUT2)

**Note:** To prevent premature wear, the PNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

Learn how to [view the settings of all mechanical devices](#) in the PNA.

- Red lines are jumpers on the front or rear panel.

- Notice on the block diagrams:
  - Extra filtering is available to optimize harmonics below 3.2 GHz on OUT1 of both sources. These filters are not used in the Hi Pwr setting.
  - Each source optionally has pulse modulation capability.

  **Note:** Pulse modulation is available ONLY on OUT1 of Src 1 and Src 2. [See block diagram](#). Your PNA must also have Pulse options. [Learn more](#).

- [Copy channel](#) feature also copies path configuration settings.

- Path Configuration is saved and recalled as part of an instrument state.

**Factory Configurations**

**Port 1 2-tone** Routes Source 2 through the internal combiner to create a two-tone signal out port 1. The standard jumper configuration is used. This is the configuration that is used to make [IMD measurements](#).

**Src 2 Out Port 2** (Option 423 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. Source power is NOT available at port 3. [Learn more about Internal Second Source capability](#).

**2 port Dual Source** (Option 224 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. This also allows pulsed measurements to be performed on both ports 1 and 2.

**Hot S-parameters** The rear panel jumpers must be manually reconfigured to allow the source 2 signal to be routed through the thru path of the internal combiner. Source 2 is used to drive the AUT into compression,
so the highest possible output power is required. Source 1, routed through the coupled path of the combiner, is used for S-parameter measurements, so a small signal is sufficient. These two signals are combined but the frequencies are usually offset.

**See Also**

- [Configuration for High-power measurements](#)
Source Phase Control (Opt 088)

Option 088 allows you to control the phase of a PNA-X source or an External source.

- **Overview**
- **Features and Limitations**
- **Phase Control Use-Cases**
- **How to make Phase Settings**
- **Active Load Pull Examples**

See other 'Setup Measurements' topics

**Overview**

The Source Phase Control feature, allowed on ALL PNA-X models, provides a specific phase difference between two sources. The phase difference can be fixed (for example, at 90 degrees), or swept between two arbitrary phase values (for example, from 0 to 360 degrees).

Any combination of PNA internal or external sources may be used. One source is selected as the controlled source and the other source is the reference source. You select the two sources by selecting the ports at which the sources are available. The choice of ports is limited for you on the Phase Control dialog. Learn about these limitations.

In addition to selecting source ports, you also select the receivers to be used to measure the phase for the sources. This can be test port receivers or the reference receivers for the specified source ports. The receivers measure the relative phase of the sources, then adjust the phase of the controlled source, then remeasure until the phase difference is within the tolerance that you specify.

Phase can also be set without using any receivers. This is called ‘Open Loop’ mode. In this mode, the phase of the controlled source is set once, and iterations are not done, resulting in phase that is less accurate and stable compared to using receivers to measure and set phase. Use Open Loop mode when you need to use the receivers to measure other parameters.

The phase of the controlled source can be swept relative to the reference source. The phase difference between the controlled and reference source is incremented and iterated on consecutive data points. Before starting the Phase Control dialog, select Sweep Type = Phase Sweep. Learn how.

When the phase of a source is controlled, the power of that source is also controlled using Receiver Leveling. Instead of the normal receiver-leveling mode where only one receiver is used, when phase control is active the ratio of two receivers is used to level the power of the controlled source. This is useful for making active load-pull measurements, as described below. In Open Loop mode, neither the phase nor the power of the source is controlled.

**About Phase Control and Error Correction**

Calibrate only those ports that are used for a phase control measurement. For example, if using ports 1 and 3 for phase control, then do NOT calibrate all four ports. If other ports are calibrated, then even ports 1 and 3 may not yield acceptable results.
After performing calibration, the phase is aligned and the power is accurate at the calibration plane.

**Features and Limitations**

- **Phase Control** is allowed ONLY in a standard S-parameter channel.
- Phase Control can be used with [Wideband pulse measurements](#) - NOT in narrow-band pulse mode.
- **Point Averaging** is NOT allowed.
- **External sources** are supported. Learn how to Configure an External Device. Phase can be controlled on Agilent MXG, PSG and ESG sources. The external source must be routed through the rear panel so that a reference receiver can measure its phase. Use the Path Configuration dialog to make switch settings and enable FOM mode.
- **Remote commands** are available that allow the phase and power of each point to be set individually, much like in source power calibration. Use these commands if you need to create a specific pattern of amplitude/phase states, such as characterizing the load-pull of an amplifier.

**Phase Control Use-Cases**

Phase control and phase sweep is useful in the following applications:

**Active load control**

Provide a controlled, electronically-settable impedance to the output port of a DUT under fixed or swept-frequency conditions. Some examples are: measuring the gain and output power of an amplifier with a known load, and measuring the output from a directional detector with a known load.

The reference source is applied to the DUT input port, and the controlled source is applied to the DUT output port as a reverse input wave. The phase and power level of the controlled source is set relative to the forward output wave of the DUT (which is determined by the reference source), so that any arbitrary load impedance (gamma) can be set.

Optionally, the phase of the controlled source can be swept with a constant frequency, so that the phase of gamma rotates while the magnitude of gamma remains constant. The ratio of reverse input wave and forward output wave as viewed on a Smith chart or polar display would appear as a circle. This capability can be combined with external load-pull software to create traditional load-pull power contours.

**Phase-controlled sources**

Set the phase and magnitude of one source relative to a reference source, to provide differential, quadrature, or arbitrary phase-offset signals at a fixed or swept frequency. Typically, another instrument, receiver, or detector would be required to measure the response of the DUT.
How to make Phase Control settings:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Sweep</strong></td>
<td>1. Click <strong>Stimulus</strong></td>
</tr>
<tr>
<td>2. then <strong>[More]</strong></td>
<td>2. then <strong>Sweep</strong></td>
</tr>
<tr>
<td>3. then <strong>[Phase Control]</strong></td>
<td>3. then <strong>More</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>Phase Control</strong></td>
</tr>
</tbody>
</table>

To perform a Phase Sweep:

| 1. Press **Sweep**                         | 1. Click **Stimulus**         |
| 2. then **[Sweep Type]**                  | 2. then **Sweep**             |
| 3. then **[Phase]**                       | 3. then **Sweep Type**        |
|                                            | 4. then **Phase Sweep**      |

To select (view) a Phase format: ([Learn more](#))

| 1. Press **FORMAT**                       | 1. Click **Response**        |
| 2. then **[Phase]**                       | 2. then **Format**           |
|                                            | 3. then **Phase, Unwrapped Phase, or Smith** |
Phase Control dialog box help

Phase Control: Channel 1

Phase Specification

Specify any Fixed Phase setting.

Start / Stop Phase
Available when Sweep Type is set to Phase Sweep. Learn how. Enter the Start and Stop phase values in degrees.

Phase Control
Click in the port cell to be controlled, then choose from the following:

- **Off** - Phase is NOT set or controlled.
- **Open Loop** - Phase and power is set, but receivers are NOT used to measure and iterate the phase or power of the source. Therefore, the setting of phase is not as accurate or stable. Open Loop mode can be used with phase sweep (for example, from 0 to 360 degrees). However, each sweep may not start at 0 degrees. NO settings on the following Phase Control Setup dialog are used in Open Loop.

  **Note:** After selecting Open Loop, set each source to ON (not Auto) using the Power and Attenuators dialog.

- **<rec/rec>, reference port (Controlled)** - Phase and power is measured and iterated to within the specified tolerance. Click Phase Control Setup to specify the source ports, the receivers, and iteration properties to use to control phase. Use the Receiver Leveling feature to set the power iteration properties.

- **Reference** is displayed to indicate the specified reference port.

Phase Control Setup
Click to launch the Phase Control Setup dialog.

Phase Control Setup dialog box help
Select a port to set its phase control configuration  This is the 'controlled' port.

Referenced to  Select a port to be used as a phase reference for the controlled port.

The two internal PNA sources are available ONLY at specific ports. These choices are limited for you on the Phase Control dialog. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. Learn more about these limitations.

Control Parameter  Select the receivers to be used to measure the phase and power of the sources.

- The LEFT receiver (a4 in the above image) measures the controlled source.
- The RIGHT receiver (b4 in the above image) measures the reference source.

The swept phase or phase offset will be the difference between these two receivers. Use either standard notation (A, R1) or logical receiver notation (a1,b1). Learn more.

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled. For example, if you select the configuration in the above dialog, both Port 4 (controlled source) and Port 1 (reference source) must be connected and measured by the Port 4 (a4 and b4) receivers. This would typically be at your DUT output. See the Active Load Pull Example below.

Background Sweep Properties

Background sweeps are phase and power measurements that are made, but the results are not displayed. For each data point, when subsequent measurements are within the specified tolerance, that point is considered settled. If consecutive phase or power measurements of the same data point are NOT within the specified tolerance before the Max Iterations is reached, then one of the following messages are displayed:

- Phase leveling warning: phase not settled.
- Phase leveling warning: power not settled.
- Phase leveling warning: phase and power not settled.

Apply Settings to All Ports  When checked, the specified settings are used for all background sweeps for all phase-controlled ports. When cleared, the following three settings are specified independently for each port pair.

Use Leveling IFBW  (NOT available for this release).

Tolerance  When consecutive phase measurements of the same data point are within this value of each
other, then the phase measurement is considered settled.

**Max Iterations** Sets the maximum number of background phase measurements to perform in order to achieve settling. If the phase is not sufficiently settled after these measurements, then the closest value is used.

---

**Active Load Control Example (4-port PNA-X)**

*See setup using a 2-port 2-source PNA-X.*

1. Select the Phase Control parameters in the above [Phase Control](#) and [Phase Control Setup](#) dialogs.

2. Setup a measurement with the same receivers that are selected on the Phase Control Setup dialog. In this example, on the 'Receivers' measurement tab, select 'a4/b4' as in the following image:

3. Select **Format**, then either **Phase** or **Smith** Chart.

---
4. If you continually see Phase leveling warning: **power** not settled, then on the **Power and Attenuators dialog**, clear Port Powers Coupled (independent port power), then add attenuation to the controlled port. This happens because of additional power being measured from both sources.

**Active Load Control with 2-Port 2-Source PNA-X Models**

1. Connect a rear-panel jumpers cable from J8 to J1.

2. On the Phase Control Setup dialog, select **Port 2** as the controlled source and **Port1 Src 2** as the reference source.

3. On the **Path Configuration dialog**, on the Configuration box, select **2- port dual source**.

4. Select the Control Parameter (receivers) **a2 / b2**.
Phase-Coherent Measurements

Coherent phase means that the measurement does NOT have random phase. Coherent-phase measurements require the comparison of phase between two sources that are sweeping simultaneously. It also requires that two receivers are measuring the two sources simultaneously.

This capability is available in the PNA-X using several applications:

- iTMSA (Opt 460) provides phase-coherent Balanced measurements.
- Phase Control (Opt 088) provides phase-coherent CW or Phase Sweep measurements.
- R/R measurements can provide simple phase-coherent measurements.

How to make phase-coherent R/R (R over R) measurements

To make a phase-coherent R/R measurements, both sources must be ON simultaneously, and the receiver measurements must be made on the same sweep. On a 4-port PNA-X, the two sources are NOT available at all PNA ports simultaneously. It is important to learn these restrictions. Also, both receiver measurements must be made on the same sweep.

1. Create a ratioed receiver measurement using two reference receivers. Learn how. For example, you might create an R1/R3 measurement, specifying the source port as either 1 or 3.

2. The source port that is selected above is turned on automatically. The other source port (port 3 in this case) must be turned ON manually using the Power and Attenuators dialog.

3. Select a phase format. Learn how.
Customize the PNA Screen

You can customize your PNA screen by showing or hiding the following display elements. All of these selections are made from the PNA View menu.

- **Status Bar**
- **Toolbars**
- **Tables**
- **Display Items**
- **Data and Memory Trace**
- **Title Bars**
- **Minimize Application**

See expanded display capabilities of the PNA-X

Learn about using pre-configured measurements and windows arrangements

Learn about Traces, Channels, and Windows on the PNA

### Status Bar

<table>
<thead>
<tr>
<th>Status</th>
<th>CH 1:</th>
<th>S11</th>
<th>No Cor</th>
</tr>
</thead>
</table>

When enabled, the status bar is displayed along the bottom of the PNA screen. The primary status bar shows the following:

- **Channel Trigger State** (Cont, Groups, Single, Hold)
- Active channel
- Measurement parameter for the active trace
- **Trace Math**
- **Error correction** for the active trace
- **Averaging Factor** for the active channel
- **Smoothing** Percentage
- **Transform** (On)
- **Gating** (On)
- IF Gating Enabled for **Pulsed App**: (G)
Manual IF Filtering for Pulsed App: (F)
- Delay if invoked using Phase Offset, Electrical Delay, or Port Extensions.
- Loss if invoked using Magnitude Offset or Port Extensions.
- GPIB status: Local (LCL), Remote Talker Listener (RMT), or System Controller (CTL).
- Error Status: (LVL, LCK, etc)

Note: A second level status bar appears when using External Test Set Control or Interface control.

The status bar state (ON or OFF) will not change when the PNA is Preset.

### How to display the Status Bar

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press DISPLAY</td>
<td>1. Click Response</td>
</tr>
<tr>
<td>2. then [More]</td>
<td>2. then Display</td>
</tr>
<tr>
<td>3. then [Status Bar]</td>
<td>3. then Status Bar</td>
</tr>
</tbody>
</table>

### Toolbars

You can display up to five different toolbars to allow you to easily set up and modify measurements.

### How to display Toolbars

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press DISPLAY</td>
<td>1. Click Response</td>
</tr>
<tr>
<td>2. then [More]</td>
<td>2. then Display</td>
</tr>
<tr>
<td>3. then [Toolbars]</td>
<td>3. then More</td>
</tr>
<tr>
<td></td>
<td>4. then Toolbars</td>
</tr>
</tbody>
</table>

### List of toolbars:
• Entry Toolbar
• Markers
• Measurement
• Sweep Control
• Stimulus
• Time Domain
• Port Extension
• All Off

Note: There is also a Cal Set toolbar available for Monitoring Error Terms.

Entry Toolbar (For PNA-X and 'C' models)

When used with softkeys, this area allows numeric values to be entered for PNA-X settings. From the keyboard, enter G for Giga, M for Mega or milli, K for kilo, and so forth.

Markers Toolbar

The markers toolbar allows you to set up and modify markers. It shows:

• Marker number
• Stimulation value
• Marker functions:
  o Delta
  o Start/Stop
  o Center/Span

Tip: To use the Front Panel Knob to change marker position, first click the Stimulus field of the marker toolbar. Then turn the knob.

Learn more about Markers

Measurement Toolbar

The measurement toolbar allows you to create a new trace for a desired S-parameter measurement in a current window or new window.
Sweep Control Toolbar

In left to right order, the buttons on this toolbar set the active channel to:

- **Hold** mode
- **Single** sweep, then Hold mode
- **Continuous** sweep

Learn more about Channel Trigger State.

Stimulus Toolbar

The stimulus toolbar allows you to view, set up, and modify the sweep stimulus. It shows the:

- **Start** value
- **Stop** value
- **Number of points**

Time Domain

The Time Domain toolbar allows you to do the following:

- Turn Transform and Gating ON / OFF
- Change the Start / Stop times for both Transform and Gating
- **More**...launches the Time Domain Transform dialog box
- **X** Closes the toolbar

The front panel Tab key steps through all of the settings on all of the toolbars on the display. If Tab does not work, press one of the Active Toolbar (color) keys.

Port Extension

The Port Extension toolbar allows you to set Port Extensions while viewing the measurement trace. Learn more about Port Extensions.

All Off
This allows you to **hide all toolbars** with a single selection.

---

**Tables**

Tables are displayed at the bottom of the selected window. Only one table may be displayed at a time for a window.

### How to display tables

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>DISPLAY</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then [<strong>More</strong>]</td>
<td>2. then <strong>Display</strong></td>
</tr>
<tr>
<td>3. then [<strong>Tables</strong>]</td>
<td>3. then <strong>More</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>Tables</strong></td>
</tr>
</tbody>
</table>

### List of tables:

- [Marker Table](#)
- [Limit Line Table](#)
- [Segment Table](#)

### Marker Table

You can display a table of marker settings. These settings include the:

- Marker number
- Marker reference (for delta measurements)
- Frequency
- Time and Distance (for Time Domain measurements)
- Response

Learn more about [Markers](#)

### Limit Line Table

You can display, set up, and modify a table of limit test settings. These include:
- Type (MIN, MAX, or OFF)
- Beginning and ending stimulus values
- Beginning and ending response values

Learn more about Limit Lines

**Segment Sweep Table**

You can display, set up, and modify a table of segment sweep settings. These include:

- State (On/Off)
- Start and Stop frequencies
- Number of Points
- IF Bandwidth (if independent levels)
- Power Level (if independent levels)
- Sweep Time (if independent levels)

Learn more about Segment sweep

**Display Items**

**How to show and hide Display items**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>DISPLAY</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then <strong>[Display Items]</strong></td>
<td>2. then <strong>Display</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Display Items</strong></td>
</tr>
</tbody>
</table>

**Display items:**

- **Trace Status**
- **Frequency Stimulus**
- **Marker (Readout) Display** (separate topic)
- **Grid SOLID | dotted**
Trace Status

For PNA-X and 'C' models
Trace status is annotated at the top of each window.
The highlighted trace number indicates the Active Trace.
Click to select a trace.

Trace Status shows the following:

- Trace number (Tr x). This is the trace number of the channel; NOT the window trace number which is used in many programming commands.
- Measurement parameter. This can be replaced with a custom Trace Title.
- Format
- Scaling factor
- Reference level

How to show/hide Trace Status

Frequency/Stimulus

Ch1: Start 300.000 kHz Stop 3.00000 GHz
Frequency/stimulus information is displayed at the bottom of each window on the screen. It shows:

- Channel number
- Start value
- Stop value

How to show/hide Frequency/Stimulus information

Marker (readout) Display

Learn more

Grid: SOLID | Dotted

Set whether to display ALL open window grid lines in solid or dotted lines. The selected setting is shown in CAPS. Once set, new windows are created using this setting. Grid lines return to SOLID when the PNA is Reset.
Set the color of the grid using Display Colors.
How to display grid settings

Limit Line Test Results
Limit line test results, **Pass** or **Fail**, are displayed on the right side of the designated window.

Limit Lines
Limit lines are displayed for the active trace in the designated window. Their position depends on:

- Limit levels
- Format
- Scaling
- Reference level

Learn more about Limit Lines

How to show/hide Limit Lines and Results

Title
You can create and display a title for each **window** using the keyboard. You can also use the following Title Entry dialog box.

The title is displayed in the upper-left corner of the selected window.

To clear a title, delete the title from the dialog box entry area and click OK.

See also Trace Titles

How to show/hide a Title

Data Trace and Memory Trace
You can view or hide the active data or memory trace.

- Make a trace active by clicking the trace status button
- To view a memory trace you must first store a trace in memory. Click **Trace**, then **Math / Memory**, then **Data => Memory**.

Learn more about Math operations
**Title Bars**

The Title bar shows the window number and Minimize / Maximize icons.

- Checked - Title bars for all PNA windows are shown.
- Cleared - Title bars for all PNA windows are hidden. This allows more room to display measurement results.

### How to show/hide the Title Bars

**Using front-panel HARDKEY [softkey] buttons**

1. Press **DISPLAY**
2. then **[More]**
3. then **[Title Bars]**

**PNA Menu using a mouse**

1. Click **Response**
2. then **Display**
3. then **More**
4. then **Title Bars**

**Minimize Application**

The Network Analyzer application can be minimized to show the desktop and Windows taskbar.

### How to minimize the Network Analyzer Application

**Using front-panel HARDKEY [softkey] buttons**

1. Press **DISPLAY**
2. then **[Windows]**
3. then **[More]**
4. then **[Minimize]**

**PNA Menu using a mouse**

1. Click **File**
2. then **Minimize Application**

To restore the PNA application, click the PNA application on the Windows taskbar.

Copy Channels

Copy channels allows you to make a duplicate channel of the same Measurement Class and with the same stimulus conditions as an existing channel.

- Why Copy Channels
- How to Copy Channels
- List of Channel Settings

Note: Beginning with A.09.40, Copy Channels CAN be used with PNA Applications, such as FCA, Gain Compression, or Noise Figure.

Other Setup Measurements Topics

Why Copy Channels

Copy channel settings if you need to create several channels that have slightly different settings.

For example, if you have an amplifier that you want to characterize over a frequency span with several different input power levels.

Follow these steps:

1. Create one measurement with your optimized channel settings.
2. Copy that channel to new channels.
3. Change the power level on the new channels.

The alternative to using Copy Channels is to create new default measurements on new channels. Then change every channel setting to your new requirement. This is very time consuming and thus shows the benefit of the Copy Channels feature.
**How to Copy Channels**

**Using front-panel HARDKEY [softkey] buttons**

1. Press TRACE/CHAN
2. then [Channel]
3. then [More]
4. then [Copy Channel]

**PNA Menu using a mouse**

1. Click Trace/Chan
2. then Channel
3. then Copy Channel

---

**Copy Channel** dialog box help

Copies an existing channel's settings to another channel. Measurement traces from the source channel are NOT copied.

**Copy channel** (also known as 'Source' channel): Select a channel to copy.

**to** (also known as 'Destination' channel): Scroll to select a channel to copy settings to. Compatible channel numbers that are currently being used are highlighted. They can be selected and overwritten.

The following are compatible destination channels:

- A channel that does not yet exist. The new channel is created with the channel's default measurement.
- A channel of the same Measurement Class as the source. The existing measurements remain on the destination channel.
- A channel of any Measurement Class that contains no measurements. Again, the destination channel is created with the channel's default measurement.

**Notes:**

- You can copy channel settings to ONLY one new or existing channel. Repeat this operation to copy to more than one channel.
The source channel is ALWAYS copied to the Active window. If you want the destination channel in a separate window, first create a compatible new measurement in a new window. Then make sure it is the Active window before you copy the channel into it.

The measurement in the destination channel becomes the active measurement.

For example:

1. **Source** channel 1: Standard S21 measurement
2. **Destination** NEW channel 2
3. **Result**: Source channel 1, S21 Measurement AND channel 2, S11 measurement. Both with same stimulus settings and in the same window. Channel 2, S11 measurement is the active measurement.

For more information see Traces, Channels, and Windows on the PNA

**List of Channel Settings**

- Frequency Span
- Power
- Cal Set usage
- Source Power Cal data
- IF Bandwidth
- Number of Points
- Sweep Settings
- Average
- **Trigger (some settings)**

Last modified:

14-Jul-2011  Works with Apps (A.09.40)
13-Feb-2008  Added note about Apps
9/12/06      Added link to programming commands
ADC Measurements

The PNA is equipped with one or more ADC (Analog to Digital Converter) inputs. These ADC inputs can be used as measurement receivers and display measurements on the PNA screen.

- Analog Inputs can be used for measuring from -10V to +10V. These inputs can be considered auxiliary receivers and used in a similar way as S-Parameter receivers.
- Analog Output Sense inputs (AOS1 and AOS2) can be used to measure the corresponding DAC outputs.
- Analog Ground input (AIG) can be used to measure the instruments analog ground (PNA-X only).

Supported Hardware

PNA-X:  **Power I/O connector** (Pins 7 and 8)
Other models:  **Aux I/O connector** (Pin 14)

How to create ADC receiver measurements

1. Press **TRACES**
2. then **[New Trace]**

1. Click **Trace/Chan**
2. then **New Trace**

![New Trace](attachment:image.png)
New Trace (ADC) dialog box help

**Note:** Sweep speed slows dramatically when measuring more than two ADC receivers.

On the **New Trace dialog**, click the **Receivers** tab.

**Activate** - check any empty line to create a trace.

**Numerator** - select from the following:

- **AI1** - Input 1
- **AI2** - Input 2 (PNA-X only)
- **AOS1, AOS2** - Output sense 1 or 2
- **AIG** - Analog ground (PNA-X only)

**Denominator** - NOT available (ONLY unratioed measurements)

**Source Port** - The ADC receiver is measured when the specified source port is sweeping.

ADC receiver traces are labeled as shown in the following images:

- The ADC1 input is being measured, with 2 as the source port.
- The Y axis is U (unitless).
- The default trace format is Real (linear).

**ADC Traces and other useful PNA functions**

Although most PNA functions work with ADC traces, the following may be especially useful.

- **Equation Editor** can be used with the trace data. Although the PNA-X ADC is measuring voltage (-10V to +10V range in 14 bits), by using a trace formula, this voltage can represent other types of measurement parameters (such as current, temperature, or a scaled voltage). See PAE example.
- **Trace averaging** and **Trace Smoothing** can be used to remove trace noise.
- **Dwell time** can be used to allow for settling.

**PNA Functions Not Supported**

- Calibration for ADC receivers is NOT supported.
- Use with FCA is NOT supported.
While the PNA is sweeping an ADC measurement, do NOT use the rear-panel Analog I/O SCPI commands.
Dynamic Range

Dynamic range is the difference between the analyzer receiver's maximum input power and the minimum measurable power (noise floor). For a measurement to be valid, input signals must be within these boundaries. Increasing dynamic range is important if you need to measure very large variations in signal amplitude, such as filter bandpass and rejection. The dynamic range is shown below for an example measurement.

To help reduce measurement uncertainty, the analyzer dynamic range should be greater than the response that the DUT exhibits. For example, measurement accuracy is increased when the DUT response is at least 10 dB above the noise floor. The following methods can help you increase the dynamic range.

- **Increase the Device Input Power**
- **Reduce the Receiver Noise Floor**
- **Improving Dynamic Range using the Front-Panel Jumpers**

**Other topics about Optimizing Measurements**

**Increase Device Input Power**

Increase the DUT input power so that the analyzer can more accurately detect and measure the DUT output power. However, use caution - too much power can damage the analyzer receiver or cause compression distortion.

**Caution! Receiver input damage level: +15 dBm.**

See how to increase input power to the device

**Tip:** You can further increase dynamic range by using an external booster amplifier to increase the input power to the DUT. See High Power Amplifier Measurements.

**Reduce the Receiver Noise Floor**

You can use the following techniques to lower the noise floor and increase the analyzer's dynamic range.

- Reduce crosstalk between the PNA receivers when measuring signals close to the noise floor. See Receiver Crosstalk.
- Use **Sweep Averaging** - learn more about Sweep Average
- Reduce the **IF Bandwidth** - learn more about [IF Bandwidth](#).

- In **Segment sweep** mode each segment can have its own IF bandwidth. For example, when measuring a filter:
  
  - In the passband, the IF bandwidth can be set wider for a fast sweep rate, as long as high-level trace noise is kept sufficiently small.
  
  - In the reject band, where noise floor contributes significantly to measurement error, the IF bandwidth can be set low enough to achieve the desired reduction in average noise level.

**Improving Dynamic Range using the Front-Panel Jumpers**

**Direct Access**

The simplest method to improve dynamic range is to remove a RCVR ‘n’ IN front-panel jumper and route the DUT output directly into that PNA receiver. This bypasses the directional coupler and limits the ability to provide Full Error Correction because the signal can not be applied in the reverse direction.

Refer to the [PNA specifications](#) to learn the dynamic range that is available with direct receiver access.

**Reverse the directional coupler**

Another method to improve dynamic range is to reverse the signal path in the test-port coupler and bypass the loss typically associated with the coupled arm.

As shown in the following graphic, the signal is applied to Port 2. The signal bypasses the coupled arm via the jumper cable connected to the Coupler Thru (or Coupler In) and the Receiver B In (or B In) ports.

When making measurements in reverse direction, the system dynamic range is degraded by 15 dB.

**Note:** Your analyzer’s block diagram may contain different components than shown below. To see the block diagram for your PNA model, see the bottom of the [specs/data sheet](#).

5-Jan-2011  Removed old E835x std reference
5-Aug-2008  Combined several topics
Number of Points

A data point is a sample of data representing a measurement at a single stimulus value. You can specify the number of data points that the PNA measures across a sweep. (A “sweep” is a series of consecutive data point measurements, taken over a sequence of stimulus values.)

The PNA sweep time changes proportionally with the number of points. However, the overall measurement cycle time does not. See Technical Specifications for more information on how the number of points, and other settings, affect the sweep time.

Note: You may experience a significant decrease in computer processing speed with increased number of points, number of traces, and calibration error terms (full 2-port or 3-port). If this becomes a problem, you can increase the amount of RAM with PNA Option 022.

How to change the number of data points

Select a number or click Custom to invoke a dialog box.

Using front-panel HARDKEY [softkey] buttons

1. Press Sweep
2. then [Number of Points]

Using a mouse with PNA Menus

1. Click Stimulus
2. then Sweep
3. then Number of Points
**Number of Points** dialog box help

Specifies the number of data points that the analyzer gathers during a measurement sweep. You can specify any number from **1** to **32,001**. The default value is 201.

**Note:** Some measurement classes may have different maximum points limitations.

Two data points are required for Time Domain.

**Tips:**

- To achieve the greatest trace resolution, use the maximum number of data points.
- For faster throughput use the smallest number of data points that will give you acceptable resolution.
- To find an optimized number of points, look for a value where there is not a significant difference in the measurement when you increase the number of points.
- To ensure an accurate measurement calibration, perform the calibration with the same number of points that will be used for the measurement.

Phase Measurement Accuracy

You can increase the accuracy of phase measurements by using the following PNA features.

- **Electrical Delay**
- **Phase Offset**
- **Spacing Between Frequency Points (Aliasing)**

**See Also**
- Port Extensions
- Comparing the PNA Delay Functions
- Phase Control
- Phase Coherent Measurements

Learn more about Phase measurements

### Electrical Delay

Electrical delay is a mathematical function that simulates a variable length of lossless transmission line. Use the electrical delay feature to compensate for the linear phase shift through a device. This feature allows you to look at only the deviation from linear phase of the device.

You can set the electrical delay independently for each measurement trace.

**How to set Electrical Delay**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SCALE</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then [<strong>Electrical Delay</strong>]</td>
<td>2. then <strong>Scale</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Electrical Delay</strong></td>
</tr>
</tbody>
</table>
Electrical Delay

Specifies the value of delay added or removed, in Time or Distance. This compensates for the linear phase shift through a device. You can set the electrical delay independently for each measurement trace.

Click the Step icon next to either Time or Distance to start the Step Size dialog.

Velocity Factor

Specifies the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

Velocity factor can also be set from the Port Extensions dialog and Time Domain Distance Marker Settings.

Softkey Display

Allows you to enter delay in either Time or Distance using the softkeys and Active Entry toolbar.

Distance Units

Select from Meters, Inches, or Feet. The step size will not change automatically when this value is changed. Learn more about Step Size.

Media

- Coax Select if the added length is coax. Also specify the velocity factor of the coax.
- Waveguide Select if the added length is waveguide. Also specify the low frequency cutoff of the waveguide.
- Cutoff Freq Low frequency cutoff of the waveguide.

Learn about Electrical Delay (scroll up)
**Step Size** dialog box help

Changes the step size that occurs when the Time or Distance up/down arrows are pressed on the Electrical Delay dialog.

- **Auto**  Step Size is set to the default value.
- **User Defined** Enter a step size value, then click OK.

This value remains the same when the units are changed. For example if a step size of 12 is entered on this dialog, then you change the units from Inches to Feet, the step size of 12 inches becomes 12 feet, not 1 feet. Therefore, change the units first, then set the step size.

**Phase Offset**

Phase offset mathematically adjusts the phase measurement by a specified amount, up to 360°. Use this feature in the following ways:

- **Improve the display of a phase measurement.** This is similar to the way you would change the reference level in an amplitude measurement. Change the phase response to center or align the response on the screen.

- **Emulate a projected phase shift in your measurement.** For example, if you know that you need to add a cable and that the length of that cable will add a certain phase shift to your measurement, you can use phase offset to add that amount and simulate the complete device measurement.

**How to set Phase Offset**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SCALE</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then <strong>[Phase Offset]</strong></td>
<td>2. then <strong>Scale</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Phase Offset</strong></td>
</tr>
</tbody>
</table>

**Programming Commands**

![Phase Offset dialog](image)
**Phase Offset** dialog box help

**Phase Offset** Type a value or use the up and down arrows to select any value up to 360 degrees.

Learn about **Phase Offset** (scroll up)

---

**Spacing Between Frequency Points (Aliasing)**

The analyzer samples data at discrete frequency points, then connects the points, creating a trace on the screen. If the phase shift through a device is >180° between adjacent frequency points, the display can look like the phase slope is reversed. This is because the data is undersampled and aliasing is occurring.

If you are measuring group delay and the slope of the phase is reversed, then the group delay will change sign. For example, the following graphic shows a measurement of a SAW bandpass filter.

- The left measurement has 51 points and indicates the group delay is negative, which is a physical impossibility. That is, the response is below 0 seconds reference line.

- The right measurement shows an increase to 201 points which indicates the group delay is positive. That is, the response is above the 0 seconds reference line.

---

**Tip:** To check if aliasing might be occurring in a measurement, either increase the number of points or reduce the frequency span.

Electrically-Long Device Measurements

A signal coming out of a device under test may not be exactly the same frequency as the signal going in to a device at a given instant in time. This can sometimes lead to inaccurate measurement results. You can choose between two techniques to eliminate this situation and increase measurement accuracy.

- Why Device Delay May Create Inaccurate Results
- Solutions to Increase Measurement Accuracy
  - Slow the Sweep Speed
  - Add Electrical Length to the R Channel

Why Device Delay May Create Inaccurate Results

The following graphic shows an example of this situation:

- In the network analyzer, the source and receiver are phase locked together and sweep simultaneously through a span of frequencies.
- The signal flow through the Device Under Test (DUT) is shown as different colors for different frequencies.
- You can see as a stimulus frequency travels through the DUT, the analyzer tunes to a new frequency just before the signal arrives at the receiver. This causes inaccurate measurement results.

If the analyzer is measuring a long cable, the signal frequency at the end of the cable will lag behind the network analyzer source frequency. If the frequency shift is appreciable compared to the network analyzer's IF detection bandwidth (typically a few kHz), then the measured result will be in error by the rolloff of the IF filter.

**Note:** There is no fixed electrical length of a device where this becomes an issue. This is because there are many variables that lead to measurement speed. When high measurement accuracy is critical, lower the sweep speed until measurement results no longer change.

Solutions to Increase Measurement Accuracy
Choose from the following methods to compensate for the time delay of an electrically long device.

**Slow the Sweep Speed**

The following methods will slow the sweep speed.

- **Increase the Sweep Time**
- **Increase the Number of Points**
- **Use Stepped Sweep**
- **Set Dwell Time**

**Add Electrical Length to the R Channel**

*Note:* This method applies to PNA models with front panel loops.

Instead of slowing the sweep, you can compensate for the electrical length of a cable or fixture.

a. Remove the R-channel jumper on the front panel of the analyzer.

b. Replace the jumper with a cable of about the same length as the device under test.

1. Add the cable on the R1 channel for S11 and S21 measurements.
2. Add the cable on the R2 channels for S22 and S12 measurements.

b. Set the analyzer for a fast sweep.

**Configuration for S22 and S12 Measurements**

This method balances the delays in the reference and test paths, so that the network analyzer’s ratioed transmission measurement does not have a frequency-shift error.

*Note:* This method works well if the delay is in a cable or fixture. For devices with long delays, this method is only suitable for uncalibrated measurements.
Reflection Accuracy on Low-Loss 2-Port Devices

To make accurate reflection measurements that have a 1-port calibration, you should terminate the unmeasured port.

- Why Terminate the Unmeasured Port
- How to Terminate the Unmeasured Port
- Resulting Measurement Uncertainty

Why Terminate the Unmeasured Port

A 2-port calibration corrects for all 12 twelve error terms. A 1-port calibration corrects for directivity, source match and frequency response, but not load match. Therefore, for highest accuracy, you must make the load match error as small as possible. This especially applies for low-loss, bi-directional devices such as filter passbands and cables. You do not need to be concerned with load match when you are measuring a device with high reverse isolation, such as an amplifier.

How to Terminate the Unmeasured Port

Use one of the following methods:

- Connect a high-quality termination load (from a calibration kit, for example) to the unmeasured port of your device. This technique yields measurement accuracy close to that of a Full SOLT 2-port calibration.

- Connect the unmeasured port of your device directly to the analyzer, inserting a 10 dB precision attenuator between the device output and the analyzer. This improves the effective load match of the analyzer by approximately twice the value of the attenuator, or 20 dB.

Resulting Measurement Uncertainty

The following graph illustrates the measurement uncertainty that results from terminating with and without a
precision 10 dB attenuator on the output of the test device.

Legend

- Filter Reflection
- Uncertainty with attenuator
- Uncertainty without attenuator

The calculations below show how adding a high-quality 10 dB attenuator improves the load match of the analyzer.

**Note:** The corresponding linear value is shown in parentheses.

**Network Analyzer:**

Load match (NALM) = 18 dB (.126)

Directivity (NAD) = 40 db (.010)

**Filter:**

Insertion loss (FIL) = 1dB (.891)

Return loss (FRL) = 16 dB (.158)

**Attenuator:**

Insertion loss (AIL) = 10 dB (.316)

\[
\text{SWR (ASWR)} = 1.05 (.024)
\]

32.26 dB Return Loss

**Calculations:**
## Without Attenuator

\[ \rho_{\text{NA}} = (FIL) \cdot (N_{\text{ALM}}) \cdot (FIL) \]
\[ = (.891) \cdot (.126) \cdot (.891) \]
\[ = .100 \]

\[ \rho_{\text{Attenuator}} = \text{NA} \]

\[ \text{Worst Case Error (EWC)} = \rho_{\text{NA}} \]
\[ = .1 \]

\[ \text{Uncertainty Adds} = -20 \log_{10} (FRL) + (EWC) + (N_{\text{AD}}) \]
\[ = -20 \log_{10} (.158) + (.100) + (.010) \]
\[ = \text{11.4 dB} \]

## With Attenuator

\[ = (FIL) \cdot (AIL) \cdot (N_{\text{ALM}}) \cdot (AIL) \cdot (FIL) \]
\[ = (.891) \cdot (.316) \cdot (.126) \cdot (.316) \cdot (.891) \]
\[ = .010 \]

\[ \rho_{\text{Attenuator}} = \text{NA} \]

\[ \text{Worst Case Error (EWC)} = \rho_{\text{NA}} + \rho_{\text{Att}} \]
\[ = .01 + .019 \]
\[ = .029 \]

\[ \text{Uncertainty Adds} = -20 \log_{10} (FRL) + (EWC) + (N_{\text{AD}}) \]
\[ = -20 \log_{10} (.158) + (.029) + (.010) \]
\[ = \text{14.1 dB} \]

\[ \text{Uncertainty Subtracts} = -20 \log_{10} (FRL) - (EWC) - (N_{\text{AD}}) \]
\[ = -20 \log_{10} (.158) - (.029) - (.010) \]
\[ = \text{18.5 dB} \]

Measurement Stability

There are several situations that can cause unstable measurements. To ensure that you are making repeatable measurements, you can use various methods to create a stable measurement environment.

- **Frequency Drift**
- **Temperature Drift**
- **Inaccurate Measurement Calibrations**
- **Device Connections**

Other topics about Optimizing Measurements

**Frequency Drift**
The analyzer frequency accuracy is based on an internal 10 MHz frequency oscillator. See Technical Specifications for stability and aging specifications.

If your measurement application requires better frequency accuracy and stability, you can override the internal frequency standard and provide your own high-stability external frequency source through the 10 MHz Reference Input connector on the rear panel.

**Temperature Drift**
Thermal expansion and contraction changes the electrical characteristics of the following components:

- Devices within the analyzer
- Calibration kit standards
- Test devices
- Cables
- Adapters

To reduce the effects of temperature drift on your measurements, do the following.

- Switch on the analyzer 1/2 hour before performing a measurement calibration or making a device measurement.
- One hour before you perform a measurement calibration, open the case of the calibration kit and take the standards out of the protective foam.
- Use a temperature-controlled environment. All specifications and characteristics apply over a 25 °C ±5 °C range (unless otherwise stated).
- Ensure the temperature stability of the calibration kit devices.
● Avoid handling the calibration kit devices unnecessarily during the calibration procedure.

● Ensure the ambient temperature is ±1°C of the measurement calibration temperature.

Inaccurate Measurement Calibrations

If a measurement calibration is inaccurate, you will not measure the true response of a device under test. To ensure that your calibration is accurate, you should consider the following practices:

● Perform a measurement calibration at the points where you connect the device under test, that is, the reference plane.

● If you insert any additional accessory (cable, adapter, attenuator) to the test setup after you have performed a measurement calibration, use the port extensions function to compensate for the added electrical length and delay.

● Use calibration standards that match the definitions used in the calibration process.

● Inspect, clean, and gage connectors. See Connector Care.

See Accurate Measurement Calibrations for more detailed information.

Device Connections

Good connections are necessary for repeatable measurements. To help make good connections, do the following:

● Inspect and clean the connectors for all of the components in the measurement setup.

● Use proper connection techniques.

● Avoid moving the cables during a measurement.
Noise Reduction Techniques

Random electrical noise which shows up in the analyzer receiver chain can reduce measurement accuracy. The following PNA functions help reduce trace noise and the noise floor which can lead to better dynamic range and more accurate measurements.

**Note:** The trace noise in microwave PNAs becomes worse below 748 MHz and is especially obvious between 10 MHz and 45 MHz. See [Reduce IFBW](#).

- **Averaging**
- **IF Bandwidth**
- **Trace Smoothing**

**See Also**
- [Group Delay](#)
- [Increase Dynamic Range](#)
- PNA data processing map.

### Other topics about Optimizing Measurements

**Averaging**

Averaging is a feature that reduces the effects of random noise on a measurement. The PNA computes each data point based on the average of several measurements. You determine the number of measurements by setting the Average factor. The higher the average factor, the greater the amount of noise reduction.

**Effects of Sweep Average**

- **Sweep averaging** - consecutive measurements occur over a number of sweeps.
- **Point averaging** - consecutive measurements occur immediately before moving to the next data point. Point averaging is usually much faster than sweep averaging. NOT available on 'C' models and [Gain Compression](#) or [Noise Figure](#) Apps.
- An **Average Counter** appears on the screen when Sweep Averaging is selected, displaying the number of sweeps that has been averaged. The effect on the signal trace can be viewed as the Average Factor increases. This can assist in the selection of the optimum number of sweep averages.
• **Channel wide** - Averaging is applied to all measurements in a channel. The Average counter is displayed for each channel.

• **Unratioed** measurements - Although you can average unratioed (single receiver) measurements, you may get unexpected results:
  
  o Phase results may tend toward 0. This is because phase measurements are relative by nature. Measuring absolute phase with a single receiver appears random. Averaging random positive and negative numbers will tend toward 0.
  
  o The noise floor does not drop when averaging unratioed measurements as on ratioed measurements.

• **Average vs IF Bandwidth** - Both can be used for the same benefit of general noise reduction. For minimizing very low noise, using Average is more effective than reducing IF bandwidth. Generally, Averaging takes slightly longer than IF bandwidth reduction to lower noise, especially if many averages are required. Also, changing the IF bandwidth after calibration results in **uncertain accuracy**.

• **Calibration** - Because averaging is a mathematical process that occurs after the raw measurement is made, averaging can be turned ON before, or after, calibration without invalidating the error correction terms. If averaging is ON before calibration, the measurement of calibration standards are averaged measurements. More time is needed to perform the calibration, but there will be less noise in the resulting error correction terms. Subsequent corrected measurements will also have less noise error. In addition, noise is further reduced by turning Averaging ON after calibration. See the PNA data processing map.

**Averaging Formula**

\[ \text{NewAvg} = \frac{\text{NewData}}{n} + \left( \frac{\text{OldAvg} \times (n-1)}{n} \right) \]

where \(n = \text{average factor}\)

From the formula, you can see that data from the first \(n\) sweeps continues to be included in the results of subsequent sweeps. Its effect is increasingly smaller but never diminishes to zero. For example, with \(n = 5\), the average of the 5 sweeps is displayed. On the 6th sweep, you see \(4/5\) the average of the first 5 sweeps plus \(1/5\) the new sweep.

The effects of older data can be eliminated by restarting the average after \(n\) sweeps.

**How to Set Averaging**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Avg</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then <strong>[Averaging]</strong></td>
<td>2. then <strong>Avg</strong></td>
</tr>
<tr>
<td></td>
<td>3. then <strong>Average</strong></td>
</tr>
</tbody>
</table>
### Average dialog box help

**Average ON**
- Checked - Averaging is applied
- Cleared - Averaging is NOT applied

**Average Factor**  Specifies the number of measurements that are averaged. Range of 1 to 65536 (2^16).

**Average Type**
- **Sweep**  Each data point is based on the average of the same data point measured over several consecutive sweeps.
- **Point**  Each data point is based on the average of the same data point measured repeatedly before going to the next data point. NOT available on Gain Compression App.

**Restart**  Applies only to Sweep averaging - NOT Point. Begins a new set of measurements that are used for the average.

[Learn more about Averaging](scroll up)

---

### IF Bandwidth

The PNA converts the received signal from its source to a lower intermediate frequency (IF). The bandwidth of the IF bandpass filter is adjustable from 40 kHz (for most PNA models) down to a minimum of 1 Hz.

Reducing the IF receiver bandwidth reduces the effect of random noise on a measurement. Each tenfold reduction in IF bandwidth lowers the noise floor by 10 dB. However, narrower IF bandwidths cause longer sweep times.

- **Channel wide**  - IF bandwidth can be set independently for each channel
- **Segment sweep**  - IF bandwidth can be set independently for each segment of segment sweep.
- **Calibration**  - Changing the IF bandwidth after calibration will cause a 'C-delta' correction level, which means that calibration accuracy is uncertain.

### Effect of Reducing IF Bandwidth

---

265
How to set IF Bandwidth

Using front-panel HARDKEY [softkey] buttons

1. Press *Avg*
2. then [IF Bandwidth]

Using a mouse with PNA Menus

1. Click *Response*
2. then *Avg*
3. then *IF Bandwidth*

**IF Bandwidth** dialog box help

**IF Bandwidth** specifies the IF (receiver) bandwidth. The value of IF bandwidth is selected by scrolling through the values available in the IF bandwidth text box. The IF BW is set independently for each channel.

The list of selectable IF Bandwidths is different depending on PNA model.

The following values are common to all models:

- 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k

In addition, the following values are PNA Model specific:

5230A Opt 020, 025, 120, 125, 140, 145, 146, 240, 245, 146

- 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

N5230A Opt 220, 225, 420, 425, 520, 525:
The following limitations apply for the highlighted IFBW settings (1 MHz and above).

Note: These wider IFBWs are used to make wideband pulsed measurements. They do NOT provide faster sweep speeds for non-pulsed measurements.

- **Dwell time** is not allowed.
- **Sweep times** that are slower than the default value are not allowed.
- **Step sweep** mode only - NOT available in Analog sweep.
- **External Trigger Delay** is not allowed.
- **Number of points** for CW sweep is limited to 1001.
- A slight shift (.1dB) in Log Mag traces may be seen when switching in and out of these bandwidths.

**Reduce IF BW at Low Frequencies**

On PNA models with a maximum frequency of 20 GHz and higher, the trace noise becomes worse below 748 MHz. This is especially obvious between 10 MHz and 45 MHz and also when Time Domain is ON. See PNA models / maximum frequencies.

When this box is checked, the PNA uses a smaller IF Bandwidth than the selected value at frequencies below 748 MHz.

This setting:

- can be made for each channel.
- is ON (checked) by default.
- also applies to segment sweep.
- is NOT available on 4-port PNA-L (model N5230A Opt 240 and 245).

Use the following calculations to determine the actual IF Bandwidth value that is used below 748 MHz.

If the result is NOT a selectable IF BW value, the next higher selectable value is used.
<table>
<thead>
<tr>
<th>Model Type</th>
<th>10 MHz to 44.999999 MHz</th>
<th>45 MHz to 748 MHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 20 GHz models:</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
<tr>
<td>ALL 2-port 20 GHz PNA models:</td>
<td>Actual IF BW = (selected IF BW) x (.05)</td>
<td>Actual IF BW = selected IF BW (No reduction)</td>
</tr>
<tr>
<td>ALL 40 GHz and higher models:</td>
<td>Actual IF BW = (selected IF BW) x (.025)</td>
<td>Actual IF BW = (selected IF BW) x (.5)</td>
</tr>
</tbody>
</table>

**PNA-X Models**

<table>
<thead>
<tr>
<th>Start Freq</th>
<th>Stop Freq</th>
<th>Actual IF BW = (selected IF BW) x n</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 MHz</td>
<td>19 MHz</td>
<td>n = .05</td>
</tr>
<tr>
<td>19 MHz+</td>
<td>53 MHz</td>
<td>n = .1</td>
</tr>
<tr>
<td>53 MHz+</td>
<td>75 MHz</td>
<td>n = .5</td>
</tr>
<tr>
<td>75 MHz+</td>
<td>26.5 GHz</td>
<td>n = 1</td>
</tr>
</tbody>
</table>

+ indicates plus 1 Hz

**Example:**

On a 67 GHz PNA, the selected IF BW is 30 KHz.

With *Reduce IF BW at Low Frequencies* checked, the actual IF Bandwidths used are:

- From **10 MHz to 44.999999 MHz**: 30,000Hz * .025 = 750 Hz (PNA uses next higher selectable value: 1000 Hz.)
- From **45 MHz to 748 MHz**: 30,000Hz * .5 = 15 KHz
- From **748 MHz** to stop sweep: **30 KHz**

**OK** Selects the value of IF bandwidth shown in the text box.

Learn about IF Bandwidth (scroll up)

**Trace Smoothing**

Trace smoothing averages a number of adjacent data points to smooth the displayed trace. The number of adjacent data points that get averaged together is also known as the smoothing aperture. You can specify aperture as either the number of data points or the percentage of the x-axis span.

Trace Smoothing reduces the peak-to-peak noise values on broadband measured data. It smoothes trace noise and does not increase measurement time significantly.

Because Trace Smoothing follows Format in the PNA data processing map, the formatted data is smoothed.
Smoothing is automatically turned off if the format is Polar or Smith Chart.

Learn more about Data Format Types.

See the PNA data processing map.

**Tips:**

- Start with a high number of display points and reduce until you are confident that the trace is not giving misleading results.
- Do not use smoothing for high-resonance devices, or devices with wide trace variations. It may introduce misleading information.
- Smoothing is set independently for each trace.

![Effects of Smoothing on a Trace](image)

**How to set Trace Smoothing**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **Avg**
2. then **[Smoothing]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Avg**
3. then **Smoothing**

![Smoothing Settings](image)

**Smoothing dialog box help**

**Smoothing ON**  When checked, applies smoothing to the displayed trace.

**Percent of Span**  Specify percent of the swept stimulus span to smooth. For example, for a trace that contains 100 data points, and specify a percent of span = 11%, then the number of data points that are averaged is 11.

**Points**  Specify the number of adjacent data points to average.

[Learn about Trace Smoothing](scroll up)
Crosstalk

Crosstalk is energy leakage between analyzer signal paths. This can be a problem with high-loss transmission measurements. Although the crosstalk specification of the PNA is exceptional, you can reduce the effects of crosstalk by doing the following:

- Set the Sweep to Alternate
- Perform an Isolation Calibration

### Other topics about Optimizing Measurements

**Set the Sweep to Alternate**

This selection is longer available from the user interface. [Learn more.]

**Perform an Isolation Calibration**

For transmission measurements, a response and isolation measurement calibration helps reduce crosstalk because the analyzer measures and then subtracts the leakage signal during the measurement calibration. The calibration improves isolation so that it is limited only by the noise floor.

**Note:** Isolation is never performed on a Smart (Guided) Calibration. [Learn more.]

Generally, the isolation error falls below the noise floor. So when you are performing an isolation calibration you should use a noise reduction technique such as sweep averages or reducing the IF bandwidth.

Effects of Accessories

Accessories in a configuration may affect the results of a device measurement. You can choose between two analyzer features that reduce the effects of accessories.

- **Power Slope to Compensate for Cable Loss**
- **Gating to Selectively Remove Responses**

Other topics about Optimizing Measurements

Power Slope to Compensate for Cable Loss

If you have a long cable or other accessory in a measurement configuration where a power loss occurs over frequency, apply the power slope function. This function increases the analyzer source power by a rate that you define (dB/GHz).

1. In the **Channel** menu, click **Power**.
2. If the slope function is not already switched on, click the **Slope** check box.
3. In the dB/GHz box, enter the rate that you want the source power to increase over the frequency sweep. Click **OK**.

Gating to Selectively Remove Responses

Gating is a feature in the time domain (option 010) that allows the analyzer to mathematically remove responses. You can set the gate for either a reflection or transmission response, but you will see different results.

- **Gating a reflection response** isolates a desired response (such as a filter's return loss), from unwanted responses (such as adapter reflections or connector mismatches).
- **Gating a transmission response** isolates a specific path in a multipath device that has long electrical lengths.

See [Time Domain Gating](#) for more information.
Achieve Fastest Sweep

You can achieve the fastest measurement sweep by adjusting the following:

- **Sweep Settings**
- **Noise Reduction Settings**
- **Measurement Calibration Choice**
- **Unnecessary Functions**

## Other topics about Optimizing Measurements

### Sweep Settings

Consider changing each of the following settings as suggested.

- **Frequency Span** - Measure only the frequencies that are necessary for your device.
- **Segment Sweep** - Use segments to focus test data only where you need it.
- **Switch Off Stepped Sweep** - Use linear swept mode to minimize sweep time when possible.
- **Auto Sweep Time** - Use this default to sweep as quickly as possible for the current settings.
- **Number of Points** - Use the minimum number of points required for the measurement.

For more information on how number of points and other settings affect sweep cycle time, see [Technical Specifications](#).

### Noise Reduction Settings

Using a combination of these settings, you can decrease the sweep time while still achieving an acceptable measurement.

- **IF Bandwidth**. Use the widest IF bandwidth that will produce acceptable trace noise and [dynamic range](#).
- **Average**. Reduce the average factor, or switch Average off.

### Measurement Calibration Choice

Choose the appropriate type of calibration for the required level of accuracy.

When full 2-port error correction is applied, the PNA takes both forward and reverse sweeps to gather all 12 error correction terms. This occurs even with a single S11 measurement displayed. All displayed measurements are updated as the second sweep is performed. Both sweeps are performed using the specified sweep time.
When calibrating greater than 2 ports, the following formula is used to determine the number of sweeps required:

- \( N \times (N-1) \) where \( N \) = the number of ports.

When full 3-port calibration is applied, 6 sweeps are required; forward and reverse for each port pair. With full 4-port correction, 12 sweeps are required, and so forth.

To limit the measurement time, perform ONLY the level of calibration that your measurements require. For example, if making only an S11 measurement, perform a 1-port calibration on that port.

Sweep speed is about the same for uncorrected measurements and measurements done using a response calibration, or one-port calibration. For more information see Select a Calibration.

### Unnecessary Functions

The analyzer must update information for all active functions. To achieve an additional increase in sweep speed, switch off all of the analyzer functions that are not necessary for your measurement application.

- **Delete Unwanted Traces**
- **Switch Off Unwanted Markers**
- **Switch Off Smoothing**
- **Switch Off Limit Testing**
- **Switch Off Math Functions**

Analyzer sweep speed is dependent on various measurement settings. Experiment with the settings to get the fastest sweep and the measurement results that you need.
Switch Between Multiple Measurements

If you need to make multiple measurements to characterize a device, you can use various methods to increase throughput. Experiment with these methods to find what is best for your measurement application needs.

- Set Up Measurements for Increased Throughput
  - Arrange Measurements in Sets
  - Use Segment Sweep
  - Trigger Measurements Selectively
- Automate Changes Between Measurements
- Recall Measurements Quickly

Other topics about Optimizing Measurements

Set Up Measurements for Increased Throughput

To achieve optimum throughput of devices that require multiple measurements, it is helpful to know the operation of the PNA. This knowledge allows you to set up the measurement scenarios that are best for your applications.

Learn more about Traces, Channels, and Windows on the PNA

Arrange Measurements in Sets

If you arrange measurements to keep the complete set of device measurements in one instrument state, you can save them so that you can later recall a number of measurements with one recall function.

See Pre-configured Measurement Setups for more information.

Use Segment Sweep

Segment sweep is helpful if you need to change the following settings to characterize a device under test.

- Frequency Range
- Power Level
- IF Bandwidth
- Number of Points

The segment sweep allows you to define a set of frequency ranges that have independent attributes. This allows you to use one measurement sweep to measure a device that has varying characteristics.

See Segment Sweep for more information.
**Trigger Measurements Selectively**

You can use the measurement trigger to make measurements as follows:

- Continuously update only the measurements that have rapidly changing data.
- Occasionally update measurements that have infrequently changing data.

For example, if you had four channels set up as follows:

- Two channels measuring the data that is used to tune a filter
- Two channels measuring the data for the out-of-band responses of the filter

You would want to constantly monitor only the measurement data that you use for tuning the filter. If you continuously update all of the channels, this could slow the response of the analyzer so that you would not be able to tune the filter as effectively.

**Note:** You must either trigger the infrequent measurement manually or with remote interface commands.

**To trigger measurements selectively:**

This procedure shows you how to set up two different measurements with the following behavior:

- Channel 1 measurement will continuously update the data.
- Channel 2 measurement will occasionally update the data.

1. In the Windows menu, click Meas Setups, Setup D.

**Set Up a Measurement Trigger for Continuous Updates**

2. In the Sweep menu, click Trigger, Trigger....

4. Under Channel Trigger State, select Channel 1, and click Continuous.

**Set Up a Measurement Trigger for Occasional Updates**

5. Under Channel Trigger State, select Channel 2, and click Single, OK.

   - If you want the analyzer to trigger more than a single sweep, click the Enable Groups check box and enter the number of sweeps.

6. In the System menu, click Keys, Trigger.

**Update the Measurement**

7. Click on the lower window to make Channel 2 the active channel.
8. On the active entry toolbar, click the type of trigger you set up.

   - Click **Single** if you set up the analyzer for a single sweep per trigger.
   - Click **Groups** if you set up the multiple sweeps per trigger.

**Note:** A trace must be active for you to initiate a trigger for that measurement.

**Automate Changes Between Measurements**

If there are slight differences between the various measurements that you need to characterize a device, you may find that it is faster to change the measurement settings using programming.

**Recall Measurements Quickly**

The most efficient way to recall measurements is to recall them as a set of measurements (instrument state).

- It only takes a short time longer to recall an instrument state that includes multiple measurements, than it does to recall an instrument state with only one measurement.

- Each recall function has time associated with it. You can eliminate that time by setting up the measurements as a set so you can recall them as a set.

See [Save and Recall Files](#) for more information.
Data Transfer Speed

When testing devices remotely using COM or SCPI, the following techniques can be used to transfer data quickly between the PNA and remote computer, helping you achieve the best measurement throughput.

- **Use single sweep (trigger) mode** to ensure that a measurement is complete before starting a data transfer.

- **Transfer the minimum amount of data** needed. For example, a trace with a few points, using segment sweep rather than a full trace with many linearly spaced points. Also, use markers instead of trace transfers.

- **Choose the REAL data format** to provide the fastest transfer speed when using SCPI programs for automated applications.

- **Use SCPI over LAN** for applications that are automated with SCPI programs.

- **Use COM programs** to provide the fastest transfer speed when using an automated application. See Data Transfer Time specifications.

**Note:** The following data is obsolete, but still serves to illustrate the relative speed between COM and SCPI.

![Data Transfer Speed Comparison](image_url)

**Other topics about Optimizing Measurements**
Using Macros

Macros are executable programs that you write, load into the analyzer, and then run from the analyzer. You can have up to 25 macros set up to run on the analyzer.

**How to Setup Macros**

**How to Run Macros**

**Macro Example**

## How to Setup Macros

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>For PNA-X and 'C' models</td>
<td>Programming Commands</td>
</tr>
<tr>
<td>1. Press MACRO</td>
<td>1. Click Utility</td>
</tr>
<tr>
<td>2. then [Macro Setup]</td>
<td>2. then Macro</td>
</tr>
<tr>
<td></td>
<td>3. then Macro Setup</td>
</tr>
</tbody>
</table>

**In the Macro Setup dialog box:**

1. Create an executable program and save it on the PNA hard drive. See SCPI or COM example programs in VBscript.

2. Use a mouse or the front-panel 'down-arrow' to select a blank line below the last entry. (There may be NO entry.)

3. Click Edit to start the Edit Macro Setup dialog.

4. In the Macro Title box, type a descriptive title for your macro.

5. Click Browse.

6. Change Files of Type.

7. Find and select your executable file. Change Files of Type if necessary.

8. Click OK on the Edit Macro Setup dialog.

9. Click OK on the Macro Setup dialog.

10. Press MACRO to run. It may be necessary to first Preset the PNA to see your macro in the menu.
**Macro Setup dialog box help**

Allows you to create a set of up to 25 macros that can be launched from the PNA application.

An external keyboard is required to enter the Macro Title and the Run string parameters.

**To add a Macro**, use a mouse or the front-panel 'down arrow' (NOT the 'Down' key) to select a blank line. Then click **Edit**.

- **Macro Title**  Shows the titles that appear in the softkeys and menu when you press the Macro key. These titles are associated with the executable files and should be descriptive so you can easily identify them.

- **Macro Executable**  Lists the complete path to the executable file. To follow the example of launching the Agilent PNA Series Home Page, the path to the executable could be "C:/Program Files/Internet Explorer/iexplore.exe.

- **Macro Runstring Parameters**  Lists the parameters that get passed to the program that is referenced in the executable file. Again following the example of launching the PNA Series Home Page, you could assign the runstring parameters "http://www.agilent.com/find/pna".

**Edit**  Invokes the **Macro Edit dialog box**.

**Delete**  Deletes the selected macro.

**Up**  Allows you to reorder the macros, moving the selected macro up one line. This order determines how they appear in the PNA Menu and in the softkeys and when you press the Macro front-panel key.

**Down**  Moves the selection down one line in the list of macros.
**Macro Edit dialog box help**

**Macro Title**  Allows you to modify the title that appears in the softkeys and menu.

**Macro Executable**  Allows you to modify the complete path to the macro executable file.

**Browse**  Allows you to look through drives and directories, to locate the macro executable file and establish the complete path to the file.

**Macro run string parameters**  Allows you to modify the parameters that are passed to the program referenced in the executable file.

See Macro Setup dialog box

---

**How to Run Macros**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>For PNA-X and 'C' models</strong></td>
<td></td>
</tr>
<tr>
<td>1. Press <strong>MACRO</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then select the macro to run</td>
<td>2. then <strong>Macro</strong></td>
</tr>
<tr>
<td></td>
<td>3. then select the macro to run</td>
</tr>
</tbody>
</table>

---

**Macro Example**

The following is an example Visual Basic Scripting (vbs) program that you can copy, install, and run on your PNA.

**Note:** Print these instructions if viewing in the analyzer. This topic will be covered by the Macro Setup dialog box.

1. Copy the following code into a Notepad file.
2. Save the file on the analyzer hard drive in the **C:/Documents** folder. Name the file **FilterTest.vbs**
3. Close Notepad
4. **Setup the macro in the PNA**
5. **Run the macro**

```
'start copying here
'this program creates a s21 measurement, with bandwidth
'markers for testing a 175MHz Bandpass filter
'it is written in vbscript using COM commands

Set PNA = CreateObject("AgilentPNA835x.Application")
PNA.Preset
```
Set chan=PNA.activechannel
Set meas=PNA.activeMeasurement
Set limts = meas.LimitTest
Set trce = PNA.ActiveNAWindow.ActiveTrace

meas.ChangeParameter "S21",1
chan.StartFrequency = 45e6
chan.StopFrequency = 500e6
trce.ReferencePosition = 8
PNA.TriggerSignal = 3

'Do Test
for t=1 to 5
   call measure
   call compare
next
msgbox("Done Testing")

sub measure
   msgbox("Connect Device " & t & " and press OK")
   PNA.ManualTrigger True
   meas.SearchFilterBandwidth
end sub

sub compare
   BW = meas.FilterBW
   if bw>6.5e7 then msgbox("Failed BW: " & BW)
   Loss = meas.FilterLoss
   if loss>5 then msgbox("Failed Loss: " & Loss)
end sub
'End copying here

Calibration Overview

The following is discussed in this topic:

- What Is Measurement Calibration?
- Why Is Calibration Necessary?
- Conditions Where Calibration Is Suggested
- What Is ECal?

What Is Measurement Calibration?

Calibration removes one or more of the systematic errors using an equation called an error model. Measurement of high quality standards (for example, a short, open, load, and thru) allows the analyzer to solve for the error terms in the error model. See Measurement Errors.

You can choose from different calibration types, depending on the measurement you are making and the level of accuracy you need for the measurement. See Select a Calibration Type.

The accuracy of the calibrated measurements is dependent on the quality of the standards in the calibration kit and how accurately the standards are modeled (defined) in the calibration kit definition file. The calibration-kit definition file is stored in the analyzer. In order to make accurate measurements, the calibration-kit definition must match the actual calibration kit used. To learn more, see Accurate Calibrations.

Calibration Wizard provides the different calibration methods used in the PNA. See Calibration Wizard.

There are quick checks you can do to ensure your measurement calibration is accurate. To learn more see Validity of a Measurement Calibration.

If you make your own custom-built calibration standards (for example, during in-fixture measurements), then you must characterize the calibration standards and enter the definitions into a user modified calibration-kit file. For more information on modifying calibration kit files, see Calibration Standards.

Note: Instrument Calibration is ensuring the analyzer hardware is performing as specified. This is not the same as measurement calibration.

Why Is Calibration Necessary?

It is impossible to make perfect hardware that would not need any form of error correction. Even making the hardware good enough to eliminate the need for error correction for most devices would be extremely expensive.

The accuracy of network analysis is greatly influenced by factors external to the network analyzer. Components of the measurement setup, such as interconnecting cables and adapters, introduce variations in magnitude and phase that can mask the actual response of the device under test.

The best balance is to make the hardware as good as practically possible, balancing performance and cost. Calibration is then a very useful tool to improve measurement accuracy.
**Conditions Where Calibration Is Suggested**

Generally, you should calibrate for making a measurement under the following circumstances:

- You want the best accuracy possible.
- You are adapting to a different connector type or impedance.
- You are connecting a cable between the test device and an analyzer test port.
- You are measuring across a wide frequency span or an electrically long device.
- You are connecting an attenuator or other such device on the input or output of the test device.

If your test setup meets any of the conditions above, the following system characteristics may be affected:

- Amplitude at device input
- Frequency response accuracy
- Directivity
- Crosstalk (isolation)
- Source match
- Load match

**What Is ECAL**

ECal is a complete solid-state calibration solution. It makes one port (Reflection), full two and three-port calibrations fast and easy. See [Using ECal](#).

- It is less prone to operator error.
- The various standards (located inside the calibration module) never wear out because they are switched with PIN-diode or FET switches.
- The calibration modules are characterized using a TRL-calibrated network analyzer.
- ECal is not as accurate as a good TRL calibration.

For information about ordering ECal modules, see [Analyzer Accessories](#) or contact your [Agilent Support Representative](#).
Calibration Standards

This following section explains the general principles and terms regarding calibration kit files. To learn how to modify calibration kit files, See Modify Calibration Kits.

- **About Calibration Kits**
- **Calibration Standards**
- **Standard Type**
- **Standard Definitions**
- **Class Assignments**

See other Calibration Topics

### About Calibration Kits

A calibration kit is a set of physical devices called standards. Each standard has a precisely known or predictable magnitude and phase response as a function of frequency.

In order to calibrate the analyzer using the standards in a calibration kit, the response of each standard must be mathematically defined and then organized into standard classes that correspond to the error models used by the analyzer.

To be able to use a particular calibration kit, the known characteristics from each standard in the kit must be stored into analyzer memory. This is done for you with the PNA. All Agilent Cal Kits containing standard definitions are stored in the PNA. For a list of Agilent calibration kits, see Analyzer Accessories.

### Calibration Standards

Calibration standards provide the reference for error-corrected measurements in the network analyzer. Each standard has a precisely known definition that includes electrical delay, impedance, and loss. The analyzer stores these definitions and uses them to calculate error correction terms.

During measurement calibration, the analyzer measures standards and mathematically compares the results with "ideal models" of those standards. The differences are separated into error terms that are later removed from device measurements during error correction. See Systematic Errors.

### Standard Type

A standard type is one of five basic types that define the form or structure of the model to be used with that standard. The standard types are shown below:
<table>
<thead>
<tr>
<th>Standard</th>
<th>Terminal Impedance</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHORT</td>
<td>zero ohms</td>
</tr>
<tr>
<td>OPEN</td>
<td>infinite ohms</td>
</tr>
<tr>
<td>LOAD</td>
<td>system impedance, Z₀</td>
</tr>
<tr>
<td>THRU/LINE</td>
<td>no terminal impedance</td>
</tr>
<tr>
<td>ARBITRARY</td>
<td>user-defined</td>
</tr>
</tbody>
</table>

Learn about other Calibration Standards:

- Data-Based Standard
- Sliding Load
- Offset Load

Standard Definitions

Standard definitions describe the electrical characteristics of the standards and the frequencies they will be used. Standard definitions can be viewed from the Advanced Modify Cal Kit menu selection. Standard definitions include:

- **Minimum Frequency**  Specifies the minimum frequency the standard is used for calibration.
- **Maximum Frequency**  Specifies the maximum frequency the standard is used for calibration.
- **Z₀**  Specifies the characteristic impedance of the standard (not the system characteristic impedance or the terminal impedance of the standard).
- **Delay**  Specifies a uniform length of transmission line between the standard being defined and the actual calibration plane.
- **Type**  Specifies type of standard (SHORT, OPEN, THRU/LINE, LOAD, ARBITRARY).
- **Loss**  Specifies energy loss, due to skin effect, along a one-way length of coaxial cable.

Loss model equation:

- The value of loss is entered as ohms/second at 1 GHz.
- To compute the loss of the standard, measure the delay in seconds and the loss in dB at 1 GHz. Then use the following formula:

\[
\text{Loss} = \frac{\text{loss (dB)} \times Z₀(\Omega)}{43429(\text{dB/second}) \times \text{delay (s)}}
\]
**Capacitance model equation:**

*C0, C1, C2, C3.* Specifies the fringing capacitance for the open standard.

- \[ C = (C0) + (C1 \times F) + (C2 \times F^2) + (C3 \times F^3) \]
- \( F \) is the measurement frequency.
- The terms in the equation are defined when specifying the open as follows:
  - \( C0 \) term is the constant term of the third-order polynomial and is expressed in Farads.
  - \( C1 \) term is expressed in F/Hz (Farads/Hz).
  - \( C2 \) term is expressed in F/Hz².
  - \( C3 \) term is expressed in F/Hz³.

**Inductance model equation:**

*L0, L1, L2, L3.* Specifies the residual inductance for the short standard.

- \[ L = (L0) + (L1 \times F) + (L2 \times F^2) + (L3 \times F^3) \]
- \( F \) is the measurement frequency.
- The terms in the equation are defined when specifying the short as follows:
  - \( L0 \) term is the constant term of the third-order polynomial and is expressed in Henries.
  - \( L1 \) term is expressed in H/Hz (Henries/Hz).
  - \( L2 \) term is expressed in H/Hz².
  - \( L3 \) term is expressed in H/Hz³.

**Class Assignments**

Once a standard is characterized, it must be assigned to a standard "class". A standard class is a group of standards that are organized according to the calibration of the PNA error model.

The number of classes needed for a particular calibration type is equal to the number of error terms being corrected.

A class often consists of a single standard, but may be composed of multiple standards. These may be required for accuracy or to cover a wide frequency range.

**Example:** A response calibration requires only one class, and the standards for that class may include an OPEN, or SHORT, or THRU. A 1-port calibration requires three classes. A 2-port calibration requires 10 classes, not including two for isolation.

The number of standards assigned to a given class may vary from one to seven for unguided calibrations. Guided calibrations allow as many standards as needed.

Calibration Classes are assigned in the Advanced Modify Cal Kit menu selection.

**The different classes used in the PNA:**

*S11A, S11B, S11C (S22A, S22B, S22C and so forth)*

These are the three classes for port 1-reflection calibrations (three classes also for S22 and S33). They are used in...
the one-port calibrations and the full two-port calibration. They are required in removing the directivity, source match, and reflection tracking errors. Typically, these classes might consist of an open, a short and a load standard for each port.

**Transmission and Match (forward and reverse)**

These classes are used to perform a full two-port calibration. The transmission class relates primarily to the transmission tracking, while the match class refers to load match. For both of these classes, the typical standard is a thru or delay.

**Isolation**

The isolation classes are used to perform a full two-port and the TRL two-port calibrations. The isolation classes apply to the forward and reverse crosstalk terms in the PNA error model.

**TRL THRU**

These are used to perform a TRL two-port calibration. The TRL thru class should contain a thru standard or a short line. If it contains a non-zero length thru standard, then the calibration type is called LRL or LRM.

**TRL REFLECT**

This class is used to perform a TRL two-port calibration. The TRL reflect class should contain a standard with a high reflection coefficient, typically an open or short. The actual reflection coefficient need not be known, but its phase angle should be specified approximately correctly (± 90 deg). The exact same reflection standard must be used on both ports in the TRL calibration process.

**TRL LINE or MATCH**

These are used to perform a TRL two-port calibration. The TRL line or match class should contain line standards, load standards, or both. If a line standard is used, its phase shift must differ from that of the TRL THRU standard by 20° to 160°. This limits the useable frequency range to about 8 to 1. Two or more line standards of different lengths may be specified to get broader frequency coverage. It is also common to include a load standard for covering low frequencies, where the line's length would be impractically long. When a load is used, the calibration type is called TRM or LRM.

**Note:** For more information, read *Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers* (Application Note 1287-11)
Calibration Wizard

The Calibration Wizard allows you to choose a Calibration method and then perform the calibration.

- How to Start Calibration Wizard
- SmartCal (Guided Calibration)
- Unguided Calibration
- Saving a Calibration

Other Cal Topics

How to start Calibration Wizard

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then [Start Cal]
3. then [Cal Wizard]

Using a mouse with PNA Menus

1. Click Response
2. then Cal Wizard

[Diagram: Calibration Wizard: Begin Calibration window]
Select the calibration method:

**SmartCal (Guided Calibration)**
This method provides a step-by-step "wizard" interface. You describe the connectors on your DUT and the cal kits you will use; it walks you through the most accurate calibration possible.

*Note:* SmartCal allows you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

- Supports ALL Cals **EXCEPT** simple open, short, and thru response Cals. See Also [TRL Calibration](#).
- Use a different Cal Kit (**including ECal**) for each port.

**Unguided Calibration**
This method provides a familiar calibration interface, but with limited capability. You choose the type of cal to perform; it allows you the flexibility to measure the standards in any order.

- Supports all Cals **EXCEPT** full 3-port, full 4-port.
- TRL is NOT supported on multiport PNAs.
- Only one Cal Kit can be used.
- Can NOT use Offset Load standard.

**Use Electronic Calibration**

- This method provides fast, software-controlled calibrations.
- Only one ECal module can be used. Use SmartCal when more than one ECal module is needed.

**Save Preferences**

- Clear to continue to see this page on subsequent calibrations.
- Check to save your calibration method choice and no longer see this page. To make this dialog re-appear, click **Response**, then **Cal**, then **Start Cal**, then **Cal Preferences**.
- Learn more about [Calibration Preferences](#).
**The Calibration Window / Channel**

During a Guided Calibration, a 'Cal Window' is created for you to view the connection of calibration standards before standards are measured. This Cal Window uses a new Cal channel that is created and duplicates the settings in the channel being calibrated. *Correction is ALWAYS OFF* for the displayed calibration channel. At the completion of the calibration, the calibration channel and window are deleted.

With PNA Rev. 7.50.27, the measurement of calibration standards can be performed while viewing any PNA window configuration you choose. The Cal Window is appended to your Custom Cal Window setting, and all windows are visible and sweeping below the Cal Wizard before the Measure (cal standard) button is pressed. The windows to be viewed and channels to be swept during the cal process are specified using [Remote commands](#). See an example.

The new Cal Window settings do not work in a FCA channel.

**SmartCal (Guided Calibration)**

A Guided Calibration automatically determines the calibration type and suggests a calibration kit that matches your DUT connectors. Guided Calibration can perform the following Cal Types:

- ALL Cals EXCEPT Open, Short, and Thru Response Cals.
- ECal on one or more ports, beginning with [PNA firmware revision 5.24](#).
- TRL - [Learn how to do TRL cals](#)

**Programming Commands**

*Note:* SmartCal DOES allow you to measure calibration standards in any order. However, you must click Next and Back without measuring standards until you get to the standard you want to measure.

The PNA displays the following dialog boxes when performing a Guided calibration on standard channels.

To learn about Calibrations for Application channels, refer to the help topic for the [Application](#).
Select Ports for Guided Calibration dialog box help

Allows you to select ports to calibrate.

**Cal Type Selection**  Select the number of ports to calibrate.

**N Port Cal Configuration**  If not calibrating all PNA ports, specify which ports to calibrate.

**Calibrate source and receiver power**  Check to perform a Guided Power Calibration. Learn more.

See Also: [Use Multiple Power Sensors to perform a Guided Power Cal](#)

**Show Advanced Settings** (Orientation & Thru Cal Section)  Available only for ECal.

**Back**  Return to Cal Wizard Begin dialog. If you did not see the 'Cal Wizard Begin' dialog but want to, click Back, then clear the Save Preferences checkbox.

For greater than 4-port cals, see [External Test Set calibration - Select Cal Type](#).

Select DUT Connectors and Cal Kits dialog box help

Allows you to select the connector type and Cal Kit for each DUT port to be calibrated.

**Connectors**  To change selection, click the connector field for each DUT port.

If your DUT connectors are not listed, you can create your own connector type and calibration kit file. The PNA includes the following example cal kits that can be used as a template. See Calibration kits for more information.

- If using a gendered (male and female) connector type, select **Type A** as the connector type.
- If using a connectorless device such as on-wafer probes, select **Type B** as the connector type.

**Cal Kits**  Select the Cal Kit to be used to calibrate each test port. The list for each DUT Port displays kits having the same connector type as the DUT.

**Identical ECal models connected?**  ECal modules can be distinguished by serial number. This can have implications on your remote [SCPI](#) programs.
85056K

The 85056K definitions in the PNA are for 2.92mm standards (2.4mm plus 2.92 adapters). To calibrate 2.4 mm connectors using the 85056K cal kit, select 85056A as the cal kit when you need the sliding load. Otherwise, select 85056D as the cal kit. Both the 85056A and the 85056D kits contain exactly the same standards as the 85056K cal kit WITHOUT the adapters.

TRL

- To perform a TRL Cal, assign a TRL Cal Kit to the lowest port number of each port pair.

- When selecting a TRL Cal Kit on a 4-port PNA, and a Global Delta Match Cal is not available, the Cal type will be set to SOLT and a “Could not find a Global Delta Match Cal.” message is displayed on the dialog box. If the selected Cal Kit will not support SOLT, the Next button will not be available. Then you must select a different Cal Kit to proceed or Cancel and perform a Global Delta Match Cal.

Modify Cal Check, then click Next, to Modify Cal (Standards AND Thru Method).

For greater than 4-port cals, see External Test Set calibration - Select DUT Connectors.

Error dialog box help

The current cal kit does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

Cal Kit Class Category Choose from SOLT and TRL. Not available with ECal modules. Click Edit to modify the appropriate class assignments.

Frequency Change the frequency range of the active channel.

Edit Modify the class assignments so that a different standard is selected.

Back Select a different Cal Kit that covers the required frequency range.

Cancel Exit the Cal Wizard
Modify Cal dialog box help

Thru #n
Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.

- The proposed Thru connections are listed automatically.
- Additional Thru connections can be selected for higher accuracy. Learn more.

Add Thru
Click to add a Thru connection. Learn more

Remove Thru
Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

1st Port / 2nd Port
Click to select the two ports to be included in the Thru connection. The order of the port numbers is not critical.

Thru Cal Method
Lists the available Thru Cal methods for the specified port pairs. Learn about the Thru Cal Method choices.

Cal Type/ Stds
Click to invoke the View / Modify Properties of Cal dialog box

Do orientation - Appears ONLY if an ECal module is selected for use.
When this box is checked (default) the PNA automatically senses the model and direction in which an ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range. If you have an E8361A or E836xB PNA and do an ECal completely within 10 - 20 MHz OR 60 - 67 GHz, you may need to do orientation manually. There may not be sufficient power to orient the ECal module at those frequencies.
Choose delta match - Available when a Delta Match Cal is required.

- Check, then click Next to invoke the Select Cal Set for Delta Match dialog box.
- Clear - The Cal Wizard uses the Global Delta Match Cal if available.

View/Detect ECaI Characterizations - Appears ONLY if an ECaI module is selected for use.
Click to invoke the View ECaI Modules and Characterizations dialog box. Displays a list of ECaI modules that are connected to the PNA.

View/Modify Properties of Cal for Ports... dialog box help

Select calibration type

Another chance to change the Thru method. 
Learn about the Thru Cal Method choices.

Advanced

Select the cal method for each connector of the Thru pair.

- **TRL** is only available if a TRL cal kit was selected for the lowest port number of the port pair.
- **QSOLT** Only available when "Defined Thru" or "Flush Thru" is selected. "QSOLT 2 <= 1" refers to the receive port 2 and source port 1(where reflection standards are connected).
- **Enhanced Response** Only available when “Defined Thru” or "Flush Thru" is selected. “EnhResp 2 <= 1” refers to the receive port 2 and source port 1.

View Modify  Click to invoke the Preview and Modify Calibration Selections dialog box.

**Note:** Changes made to the Cal Kit through this dialog are temporary that last only for this calibration. To make permanent changes to the Cal Kit, perform Advanced Modify Cal Kits.
**Select Cal Set for Delta Match** dialog box help

This dialog box appears when a Delta Match Cal is required and **Choose delta match** was selected. [Learn more](#).

Displays the Cal Sets that meet the requirements of the Delta Match Cal.

Select either a User Cal Set or **Global Delta Match Cal**.

If there is no suitable choice for a Delta Match Cal:

1. Click **Cancel**, then **Cancel** again to quit the Cal Wizard.
2. Perform either a **Global Delta Match Cal** or a SOLT cal and save the result in a User Cal Set.
3. Start the Cal Wizard to re-initiate this calibration.
4. Select the Global Delta Match Cal or User Cal Set.
**Calibration Steps** dialog box help

**Note:** Beginning in PNA Rev. 6.0, calibration can be performed with External triggers. Learn more.

As each new cal step prompt appears, the traces are setup for the next standard measurement. Also, sweeps are triggered continuously until the Measure button is pressed. This way you can view the integrity of the standard connection.

Prompts for standards to be measured.

- **Measure** Click to measure the standard.
- **Done** Click after a standard is re-measured and all measurements for the calibration are complete.
- **Next** Click to continue to the next calibration step. Does NOT measure the standard.

If a standard is NOT measured, a warning appears and **Done** will not be available after the last Cal step.

**Note:** Smart (Guided) Cal allows you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

---

**Sliding Load Measurement** dialog box help

Allows you to measure the sliding load standard. Learn more about the Sliding Load standard.

To ensure an accurate calibration, carefully follow the instructions that were provided with your sliding load.

**To Measure a Sliding Load:**

1. Connect the sliding load to the measurement port.

2. Position the sliding element, then click **Measure**. Do not move the sliding element until measurement is complete.

3. Measure the sliding load for at least five and up to seven positions for best accuracy.

   **Note:** The positions of the sliding element should cover the full length of the slide, but be unequally spaced to reduce the possibility of overlapping data points. Most sliding loads have marks for each slide position.

4. Click **Done** after the final measurement.
4. Remove sliding load from the measurement port.

5. Measure the remaining standards.

**Specify delay** dialog box help

This dialog appears ONLY when Adapter Removal or Unknown Thru calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Adapter delay** To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here. The required precision value is the accuracy that is required to characterize the delay value.

**Nominal phase offset** (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

**For FCA calibrations**, this dialog box appears twice: once for the input frequencies and once for the output frequencies. The values can be slightly different.

The **Calibration Complete** dialog box appears after all standards are measured.

**Unguided Calibration**

The PNA displays the following dialog boxes when performing an Unguided calibration:
Select Calibration Type for Mechanical Standards dialog box help

Unguided calibration does **NOT** support cals greater than 2 ports or **ECal** calibrations.

**TRL Cal** should be performed using **Guided Calibration**.

### Calibration Type Selection

- 2-Port SOLT
- 1-Port SOL
- TRL - NOT available on PNA models with more than 2 ports.
- **Response** - Reflection and Thru (if the active measurement is transmission)

### Cal Configuration

If not calibrating all PNA ports, specify which ports to calibrate.

**Back**  Return to **Cal Wizard Begin** dialog. If checked, you can clear the **Save Preferences** checkbox to see the Begin page when the Cal Wizard begins.

**View/Select Cal Kit**  Click to invoke the **Select Cal Kit dialog box**.

**Next**  Click to continue to **Measure Mechanical Standards** dialog box.

**Note:** If the DUT connector type has an impedance other than 50 ohms (waveguide = 1 ohm), change the system impedance before performing a calibration. See **Setting System Impedance**.
Select Cal Type dialog box help

This dialog box only appears if the selected Cal Type is TRL in the previous dialog box.

**TRL Reference Plane**  Select which standard to use to establish the position of the measurement reference plane.

- **THRU Standard**  Select if the THRU standard is zero-length or very short.
- **REFLECT Standard**  Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

**TRL Impedance**

- **LINE Standard**  Specifies that the characteristic impedance of the LINE standard should be used as the system impedance. This ignores any difference between Offset Z0, Offset Loss, and System Z0.
- **SYSTEM Impedance**  Transforms the LINE standard impedance and loss to that of the system impedance for use with the calibration error terms. The TRL calibration will first compute the error terms assuming the LINE standard impedance is the system's characteristic impedance (same as previous LINE selection), then modify the error terms to include the impedance transformation. This should only be used with coax since the skin effect model used is a coaxial model.

Learn how to change System Z0.

To learn to substitute other calibration kits, see Advanced Modify Cal Kits.

Select Cal Kit dialog box help

Displays the calibration kit files available for Unguided calibration. Select the desired calibration kit file and click OK.

**Choose class type**  Unguided TRL calibration is NOT available on the 4-port PNA.

**Edit Class Assignments**  Allows modification of the selected Cal Kit class assignments.

To learn to substitute other calibration kits, see Advanced Modify Cal Kits.

**Note:**  If the Cal Kit has an impedance other than 50 ohms (waveguide=1 ohm), change the system impedance before performing a calibration. See Setting System Impedance.
Measure Mechanical Standards dialog box help

**Note:** Beginning in PNA Rev. 6.0, calibration can be performed with External triggers. [Learn more.](#)

Displays the calibration kit file and standards required for the calibration.

- Standards may be connected and measured in any order.
- Connect the standard to the measurement port and click its associated green button. A check mark indicates the standard has been measured.
- If a standard type contains multiple standards, the [Multiple Standards dialog box](#) opens to display the multiple standards included in the calibration kit file.
- If a sliding load is included in the calibration kit file, the [Sliding Load dialog box](#) opens to perform the measurement with the standard.

**Reflection Response** Select EITHER Open or Short standard, then click **Next**.

**Isolation** Requires one load for each test port of the PNA. [Learn more about Isolation.](#) Use when your measurement requires maximum dynamic range (> 90 dB). See also [Isolation Portion of 2-Port Calibration](#).

**Normalize** Available when performing a response cal for any measurement. After Normalize is pressed and the Cal is complete, the data trace is flat when the same physical connections are present on the port. This is similar to [Data/Memory](#), except that the response cal is saved with Cal data and can be applied to other like measurements. Data/Memory is still available after using Normalize. You would usually connect a THRU standard when calibrating a transmission measurement, and a SHORT standard when calibrating a reflection measurement.

**Show Prompts** Check to provide a reminder for the required connection when you click on the standard.
Multiple Standards dialog box help

Select the standards to be measured.

**Note:** You may see both male and female standards. The Unguided cal has no knowledge of the gender of your connector types. **Choose the gender of your DUT connector**, NOT the test port. Then click OK.

To modify this calibration class to show only one standard, on the Calibration menu, click **Advanced Modify Cal Kits**. Select the Cal kit and click **Edit Kit**. In **Class Assignment**, click **Edit**. Learn more about **Modify Calibration Class Assignments**.

- Connect the standard to the measurement port and click its associated button. A check mark in the **Acquired** box indicates the standard has been measured.

- To cover the entire frequency range, you may need to measure more than one standard. The order in which the standards are measured is important. The last standard that is measured will override the others in respect to the frequency range of the standard definition. **Example:** In the case of measuring both a broadband load and a sliding load, you would measure the sliding load last. This is because the frequency range of the sliding load is a subset of the broadband load.

Learn more about **Modify Calibration Class Assignments**.

Saving a Calibration

SmartCal, ECal, and Unguided Calibrations end with the following dialog box:

**Calibration Completed** dialog box help

**Finish**  Save to the channel's calibration register.

**Save As User Cal Set**  Invokes the **Save as User Cal Set dialog box** AND save to the channel's calibration register.

**Cancel**  Calibration is NOT applied or saved.

Learn about **Calibration Registers**.

Learn about **User Cal Sets**.
### Save as User Cal Set dialog box help

**Existing Cal Sets** - Lists the Cal Set names saved on the PNA.

**Select Cal Set from list or type new name below**  Specify a name for the new Cal Set. Either accept the suggested new name, type a new name, or select a name from the list to overwrite an existing name.

**Edit Name**  If there is no keyboard, click to start the PNA typing tool that can be used from the PNA front panel.

**Save**  Saves the Cal Set to the new Cal Set name.

Learn how to select a default Cal Type.

Other Cal Types (Separate Topic)

- Source and Receiver Power Cals

See other Calibration Topics

TRL Family

Application: Used to accurately calibrate any pair of ports when calibration standards are not readily available.

Note: A Delta Match Cal is required to cal test ports that do not have a dedicated reference receiver.

- Learn more about TRL family cal
- For more information on modifying standards, see Calibration Standards.

Calibration Method: SmartCal

General Accuracy: Very High

Standards Required: THRU, REFLECT, LINE or similar combination

Systematic Errors Corrected:
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
• Frequency response reflection tracking

SOLT

Application: Used to accurately calibrate any number of ports.

General Accuracy: High

Calibration Method: SmartCal, Unguided Calibration, ECal

Standards Required: (SHORT, OPEN, LOAD, THRU) or ECal module

Systematic Errors Corrected (on all ports):
• Directivity
• Source match
• Isolation (see exceptions)
• Load match
• Frequency response transmission tracking
• Frequency response reflection tracking

Enhanced Response

Application: Used to calibrate two ports when only measurements in one direction (forward OR reverse) are required. Measurements are faster because a second sweep is NOT required.

• Reflection Standards (OPEN, SHORT, LOAD) are connected to the source port to be calibrated.
• Defined THRU or Flush THRU standard is connected between port pairs.
• Much quicker than SOLT when using a mechanical cal kit. ECal can also be used.

To select Enhanced Response:

For a standard S-parameter Cal, select SmartCal in the Cal Wizard.

Then, for all cals:

1. At the ‘Select DUT Connectors page’, check Modify Cal, then click Next.

2. Under ‘Cal Type’, select Enhanced Response.

Enhanced Response cal also be selected as the default Cal Type using Cal Preferences.

General Accuracy: High

Calibration Method: SmartCal, ECal

Standards Required: (SHORT, OPEN, LOAD, Defined THRU or Flush THRU)

Systematic Errors Corrected:
• Directivity (source port)
• Source match (source port)
• Isolation (see exceptions)
• Load match (receiver port) - used only to produce transmission tracking term.
• Frequency response transmission tracking (receiver port).
• Frequency response reflection tracking (source port).

**QSOLT (Quick SOLT)**

Application: Used to quickly calibrate any number of ports. Developed specifically for use with external multiport test sets.

**Note:** A Delta Match Cal is required to cal test ports that do not have a dedicated reference receiver.

- Reflection Standards (OPEN, SHORT, LOAD) are connected to only ONE of the ports to be calibrated. The lower port number of the ports to be calibrated is selected by default. This can be changed through the Modify Cal / Cal Type setting.
- Defined THRU or Flush THRU standards are connected from the reflection standard port to the remaining ports to be calibrated.
- Much quicker than SOLT when using a mechanical cal kit.
- Based on TRL math.

**General Accuracy:** Not as high as SOLT

Calibration Method: SmartCal, ECaI

Standards Required: (SHORT, OPEN, LOAD, Defined THRU or Flush THRU)

Systematic Errors Corrected:
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
- Frequency response reflection tracking

**1-Port (Reflection)**

Application: Used to accurately calibrate any single test port for reflection measurements only.

Calibration Method: SmartCal, Unguided Calibration, ECaI

**General Accuracy:** High

Standards Required: (SHORT, OPEN, LOAD) or ECaI module

Systematic Errors Corrected:
- Directivity
- Source match
- Frequency response reflection tracking
Open / Short Response

Application: Used to quickly calibrate any single test port for reflection measurements only.

Calibration Method: Unguided Calibration

General Accuracy: Low

Standards Required: OPEN or SHORT

Systematic Errors Corrected:
Frequency response reflection tracking

Thru Response (Isolation Optional)

Application: Used to quickly calibrate any pair of test ports for transmission measurements only. Isolation is not usually recommended. Learn more about Isolation

Calibration Method: Unguided Calibration

General Accuracy: Low

Standards Required: THRU

Isolation: One LOAD for each PNA test port.

Systematic Errors Corrected:
• Frequency response reflection tracking
• Isolation

Save and Recall: Instrument States and Cal Set Data

See other Calibration Topics

What are PNA Cal Sets
At the completion of a calibration, all calibration data is stored to a Cal Set. The Cal Set can be applied later to any channel that has the same stimulus settings as the Cal Set, thereby saving the time it takes to perform another calibration. The following data is saved to a Cal Set:

- Name
- Cal Set Description
- Cal Set Attributes - stimulus settings, cal type, port association
- Standards data
- Error term data
- GUID (Globally Unique IDentifier)

Cal Registers and User Cal Sets
There are two types of Cal Sets:

- Cal Registers (channel specific)
- User Cal Sets

Calibration data is automatically saved to a Cal Register at the end of every calibration. You can also choose to save the cal data to a User Cal Set.
New with PNA Release 5.0, Calibration Registers are designed to simplify calibrations for most users. When a calibration is complete, the data is automatically saved to the channel's Cal Register, overwriting (or appended to) the previous cal data stored in that register. This concept is similar to previous Agilent Vector Network Analyzers.

- Every channel has ONE dedicated Cal Register. They are named CHn_CALREG, where n is the channel number. The name cannot be changed.

- Cal Registers are more volatile because they are overwritten (or appended) each time a calibration is performed on that channel. The Cal data is always saved, but only temporarily.

- Cal Registers can be applied to other measurements, but ONLY on the same channel as the Cal Register.

**User Cal Sets**

At the end of a calibration, you can choose to also save cal data to an existing or new User Cal Set.

- User Cal Sets can be applied to any number of channels simultaneously.

- User Cal Sets are named by you for easy identification.

- You can have an unlimited number of User Cal Sets.

- At any time, you can copy Cal Register data to create a User Cal Set. See [Cal Set Properties](#).

**Note:** You can set a Preference to revert the pre-5.0 behavior - Cal data was automatically saved to a User Cal Set instead of a Cal Register.

**Appending Data in a Cal Set**

At the end of a calibration, data is saved to the channel's Cal Register and, if you choose, to a User Cal Set. When you choose to save to an existing User Cal Set, the PNA attempts to append the new error terms to the existing User Cal Set. The existing Cal Set data is completely overwritten UNLESS the new data can coexist with the existing data according to the following two rules:

- The stimulus settings of the new data must exactly match the existing data.

- The new cal must involve different ports from the existing cal.

For example:

**Case 1** - An existing Cal Set contains a full 2-port cal between ports 1 and 2. Using the same stimulus settings, you perform a 1-port cal on port 3. At the end of the cal, you click Save As User Cal Set and select the existing full 2-port User Cal Set.

**Result:** The 1-port cal is appended to the 2-port User Cal Set. There is NO overlap between them.

**Case 2** - Same situation as Case 1, except the 1-port cal is performed on port 1.

**Result:** The Cal Set will contain a 1 port cal on port1 and a 1 port cal on port 2. The overlapping tracking terms are removed rendering the original full 2 port cal invalid.

**How to Manage and Apply Cal Sets and Cal Types**

309
The PNA attempts to apply a Cal Set, and turn error correction ON, for ALL of the measurements on the active channel. This may not always be possible. For example, suppose a channel contains both S11 (reflection) and S21 (transmission) measurements. If a Cal Set that contains only an S11 Cal Type is applied to that channel, the Cal Set does not contain the error terms to correct the S21 measurement. Error correction is turned ON for the S11 measurement and NOT turned on for the S21 measurement.

There are two ways to apply an existing Cal Set (Cal Register or User Cal Set) to a measurement:

1. Recalling an Instrument State with Cal data (.cst file) - A .cst file contains an Instrument State with all measurement attributes AND a 'pointer' to the Cal Set that was used to calibrate the measurement. Before saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the measurement. Because Cal Registers are automatically overwritten when a new calibration is performed, it is likely that the Cal Register data will change before the .cst file is recalled.

2. Create a new measurement and select a Cal Set to apply to the active channel.

**Note:** NEVER copy or modify Cal Sets from Windows Explorer or other applications. Cal Sets should only be accessed through the PNA Application.

**How to select and apply a Cal Set to the active channel**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[Manage Cals]**
3. then **[Cal Set]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Cal**
3. then **Manage Cals**
4. then **Cal Sets**

**Calibration Selection** dialog box help

This dialog box allows you to manage and apply Cal Sets. Although the number of Cal Sets you can have is limited only by the amount of PNA memory, it is considered
unusual to have more than about 10 existing Cal Sets, or one current Cal Set for every unique channel setup. Old Cal Sets (with 'stale' data) should be deleted or overwritten.

The active channel’s Cal Register always appears, even if empty. Cal Registers that belong to other channels appear in the list of Cal Sets only if the channel exists, and only if they contain data.

- Learn about Cal Registers.
- Learn how to View the Error Terms of a Cal Set.

To apply a Cal Set to the active channel, click a row to select that Cal Set, then click Apply Cal.

Note: A Cal Set must have been generated from the same measurement class as the active channel in order for it to Applied.

Columns click a heading to sort by that column
- **Cal Set Name** Name to identify the Cal Set.
- **Description** User-settable text to further identify the Cal Set.
- **Channels** Channel numbers that are currently using this Cal Set. A blank entry means it is not currently in use.
- **CalType / Ports** Type of Cal contained in the Cal Set. Learn about applying appropriate Cal Types.
  - **Cal Type Abbreviations:**
    - 1P, 2P, 3P, 4P... - Full n-Port calibrations
    - R - Response (instead of ports, shows the measurement type that it corrects.)
    - ER/x-y **Enhanced Response**, where x is the receive port; y is the source port.
    - VMC **Vector Mixer Cal**
    - SMC **Scalar Mixer Cal**
- **Modified** Date and time the Cal Set was last modified.

Buttons
- **Copy** Invokes the Save as User Cal Set dialog box. Type a name for the copy of the selected Cal Set data.
- **Show / Edit Properties** Invokes the Cal Set Properties dialog box. This allows you to view all of the Cal Set properties and create a duplicate User Cal Set from an existing User Cal Set or Cal Register.
- **Delete** Permanently deletes the Cal Set after you choose OK to a warning prompt.
- **Delete All** Permanently deletes ALL listed Cal Sets and Cal Registers after you choose OK to a warning prompt.
- **Apply Cal** Applies the selected Cal Set to the active channel. If the stimulus settings of the Cal Set and channel are different, a choice must be made.
- **Unselect** Available ONLY if the selected Cal Set is being used by the active channel. Click to 'Un-apply' the Cal Set, then click Close to exit with the Cal Set un-applied.
- **OK** Always APPLIES THE SELECTED CAL SET to the active channel, then closes the dialog box.
- **Close** Exit the dialog box. Performs no further action.
Cal Set Properties dialog box help

Allows you to view all of the Cal Set properties and create a duplicate User Cal Set from an existing User Cal Set or Cal Register.

- **Name**  Edit name of the User Cal Set. You can NOT change the name of a Cal Register.
- **Description**  Descriptive text to further identify the Cal Set.
- **Cal Set Properties**  Lists descriptive information and stimulus conditions of the Cal Set.

Learn how to View the Error Terms of a Cal Set.

Stimulus Setting Different between Cal Set and Measurement

Select Cal Set -- Choose Stimulus Settings

The Cal Set that you have selected has different stimulus settings than the active channel.

Please select one of the following actions:

- **A**  Do not change the active channel's stimulus settings. If necessary, interpolation will be turned on automatically.
- **B**  Change the active channel's stimulus settings to match those of the selected Cal Set.
The Cal Set contains the channel stimulus settings that were in place when the Cal Set was saved. This dialog appears when the Cal Set channel settings are different than those of the channel to which the Cal Set is being applied. Choose between the following options. (See above image).

- A. Keep the Active Channel Stimulus settings. Interpolate if possible.
  - If the Cal Set frequency range is greater than the active channel, then Interpolation will be turned ON. Learn more about Interpolation Accuracy
  - If the Cal Set frequency range is less than the active channel, then this option is not available.
- B. Keep the Cal Set Stimulus settings. The Active Channel stimulus setting are changed.

OK  Make the change.
Cancel  Cal Set will NOT be applied.

**Examples of Cal Set Usage**
The following examples show how Cal Sets increase flexibility and speed in making analyzer measurements.

- Using one User Cal Set with many Channels
  - Using one Measurement with many Cal Sets

**Using one User Cal Set with many Channels**
It is possible to do one calibration, then apply it to several channels.

An example:
During a manufacturing process, you may have many calibrated channels. You may wish to continuously cycle through the measurements and examine them individually. Occasionally, you may wish to refresh the calibration without having to recreate all the measurement state files.

Here is how: Examine the stimulus settings for each channel. Then make the User Cal Set stimulus range a super-set of the whole group. Each channel can then use the same User Cal Set. Some calibrations will be interpolated. **Note:** Make sure that interpolation is turned on.

Notice in the following image, Cal Set 78 is used on more than one channel, in this case Channel 5 and 16.
Using one Measurement with many Cal Sets

The drawback with having one very large User Cal Set associated with many instrument states could be a loss of accuracy due to interpolation. In such cases, consider using one User Cal Set for each stimulus setting. The stimulus conditions can then be changed for a channel by applying different User Cal Sets. Other settings (window setups, measurement definitions, scaling, limits, markers) will not change. This may result in faster state changes than if you saved and recalled *.cst files for each set of stimulus conditions.

Example #1: An amplifier needs to be measured at several input power levels. Calibrate at several power levels and save each calibration in a separate User Cal Set. Then, apply the User Cal Sets to the single measurement consecutively.

Example #2: Making an S21 Measurement, you need to measure both wide span and narrow span characteristics of the device. One Cal Set covers the wide span setup; another the narrow span setup.

Archiving Cal Sets using .cal or .csa files

Because User Cal Sets can easily be deleted, provide extra backup by also saving your calibration as a .cal or .csa file (see saving a .cal file).

Example:

One person performs a calibration, names and saves it as a User Cal Set. This Cal Set is available for any other person to use. A second user could accidentally delete or modify the User Cal Set requiring the originator to repeat the calibration.

Security can be provided for calibration data by saving the Cal Set to a .cal file or .csa file. At a later time, the file could be recalled and the original calibration restored.

How to set Error Correction

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press Cal</td>
<td>1. Click Cal</td>
</tr>
<tr>
<td>2. then Correction ON/off</td>
<td>2. then Correction ON/off</td>
</tr>
</tbody>
</table>

**Error Correction**

The Error Correction ON setting means that the calibration error terms are applied to the measurement. Error Correction is automatically turned ON when a calibration is performed or if a Cal Set is applied to a measurement. The PNA attempts to turn error correction ON for ALL of the measurements on the active channel. This may not always be possible when applying Cal Sets. For more information, see Applying Cal Sets.

When full 2-port error correction is ON, both forward and reverse sweeps are required to gather all 12 error terms, even if only one reflection measurement is displayed. This may result in a higher measurement speed than expected. Learn more.

You can always turn Error Correction OFF for the active measurement by clicking Correction OFF. The PNA will turn Error Correction OFF automatically when making stimulus changes under some conditions. To turn correction back ON, click Correction ON. Then:

- If Interpolation can NOT be performed, a dialog box will ask if you would like to change the stimulus settings to those of the applied calibration. Click OK or Cancel.
• If Interpolation can be performed, the stimulus setting will change and correction turned ON.

**Viewing Correction Level**

The correction level provides information about the accuracy of the active measurement. Correction level notation is displayed on the status bar for different calibration types like response, full 2-port, TRL, or power calibration.

**To View Correction Levels:**

In the **View** menu, click **Status Bar**. The status bar appears and displays the following items:

- a. Active Channel
- b. Measurement parameter
- c. Correction Level (see description below)
- d. Calibration type

<table>

<tr>
<td>C△ Changed</td>
<td>Uncertain</td>
</tr>
<tr>
<td>No Cor</td>
<td>Lowest</td>
</tr>
</tbody>
</table>

**C Full Correction**

Full Correction level is displayed immediately after a calibration is performed or when a valid Cal Set is applied. If you require optimum accuracy, avoid adjusting analyzer settings after calibration so your measurement remains at this level.

**C* Interpolated Correction**

"C star" appears in the status bar when a measurement is being interpolated. See Interpolation (above) and Interpolation Accuracy.

**C△ Changed Settings**

"C-delta" appears in the status bar when one or more of the following stimulus settings change. The resulting measurement accuracy depends on which parameter has changed and how much it has changed. For optimum accuracy, recalibrate using the new settings.

- **Sweep time**
- IF Bandwidth
- Port power
- Stepped sweep enabled/disabled

**No Corr  No Correction**

The following will cause the PNA to turn Error Correction OFF for the channel:

- Decrease the start frequency
- Increase the stop frequency
- Change start frequency, stop frequency, or number of points with Interpolation OFF.
- Change sweep type

### How to set Interpolation

<table>
<thead>
<tr>
<th>Using front-panel [HARDKEY] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>Press <strong>CAL</strong></td>
<td>1. Click <strong>Cal</strong></td>
</tr>
<tr>
<td>then <strong>[More]</strong></td>
<td>2. then <strong>More</strong></td>
</tr>
<tr>
<td>then <strong>[Interpolation ON/off]</strong></td>
<td>3. then <strong>Interpolation ON/off</strong></td>
</tr>
</tbody>
</table>

### Interpolation

Calibration interpolation adjusts calibration error terms to match changes to the following settings that you make AFTER a calibration is performed or a Cal Set applied.

The Interpolation **ON** setting means that interpolation is enabled for the active measurement. This does not necessarily mean that the measurement is interpolated. When enabled (ON), if interpolation becomes necessary because you change any of the following stimulus settings, then interpolation will be applied. When stimulus settings change while interpolation is OFF, interpolation is NOT applied but instead, error correction is turned OFF.

Interpolation occurs (if enabled) when you change any of the following settings:

- Start frequency increased
- Stop frequency decreased
- Number of points
Note: Decreasing the start frequency, or increasing the stop frequency will always turn correction OFF. (Exception: Power Calibration DOES extrapolate to the start and stop frequencies.)

**Interpolation Accuracy**

When a measurement is interpolated, the accuracy of the measurements cannot be predicted. It may be affected significantly or not at all. Identifying measurement errors in these cases must be determined on a case-by-case basis.

Significant measurement inaccuracy WILL occur when the phase shift between measurement points increases more that 180 degrees. The PNA will incorrectly interpolate the new phase data. For more information, see phase accuracy.

In general, the chances of significant inaccuracy increases when interpolating measurements under the following conditions:

- when increasing, rather than decreasing, the frequency span between measurement points.
- when frequency span between measurement points becomes much greater.
- when measurement frequencies are very high, especially above 10 GHz.

Calibration Thru Methods

- What is a Non-Insertable Device
- Choosing a Thru Method
- Flush Thru
- Adapter Removal
- Swap Adapters (separate topic)
- Defined Thru
- Unknown Thru
- ECal Thru Method Choices

Other Cal Topics

What is a Non-Insertable Device
To understand the Thru method choices, you must first understand what is meant by "Non-Insertable device". These definitions also apply to ECal modules. Substitute "ECal module" for "device". Then see ECal Thru Method Choices.

A non-insertable device is one whose connectors could NOT mate together. They either do not have the same type of connector or they have the same gender. This also means that the test port cables would not mate together, as in the following diagram.

An insertable device is one whose connectors could mate together. They have the same type of connector and opposite, or no, gender. This also means that the test port cables would mate together, as in the following diagram.
Choosing a Thru Method of Calibration

The Thru method is selected from the Cal Wizard. Select the Modify checkbox in the Select DUT Connectors and Cal Kits dialog box.

Notes:
For ECal, the following choices have different meanings. See THRU methods for ECal.
For 4-port calibration, see How can we measure only 3 THRU connections?

Choice for Insertable Devices: FLUSH Thru (also known as Zero-length Thru)

When calibrating for an insertable device, the test ports at your measurement reference plane connect directly together. This is called a zero-length THRU, or Flush THRU meaning that the THRU standard has zero-length: no delay, no loss, no capacitance, and no inductance. Your calibration kit may not have a physical THRU standard because it is assumed you have an insertable device and will be using a zero-length THRU.

Choices for Non-Insertable Devices

The following methods calibrate for a non-insertable device:

- **Adapter Removal** Accurate, but least convenient.
- **Defined Thru**
- **Unknown Thru Cal** Preferred method.

Adapter Removal Calibration

This method is potentially very accurate. However, it requires many connections which increases the chances of inaccurate data.

Two full 2-port calibrations are performed: one with the adapter connected at port 1, and the other with the adapter connected to port 2. The result of the two calibrations is a single full 2-port calibration that includes accurate characterization and removal of the mismatch caused by the adapter.

Performing an Adapter Removal Cal requires:

- a THRU adapter with connectors that match those on the DUT.
- calibration standards for both DUT connectors.
To select Adapter Removal during a SmartCal, select the **Modify** checkbox in the **Select DUT Connectors and Cal Kits** dialog box. The Cal Wizard will guide you through the steps.

Learn how to perform an **Adapter Removal Cal using ECal**.

**Defined Thru** (also known as **Known Thru, Cal Kit Thru, ECal Thru, Characterized Thru**)

Defined Thru uses the THRU definition that is stored in the Cal Kit file or ECal module. The THRU standard may have worn over time, making it not as accurate as when it was new. Defined Thru is usually more accurate than Adapter Removal, but not as accurate as **Unknown Thru** method.

**Notes**

- If performing an ECal, this is the THRU standard in the ECal Module.
- If Defined Thru appears as a potential THRU method in the **SmartCal Wizard**, this means that there is a defined THRU standard in the selected Cal Kit. This could be a **Zero-length Thru**. The SmartCal Wizard will prompt you to connect the required standard when appropriate.

To define a THRU standard in a Cal Kit (not ECal module):

1. From the PNA Menu, click Calibration, **Advanced Modify Cal Kits**.
2. Select the Cal Kit
3. Click Edit Kit
4. Click Add
5. Select THRU
6. Complete the dialog box.

The next time you perform a Guided Cal, this Defined THRU standard will be available if the DUT connector types match the THRU standard.

**Unknown Thru Cal**

Unknown Thru Cal is the **preferred** THRU method of calibrating the PNA to measure a non-insertable device. The Unknown Thru calibration is also known as **Short-Open-Load-Reciprocal Thru** (SOLR) calibration.

- Very easy to perform.
- Better accuracy than **Defined Thru** and usually better than **Adapter Removal**.
- Does not rely on existing standard definitions that may no longer be accurate.
- Causes minimal cable movement if the THRU standard has the same footprint as the DUT. In fact, the DUT can often BE the THRU standard.

**About the Unknown Thru Process**
SmartCal guides you through the process. Although the following process describes ports 1 and 2, Unknown Thru can be performed on any two ports when using a multiport PNA.

1. Perform 1-port cal on port 1.
2. Perform 1-port cal on port 2.
3. Connect Unknown Thru between ports 1 and 2.
4. Measure Unknown Thru.
5. **Confirm Estimated Delay.** This estimate may be wrong if there are too few frequency points over the given frequency span. You can measure the delay value independently and enter that value in the dialog box.

**The Unknown Thru Standard**

- Can have up to about 40 dB of loss and long electrical length.
- Must be reciprocal: S21=S12.
- Must know the phase response to within 1/4 wavelength (see step 5 above).
- Can be the DUT if it meets these conditions.

**Unknown Thru Limitations**

- Unknown Thru is NOT supported during a TRL calibration.
- Beginning with PNA code release 5.25, Unknown Thru CAN be performed using a 4-port PNA-L that does NOT have a reference receiver for each test port. However, a Delta Match Calibration is usually required before the Unknown Thru is measured.
- Unknown Thru is NOT supported on E8801A, E8802A, and E8803A.

**ECal Thru Method Choices**

When the ECal module connectors exactly match the DUT connectors, choose from the following THRU methods:

**ECal Thru as Unknown Thru**  [Learn more about Unknown Thru](#)

- Measures the THRU state of the ECal module as an Unknown Thru.
- The default method when the ECal module connectors match the DUT.
- Very accurate and easy.
- May require a Delta Match Cal.

**Flush Thru (zero-length Thru)**  [Learn more about Flush Thru](#)
• Requires an insertable ECal module / DUT.
• Remove the ECal module and connect the two reference planes directly together for a zero-length thru.
• Accurate, but not as easy as ‘ECal Thru as Unknown Thru’.

**ECal (Defined Thru)**

• Measures the THRU state of the ECal module.
• Very easy, but not very accurate.

**Unknown Thru**

• Remove the ECal module.
• Then connect a Thru adapter to be measured as Unknown Thru.
• May require a Delta Match Cal.

When the ECal module connectors do NOT exactly match the DUT connectors, choose from the following two methods:

**Adapter Removal**

• Can be used with ECal when your DUT is NON-insertable. However, the ECal module MUST be insertable, and the adapter connectors must exactly match the connectors of the DUT as in the following diagram.

**Note:** With PNA release 4.8, adapter removal now performs 2-port measurements on both sides of the adapter. It previously performed 2-port measurements on one side and 1-port measurements on the other. This improves the accuracy of the adapter removal calibration.

---

**ECal User Characterization**
In cases when adapter removal cannot be performed, ECal User Characterization is ALWAYS possible if you have the right adapters. A User Characterization is performed once and stored in the ECal module. However, accuracy is compromised every time you remove, then reconnect, the adapter with the ECal module.

- 20-Feb-2008  Added bullet for default ECal method
Accurate Measurement Calibrations

Calibration accuracy is affected by the type of calibration, quality of the calibration standards, and the care with which the calibration is performed. This section provides additional information about how to make accurate calibrations.

- Measurement Reference Plane
- Effects of Using Wrong Calibration Standards
- Data-based versus Polynomial Calibration Kits
- Accuracy Level of Interpolated Measurement
- Effects of Power Level
- Using Port Extensions
- Isolation Portion of 2-Port Calibration
- Choosing a Thru Method

Learn how to determine the validity of your calibration.

Measurement Reference Plane

Most measurement setups will NOT allow you to connect a device under test (DUT) directly to the PNA front panel test ports. More likely, you would connect your device to test fixtures, adapters, or cables that are connected to the PNA.

A calibration takes place at the points where calibration standards are connected during the calibration process. This is called the measurement reference plane (see graphic). For the highest measurement accuracy, make the calibration reference plane the place where your DUT is connected. When this occurs, the errors associated with the test setup (cables, test fixtures, and adapters used between the analyzer ports and the reference plane) are measured and removed in the calibration process.
Effects of Using Wrong Calibration Standards

Normally, a calibration is performed using a calibration kit that contains standards with connectors of the same type and sex as your DUT.

However, your calibration kit may not always have the same connector type and gender as your device. For example, suppose your device has 3.5mm connectors, but you have a Type-N calibration kit. If you use an adapter to connect the Type-N standards to the 3.5mm test port, then the adapter becomes part of the calibration and NOT part of the test setup. This will result in significant errors in your reflection measurements.

Data-based versus Polynomial Calibration Kits

The Select DUT Connectors and Cal Kits dialog box offers a data-based model and a polynomial model for the newest high-frequency cal kits. See PNA Accessories. The data-based models provide higher accuracy for describing calibration standards than the polynomial models. It is RECOMMENDED that the data-based model be used if the most accurate results are desired.

Learn about the “Expanded Math” feature.

Effects of Power Level

To attain the most accurate error correction, do NOT change the power level after a calibration is performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, S-parameter measurements can be made with only a small degradation of accuracy. If a different attenuator range is selected, the accuracy of error correction is further degraded.

To check the accuracy of a calibration, see Validity of a Calibration.

Using Port Extensions

Use the port extensions feature after calibration to compensate for phase shift of an extended measurement.
reference plane due to additions such as cables, adapters, or fixtures.

Port extensions is the simplest method to compensate for phase shift, mismatch, and loss of the path between the calibration reference plane and the DUT.

Learn how to apply port extensions.

Learn about characterizing a test fixture.

**Isolation Portion of 2-Port Calibration**

The isolation portion of a calibration corrects for crosstalk, the signal leakage between test ports when no device is present. When performing an UNGUIDED 2-port calibration, you have the option of omitting the isolation portion of the calibration.

**Note:** Isolation can be performed on a Smart (Guided) Calibration ONLY remotely using SCPI or COM.

The uncorrected isolation between the test ports of the PNA is exceptional (typically >100dB). Therefore, you should only perform the Isolation portion of a 2-port calibration when you require isolation that is better than 100dB. Perform an isolation calibration when you are testing a device with high insertion loss, such as some filter stopbands or a switch in the open position.

The isolation calibration can add noise to the error model when the measurement is very close to the noise floor of the analyzer. To improve measurement accuracy, set a narrow IF Bandwidth.

**How to perform an isolation calibration**

Isolation is measured when the Load standards are connected to the PNA test ports. For best accuracy, connect Load standards to BOTH test ports each time you are prompted to connect a load standard. If two Loads are not available, connect the untested PNA port to any device that will present a good match.

**Choosing a Thru Method**

When calibrating for a non-insertable device, you must choose a method to calibrate for the THRU error terms. This can have a significant effect on measurement accuracy. Learn more about choosing a thru method.

Validity of a Calibration

This section helps you determine if your calibration is valid and how the analyzer displays correction level information for your measurement.

- Frequency Response of Calibration Standards
- Validating a Calibration
- Quick Check
- ECal Confidence Check
- Verification Kit

See other Calibration Topics

Frequency Response of Calibration Standards

In order for the response of a calibration standard to show as a dot on the smith chart display format, it must have no phase delay with respect to frequency. The only standards that exhibit such "perfect" response are the following:

- 7-mm short (with no offset)
- Type-N male short (with no offset)

There are two reasons why other types of calibration standards show phase delay after calibration:

1. The reference plane of the standard is electrically offset from the mating plane of the test port. Such devices exhibit the properties of a small length of transmission line, including a certain amount of phase shift.

2. The standard is an open termination, which by definition exhibits a certain amount of fringe capacitance and therefore phase shift. Open terminations which are offset from the mating plane will exhibit a phase shift due to the offset in addition to the phase shift caused by the fringe capacitance.

The most important point to remember is that all standards are measured in order to remove systematic errors from subsequent device measurements. As a result, if calibration standards with delay and fringe capacitance are measured as a device after a calibration, they will NOT appear to be "perfect". This is an indication that your analyzer is calibrated accurately and working properly.

Validating a Calibration

At the completion of a calibration or selection of a stored Cal Set, validation can accomplish the following:
**Improve Measurement Accuracy** – Once a measurement calibration has been performed, its performance should be checked before making device measurements. There are several sources of error that can invalidate a calibration: bad cables, dirty or worn calibration standards that no longer behave like the modeled standards, and operator error.

**Verify Accuracy of Interpolation** – You should validate the calibration if you are testing a device and the measurements are uncertain because of interpolation. For more information see Interpolation Accuracy.

**Verify Accuracy of Cal Standards** – To check accuracy, a device with a known magnitude and phase response should be measured.

**Quick Check**

For this test, all you need are a few calibration standards. The device used should not be one of the calibration standards; a measurement of one of these standards is merely a measure of repeatability.

The following reflection and transmission Quick Check tests can be applied to all test ports.

**To verify reflection measurements, perform the following steps:**

1. Connect either an OPEN or SHORT standard to port 1. The magnitude of $S_{11}$ should be close to 0 dB (within a few tenths of a dB).

2. Connect a load calibration standard to port 1. The magnitude of $S_{11}$ should be less than the specified calibrated directivity of the analyzer (typically less than -30 dB).

**To verify transmission measurements:**

1. Connect a THRU cable (or known device representative of your measurement) from port 1 to port 2. Verify the loss characteristics are equivalent to the known performance of the cable or device.

2. To verify $S_{21}$ isolation, connect two loads: one on port 1 and one on port 2. Measure the magnitude of $S_{21}$ and verify that it is less than the specified isolation (typically less than -80 dB).

**Note:** To get a more accurate range of expected values for these measurements, consult the analyzer's specifications.

**ECal Confidence Check**

ECal Confidence Check is a method to check the accuracy of a calibration performed with mechanical standards or an ECal module. The confidence check allows you to measure an impedance state in the ECal module (called the confidence state), and compare it with factory measured data stored in the module.

In order for this test to be valid, the test ports of the ECal module must connect directly to the calibration reference plane (without adapters).

**Note:** In the N469x series of 2-port ECal modules, from the module minimum frequency up to approximately 2 GHz, the confidence state has a very high amount of transmission loss. In this frequency range, calibrated measurements of transmission $S$-parameters for the confidence state may vary much more than expected from the Agilent-characterized data in the measurement memory trace. When comparing the measurement trace and memory trace you, ignore the data for frequencies up to 2 GHz.
How to Perform ECal Confidence Check:

1. Connect ECal module to the analyzer with the USB cable. See Connect ECal Module to the PNA. Note: Terminate any unused ECAL ports with a 50 ohm load.

2. Allow the module to warm up for 15 minutes or until the module indicates READY.

3. Do one of the following to start ECal Confidence Check

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press CAL</td>
<td>1. Click Response</td>
</tr>
<tr>
<td>2. then [More]</td>
<td>2. then Cal</td>
</tr>
<tr>
<td>3. then [Ecal]</td>
<td>3. then More</td>
</tr>
<tr>
<td>4. then [Confidence Check]</td>
<td>4. then ECal</td>
</tr>
<tr>
<td></td>
<td>5. then Confidence Check</td>
</tr>
</tbody>
</table>

On the following ECal Confidence Check dialog box:

4. Click Read Module Data. The following occurs:
   - ECal module is set to "confidence state".
   - PNA reads and displays stored data.
   - PNA measures and displays "confidence state".

5. To view a different parameter, select Change Measurement and select the check box for the desired parameter. The default is the active channel parameter.

6. Select the viewing option in the Trace View Options block.

7. Compare the stored and measured data for each measurement parameter.

Notes:

- After exiting ECal Confidence Check, the ECal module remains in the same impedance state and the factory (or user-characterized) data is still stored in the memory trace. Therefore, you can save both the data and memory trace as a *.csv files and import them to a spreadsheet. Learn how.

- If the two traces show excessive difference, there may be a loose or dirty connection at the test ports or damage to the test cables. Carefully inspect the cables and connections. Then clean and gage each connector, and re-calibrate if needed.
The User Characterization setting selects the user-characterization data instead of the factory characterization data (available when a User-Characterization is stored in the ECal module).

**ECal Confidence Check** dialog box help

Compares the accuracy of corrected (calibrated) data with stored data in the ECal module. For the check to be valid, the module test ports must connect directly to the calibration reference plane (without an adapter). Learn more about ECal Confidence Check.

**Measurement**

Change Measurement Opens the Measure dialog box.

**Use ECal Module**

Read Module Data

- Copies stored data from the ECal module to Memory.
- Changes state of ECal module to confidence state.
- Measures and displays confidence state and Memory trace.

**User Characterization** Selects the user-characterization data (stored in the module) instead of the factory characterization data (available when a User-Characterization is stored in the ECal module).

**Scale** Opens the Scale dialog box.

**Show Prompts** Check to show a reminder for the connection (default).

**Trace View Options**

Data and Memory Trace Displays current measurement data and Memory trace.

Data / Memory Performs an operation where the current measurement data is divided by the data in memory.

Data + Memory Performs an operation where the current measurement data is added to the data in memory.
**Verification Kit**

Measuring known devices, other than calibration standards, is a straightforward way of verifying that the network analyzer system is operating properly. Verification kits use accurately known verification standards with well-defined magnitude and phase response. These kits include precision airlines, mismatch airlines, and precision fixed attenuators. Traceable measurement data is shipped with each kit on disk and verification kits may be re-certified by Agilent.

See [Analyzer Accessories](#) for a list of Agilent verification kits.

Using ECal

This topic discusses all aspects of performing an ECal:

- **ECal Overview**
- **Connect ECal Module to the PNA**
- **How to Perform a Calibration Using ECal**

See Also:
- ECal User-Characterization
- Restore ECal Module Memory

---

ECal Overview

ECal is a complete solid-state calibration solution. Every ECal module contains electronic standards that are automatically switched into position during a PNA measurement calibration. These electronic standards have been measured at the factory and the data stored within the memory of the ECal module. The PNA uses this stored data, along with the PNA-measured data, to calculate the error terms for a measurement calibration.

ECal modules are available in 2-port and 4-port models and a variety of connector types, covering many frequency ranges. See [Analyzer Accessories](#) for more about available ECal modules and ordering information.

You can perform the following calibrations with ECal:

- 1-Port Reflection calibration
- Full 2-Port calibration
- Full 3-Port calibration
- Full 4-Port calibration

Verify the validity of a mechanical or ECal calibration with [ECal confidence check](#).

**Care and Handling of ECal Modules**

You can improve accuracy, repeatability, and avoid costly repair of equipment in the following ways.

- Practice proper connector care. See [Connector Care](#).
- Protect equipment against ESD damage. Read [Electrostatic Discharge Protection](#).

**Power Level into an ECal module**
NEVER exceed the following Damage levels to the ECal module.

For highest accuracy, do not exceed the following ECal Compression levels when calibrating:

<table>
<thead>
<tr>
<th>Model</th>
<th>Compression level</th>
<th>Damage level</th>
</tr>
</thead>
<tbody>
<tr>
<td>N469x series</td>
<td>-5 dBm</td>
<td>+10 dBm</td>
</tr>
<tr>
<td>N4432A series</td>
<td>-7 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>N4433A series</td>
<td>+7 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>N4431x series</td>
<td>+9 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>8509x series</td>
<td>+9 dBm</td>
<td>+20 dBm</td>
</tr>
</tbody>
</table>

When using the PNA-X, the power level can be increased after calibration with minimal impact on measurement accuracy.

**Connect ECal Module to the PNA**

ECal modules are controlled and powered through a USB connection to the PNA. When you connect the module, the PNA automatically recognizes the type of module, frequency range, and connector type.

See Important First-time USB connection note.

ECal modules connect to the USB port on the front or rear panel of the PNA.

1. Wear a grounded wrist strap when making connections.
2. Connect the USB cable **Type B** connector to the ECal module and the USB cable **Type A** connector to the front or rear panel USB connector of the analyzer, as shown in the following graphics.
Notes:

- Unused ECal modules that have completed a calibration may remain connected to the USB port.
- You can connect and disconnect the ECal module while the analyzer is operating. However, DO NOT connect or disconnect the module while data transfer is in progress. This can result in damage or at least corrupted data.

How to Perform a Calibration Using ECal

Select an ECal module that has connectors of the same type and gender as the DUT. If such an ECal module is not available, a module with connectors different from the DUT can be used by using Advanced Settings or User Characterization.

Connect the ECal module ports to the PNA ports. During the calibration process the PNA can either automatically detect how the ECal module is connected, or the orientation can be performed manually.

1. Connect the ECal module USB cable to the analyzer USB. See Connect ECal Module USB to PNA USB.
2. Allow the module to warm up until it indicates READY.
3. Enter the analyzer settings. See Set Up Measurements.
4. Do one of the following to start the Calibration Wizard

   Using front-panel HARDKEY [softkey] buttons
   1. Press CAL
   2. then [Start Cal]
   3. then [Cal Wizard]

   Using a mouse with PNA Menus
   1. Click Response
   2. then Cal
   3. then Cal Wizard

5. In the Calibration Wizard Begin dialog box, click Use Electronic Cal (ECal).

Note: To calibrate with more than one ECal module, select SmartCal, then choose the ECal modules as your Cal Kits.
### Select Calibration Ports and ECal Module dialog box help

Allows you to select calibration type and settings.

**Cal Type Selection / Configuration** Select the number of ports to calibrate. Then select the port number configuration.

- **4 Port ECal** Available only if using a 4-port PNA. No additional configuration necessary.
- **3 Port ECal** Available only if using a 4-port or 3-port PNA.
- **2 Port ECal**
- **1 Port ECal** (Reflection) Advanced Settings are not available.

**View/Select ECal Module** Click to [Select the ECal module](#) if more than one ECal module is connected to the PNA. Also, [Select the User Characterization](#) within the module. [Learn more about User Characterization.](#)

**Show Advanced Settings** Check to display the Advanced Settings when Next is clicked.

**Back** Return to [Cal Wizard Begin](#) dialog. If checked, you can clear the Save Preferences checkbox to see the Begin page when the Cal Wizard begins.

**Note:** The PNA no longer allows ECal isolation to be performed. The inherent isolation of the PNA is better than that attained with correction using an ECal module.

Terminate any unused ECal ports with a 50 ohm load.

---

### ECal module not found dialog box help

Displays an error message indicating the ECal module is not connected or has not been recognized by the network analyzer.

- **Retry** Check the USB connections and click to continue.

**Notes:**

- If your ECal module is not detected, try to unplug, then reconnect the USB connector to the PNA.
- When the ECal module is connected to the network analyzer for the first time, it may take approximately 30 seconds for the analyzer to recognize the module and make it available for calibration.
- For best accuracy, allow the ECal module to warm-up until it indicates READY.
- Agilent 8509x and N4431 ECal modules, when first connected, draw significantly more current than other modules. This could cause the USB to stop working in certain situations. [See USB limitations.](#)
- See Connect ECal Module USB to PNA USB.

**Select Module and Characterization** dialog box help

**ECal Module**  Select one of the ECal modules that are connected to the PNA.

**Detect Connected ECals**  Click to rescan the USB for ECal modules.

**Available Characterizations**

**ECal Module Memory** - Displays the factory and [user characterizations](#) that are stored in the ECal module.

**PNA Disk Memory** - Displays the user characterizations that are stored in PNA Disk Memory. [Learn more User Characterizations in PNA Disk Memory](#).

Select either the characterization data to use for the calibration. Once selected, that characterization becomes the default selection until the PNA is turned OFF and restarted. When restarted, **Factory** again becomes the default selection.
**Error: Frequency Range** dialog box help

The current cal standards (or ECAL module) does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

- **Cal Kit Class Category**  Not available with ECAL modules.
- **Frequency**  Change the frequency range of the active channel.
- **Edit**  Not available with ECAL modules.
- **Back**  Select a different characterization that covers the required frequency range.
- **Cancel**  Re-characterize the module with an increased frequency range.

**Select DUT Connectors and Cal Kits** dialog box help

If the ECAL module or selected User Characterization has more than one connector type, then the following dialog box is presented which allows you to describe the DUT connector type. Otherwise, click next to proceed to **Advanced Settings** (if checked) or **ECAL Steps**.

**Connectors**

The available connectors are listed for each DUT port.
**Advanced Settings** dialog box help

**Thru #n**
Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.

- The proposed Thru connections are listed automatically.
- Additional Thru connections can be selected for higher accuracy. [Learn more](#).

**Add Thru**
Click to add a Thru connection. [Learn more](#).

**Remove Thru**
Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

**1st Port / 2nd Port**
Click to change the two ports to be included in the Thru connection. The order of the port numbers (1st or 2nd) is not critical.

**Thru Cal Method**
Lists the available Thru Cal methods for the specified port pairs. [Learn about ECal Thru Methods](#).

**Cal Type/ Stds**
Click to invoke the View / Modify Properties of Cal dialog box.

**Do orientation**
When this box is checked (default) the PNA automatically senses the model and direction in which an ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range. If you have an **E8361A** or **E836xB** PNA and do an ECal completely within 10 - 20 MHz OR 60 - 67 GHz, you may need to do orientation manually. There may not be sufficient power to orient the ECal module at those frequencies.

**Choose delta match**
Available only when a Delta Match Cal is required.

- Check, then click **Next** to invoke the **Select Cal Set for Delta Match** dialog box.
- Clear - The Cal Wizard uses the **Global Delta Match Cal** if available.
Specify how the ECaI module is connected dialog box help

This dialog box appears when the Do orientation checkbox in the previous dialog box is cleared. Click the ECal Port that is connected to each PNA port.

Electronic Calibration Steps dialog box help

Note: Beginning in PNA Rev. 6.0, ECal can be performed with External triggers. Learn more.

Displays the instructions for each measurement required for calibration.

Measure  Measures the ECal standards.

ECal User Characterization

- **Overview**
- **How to Perform a User Characterization**
- **Manage Disk Memory**
- **Restore ECal Module Memory**

See also **Using ECal**

**Other Calibration Topics**

**Overview**

A user-characterized ECal module allows you to add adapters to the ECal module, re-measure the standards in the ECal module, INCLUDING the adapters, then add that data to ECal memory or save it to the PNA hard drive. This extends the reference plane from the module test ports to the adapters.

**Why perform a user characterization?**

- If you need to use adapters with your ECal module, you could characterize your ECal module with the adapters attached and perform subsequent ECals in a single step.

- If you have a 4-port ECal module, you could configure the module with adapters of different connector types, then perform a user characterization of the module. When you need to test a DUT with a pair of the connector types on your module, calibrate the PNA with a 1-step ECal using the same two connectors on the User-characterized module.

- If you test devices in a fixture, you could embed the characterization of the fixture in the characterization of the module. To do this, during the mechanical calibration portion of the user characterization, calibrate at the reference plane of the device as you would normally calibrate. Then remove the fixturing to be embedded and insert the ECal module to be characterized. When measuring the ECal module, the PNA removes the effects of the fixturing and stores the measurement results in the user characterized ECal module. Subsequent calibrations with that user-characterized module will also remove the fixture effects.

**Notes:**

- Both 2-port and 4-port ECal modules support user characterization.

- User Characterization does not delete the factory characterization data. The factory data is saved in the ECal module in addition to the user characterization data.

- The ECal Data Wipe Utility is the only way that data can be deleted from the module. Learn more at [http://na.tm.agilent.com/pna/apps/applications.htm](http://na.tm.agilent.com/pna/apps/applications.htm).

- Beginning with A.06.03, a User Characterization can be performed beyond the frequency range of the ECal
module. Although this practice is allowed, calibration accuracy with the extended user characterization is likely to be degraded. To determine the level of degradation, compare measurements of a variety of devices using a PNA with a mechanical cal kit calibration versus an ECal extended user characterization calibration.

- Beginning with A.08.33, you can save up to 12 User Characterizations in a single ECal module. Previous releases allowed up to 5. There are memory limitations. The PNA will determine if the contents of a user characterization will fit inside the module before it is performed.

- Saving a new User Characterization with PNA releases before A.08.33 will erase any User Characterizations greater than 5. This is because the PNA completely rewrites ALL ECal User Characterizations when saving a new one in order to free storage space in the ECal module.

- Beginning with A.08.33, a User Characterization can be performed remotely. See programming commands.

User Characterizations can be saved to the PNA Disk Memory beginning with A.09.00. Learn how.

This feature provides the following benefits:

- A User Characterization using connectors that are NOT included in the supported connector table can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed by firmware using a description of any length for the User-characterization.

- There is NO limit to the number of data points allowed in a User-characterization stored to disk memory. When stored in the ECal module, the number of data points is limited by the PNA firmware.

- The number of User-characterizations that can be stored to disk memory is limited only by available disk space.

- User-characterizations stored to disk memory can be freely shared between PNAs that have PNA Rev. 9.00 or later.

How to Perform a User Characterization

SUMMARY (A detailed procedure follows.)

1. Select adapters for the module to match the connector configuration of the DUT.

2. Either calibrate the PNA using mechanical standards or recall an existing Cal Set.
3. Measure the ECal module, including adapters, as though it were a DUT.

4. The measurement results are the characterization data that then gets stored inside the module.

**Note**

A 2-port PNA can be used to perform a User Characterization on a 4-port ECal module. However, a 4-port ECal module has SIX different port pairs. The PNA must be recalibrated for each port pair that uses unique connector types or gender.

- If all 4 ECal module ports have the same connector type and gender, then only one PNA calibration is required to measure all six port pairs.
- If all 4 ECal module ports have different connector types or gender, then 6 calibrations are required.

When more than one PNA calibration is required during a User Characterization, then ALL calibrations must be performed using the standard Cal Wizard, saved to Cal Sets, and then recalled from Cal Sets DURING the User Characterization.
Detailed steps to Perform a User Characterization

1. Connect the ECal module to the network analyzer with the USB cable. See Connect ECal Module USB to PNA USB.
2. Allow the module to warm up until it indicates READY.
3. Preset the analyzer.
4. Set up the measurement. For best accuracy, the IF bandwidth should be set to 1 kHz or less.
5. Start and complete the Characterize ECal Module Wizard:

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then [More]
3. then [ECal]
4. then [Characterize ECal Module]

Using a mouse with PNA Menus

1. Click Response
2. the Cal
3. then More
4. then ECal
5. then Characterize ECal Module
Select Module and Location dialog box help

**ECal Module**  Select one of the ECal modules that are connected to the PNA.

**Detect Connected ECals**  Click to rescan the USB for ECal modules.

**Location**

- **ECal Module Memory**  Click Next to see the following dialog.

- **PNA Disk Memory**  Enter a Characterization Name. This name appears when selecting a user characterization to be used with subsequent calibrations.
  
    - Learn how to manage characterizations that are stored to PNA disk memory.
    - See the benefits of storing the User Characterization to PNA Disk Memory.

**Keyboard**  Launches a keypad that can be used to type a characterization name from the PNA front panel.

**Next**  Click to continue to the Select Connectors for the Characterization dialog box.

See note regarding extended frequency use.

Select User Number for new characterization dialog box help

Scroll to view all of the parameters of the stored characterizations. Select an empty location or select to overwrite an existing characterization.

**Next**  Click to continue to the Select Connectors for the Characterization dialog box.

See note regarding extended frequency use.
Select Connectors for the Characterization dialog box help

Connector Notes

When performing an ECaL User Characterization, do NOT use a custom connector name that you added to this list. If you need to use a custom-defined connector type, select "Type B", or one of the "Type A" variations from the list of connectors for each port.

A User Characterization using connectors that are NOT included in the supported connector table cannot be stored to the ECaL module. But when stored to disk memory, ANY connector type is allowed. Learn more about storing to PNA Disk Memory.

Select the adapters for the ECaL module test ports. Select No adapter if no adapter is used on a port.

PORT A Lists the connector types available for Port A.
PORT B Lists the connector types available for Port B.
PORT C Lists the connector types available for Port C (available with a 4-port ECaL module).
PORT D Lists the connector types available for Port D (available with a 4-port ECaL module).
Next Click to continue to the Calibrations to perform or recall dialog box.
Calibrations to perform or recall dialog box help

The PNA must be calibrated before measuring the ECal module and necessary adapters. This dialog box displays the number and types of mechanical calibrations required for the characterization.

**Guide me through this cal now** Click to perform a Guided calibration. A calibration kit is required for each connector type.

**Note:** TRL calibrations can NOT be performed on a 4-port PNA during the calibration portion of a User Characterization. However, this type of Cal can be performed using the Cal Wizard, saved to a Cal Set, then recalled at this point in the User Characterization.

If more than one calibration is required, this selection is not available. See Note.

Let me recall this cal from a cal set Click to select an existing Cal Set. You cannot select a Cal Set that is currently in use. Learn more about Using Cal Sets.

Next Click to continue to either the Select Cal Kits or the Select Cal Set dialog box.

Select Cal Kits dialog box help

Provides a list of calibration kits to perform the calibration. Select the Cal Kit you will use for each port.

**Enable Unknown Thru for characterizing the module** Check to enable. This reduces the number of steps required to characterize the THRU standard. This setting is available only on PNA models with one reference receiver per test port.

Next Click to continue to the Select Cal Set dialog box.
Select Cal Set dialog box help

The calibration that you perform will be written to a Cal Set. This dialog box allows you to select a Cal Set to overwrite, or to write to a new Cal Set. The current choice is visible below the Select Cal Set button.

Select Cal Set  Click to open the Select A Cal Set dialog box.
Create new Cal Set  Check to create a new Cal Set to store the calibration. Clear to select and overwrite a stored Cal Set.
Next  Click to continue to the Guided Calibration Steps dialog box.

Note: Remember the Cal Set name for future reference.

Guided Calibration Steps dialog box help

Instructs you to connect each calibration standard to the measurement port.

Measure  Click to measure the standard.
Back  Click to repeat one or more calibration steps.
Done  Click after a standard is re-measured and all measurements for the calibration are complete.
Next  Click to continue to the next calibration step. (Does not measure the standard.)
Cancel  Exits Calibration Wizard.

The Specify nominal delay or Guided Calibration completed dialog box appears when the steps are completed.
Specify nominal delay dialog box help

This dialog ONLY appears when Adapter Removal or Unknown Thru calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Nominal adapter delay** To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here.

**Nominal phase offset** (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

Guided Calibration completed dialog box help

Allows you to finish the calibration and continue to the next characterization steps.

- **No. Finish now** Select to save Cal Set data.
- **Yes** Allows selection of Save options.
- **Next** Click to continue to the Exit to Inspect Quality of Calibration dialog box.
**Exit to Inspect Quality of Calibration** dialog box help

Allows you to exit User Characterization to validate the calibration before proceeding with the characterization.

- **Back** Allows you to repeat calibration.
- **Next** Click to continue to the Characterization Steps dialog box.
- **Cancel** Exits the Calibration.

To return to the current step:

2. In the Select user number for new characterization dialog box, click **Next**.
3. In the Select Connectors for Characterization dialog box, click **Next**. (Previous entry is stored in memory.)
4. In the Calibrations to perform or recall dialog box, recall the Cal Set that you just performed.

**Characterization Steps** dialog box help

Describes the instructions for each measurement required for characterization.

- **Measure** Measures the ECal module.
- **Next** Click to continue to the Information for the New Characterization dialog box when measurements are complete.
Information for the New Characterization dialog box help

Allows you to describe the properties of the User Characterization.

**Next** Click to continue to the Write Characterized Data to the ECal module dialog box.

To minimize the number of characters, use the following 3-character codes to describe the connectors listed. A User Characterization using connectors that are NOT included on this list can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed. Learn more about storing to PNA Disk Memory.

- summary from user characterization

Cancel  Click to exit (characterization complete).
Finish  Click to exit (characterization complete).

Manage ECal User Characterizations in Disk Memory

Normally, user characterizations that are stored in PNA disk memory can be used indefinitely without needing them to be managed. However, this dialog allows you to backup the characterizations in case they are accidentally erased, or to save them to a file that can be moved to another PNA.

How to Manage ECal User Characterizations in Disk Memory

- **Using front-panel HARDKEY [softkey] buttons**
  1. Press **Cal**
  2. then [More]
  3. then [ECal]
  4. then [Manage ECal Disk Memory]

- **Using a mouse with PNA Menus**
  1. Click **Response**
  2. then **Cal**
  3. then **More**
  4. then **ECal**
  5. then **Manage ECal Disk Memory**

Programming Commands
Manage ECal User Characterizations in Disk Memory dialog box help

This dialog allows you to save user characterizations to files in case they are accidentally erased, or so they can be moved to another PNA.

**ECal Module**  Select an ECal Module from the list for which user characterizations are currently stored in PNA disk memory.

**Save As**  Saves a User Characterization that is currently in PNA disk memory to a *.euc file. This file can be used as a backup in case the archive file is accidentally deleted, or allows you to move the file to another PNA to be used with the selected ECal Module.

**Import**  Loads a previously saved *.euc file for use on the PNA with the specified ECal module.

**Delete**  Removes a User Characterization from PNA disk memory.

---

**Restore ECal Module Memory**

When user-characterized data is written to the ECal module, the entire contents of ECal memory is also written to the PNA hard drive, including the factory ECal data. In the unlikely event that your ECal module memory is lost, you can restore all ECal data to ECal memory.

**Caution:** If a new factory cal was performed after the ECal memory was written to the PNA, the new factory cal data will also be overwritten.

**Note:** An ECal Data Wipe Utility destroys all user data per US DoD 5220.22-M. Learn more at [http://na.tm.agilent.com/pna/apps/applications.htm](http://na.tm.agilent.com/pna/apps/applications.htm)

TRL Calibration

TRL (Thru, Reflect, Line) represents a family of calibration techniques that measure two transmission standards and one reflection standard to determine the 2-port 12-term error coefficients. For example, TRM (Thru, Reflect, Match), LRL (Line, Reflect, Line), LRM (Line, Reflect, Match) are all included in this family.

The traditional SOLT calibration measures one transmission standard (T) and three reflection standards (SOL) to determine the same error coefficients.

- Why Perform a TRL Cal?
- The TRL Calibration Process
- TRL Cal Kits
- Cal Standards Used in TRL
- TRL in 4-port PNA a

Why Perform a TRL Cal?

TRL calibration is extremely accurate, in most cases more accurate than an SOLT cal. However, very few calibration kits contain TRL standards. TRL Cal is most often performed when you require a high level of accuracy and do not have calibration standards in the same connector type as your DUT. This is usually the case when using test fixtures, or making on-wafer measurements with probes. Therefore, in some cases you must construct and characterize standards in the same media type as your DUT configuration. It is easier to manufacture and characterize three TRL standards than the four SOLT standards.

Another advantage of TRL calibration is that the TRL standards need not be defined as completely and accurately as the SOLT standards. While SOLT standards are completely characterized and stored as the standard definition, TRL standards are modeled, and not completely characterized. However, TRL cal accuracy is directly proportional to the quality and repeatability of the TRL standards. Physical discontinuities, such as bends in the transmission lines and beads in coaxial structures, will degrade the TRL calibration. The connectors must be clean and allow repeatable connections.

To learn more about Cal Standard requirements, see Cal Standards Used in TRL.

The TRL Cal Process

Although TRL can be performed using the Cal Wizard Unguided Cal selection, the following process uses the easier SmartCal selection. Both selections require that you already have TRL calibration standards defined and included in a PNA cal kit.

1. Preset the PNA
2. Set up a measurement and the desired stimulus settings.
3. Click Calibration / Calibration Wizard
4. Click **SmartCal (Guided Cal)**.

5. **Select the DUT connectors and Cal Kit** for each port. The LOWEST port number of each **port pair** MUST include TRL standards. TRL appears as the **Cal Method**.

6. Check **Modify Cal, Next**, then **View/Modify** to change **default TRL options** if necessary.

7. Follow the prompts to complete the calibration.

8. **Check the accuracy** of the calibration

---

### TRL Cal Kits

Agilent Technologies offers two cal kits that include the required standards to perform a TRL calibration: 85050C (APC 7mm) and 85052C (3.5mm). Both kits include the traditional Short, Open, and Load standards. (The Thru standard, not actually supplied, assumes a **zero-length Thru**). In addition, the kits include an airline which is used as the LINE standard. To use the airline, the kits include an airline body, center conductor, and insertion / extraction tools. The APC 7 kit includes an adapter to connect the airline to the APC connector.

### Cal Standards Used in TRL

These standards must be defined in your TRL cal kit:

**THRU**

**Note:** **All THRU calibration methods** are supported in a TRL Cal **EXCEPT** Unknown Thru.

- The THRU standard can be either a zero-length or non-zero length. However, a zero-length THRU is more accurate because it has zero loss and no reflections, by definition.
- The THRU standard cannot be the same electrical length as the LINE standard.
- If the insertion phase and electrical length are well-defined, the THRU standard may be used to **set the reference plane**.
- Characteristic impedance of the THRU and LINE standards defines the reference impedance of the calibration.
- If a THRU standard with the correct connectors is **NOT** available, an adapter removal cal can be performed.

**REFLECT**

- The REFLECT standard can be anything with a high reflection, as long as it is the same when connected to both PNA ports.
- The actual magnitude of the reflection need not be known.
- The phase of the reflection standard must be known within 1/4 wavelength.
- If the magnitude and phase of the reflection standard are well-defined, the standard may be used to **set the reference plane**.
**LINE**

The LINE and THRU standards establish the reference impedance for the measurement after the calibration is completed. Learn more. TRL calibration is limited by the following restrictions of the LINE standard:

- Must be of the same impedance and propagation constant as the THRU standard.
- The electrical length need only be specified within 1/4 wavelength.
- Cannot be the same length as the THRU standard.
- A TRL cal with broad frequency coverage requires multiple LINE standards. For example, a span from 2 GHz to 26 GHz requires two line standards.
- Must be an appropriate electrical length for the frequency range: at each frequency, the phase difference between the THRU and the LINE should be greater than 20 degrees and less than 160 degrees. This means in practice that a single LINE standard is only usable over an 8:1 frequency range (Frequency Span / Start Frequency). Therefore, for broad frequency coverage, multiple lines are required.
- At low frequencies, the LINE standard can become too long for practical use. The optimal length of the LINE standard is 1/4 wavelength at the geometric mean of the frequency span (square root of $f_1 \times f_2$).

**MATCH**

If the LINE standard of appropriate length or loss cannot be fabricated, a MATCH standard may be used instead of the LINE.

- The MATCH standard is a low-reflection termination connected to both Port 1 and Port 2.
- The MATCH standard may be defined as an infinite length transmission line OR as a 1-port low reflect termination, such as a load.
- When defined as an infinite length transmission line, both test ports must be terminated by a MATCH standard at the same time. When defined as a 1-port load standard, the loads are measured separately. The loads are assumed to have the same characteristics.
- The impedance of the MATCH standard becomes the reference impedance for the measurement. For best results, use the same load on both ports. The load may be defined using the data-based definition, the arbitrary impedance definition, or the fixed load definition.

- See [Modify Calibration Kits](#) for detailed information about creating and modifying Calibration kit definitions.
- For more information, read [Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers (Application Note 1287-11)](#)

**TRL on a 4-port PNA and with an External Test Set**

Beginning with the PNA code revision 5.25, TRL CAN be performed on a 4-port PNA and with an External Test Set enabled. Previously, a TRL calibration required a PNA with a reference receiver for each test port. With the new
TRL method, a Delta Match Calibration is first performed and applied. The accuracy of this TRL cal greatly depends on the accuracy of the Delta Match Calibration. With an accurate Delta Match Calibration, the difference in accuracy between a traditional TRL cal and this TRL cal is negligible.

**How to Perform a TRL Cal on a multiport PNA**

1. Click **Calibration, Cal Wizard**.
2. Select a TRL cal kit for the ports to be calibrated.
3. During the calibration, the Cal Wizard prompts you for a **valid Delta Match Cal**.

---

Last modified:

- 9/12/06  with Ext Test Set
Calibration Preferences Wizard

Two Cal Preferences are set from this Wizard:

1. Whether or not to show the first 'Method' Page of the Cal Wizard
2. Select and order the Cal Types that are available during a SmartCal with Mechanical Standards

To change either of these choices, you must select Yes, Enable the calibration preferences at the first Wizard page.

How to change Cal Preferences

Programming commands are NOT available for the preference settings discussed in this topic, although there are other Cal Preferences that can be set remotely.

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then [Start Cal]
3. then [Preferences]

Using a mouse with PNA Menus

1. Click Response
2. then Cal
3. then Start Cal
4. then Preferences

Cal Preferences Wizard dialog box help

Use this dialog to change either of the following preferences:

- Show or Hide the first page of the Cal Wizard
- Select order of calibrations that are offered.

To change either of these choices, you must select Yes, Enable the calibration preferences.
**Cal Preferences of...** dialog box help

Use this dialog to change which Cal method to perform.

After making this selection, the first page of the Cal Wizard will not be shown on subsequent calibrations.

To change ONLY the order of Cal Types that are offered, and none of these preferences, you must do the following:

1. Select one of these choices and click **Next**.
2. Select and order the Cal Types, then click **Next**.
3. Click **Finish**.
4. Click **Cal**, then **Cal Wizard**.
5. On the first Cal Wizard page that shows, click **Back**, then clear the **Preferences** checkbox.
Cal Type Preferences dialog box help

This dialog is used to set which Cal Types are available, and the order in which they are selected as the default choice, during a SmartCal with Mechanical Standards. This setting is also used to set the default Cal Type for Guided calibrations using SCPI or COM.

The specified Cal Type order should allow you to make fewer changes to the Cal Type during a SmartCal with Mechanical Standards.

For example, in the above image, the first Cal Type on the list is TRL. When doing a SmartCal with Mechanical Standards:

- If a TRL Cal Kit is available for the specified DUT connectors, then TRL becomes the default Cal Type.
- If a TRL Cal Kit is NOT available, then the second Cal Type on the list (SOLT) is evaluated for compatibility with the available Cal Kits, and so forth with the Cal Types that remain on the list.
- If TRL is removed from the list, that Cal Type is NOT available for selection during a SmartCal with Mechanical Standards.

Learn more about Cal Types.
See where you choose Cal Type during a SmartCal

Prioritized list of choices for default Cal Type  Shows the current list of Cal Types and the order in which they will be selected for Mechanical calibrations.

Change  Click to invoke the Modify list of default Cal Types dialog.

Restore factory defaults  Returns the list to the original selections and order. The factory defaults are in order of accuracy from highest (TRL) to lowest (QSOLT).

Cancel  Closes the dialog without making changes.

Notes:

- Your Cal Type settings are saved only until the PNA application is closed. When re-opened, the factory default settings are restored.

Learn more about QSOLT Calibration
Modify list of default Cal Types dialog box help

Use this dialog to Add, Remove, and re-order the available Cal Types. There must be at least ONE selected Cal Type to perform a SmartCal with Mechanical Standards.

**Unselected Cal Types**  Cal Types in this list will not be presented as a choice during a Calibration.

**Selected Cal Types**  Cal Types in this list will be presented, in order, as the default choice during a Calibration. Click a Cal Type to select it, then click the following buttons to perform that operation.

**Add / Remove buttons**  Click to Add and Remove the selected Cal Types from the Selected Cal Types list.

**Move Up / Down**  Click to re-order the Selected Cal Types list.

Cal Preferences Complete dialog box help

Either Enable or Disable Cal Preferences.

See how to select ONLY Cal Type Preferences and continue to show the first Cal Wizard page.

Measurement Errors

You can improve accuracy by knowing how errors occur and how to correct for them. This topic discusses the sources of measurement error and how to monitor error terms.

- Drift Errors
- Random Errors
- Systematic Errors
  - 3-Port Error Terms
  - 4-Port Error Terms
- Monitoring Error Terms

See other Calibration Topics

Drift Errors

Drift errors are due to the instrument or test-system performance changing after a calibration has been done. Drift errors are primarily caused by thermal expansion characteristics of interconnecting cables within the test set and conversion stability of the microwave frequency converter and can be removed by re-calibrating.

The time frame over which a calibration remains accurate is dependent on the rate of drift that the test system undergoes in your test environment.

Providing a stable ambient temperature usually minimizes drift. For more information, see Measurement Stability.

Random Errors

Random errors are not predictable and cannot be removed through error correction. However, there are things that can be done to minimize their impact on measurement accuracy. The following explains the three main sources of random errors.

Instrument Noise Errors

Noise is unwanted electrical disturbances generated in the components of the analyzer. These disturbances include:

- Low level noise due to the broadband noise floor of the receiver.
- High level noise or jitter of the trace data due to the noise floor and the phase noise of the LO source inside the test set.

You can reduce noise errors by doing one or more of the following:

- Increase the source power to the device being measured - ONLY reduces low-level noise.
Narrow the IF bandwidth.

Apply several measurement sweep averages.

**Switch Repeatability Errors**

Mechanical RF switches are used in the analyzer to switch the source attenuator settings. Sometimes when mechanical RF switches are activated, the contacts close differently from when they were previously activated. When this occurs, it can adversely affect the accuracy of a measurement. You can reduce the effects of switch repeatability errors by avoiding switching attenuator settings during a critical measurement.

**Connector Repeatability Errors**

Connector wear causes changes in electrical performance. You can reduce connector repeatability errors by practicing good connector care methods. See Connector Care.

**Systematic Errors**

Systematic errors are caused by imperfections in the analyzer and test setup.

- They are repeatable (and therefore predictable), and are assumed to be time invariant.
- They can be characterized during the calibration process and mathematically reduced during measurements.
- They are never completely removed. There are always some residual errors due to limitations in the calibration process. The residual (after measurement calibration) systematic errors result from:
  - imperfections in the calibration standards
  - connector interface
  - interconnecting cables
  - instrumentation

**Reflection** measurements generate the following three systematic errors:

- **Directivity**
- **Source Match**
- **Frequency Response Reflection Tracking**

**Transmission** measurements generate the following three systematic errors:

- **Isolation**
- **Load Match**
- **Frequency Response Transmission Tracking**
Notes about the following Systematic Error descriptions:

- The figures for the following six systematic errors show the relevant hardware configured for a forward measurement. For reverse measurements, internal switching in the analyzer makes Port 2 the source and Port 1 the receiver. 'A' becomes the transmitted receiver, 'B' becomes the reflected receiver, and 'R2' becomes the reference receiver. These six systematic errors, times two directions, results in 12 systematic errors for a two port device.

- For simplicity, it may be stated that ONE standard is used to determine each systematic error. In reality, ALL standards are used to determine ALL of the systematic errors.

- The following describes an SOLT calibration. This does not apply to TRL, or other types of calibration.

**Directivity Error**
All network analyzers make reflection measurements using directional couplers or bridges.

With an ideal coupler, only the reflected signal from the DUT appears at the 'A' receiver. In reality, a small amount of incident signal leaks through the forward path of the coupler and into the 'A' receiver. This leakage path, and any other path that allows energy to arrive at the 'A' receiver without reflecting off the DUT, contributes to directivity error.

**How the Analyzer Measures and Reduces Directivity Error**
1. During calibration, a load standard is connected to Port 1. We assume no reflections from the load.
2. The signal measured at the 'A' receiver results from the incident signal leakage through the coupler and other paths.
3. Directivity error is mathematically removed from subsequent reflection measurements.

**Isolation Error**
Ideally, only signal transmitted through the DUT is measured at the 'B' receiver.

In reality, a small amount of signal leaks into the 'B' receiver through various paths in the analyzer.

The signal leakage, also known as crosstalk, is isolation error which can be characterized and reduced by the analyzer.
How the Analyzer Measures and Reduces Isolation Error

1. During calibration, load standards are connected to both Port 1 and Port 2.
2. The signal measured at the 'B' receiver is leakage through various paths in the analyzer.
3. This isolation error is mathematically removed from subsequent transmission measurements.

Source Match Error

Ideally in reflection measurements, all of the signal that is reflected off of the DUT is measured at the 'A' receiver. In reality, some of the signal reflects off the DUT, and multiple internal reflections occur between the analyzer and the DUT. These reflections combine with the incident signal and are measured at the 'A' receiver, but not at the 'R' receiver.

This measurement error is called source match error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Source Match Error

1. During calibration, all reflection standards are connected to Port 1. Known reflections from the standards are measured at the 'A' receiver.
2. Complex math is used to calculate source match error.
3. Source match error is mathematically removed from subsequent reflection and transmission measurements.

**Load Match Error**

Ideally in transmission measurements, an incident signal is transmitted through the DUT and is measured at the 'B' receiver. In reality, some of the signal is reflected off of Port 2 and other components and is not measured at the 'B' receiver. This measurement error is called load match error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Load Match Error

1. The Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a characterized thru adapter is inserted. This allows a known amount of incident signal at Port 2.

2. The signal measured at the 'A' receiver is reflection signal off of Port 2.

3. The resulting load match error is mathematically removed from subsequent transmission and reflection measurements.

**Frequency Response Reflection Tracking Error**

Reflection measurements are made by comparing signal at the 'A' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "A over R1" (A/R1).

For ideal reflection measurements, the frequency response of the 'A' and 'R1' receivers would be identical. In reality, they are not, causing a frequency response reflection tracking error. This is the vector sum of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed by:

- signal-separation devices
- test cables
- adapters
• variations between the reference and test signal paths

Frequency response reflection tracking error can be characterized and reduced by the analyzer.

**How the Analyzer Measures and Reduces Frequency Response Reflection Tracking Error.**

1. During calibration, all reflection standards are used to determine reflection tracking.

2. The average 'A' receiver response is compared with the 'R1' receiver response.

3. Complex math is used to calculate Frequency Response Reflection Tracking Error (see the following diagram). This frequency response reflection tracking error is mathematically removed from subsequent DUT measurements.

**Note:** In reflection response calibrations, only a single calibration standard is measured (open or short) and thus only its contribution to the error correction is used.

**Frequency Response Transmission Tracking Error**

Transmission measurements are made by comparing signal at the 'B' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "B over R1" (B/R1).

For ideal transmission measurements, the frequency response of the 'B' and 'R1' receivers would be identical.

In reality, they are not, causing a frequency response transmission tracking error. This is the vector sum of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed
by:

- signal-separation devices
- test cables
- adapters
- variations between the reference and test signal paths

Frequency response transmission tracking error can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Frequency Response Transmission Tracking Error.

1. During calibration, the Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a characterized thru adapter is inserted. This allows a known amount of incident signal to reach Port 2.

2. Measurements are made at the 'B' and 'R1' receivers.

3. Complex math is used to calculate Frequency Response Transmission Tracking Error (see the following diagram). This frequency response transmission tracking error is mathematically removed from subsequent DUT measurements.
3-Port Error Terms

The following flow diagram displays the 3-port error term model:

where:

- **E** = error term
- **DIR** = Directivity
- **MAT** = Forward Source Match and Reverse Load Match
- **TRK** = Forward Reflection Tracking and Reverse Transmission Tracking

4-Port error terms

A full 4-port calibration requires the following terms:

Learn about the port numbering convention for error terms.

**How can we measure only 3 THRU connections?**

On a 4-port PNA, a full 4-port cal can be performed while measuring only 3 THRU connections. Measuring more than 3 THRU connections will give higher accuracy.

By measuring all of the reflection terms, and 3 transmission THRU connections, there is adequate information available to calculate the remaining transmission terms. The following is a high level explanation of the concept. The actual calculations are much more complex.

To simplify, let’s substitute letters (A,B,C,D) for port numbers from the diagram above so that they can be combined without confusion. Also for simplicity, let’s assume that the source match and directivity errors are zero.

- The reflection errors are all measured (AA, BB, CC, DD).
- Lets assume we measure a THRU between ports AB, AC, AD. The reverse direction for these THRUs are
also measured at the same time (BA, CA, DA).

- The terms left to calculate are BC, CB, BD, DB, CD, DC.

The following shows how the BC term is calculated from BA and AC:

$$\frac{BA \cdot AC}{AA} = \frac{B \cdot A \cdot C}{A} = BC$$

Similarly:

- CB is calculated from CA and AB
- BD is calculated from BA and AD
- DB is calculated from AB and DA
- CD is calculated from CA and AD
- DC is calculated from DA and AC

**Monitoring Error Terms using Cal Set Viewer**

You can use **Cal Set Viewer** to monitor the measured data and the calculated error term. This will help to determine the health of your PNA and the accuracy of your measurements.

By printing or saving the error terms, you can periodically compare current error terms with previously recorded error terms that have been generated by the same PNA, measurement setup, and calibration kit. If previously generated values are not available, refer to Typical Error Term Data in Appendix A, "Error Terms", of the Service Guide.

**Note**: The service guide for your PNA is available at [http://www.agilent.com/find/pna](http://www.agilent.com/find/pna). It is also on the CDROM that was shipped with your PNA.

- A stable system should generate repeatable error terms over about six months.
- A sudden shift in error terms over the same frequency range, power, and receiver settings, may indicate the need for troubleshooting system components. For information on troubleshooting error terms, see Appendix A, "Error Terms", of the Service Guide.
- A subtle, long-term shift in error terms often reflects drift or connector and cable wear. The cure is often as simple as cleaning and gauging connectors or inspecting cables.

**Viewing Cal Set Data**

- Existing measurement traces are unaffected by the Cal Set Viewer.
- The Cal Set data trace is presented in the highest unused channel number (usually 32) in the active window.
- The Cal Set data trace is labeled as S11 in the status bar regardless of the type of error term or standard.
- Only one Cal Set error term or standard data can be viewed at a time. However, a data trace can be stored into memory and then compared to other data traces.
How to access Cal Set Viewer

Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then [Manage Cals]
3. then **[Cal Set Viewer]**

Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Manage Cals**
4. then **Cal Set Viewer**

How to use Cal Set Viewer

1. Use the down arrow to select a Cal Set. Then click either:
   
   - **Error Terms** - calculated data.
   - **Standards** - the raw measurement data of the Standard. **ONLY** available with Unguided Cal (not ECal or Guided Cal).

2. Use the down arrow to select an error term or standard to view.
3. Select the **Enable** check box to view the data on the PNA screen.

**Port numbering convention** for error terms is the same as for S-Parameters:

**E Term (Receiver, Source)** with the following exceptions:

- Load Match (2,1) - The match of port 2 which is measured by making an S11 measurement.
- Load Match (1,2) - The match of port 1 which is measured by making an S22 measurement.
- Transmission Tracking (2,1) - The port 2 receiver relative to the port 1 reference. (source=port 1).
- Transmission Tracking (1,2) - The port 1 receiver relative to the port 2 reference. (source=port 2).
- And so forth for multiport calibrations.

Modify Calibration Kits

You can create or modify calibration kit files using Advanced Modify Cal Kits.

- About Modifying Calibration Kits
- Creating a New Cal Kit from an Existing Cal Kit
- Creating Custom Calibration Kits using a New Connector Family
- How to Modify Cal Kits
- Calibration Class Assignments
- Waveguide Cal Kits

Note: For a detailed discussion of Cal Kits and standards, read Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers (Application Note 1287-11)

About Modifying Calibration Kits

You can modify calibration kit files or create a custom one. You can also modify Data-based Cal Kits. Learn how.

For most applications, the default calibration kit models provide sufficient accuracy for your calibration. However, several situations exist that may require you to create a custom calibration kit:

- Using a connector interface different from those used in the predefined calibration kit models.
- Using standards (or combinations of standards) that are different from the predefined calibration kits. For example, using three offset SHORTs instead of an OPEN, SHORT, and LOAD to perform a 1-port calibration.
- Improving the accuracy of the models for predefined kits. When the model describes the actual performance of the standard, the calibration is more accurate. (Example: A 7 mm LOAD is determined to be 50.4Ω instead of 50.0Ω.)
- Modifying the THRU definition when performing a calibration for a non-insertable device.
- Performing a TRL calibration.

Creating a New Cal Kit from an Existing Cal Kit

You can create a new custom Cal Kit using a copy of an existing Cal Kit as a starting point. Here is how:

1. From the Edit PNA Cal Kits dialog, click Import Kit to load the Cal Kit you want to use as a starting point. A “Duplicate Name...” message appears. Click OK to load a duplicate copy of the Cal kit into the last position of the Edit PNA Cal Kits dialog.
2. Select the imported kit.

3. Click **Edit Kit**, then change the **Cal Kit Name and Description**.

4. Click **Installed Kits - Save As** to save the new Cal Kit to a .ckt file.

5. Recommended: Also click **Edit PNA Cal Kits - Save As** to save the entire collection of Cal Kits to a .wks file.

6. If using a new or modified connector, click **Change Family** to change the connector family.

7. Click **Add or Edit** to change connector descriptions and parameters.

8. Make modifications to your new custom Cal Kit as required. Save your work by clicking **Installed Kits - Save As**

**Note:** Custom Cal Kits must be imported after a firmware upgrade. [Learn more](#)

**Creating Custom Calibration Kits using a New Connector Family**

To create a custom calibration kit that uses a new connector type, you must first define the connector family. The connector family is the name of the connector-type of the calibration kit, such as:

- APC7
- 2.4 mm
- Type-N (50 Ω)

Although more than one connector family is allowed, it is best to limit each calibration kit to only one connector family.

If you are using a connector family that has male and female connectors, include definitions of both genders. If you are using a family with no gender, such as APC7, only one connector definition is required.

Use the following steps to create a custom calibration kit:

1. In the **Edit PNA Cal Kits dialog box**, click **Insert New** to add the new connector family.

2. In the **Edit Kit dialog box**:
   - Type the Kit Description for the custom cal kit.
   - Click **Add** in the Connectors section of the dialog box.

3. In the **Add Connector dialog box**:
   - Type a Connector Family name.
   - Type a Description of the connector.
   - Select the Gender of one of the connectors.
   - Type the minimum and maximum Frequency Range.
• Type the Impedance.
• Click the down-arrow to select the Media.
• Type the cut-off frequency.
• Click Apply.
• Click OK.

4. If you need to add another connector gender, in the Edit Kit dialog box:
• Click Add in the Connectors section again for the next connector gender.

5. If you are adding another connector gender, repeat step 3.

Note: If you have male and female versions of the connector family, you probably do NOT also have a NO GENDER version.

6. Now that the connector family is added to the custom cal kit, you are ready to add new calibration standards. In the Edit Kit dialog box:
• Under the list of standards, click Add.

7. In the Add Standard dialog box:
• Select the type of standard (OPEN, SHORT, LOAD, or THRU).
• Click OK.

8. In the Edit/Add Standards dialog box:
• Complete the information in the dialog box for the standard you selected. Note that for banded standards, the start and stop frequency may be different than the frequency range of the specified connector. Edit the start and stop frequencies as needed.
• Click OK when all the settings are correct.

9. Repeat steps 6 - 8, as necessary, to add all standards and definitions to the new custom cal kit.

10. Assign each of the standards to a calibration class. This is done through the Modify Calibration Class Assignment dialog box.

11. Click File, PrintToFile. PrintToFile will generate a .prn file (ascii file with comma delimiters) that can be imported into a spreadsheet.

12. Import the .prn file into an application such as Microsoft Excel, and print the results.

13. Use the spreadsheet to verify that each standard in the kit belongs to the same connector family and the
gender of each standard is properly specified. It is important that the connectors and genders for your standards are correctly defined and verified in order for your SmartCal (guided calibrations) to work properly.

**How to Modify Cal Kits**

The series of dialog boxes that follow allow you to modify the standard definitions or class assignments of calibration kit files.

### Using front-panel

**HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[More]**
3. then **[Cal Kit]**

### Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **More**
4. then **Cal Kit**

**Edit PNA Cal Kits**

![Image of Edit PNA Cal Kits dialog box]

- **Open**
- **Save As**
- **Restore Defaults**
- **Installed Kits**

- **ID**
- **Kit Name**
- **Description**

- **Options**
  - **Edit Kit**
  - **Delete**
  - **Sort**
  - **Print to File**

- **Buttons**
  - **OK**
  - **Cancel**
  - **Help**
**Edit PNA Cal Kits** dialog box help

Provides access to all Agilent cal kits and allows modification of their standard definitions.

**PNA Cal Kits and Firmware Upgrades**

- The default "factory" cal kits are overwritten when new firmware is installed. Your custom cal kits (files with custom filenames) are NOT overwritten. However, the custom cal kits must be imported (click **Import Kit**) into the new firmware.

- All PNA cal kits can only be imported by the current firmware revision and later. They can NOT be imported by PAST firmware revisions. Once a Cal Kit has been imported by a later firmware revision, it cannot be imported by the previous version of firmware from which it originated.

- When a firmware upgrade takes place, ALL cal kits, both factory and custom, that are present on the PNA are saved to a single *.wks file using a unique filename. These files are NOT Excel spreadsheet files. They are opened using the **Open** button (see below). They can be used as archives of cal kits from previous firmware versions.

**Open** Opens an archive of cal kits from past firmware upgrades and 'Save As' operations.

**Save As** Saves ALL cal kits in the PNA to a *.wks file.

**Restore Defaults** Re-installs the default factory contents of all Agilent cal kits from the PNA hard drive. The factory Agilent cal kits are stored on the PNA hard drive at C:/Program Files/Agilent/Network Analyzer/PnaCalKits/factory.

**Installed Kits**

- **Import Kit** Invokes the **Import Kit** dialog box.

- **Save As** Saves the selected calibration kit and definitions (using .ckt file type).

- **Insert New** Invokes a blank **Edit Kit dialog box** to create new calibration kit definitions.

- **Print to File** Prints the contents of the selected cal kit to a .prn file.

- **Edit Kit...** Invokes the **Edit Kit dialog box** to modify selected calibration kit definitions. [Learn how to modify Data-based Cal Kits](#).

- **Delete** Deletes selected calibration kit file.

- ^ Selects previous / next calibration kit in list.

For more information see [Creating Custom Calibration Kits using a New Connector Family](#).
Imports calibration kit definitions from hard disk or other drive that are saved in the various formats. With PNA version 4.0 or later, four kit types can be imported.

**Note: See PNA Cal Kits and Firmware Upgrades**

Files of type  Select the file type of your Cal Kit

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

File name  Navigate and select your cal kit file.

Open  Imports the selected file. The kit is added at the end of the list of cal kits.

**Importing Kits other than current PNA Series Kits**

Cal kit files from Agilent “legacy” network analyzers (listed above) may not contain information that the PNA requires. Therefore, the PNA may modify the cal kit name and description, the cal standards, and the cal class assignments in a best effort manner. You may need to correct these modifications after importing your legacy cal kit to meet your specific requirements.

- “Legacy” cal kit files are based on the analyzer test port sex; PNA cal kits are based on the Device Under Test (DUT) connector sex. Therefore, when the kit is imported the standard’s label and description are reversed and are noted as F- (female) and M- (male).
- When a Coaxial standard is detected in the kit file, a pair of male/female connectors is typically created.
- Waveguide standards that are created as connector have no gender.

**Edit Kit** dialog box help

**Identification**
- **Kit Number** Number of the selected calibration kit.
- **Kit Name** Allows you to change the Name of the selected calibration kit.
- **Kit Description** Allows you to change the description of the selected calibration kit.

**Connectors**

**Note:** You can NOT use a connector with a new or modified name to perform an ECal User Characterization.

The following is the list of Factory-defined connector type strings:
<table>
<thead>

</tbody>
</table>

Click the down arrow to change the connector type.

**Add or Edit** Invokes the Add or Edit Connector dialog box which allows you to add new connector type to the calibration kit or edit the connector properties.

**Change Family** Invokes the Change Connector Family dialog box which allows you to rename the entire connector family name.

**Class Assignments**

Click the down arrow to change the Class Assignment.

**Edit** Invokes the Modify Calibration Class Assignments dialog box.

**Standards in Kit**

Lists the current standards and descriptions in the cal kit.

**Add...** Invokes the Add Standard dialog box that allows you to add definitions for a standard.

**Edit...** Invokes the Edit dialog box that allows you to modify standard definitions for the selected standard: either Open, Short, Load, or Thru.

**Delete** Deletes selected standard from calibration kit.
Add or Edit Connector dialog box help

**Identification**

**Note:** You can NOT use a connector with a new or modified name to perform an ECal User Characterization.

**Connector Family** Allows you to Add or Edit a specific connector name. If you change Connector Family to a unique name, the name and selected Gender is ADDED to the list of connectors in that kit.

**Note:** To change the Connector Family Name of all connectors in the Kit, click Change Family on the previous dialog box.

**Description** Displays connector type and gender.

**Frequency Range**

- **Min** Allows you to define the lowest frequency at which the standard is used for calibration.
- **Max** Allows you to define the highest frequency at which the standard is used for calibration.

**Gender**

Allows you to define the connector gender.

**Impedance**

Allows you to define the impedance of the standard. During a TRL Guided Cal, this value is also used as the System Z0 reference impedance. Learn more.

**Media**

Allows you to define the medium (or ‘geometry’) of the connector: COAX or WAVEGUIDE.

**Waveguide Cal Kits**

If modifying or creating a waveguide cal kit, be sure to make the following settings. You can create a custom waveguide cal kit using an existing factory waveguide Cal kit as a starting point. The factory cal kits already have these settings.
• Frequency Range: Min. frequency = Cutoff frequency.

• Gender: No Gender

• Impedance Z0: 1 ohm

• Media: Waveguide

• Cutoff Frequency enter the low-end cutoff frequency.

• Height/Width Ratio Used to calculate waveguide loss. This value is usually on the data sheet for waveguide devices. For more information see App Note 1287-11.

Other waveguide settings

• If performing an Unguided Cal, change System Impedance to 1 ohm.

• For waveguide, choose TRL (Thru-Reflect-Line) calibration type. These calibration types are more accurate and take fewer steps than SOLT.

---

**Change Connector Family**

<table>
<thead>
<tr>
<th>Previous Connector Family</th>
<th>APC 3.5</th>
</tr>

<tbody>
<tr>
<td>Specify New Connector Family</td>
<td>APC 3.5</td>
</tr>
</tbody>
</table>

**Change Connector Family** dialog box help

**Note:** You can NOT use a connector with a new or modified name to perform an ECal User Characterization.

Performs a text “Search and Replace” function. Within the description field of each of the standards of the current Cal Kit, it searches for the Previous Connector Name and replaces it with the New Connector Name.

**Specify New Connector Name** Allows you to replace the primary connector-family name from the selected kit with the new connector-family name. The PNA allows multiple connector-families per kit.

**Previous Connector Name** Displays the primary connector-family name. All occurrences of the previous connector name will be replaced throughout calibration dialog boxes. This includes calibration kit labels and description fields.

**Notes:**

• String replacement requires an exact match and is case sensitive. For example, "Type N" does not match "type N", and "apc 7" does not match "APC 7".

• Some calibration kits may include connector names that do not match strings within labels or description fields. You may reuse the Change Connector Name dialog to standardize the name within the kit, and then to replace the standard name with the new name.

**Example:**
Select the 85056A calibration kit. The default connector-family name is "APC 2.4". However, many
standard description files are labeled "2.4 mm". You may want to replace the connector family name with a new name and update the standard descriptions to match the new name. For this kit, use a two step procedure.

1. Use the Change Connector Name dialog to replace "APC 2.4" with "2.4 mm".
2. Use the Change Connector Name dialog to replace "2.4 mm" with the new name, "PSC 2.4 mm".

See Also Creating a New Cal Kit from an existing Cal Kit

---

### Modify Calibration Class Assignments dialog box help

Allows you to assign single or multiple standards to Calibration Classes.

There are two ways to get here:

1. Click **Calibration**
2. Click **Advanced Modify Cal Kit..**
3. Select the Cal Kit, then click **Edit Kit**
4. Under Class Assignments, select the Cal Method (SOLT, TRL), then click **Edit**

You can also get here during a SmartCal Calibration.

1. From the **Select DUT Connectors and Cal Kits dialog**, check **Modify Cal**, then click **Next**.
2. At the Modify Cal dialog, click a **Mod Stds** button.

3. At the View/Modify Properties Dialog, select the Cal Method (SOLT, TRL), then click **View/Modify**

To assign a standard to a calibration class:

1. Select the **Calibration Kit Class**
2. Select the standard from the **Unselected Standards** field
3. Click the right arrow to move the standard to the **Selected Standards** field.

**Notes:**

- During an Unguided Cal all of the **Selected Standards** are presented. You then choose which of these standards to measure.

- The MATCH standards must be assigned to the FWD MATCH, REV MATCH, and LINE classes. See [TRL calibrations](#) to learn more about TRL standards.

- Use MOVE UP and MOVE DOWN to change the ORDER of the standard. The order is used during a **SmartCal** to determine overlap priorities when:

  - **Multiple standards are valid for a frequency** - standards are presented in the order in which they appear.

  - **Using two sets of standards** - modify the order in which standards appear to reflect the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

To Add or Edit standards, click Calibration then, click **Advanced Modify Cal Kit**.

- See [TRL Class Assignments](#)

- [Learn more about Calibration Classes.](#)

**Calibration Class Label**

The label that appears on the Unguided Cal - Measure Mechanical Standards dialog box. For example, the Calibration Class Label "**Modified OPEN**" would yield the following prompt:

![Diagram of a calibration kit with labels: Short, Loads, Thru, Open, Short, Loads, with Modified OPEN highlighted.](Diagram)
The following selections in this dialog box depend on your Class Assignment selection (SOLT or TRL) in the Edit Kit dialog box.

**SOLT ONLY**

**Link FWD TRANS, FWD MATCH, REV TRANS, and REV MATCH** Check to automatically assign the standard definition for FWD TRANS to FWD MATCH, REV MATCH, and REV TRANS. Clear to separately assign FWD MATCH, REV MATCH and REV TRANS classes (SOLT calibrations only).

**Expanded Calibration**

The following two check boxes apply ONLY during Guided Calibrations. For Unguided Calibration, these check boxes are ignored, including the case where the multiple standards dialog box is presented.

- **Measure all mateable standards in class** Check this box to attain the very highest accuracy possible. For example, if a cal kit contains several load standards, during the calibration process you will be prompted to measure each of the standards. This could require a significant amount of calibration time. When checked, the "Use expanded math when possible" box is also checked automatically.

- **Use expanded math when possible** Some kits contain multiple calibration standards of the same type that together cover a very wide frequency range. (For example: multiple shorts, or a lowband load and a sliding load.) If a calibration requires more than one standard to cover the calibration frequency range, there can be regions of overlapping measurements. When this checkbox is selected, the PNA automatically computes the most accurate measurement in the overlap regions using a "weighted least squares fit" algorithm. This function improves accuracy without slowing the calibration speed.

  - Manually select this checkbox only when using a cal kit that contains multiple standards of the same type. (For example: multiple shorts, or a lowband load and a sliding load.)
  
  - The checkbox is cleared by default when a polynomial model is selected from the cal kit menu.
  
  - The checkbox is selected by default when the 85058B or 85058E data-based model is selected from the cal kit menu.

**TRL ONLY**

If TRL is selected as Class Assignment in the Edit Kit dialog box, the following changes appear in this dialog:

![Calibration Kit Class](image)

**Calibration Kit Class**

- Learn more about TRL standards.

- Isolation calibration is not usually necessary in the PNA.

**LRL line auto characterization**
**Note:** This setting ONLY applies if an LRL Cal Kit is being modified AND Testport Reference Plane is set to Thru Standard AND the TRL Thru class standard and the TRL Line/Match class standard both have the same values for Offset Z0 and Loss. Otherwise, this setting is ignored.

- Check the box to allow the PNA to automatically correct for line loss and dispersion characteristics.
- Clear the box if anomalies appear during a calibrated measurement which may indicate different loss and impedance values for the Line standards.

**Calibration Reference Z0 (TRL only)**

**System Z0**  The system impedance is used as the reference impedance. During an Unguided Cal, the value that is set at **System => Configure => System Z0** is used. During a Guided Cal, the Z0 of the Cal standard's connector definition sets the System Z0. See where this value is set.

Make this selection when the desired test port impedance differs from the impedance of the LINE standard. Also, make this selection when skin effect impedance correction is desired for coax lines.

**Line Z0**  The impedance of the line standard is used as the reference impedance, or center of the Smith Chart. Any reflection from the line standard is assumed to be part of the directivity error.

**Testport Reference Plane (TRL only)**

**Thru Standard**  The THRU standard definition is used to establish the measurement reference plane. Select if the THRU standard is zero-length or very short.

**Reflect Standard**  The REFLECT standard definition is used to establish the position of the measurement reference plane. Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

Also, select if a flush short is used for the REFLECT standard because a flush short provides a more accurate phase reference than a Thru standard.
**Add Standard** dialog box help

Allows you to add standards to the calibration kit file.

**OPEN** Adds an open to the calibration kit file.

**SHORT** Adds a short to the calibration kit file.

**LOAD** Adds a load to the calibration kit file.

**THRU** Adds a thru to the calibration kit file.

**DATA BASED STANDARD** Adds a data-based standard to the calibration kit file.

**OK** Invokes a blank Edit Standards: Open, Short, Load, Thru, or Data-Based dialog box.

For more information see Creating Custom Calibration Kits using a New Connector Family.

---

**Edit / Add Standards (Open, Short, Load, Thru, or Data-based)**

![Diagram of Edit/Add Standards dialog box](image)

**Edit / Add Standards** dialog box help

The boxed areas of the previous graphic applies to all standard types.

The other areas change depending on the type of standard selected.

**Identification**

- **Standard ID** Number in list of standards
- **Label** Type of standard.
- **Description** Description of standard.

**Frequency Range**

- **Min** Defines the lowest frequency at which the standard is used for calibration.
Max  Defines the highest frequency at which the standard is used for calibration.

Connector
Indicates the type and gender (Male, Female, None) of the standard.

Delay Characteristics
Delay  Defines the one-way travel time from the calibration plane to the standard in seconds.
Z0  Defines the impedance of the standard.
Loss  Defines energy loss in Gohms, due to skin effect, along a one-way length of coaxial cable.

The following applies to standard types Open, Short, Load, Thru, and Data-based

Open Standard

<table>
<thead>
<tr>
<th>Open Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>C0</td>
</tr>
<tr>
<td>C1</td>
</tr>
</tbody>
</table>

C0, C1, C2, C3  Specifies the fringing capacitance.

Short Standard

<table>
<thead>
<tr>
<th>Short Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>L0</td>
</tr>
<tr>
<td>L1</td>
</tr>
</tbody>
</table>

L0, L1, L2, L3  Specifies the residual inductance.

Load Standard

<table>
<thead>
<tr>
<th>Load Type</th>

<th>Offset Load Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Offset Standard: THRU</td>
</tr>
<tr>
<td>Second Offset Standard: 7-32 Line</td>
</tr>
<tr>
<td>Load Standard: ADPTR/LOAD -M-</td>
</tr>
</tbody>
</table>

Allows you to select the type of load.
Load Type

**Fixed Load**  Specifies the load type as Fixed. The fixed load is assumed to be a perfect termination without reflection.

**Sliding Load**  A sliding load is defined by making multiple measurements of the device with the sliding load element positioned at various marked positions of a long transmission line. The transmission line is assumed to have zero reflections and the load element has a finite reflection that can be mathematically removed using a least squares circle fitting method.

A sliding load cal can be very accurate when performed perfectly. It can also be very inaccurate when not using proper technique. **For accurate results, closely follow the users manual instructions for the sliding load.**

**Arbitrary Impedance**  Specifies the load type to be have an impedance value different from system Z0. An arbitrary impedance device is similar to a fixed load except that the load impedance is NOT perfect. Early firmware releases of the PNA series used a fixed resistance value. A complex terminating impedance has been added to allow for more accurate modeling of circuit board or on-wafer devices.

The following Complex Impedance settings are available ONLY when Arbitrary Impedance is selected.

- **Real**  The real portion of the impedance value.
- **Imaginary**  The imaginary portion of the impedance value.

**Offset Load**  In Jan 2006, Offset Load definitions were added to TRL and Waveguide Cal Kit files. Using an Offset Load standard results in a more accurate calibration than with a Broadband Load. Therefore, when performing a calibration using one of the modified Cal Kit definitions, you may be prompted to connect more standards than before this change.

**Note:** The Offset Load standard can be used ONLY during a **SMART (Guided) calibration**.

To revert to using the Broadband Load Standard without offset, do the following:

1. Click **Calibration**, then **Advanced Modify Cal Kit**
2. Select the kit, then click **Edit Kit**
3. Under Class Assignments, click **Edit**
4. Select Calibration Kit Class **S11C** (Loads)
5. Under Selected Standards, select **Broadband Load**, then click **Move Up** until the standard is at the top of the list. This will ensure that the Broadband Load is used first.

**About Offset Load**

An offset load is a compound standard consisting of a load element and two known offset elements (transmission lines) of different length. The shorter offset element can be a zero-length (Flush-thru) offset. The load element is defined as a 1-port reflection standard. An offset load standard is used when the response of the offset elements are more precisely known than the response of the load element. This is the case with waveguide. Measurement of an offset load standard consists of two measurements, one with each of the two offset elements terminated by the load element. The frequency range of the offset load standard should be set so that there will be at least a 20 degree separation between the expected response of each measurement.
To specify more than two offset elements, define multiple offset load standards. In cases where more than two offsets are used, the frequency range may be extended as the internal algorithm at each frequency will search through all of the possible combinations of offsets to find the pair with the widest expected separation to use in determining the actual response of the load element.

The following Offset Load settings are available ONLY when Offset Load is selected.

- First Offset Standard
- Second Offset Standard
- Load Standard

### Thru Standard

**Connectors**

Defines connector type and gender at both ports.

### Data-Based Standard

**Connectors**

Defines connector type and gender at both ports.

**Upload Data From File**

Click Browse to load data from a file.

### Connectors

Power Calibration

Source and Receiver Power Calibrations work together to provide very accurate power levels from the source, and very accurate power measurements from the PNA receivers.

- **Source Power Calibration Overview**

Source Power Calibration Overview

Perform Source Power Calibration when you need accurate power levels at some point in the measurement path between the PNA test ports. For example, you need to characterize the gain of an amplifier across a frequency range at a specified input power. You would perform a source power cal at the input of the amplifier to ensure the exact power level into the amplifier across the frequency range.
Using a Source Power Cal, you can expect the power at the point of calibration to be within the range of the uncertainty of the power meter and sensor that is used.

**Source Power Calibration...**

- Is independent of measurement type. It corrects the PNA source regardless of which receivers are being used in a measurement. Therefore, it can be used with both ratio or non-ratio measurements.

- Applies ONLY to those measurements on the selected channel that use the test port that was specified as the Source for the calibration. For example, if you specify Channel 1 and Port 1 as the source to be calibrated, only those measurements on channel 1 that use port 1 as the source will be corrected.

- Can be used in conjunction with other measurement calibrations, such as a full 2-port calibration. For highest accuracy, perform the measurement calibration AFTER the source calibration.

- Can be used with Power Sweep type. Source Power Cal will correct the power at all power levels across the power sweep.

- Can be used with Port Power Uncoupled.

- Forces sweep mode to Stepped on measurements with source power correction turned ON.

- Beginning with PNA Rev. 7.50, an external source can be calibrated using Source Power Cal.

**Overview of How it works:**

See Important First-time USB connection note.

Click to see the detailed procedure

1. Specify the measurement settings (frequency range, IFBW and so forth).

   **Note:** When using an Agilent 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the Power Sensor Settings dialog, because the PNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

3. Connect a power meter sensor to the point at which you want a known power level. This may be at the input or output of your device, or some other point between the test ports.

4. The PNA source is stepped through the specified frequency range, and power is measured with the power meter. At each data point, the source power is adjusted until the measured power is within your specified accuracy level.

5. When complete, the power meter is preset. The source power calibration can be saved as part of the instrument state.

6. The power meter is removed and the measurement path reconnected.

7. The calibration is automatically applied to the channel. All measurements on that channel using that source port benefit from the source power cal.
8. Perform an S-parameter calibration AFTER a Source Power Cal. The S-parameter cal is performed using the corrected stimulus power levels for the relevant ports.

**Verify** the source power calibration using the following procedure.

1. Connect the power meter as it was during the source power calibration.
2. Set the PNA to **Point Trigger** mode.
3. Trigger the PNA across the trace. Read about the behavior of the **sweep indicator**.
4. At each data point, the power meter should read the corrected power level within the specified tolerance.

**Supported Power Meters and Sensors**

See Agilent's Power Meters and Sensors Webpage.

**Power Meters**

The following Agilent Power Meters are supported:

- HP 437B / 438A power meters
- E-Series power meters (E4418 and E4419) and all supported sensors.
- P-Series power meters (N1911A and N1912A) and all supported sensors.
- EPM Series power meters (E4416A and E4417A) and all supported sensors.
- N1913A and N1914A power meters and all supported sensors.
- U2000 Series USB power sensors. See **USB Power Sensors** (below)

**Notes**

- N1911A, 12A, 13A, and 14A power meters have a ‘**device-side**’ USB connector and are controlled by the PNA exactly like a USB sensor. See **USB Power Sensors** (below). Although these meters may also have a front-panel USB port, USB power sensors must be connected directly to one of the PNA USB ports.
- The **82357A USB/GPIB Interface** can be used to control power meters.
- **Create a Custom Power Meter Driver** for use with other power meters.

**Power Sensors**

You can perform a Source Power Calibration with ALL power sensors that are supported by the above power meters. However, Source Power Calibration operates slowly with the Agilent E930x and E932x power sensors. Multiple power sensors can be used to cover the frequency span of the measurement. **Learn how.**
**USB power sensors** are supported beginning with PNA Rev 7.50.

- Only one USB power sensor can be used to cover the entire frequency span.

- To select a USB power sensor:
  1. Connect the sensor directly to one of the PNA USB ports.
  2. From the **Source Power Cal** dialog, click **Power Meter Config**.
  3. On the **Power Meter Settings** dialog, select **USB**.

- Or select a USB power sensor that is configured as a PMAR Device. [Learn how]

See Important First-time USB connection note.
See note about Zeroing USB Power Sensors.
See also: Power Meters as Receivers (PMAR)
3. Apply power to the power meter and allow 30 minutes warm-up time before beginning calibration.

4. Select Source Power Cal as follows:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press CAL</td>
<td>1. Click Response</td>
</tr>
<tr>
<td>2. then [Power Cal]</td>
<td>2. then Cal</td>
</tr>
<tr>
<td>3. then [Source Cal]</td>
<td>3. then Power Cal</td>
</tr>
<tr>
<td></td>
<td>4. then Source Cal</td>
</tr>
</tbody>
</table>

5. Complete the Source Power Cal dialog box (below), including Options, Loss Compensation and Power Sensor Settings, as needed.

   **Note:** When using an Agilent 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the Power Sensor Settings dialog, because the PNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

6. When complete, click Take a Cal Sweep in the Source Power Cal dialog box.

7. Follow the prompts to connect the sensors as required.

8. At this time you can change the Source Port setting and perform a Source Power Cal on a different port.

9. When calibration is finished, click OK. Correction is then applied and turned ON for the relevant ports on the active channel.

10. Remove sensor.

11. SrcPwrCal is displayed in the status bar when Source Power Correction is applied to the Active Measurement.

12. Perform a S-parameter calibration, which would use the corrected stimulus power levels for the relevant ports.

---

**To turn Source Power Correction OFF:**

- On the Calibration menu, point to Power Calibration, then click Source Power Correction on/OFF.

- ONLY correction for the source port of the ACTIVE MEASUREMENT is turned OFF (regardless of port power coupling setting.)
Interpolation or Extrapolation

If the original stimulus settings are changed, Interpolation or EXTRAPOLATION is applied and SrcPwrCal* is displayed in the status bar. This is different from measurement calibration interpolation. For example, if the frequency span is increased, the PNA will extrapolate new correction values rather than turn correction off. This is to protect your test device from being overpowered by the source. If the original settings are restored, then source power calibration returns to full correction.

Source Power Cal dialog box help

![Source Power Calibration dialog box](image)

**Note:** Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

**Power**

- **Cal Power** The calculated power (in dBm) at the calibration point. This value is the specified PNA source power plus the Power Offset value.

- **Power Offset** Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement. These components will remain during a measurement. For example, specify 10 dB to account for a 10 dB amplifier in the path to your DUT. Following the calibration, the PNA power readouts are adjusted to this value.

To account for components that will be removed when the calibration is complete, use the Loss Compensation table.

**Channel and Port Selection**

- **Channel** Specifies the channel on which to perform the calibration. This setting defaults to the active channel.

- **Source Port** Specifies the source port to be corrected. This setting defaults to the source port for the active measurement.

Beginning with PNA Rev. 7.22, external sources can be calibrated using his dialog. Learn more.
### Accuracy
At each data point, power is measured using the specified Power Meter Settling Tolerance and adjusted, until the reading is within this Accuracy Tolerance or the Max Number of Readings has been met. The last power reading is plotted on the screen against the Tolerance limit lines.

- **Tolerance**: Sets the maximum desired deviation from the specified Cal Power level in 0.005 dB increments from 0 to 5 dB.
- **Max Number of Readings**: Sets the maximum number of readings to take at each data point for iterating the source power.

### Calibration Status
Allows you to turn Source Power Cal ON | OFF and view Cal data for each port, regardless of the active measurement. This feature allows the Internal Second Source to be calibrated and turned ON | OFF, even when being used as an incidental source in a measurement, such as an LO.

- **Calibration ON**: Check to turn Source Power Calibration ON for the specified source port.
  
The displayed text indicates when interpolation is applied for the calibration.

### Buttons
- **Options**: Invokes the Source Power Cal Options dialog. Label to the left of the button displays the current 'Options' setting.
- **Power Meter Config**: Invokes the Power Meter Settings dialog box
- **Take Cal Sweep**: Begins source power calibration measurement.
- **OK**: Applies calibration. This button is disabled until the Take Cal Sweep has been pressed.
- **Cancel**: If a sweep is in progress, cancels the sweep. Press again to close the dialog.

### Pass / Fail Limits
Limit lines are drawn on the Source Power Cal measurement graticule area. These lines are at the Cal Power +/- the current setting of Accuracy Tolerance. A FAIL during the Source Power Cal sweep means that the PNA was unable to measure power to within the Accuracy Tolerance. Tight tolerances are more difficult to achieve at lower Cal Power levels. When a FAIL indication appears, increase the Max Number of Readings. If this does not cause a PASS condition, then decrease the Accuracy Tolerance value.

### See Also
- Learn more about **Source Power Cal**
- Learn about **External Testsets** and Source Power Cal.
Provides options for measurement of the source power.

**Note:** At low power levels (less than -30 dBm) most power meters are not as accurate as a PNA receiver.

**Calibration Reference** Choose power meter/PNA receiver to use to measure power.

- **Use a power meter.** Traditional source power calibration using only a power meter to measure the source power at each data point. Most accurate (at higher power levels) and slowest method.

  **Note:** Because the following two settings use PNA receivers to make power measurements, they do NOT work correctly when a Frequency Offset value is being used.

- **Use a power meter once, then use the PNA reference receiver.** When checked, the first reading at each data point uses a power meter to calibrate the reference receiver. Subsequent readings, if necessary to meet your accuracy requirement, are measured using the reference receiver. This technique is much faster than using the power meter, and more accurate when measuring low power levels.

  **Note:** Do NOT use this setting if there is a component before the power sensor that exhibits non-linear behavior, such as a power amplifier in compression. Use a power meter, and **Calibrate the source at multiple power levels**.

- **Use a receiver.** Select a PNA Receiver or a PMAR (Power Meter as Receiver).

  **PNA receiver** - For highest accuracy, first calibrate the receiver by performing a source power cal using a power meter, then a **receiver cal**. That receiver can then be used to quickly calibrate other PNA source ports, or used on another channel with different stimulus settings. This would be useful, for example, if the power level of the measurement was below the sensitivity of the power sensor. Calibrate the PNA receiver using a source power cal that is within the sensitivity of the sensor. Then, use the calibrated receiver to perform a second source power cal at the reduced power level.
The PNA receiver is specified using either standard receiver notation or logical receiver notation.

It is best to use the reference receiver for the source port to be calibrated. For example, if calibrating source port 2, specify the "B" or "a2" receiver.

To ensure an accurate source power cal, the frequency range over which the receiver was calibrated must be the same or larger than the "receiver only" source power calibration.

All accuracy and settling tolerance and number of reading settings apply just as they do with a power meter reading.

**PMAR Device** - The power meter/sensor must first be configured. [Learn how to Configure a PMAR device.](#)

- **Use a power table and the PNA reference receiver** Used to provide power leveling with mmWave test set and modules. [Learn more.](#)

**Calibrate the source at multiple power levels** Used primarily with mmWave measurements.

This feature can also be used with standard PNA measurements when a component is used in the source path such as a booster amp which does not have NOT linear gain or loss over frequency. If this is not true for your setup but want to improve your source power accuracy, consider using the [Receiver Leveling](#) feature.

When checked, source power is measured using the specified 'Cal Reference' device (power meter/sensor or PNA receiver) and iterated on a sweep-to-sweep basis to construct a 2-dimensional power table: Power IN, Power OUT, over all frequencies.

- Click **Power Levels** to launch the [Source Cal Power Levels dialog box](#) to set the power levels at which source power is to be measured.

  - The source power cal is saved, but the power table is NOT accessible.

**Note:** If your measurement requires more or less source power than you specified in the Power Levels dialog, then the minimum or maximum source power correction will be used. The correction values are NOT extrapolated. This WILL result in source power inaccuracy.

**Calibrate the PNA reference receiver** Check to calibrate the appropriate reference receiver to the power level that is measured at the calibration plane. Do this to make very accurate measurements using the calibrated reference receiver. This cal is done in addition to the standard source power cal using the any of the methods listed above. At the end of the source power cal measurement sweep, you can optionally save the reference receiver cal to a Cal Set to be recalled at a later time. The Cal is saved when the **OK** button is clicked to close the Source Power Cal dialog.
Source Cal Power Levels dialog box help

This dialog appears when you click **Power Levels** on the [Source Power Cal Options dialog](#).

Specify the power levels at which the Source Power will be calibrated.

**Note:** If your measurement requires more or less source power than specified here, then the minimum or maximum source power correction will be used. The correction values are NOT extrapolated. This WILL result in source power inaccuracy.

- **Max Power** - The highest power level at which to calibrate.
- **Min Power** - The lowest power level at which to calibrate.
- **Power Step** - Calibrate at every incremental power level, between the Max and Min Power settings.

Power Meter Settings dialog box help

This dialog appears when you click the **Power Meter Config** button on many dialog boxes.
Communication

- **GPIB / Address** Select GPIB power meter. Then select the address for the power meter. Default is 13. The PNA will search VISA interfaces that are configured in the Agilent IO Libraries on the PNA.

- **USB** PNA scans the USB for connected power sensors. Select a power sensor from the list. Only ONE USB power sensor can be configured to cover the entire frequency range of the calibration. See USB sensor accuracy note.

- **LAN** Specify the Hostname or IP address of the Power Meter.

- **Any** For future use.

**Sensors** Invokes the power sensor settings dialog box.

**Settling**

These Settling settings do not apply when a PNA receiver is the power measurement device. Each power meter reading is "settled" when either:

- two consecutive meter readings are within this **Tolerance** value or

- when the **Max Number of Readings** has been met.

The readings that were taken are averaged together to become the "settled" reading. The settled reading is then compared to the **Accuracy Tolerance requirements** (tolerance and max readings) specified on the Source Power Cal dialog box.

**Tolerance** When consecutive power meter readings are within this value of each other, then the reading is considered settled.

**Max Number of Readings** Sets the maximum number of readings the power meter will take to achieve settling.

**Sensor Loss Compensation**

- **Use Loss Table** Select this checkbox to apply loss data to Source Power calibration correction (such as for an adapter on the power sensor).

- **Edit Table** Invokes the Power Loss Compensation dialog box.
To Add a Row to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard.

To Edit a value, double-click in the cell to be edited.

Beginning with A.08.33, these values can be loaded from an S2P file using the Characterize Adaptor Macro. Compensates for losses that occur when using an adapter or coupler to connect the power sensor to the measurement port. These components will be removed when the calibration is complete. To account for components that will remain during the measurement, use the Power Offset setting.

The Frequency / Loss pairs define the amount of loss for the entire frequency range. For example, using the entries in the above dialog image:

- 0.5 dB is used to compensate power sensor measurements up to 1 GHz.
- Each data point between 1 GHz to 2 GHz is linearly interpolated between 0.5 dB and 1 dB.
- 1 dB is used above 2 GHz.
- A single frequency/loss segment is applied to the entire frequency range.

Enter up to 100 segments to achieve greater accuracy.

**Frequency** Enter a frequency in Hz.

**Loss** Enter a loss as a POSITIVE value in dB. To compensate for gain, use NEGATIVE values.

**Delete Table Segment** Deletes row indicated in the field.

**Delete All** Deletes all data in the table.

The Power Loss Compensation table survives PNA Preset and Power OFF. To NOT use Loss compensation, clear the Use Loss table checkbox on the Power Meter Settings dialog.
This dialog appears when you click the Sensors button on the Power Meter Settings dialog.

**Note:** Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

**Sensor A (B)** Displays one of the following messages depending on type of sensor.

- **Not connected** The PNA is not detecting a power sensor.

- **Cal factors are contained within this sensor** Internal Reference Cal Factor and Cal Factor data are loaded automatically.

- **Sensor Data** Allows the following entries for power sensor data:
  
  - **Reference Cal Factor** Specifies the sensor's Reference Cal Factor.
  
  - **Cal Factor Table** Specifies the frequency and corresponding Cal Factor for the sensor.
  
  - **Delete Cal Factor** Deletes the indicated row in the table.
  
  - **Delete All** Deletes all data in the table.
  
  - **To Add a Row** to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard. A row is added to the bottom of the table. The table is automatically sorted by frequency when OK is pressed.

**Use this sensor only** Check this box to use this sensor over the entire frequency span of the measurement, even if two sensors are connected to power meter.

Clear this box to allow entry of minimum and maximum frequencies for the sensor. Only ONE of the two sensors can have this box checked. You will be prompted to connect the appropriate sensor during the power calibration.

**Minimum Frequency** Specifies the minimum frequency range for the sensor when using dual sensors.

**Maximum Frequency** Specifies the maximum frequency range for the sensor when using dual sensors.
Perform Sensor Zeroing and Calibration  Zero and/or calibrate the power sensor before measuring data. Follow prompts that may appear. Press Zero/Calibrate Sensor to perform required calibration steps. If the following settings are 'greyed', Internal or External zeroing is selected automatically based on the power meter/sensor model.

- **Internal Zero** - A switch inside the power sensor removes the zero circuit from the incident power.
- **External Zero** - Requires that you physically remove the sensor from incident power.

**Note for the U2000 Series USB power sensors**
Select External Zero ONLY when the power to be measured is below the specified level. Otherwise, the U2000 series performs internal zeroing automatically when needed. See your power sensor documentation for more details.

- U200xA - below -30 dBm
- U200xH - below -20 dBm
- U200xB - below 0 dBm

If your U2000 power sensor 'hangs' when external zeroing, upgrade the power sensor firmware to Rev. A.01.02.00 or higher to fix this problem.

**Copy a Source Power Calibration to other Channels**
A macro application is now available that copies a Source Power Calibration to other channels. Once downloaded and installed on a PNA, the macro is automatically configured up. To learn more, click Help on the application main dialog. Get the application from http://na.tm.agilent.com/pna/apps/applications.htm.

**Saving a Source Power Calibration**
Because Source Power Cal calibrates source hardware, the calibration data is saved as part of the Instrument State, in either a .sta file or a .cst file. This correction is applied to all measurements on the channel that uses the calibrated source. See Save Instrument State.

**Reducing Time to Complete a Source Power Calibration**
The time required to perform a Source Power Calibration depends on source power, number of points, and number of readings taken. You can reduce this measurement time with the following methods:

- **Reduce number of points before calibration.** You can reduce the number of points before the measurement, then return the number of points to its original value after calibration is complete and correction is ON. The analyzer will perform a linear interpolation, although with some loss in accuracy.
- **Use an Agilent E-Series sensor.** You can obtain 40+ readings per second over GPIB with this type of
sensor on the PNA.

- **Increase power to the sensor.** Lower power may have longer settling time with some sensors.

- **Check** Use Reference Receiver for Iteration.

**Receiver Power Calibration**

**Note:** Beginning with PNA firmware rev A.09.30, a Guided Power Cal can be performed during an S-parameter Guided Calibration. [Learn more.]

Receiver power calibration mathematically removes frequency response errors in the specified PNA receiver, and adjusts readings to the same, or a value offset from, the source power calibration level. It is the same as doing a **Response Cal** or **Data / Memory, (Normalization)** but with the data shifted to the **Cal Power** value.

Use Receiver Power Calibration to make very accurate absolute power (amplitude) measurements.

**Receiver Power Calibration:**

- Is ONLY allowed when making absolute power (**unratioed**) measurements.

- Is most accurate when a source power calibration was performed first.

- Applies to all unratioed measurements in the active channel using that receiver.

- Can be saved in a Cal Set and later reapplied to a like measurement.

**Interpolation**

Like other calibration types, if the original stimulus settings are narrowed, interpolation is applied and **C* Rcvr Pwr** is displayed in the status bar. If the original stimulus settings are made wider, the PNA will turn Receiver Power Correction **OFF**.

If the original settings are restored, then receiver power calibration returns to full correction.

**How to perform a Receiver Power Calibration**

1. Perform a [Source Power Calibration](#).

2. Set the active measurement to unratioed. [Learn How](#).

3. Connect a THRU line from the source port to the receiver port.

   - When performing a receiver power cal on a reference receiver, no connection is necessary as the receiver is internally connected to the source.

   - When the receiver port and the source port are the same (receiver A, source port 1), then connect an open or short to get maximum power to the receiver. This practice is not recommended. It is best to use different ports for the source and receiver.

4. Ensure correction for Source Power Calibration is ON as indicated by **Src Pwr Cal** or **Src Pwr Cal** in
5. Start the **Calibration Wizard**

### Using front-panel HARDKEY [softkey] buttons

1. Press **CAL**
2. then **[Power Cal]**
3. then **[Receiver Cal]**

### Using a mouse with PNA Menus

1. Click **Response**
2. then **Cal**
3. then **Power Cal**
4. then **Receiver Cal**

---

### Select Calibration Type for Unratioed Measurement dialog box help

**Cal Type Selection**  Select **Receiver Power**

**Receiver Power Configuration**

**Cal Power**  Specifies the power level to be displayed on the measurement when complete. (Source Port Power + Power Offset).

**Source Port Power**  Test port Power set for the measurement.  [Learn how to change Test Port Power](#)

**Power Offset**  Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement AFTER a source power cal has been performed. Following the calibration, the PNA power readouts are adjusted to the Cal Power value.

**Next**  Click to continue the Calibration Wizard.

**Notes:**

- When Receiver Power Cal is finished, **C RcvrPwr** is displayed in the status bar and correction data is applied to subsequent sweeps.

- To turn correction **OFF**, click **Calibration**, point to **Power Calibration**, then set **Receiver Power Correction** to **OFF**.

[Learn more about Receiver Power Cal (scroll up)](#)
**Saving a Receiver Power Calibration**

Beginning with PNA Revision 5.0, Receiver Power Cal is saved to a [Cal Register](#) and optionally to a [User Cal Set](#). It can be applied to measurements in the same way as other Cal Types. Previously, Receiver Power Cal data was saved as part of an Instrument State and was only applied to the measurement on which it was performed.

[Learn more about Saving PNA files types.](#)

Fixture Simulator

The following features allow you to mathematically add (embed) or remove (de-embed) circuits to, or from, your PNA measurements. The mathematical models are applied to specific ports for all measurements on the channel.

Notes

- Beginning with PNA Rev. A.09.20, the following features are available in GCA, GCX, Swept IMD, Swept IMDX, Noise Figure, and NFX Apps:
  - Port Extensions (Not available in Swept IMD or IMDX)
  - 2 Port De-embedding
  - Port Matching
  - Port Z Conversion
- All other Fixturing features are available ONLY in a standard channel.
- When fixturing is enabled, all of the enabled fixturing features are applied when snp files are saved.

See Also

- Procedures: To Embed or De-embed?
- Characterize Adaptor Macro can be used to create S2P files from Cal Sets.
- "De-embedding and Embedding S-Parameter Networks Using a Vector Network Analyzer" App note, for more conceptual information on Fixture Simulation.
- See an example of how these functions can be used to de-embed unwanted effects of a test fixture, and then mathematically embed the DUT in the circuit in which it is used.

Order of Fixture Operations

- The fixturing operations are applied to the measurement results. The order of operations 1 through 4 can be changed using the SCPI command: CALC:FSIM:SEND:OORD. Learn how to send this command from the GPIB Command Processor Console.
- The order of the operations 5 through 8 can NOT be changed.
- In the PNA data processing chain, the Fixture Simulator functions occur at the same time as the Apply Error Terms block.

First, the following Single-ended measurement functions are processed in this order:

1. Port Extensions
2. **2-Port De-embedding**

3. **Port Matching Circuit Embedding**

4. **Port Z (Impedance) Conversion**

5. **4-Port Network (single-ended) Embed/De-embed**

Then, **Balanced** measurement functions are processed in this order:

6. **Balanced Conversion**

7. **Differential / Common Mode** Port Z Conversion

8. **Differential Matching Circuit Embedding**

Then, **Source power compensation** is optionally applied to compensate for the aggregate loss through all enabled fixturing operations.

**Note:** Port Z (Impedance) conversion uses values in the following prioritized order:

1. Balanced (Differential or Common Mode) - if enabled, these values are always used.
2. **Single Port Impedance** - if enabled, this value is used if Balanced is not enabled.
3. **System Impedance** - if neither balanced or single port is enabled, this value is used.

---

**How to select Fixturing Simulator**

**About Fixturing ON/off**

**BOTH** of the following must occur to turn a fixturing selection **ON**.

**EITHER ONE** will turn a fixturing selection **OFF**.

1. Check **Fixturing ON/off**

   Port Extensions is **NOT** affected by Fixturing ON/off.

2. Check **Enable** on the individual fixturing selection dialog box.

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[More]**
3. then **[Fixtures]**

**Using a mouse with PNA Menus**

1. Click **Cal**
2. then **More**
3. then **Fixtures**
Port Matching dialog box help

**Note:** Beginning with PNA Rev. A.09.20, this feature is available to the following measurement classes: GCA, Swept IMD, Swept IMDx, Noise Figure, NFX, and standard (S-Parameter) channels.

This function specifies a circuit to embed (add) to the measurement results. [See Order of Fixture Operations.](#)

**Enable Port Matching** Check to apply the settings to the measurement results. Must also enable Fixturing.
**ON/off.**

**Port** - Select Port in which to apply simulation.

**Circuit Model for Matching** - Choose one of the following that best emulates your fixture at the selected PNA port:

<table>
<thead>
<tr>
<th>Circuit Model</th>
<th>Diagram</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Series L - Shunt C</strong></td>
<td>![Diagram]</td>
</tr>
<tr>
<td><strong>Shunt C - Series L</strong></td>
<td>![Diagram]</td>
</tr>
<tr>
<td><strong>Shunt L - Series C</strong></td>
<td>![Diagram]</td>
</tr>
<tr>
<td><strong>Series C - Shunt L</strong></td>
<td>![Diagram]</td>
</tr>
<tr>
<td><strong>Shunt L - Shunt C</strong></td>
<td>![Diagram]</td>
</tr>
</tbody>
</table>

**User Defined (S2P File)** Load a file that is specified with User S2P File button.

**None** Use no circuit model.

**User S2P File** Click to specify an S2P file of the circuit model to embed at the selected port. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the PNA, the PNA setting is used. **Characterize Adaptor Macro** can be used to create S2P files from Cal Sets.

**Circuit Values**

- **Capacitance (C), Inductance(L), Resistance(R), Conductance(G)** Values for the specific components of the circuit type that models your fixture.

**Reset** Restores the default values.
De-Embed when you have performed a calibration and then added a fixture (an adapter, an attenuator, a longer cable, etc.) that connects between the Cal reference plane and your DUT. This function removes the effects of a test fixture from the measurement results.

The de-embedding operation recalls an .s2p file (Touchstone format) which includes the electrical characteristics of a 2-port fixture or device. The file can be in any standard format (real-imaginary, magnitude-angle, dB-angle).
Enable De-embedding  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Enable Extrapolation  Check to apply a simple extrapolation when the S2P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of both the channel and the S2P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

This setting also causes 4-port Extrapolation to be enabled and disabled.

Port  The PNA port to which the recalled de-embedding file is applied.

From the drop-down menu, select User Defined (S2P File).

Reverse Adaptor Ports  Check to cause the Fixture/Adapter to be configured with Port 2 connected to the PNA and Port 1 to be connected to the DUT. The image in the dialog reflects that change.

User S2P File  Click to specify an existing .S2P file. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the PNA, the PNA setting is used. Characterize Adaptor Macro can be used to create S2P files from Cal Sets.

Port Z (Impedance) Conversion dialog box help

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following measurement classes: GCA, Swept IMD, Swept IMDx, Noise Figure, NFX, and standard (S-Parameter) channels.

This function corrects the measurement and displays the results as if the measurement had been made into the specified impedance value. However, the physical port termination is still approximately 50 ohms.

The specified impedance value is applied to all of the measurements on ONLY the active channel.

See Order of Fixture Operations.

Enable Port Z Conversion  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

R  Real part of the impedance value.

jX  Imaginary part of the impedance value.

Close  Applies the entries and closes the dialog box

See note about Port Impedance priority.
4-Port Embed/De-embed dialog box help

This function specifies a single-ended 4-port circuit (*.S4P file) to embed (add) or de-embed (remove) from the measurement results. Computation takes place BEFORE Balanced conversion. See Order of Fixture Operations.

There is a single normalized impedance value for each port in the *.S4P file. This impedance value must match the impedance of the previous Port Z setting, or the PNA port impedance.

The PNA will interpolate if the number of data points that are read is different from the current PNA setting.

**Enable 4-Port Embed/De-embed** Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

**Enable Extrapolation** Check to apply a simple extrapolation when the S4P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of both the channel and the S4P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

This setting also causes 2-port Extrapolation to be enabled and disabled.

**Topology:** Select a DUT topology.

Refer to the images on the 4-port embed/De-embed dialog box.

- **A** - 2 PNA/DUT Ports
- **B** - 3 PNA/DUT Ports
- **C** - 4 PNA/DUT Ports

**The following 2 Topology configurations are NOT addressed with standard images in dialog box:**

1. If you have a 4-port DUT; 4-port network on one side; None on the other side.
• Specify **Topology C**.
  
  • Use 4-port Network on one side.
  
  • Use 4-port Network on the other side; set to **None**.

2. If you have a 3-port DUT and networks as follows:

   ![Diagram](image)

   • Specify **Topology B**.
   
   • Use 4-port Network1 on one side.
   
   • Use **2-port network** on the other side.

---

**NA Ports** - Select the PNA Port that is connected to each circuit port.

**Network Ports** Select the network ports that represent the configuration of the S4P file. By default, ports 1 and 2 are connected to the PNA and ports 3 and 4 are connected to the DUT.

**None, Embed, De-embed** For Network1 and Network2, select:

  - **None** - The same as disabling.
  
  - **Embed** - Add the specified network circuit to the measurement results. [See 2-port Embed image](image).
  
  - **De-embed** - Remove the specified network circuit from the measurement results. [See 2-port De-embed image](image).

**Browse** For both Network1 and Network2, navigate to find the .S4P file to embed or de-embed.

**OK** Applies the changes and closes the dialog box.

**Cancel** Does NOT apply the changes and closes the dialog box.
Differential Impedance Conversion dialog box help

This function sets the Differential impedance value for each balanced port.
The default value for $R$: is the SUM of the impedance values for both ports that make the logical port. If Port Z Conversion is not enabled, then System $Z_0$ values for both ports are summed.

See Order of Fixture Operations.

Enable Differential Z Conversion Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Logical Port Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the measurement topology.

R Real part of the impedance value.

jX Imaginary part of the impedance value.

Close Closes the dialog box.

See note about Port Impedance priority.

Common Mode Impedance Conversion dialog box help

This function sets Common Mode Impedance value for each balanced port.
The default value for $R$: is calculated as follows.

$$\frac{(Z_1 \times Z_2)}{(Z_1 + Z_2)}$$

Where ports 1 and 2 comprise the logical port:

$Z_1$ = the Port Impedance values for port 1
$Z_2$ = the Port Impedance values for port 2

If Port Z Conversion is not enabled, then System $Z_0$ values for port 1 and 2 are used in the calculation.

See Order of Fixture Operations.

Enable Common Mode Z Conversion Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Logical Port Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the measurement topology.

R Real part of the impedance value.
jX  Imaginary part of the impedance value.

**Close** Closes the dialog box.

See note about Port Impedance priority.

---

### Differential Port Matching dialog box help

This function allows the embedding of a differential matching circuit at a balanced port. See *Order of Fixture Operations*.

**Enable Differential Port Matching** Check to embed the selected matching circuit to the measurement results. Must also enable **Fixturing ON/off**.

**Logical Port** Choose **Logical DUT port** to receive the selected matching circuit. To see logical port numbers, see the **measurement topology**.

**Select Circuit** Select a matching circuit. Choose from:

- **Shunt L - Shunt C** Predefined circuit.

### Circuit Values

Choose from:

- **C** Capacitance value
- **G** Conductance value
- **L** Inductance value
- **R** Resistance value
- **User defined**  Select an *.S2P file that represents the matching circuit. Then click **Browse** to navigate to the *.S2P file.

  **Note:** For the *.S2P file:
  - Port 1 of the circuit is assumed to be connected to the PNA
  - Port 2 of the circuit is assumed to be connected to the DUT.

- **None**  No embedded circuit on selected port.

**Close** Closes the dialog box.

---

**Power Compensation** dialog help

This function adjusts the source power at the specified port to compensate for the combined amount of gain or loss through ALL enabled fixturing operations. Use this function to set the power level at the DUT input.

For example:

- Your DUT requires a fixture on the input port which is connected to PNA port 1.
- The fixture description (such as an S2P file at the [2-port De-embed function](#)) indicates the fixture has approximately 2 dB of loss across the frequency span.
- You set source power to 0 dBm. But you want 0 dBm at the DUT input (the fixture output).
- Check Power Compensation on Port 1 and enable **Fixturing**.
- Power Compensation causes the source power to be increased by approximately 2 dB so that the power at the fixture output plane will remain at 0 dBm.

Power Compensation affects all measurements in the channel.

Enable **Fixturing** to use Power Compensation.

**Note:** Use caution when applying power compensation. Always test your setup without a DUT in a place. If you
are using S2P files, Recall your S2P file into the PNA so you can verify that the device your S2P file describes is what you intended it to be. It is too easy to misalign data in S2P files if they are constructed by hand.

**Fixture Simulator Example**

The following example shows a DUT and the matching circuit with which the DUT will be used in its intended application. When the DUT is tested in a high-volume manufacturing environment, multiple test fixtures are often required. The most accurate way to test the DUT and ensure measurement consistency between the different test fixtures is to use a simple, repeatable, test fixture without the actual matching elements.

To get the desired performance data, the parasitic effects of the fixture must first be removed (de-embedded) from the measured data. Then a perfect "virtual" matching circuit must be simulated and added mathematically (embedded) to the corrected, measured data. The result is an accurate display of the DUT as though it was actually tested with a physical matching circuit, but without the uncertainties of using real components.

![Test Device and the circuit in which it will be used.](image)

Rs = 50 Ω
RL = 200 Ω

**Circuit Simulation**

Port Z Conversion Port Extensions/ De-embed Balanced Conversion

Port Matching Diff Port Match Balanced Z Conversion

1. **Create a balanced measurement** using single-ended to balanced (SE-Bal) topology. Include all relevant measurement settings (IFBW, number of points, and so forth). Once the measurement is created and
calibrated, the measurement parameter can be easily changed. For example, Sdd22 to Sds21.

2. Calibrate the measurement at the point where the simple test fixture is connected to the PNA. Use accurate calibration standards and definitions.

3. Remove the effects of the three uncalibrated transmission lines of the simple test fixture. This can be done in several different methods. The easiest is to use manual or automatic **Port Extensions** to move the calibration reference plane to the DUT. This removes the electrical length and loss of the fixture’s transmission lines, but does not account for fixture mismatch. Another method is to de-embed previously-created *.S2p files of the 3 transmission lines. The files can be created using external ADS modeling software. Another alternative is to create the *.S2P files by independently measuring all 3 ports of the test fixture and saving the results of each to an S2P file.

4. With the test fixture connected to the PNA and a DUT inserted, the measurement results now appear as though calibration was performed at the connections to the DUT, and the device was measured in a 50-ohm single-ended test environment. The following steps will cause the results to reflect the performance of the device as though the device is embedded in the circuit in which it will be used.

5. Port 1 of the device is a single-ended port and sees a source impedance the same as the PNA system impedance, so no change is required. However, if Rs were a value other than 50 ohms, **Port 1 Impedance Conversion** would be used to simulate the different impedance.

6. **Port Matching** is used to simulate L1 inductance. Select any of the Shunt L circuits to embed (add) to the measurement results. Enter the value of L and R. The C and G values can be entered as 0 (zero).

7. **Port Matching** is used to simulate C1 and C2 capacitance. For both port 2 and port 3, select any of the **Series C** circuits to embed (add) to the measurement results. Enter the value of C and G. The L and R values can be entered as 0 (zero).

8. **Balanced Conversion** mathematically simulates the measurement in balanced mode.

9. **Differential Port Matching** is used to simulate L2 inductance. Select Shunt L- Shunt C and enter the inductance/resistance value. The C and G values can be entered as 0 (zero).

10. Finally, **Differential Z Conversion** is used to simulate a circuit termination of 200 ohms. If you are making Common Mode measurements, specify **Common Mode Z Conversion**.

Last modified:
12-Nov-2010  Added extrapolation and reverse (A.09.33)

Port Extensions

Port extensions allow you to electrically move the measurement reference plane after you have performed a calibration.

Note: Beginning with PNA Rev. A.09.20, this feature is available to the following measurement classes: GCA, Noise Fixture, NFX, and standard (S-Parameter) channels.

- Why and How to use Port Extensions
- Manual Port Extensions Procedure
- Port Extensions dialog and Toolbar
- Step Size dialog
- Automatic Port Extension dialog

See Also
- PNA Data Flow Map
- Fixture Compensation features
- Phase Accuracy
- Comparing the PNA Delay Functions

Why use Port Extensions

1. You are unable to perform a calibration directly at your device because it is in a test fixture. Perform a calibration at a convenient place, then use port extensions to compensate for the time delay (phase shift), and optionally the loss, caused by the fixture.

2. You have already performed a calibration, and then decide that you need to add a length of transmission line in the measurement configuration. Use port extensions to "tell" the analyzer you have added the length to a specific port.
Important Note: Port Extensions and PNA Data Flow

See PNA Data Flow diagram

Normally, Port Extensions are applied to individual S-parameters in the Phase Correction process and only applies to displayed S-parameters.

However, when Fixturing is ON or when making a Balanced Measurement, Port Extension compensation is applied in the Apply Error Terms process which affects ALL S-parameters, whether displayed or not. This allows all underlying S-parameters to have proper extensions applied.

Therefore, when using Port Extensions with features that require more than a single S-parameter (such as k-factor in equation editor), do one of the following:

- Enable Fixturing - Individual Fixturing features are NOT required to be enabled.
- Use 8510 Mode Data Processing.

When Port Extension compensation is applied in the Apply Error Terms process, after a Data-to-Memory operation has been performed, further changes to Port Extensions settings will NOT be applied to the Memory trace.

How to use Port Extensions

- If you know the electrical length of the fixture or additional transmission line, enter the value directly to the Time setting.
- If you know the physical length of the fixture or additional transmission line, enter the value directly to the Distance setting.
- If you do NOT know either the electrical or physical length of the fixture or additional transmission line, you must be able to connect an OPEN or SHORT to the new reference plane - in place of the DUT. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane.
- Port Extensions can then be added manually (as follows), or by using Automatic Port Extensions.

Manual Port Extensions Procedure

1. Select a calibrated S11 measurement.
2. Select Phase format.
3. With an OPEN or SHORT at the calibration reference plane, verify that the phase across the frequency span is at or near zero.
4. Connect the fixture or added transmission line and attach an OPEN or SHORT in place of the DUT. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. On the Port Extension toolbar or dialog, increase either Time or Distance until the phase response is flat across the frequency span of interest.
5. If you know the loss of the additional transmission line, enter the Loss Compensation values using either one or two data points.

**Note:** Most OPEN and SHORT standards have delay. Therefore, adjusting delay with this method results in a delay equal to two times the delay of the OPEN or SHORT.

### How to access Port Extensions settings

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[Port Extensions]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Cal**
3. then **Port Extension**

---

**Port Extensions dialog and Toolbar help**

**Note:** Beginning with PNA Rev. A.09.20, this feature is available to the following measurement classes: GCA, Noise Fixture, NFX, and standard (S-Parameter) channels.

Port extensions settings affect all measurements on the active channel that are associated with a particular port.

- **Learn Why and How to use Port Extensions** (scroll up).

- **Port Extension** Turns ON and OFF port extensions on all ports.

- **Port** Select a PNA port for delay and loss values. Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

- **Show Toolbar** Check to show the Port Extensions toolbar. The toolbar allows you to make adjustments to the port extensions while showing more of the PNA screen. Beginning with PNA rev A.08.50, this is the only way to
Delay settings

Enter delay in either Distance or Time by entering a value or clicking the up/down arrows. Click to start the Step Size dialog.

Time  The amount of port extension delay in time. Enter a positive value.

Distance  The amount of port extension delay in physical length. Enter a positive value.

Distance Units  (Dialog ONLY) Select from Meters, Inches, or Feet. The Step Size setting will not change automatically. Learn more.

Loss Compensation

The following settings allow the entire frequency span to be corrected for loss.

Loss at DC  Offsets the entire frequency span by this value. Loss1 or Use1 must also be checked. To compensate for loss at DC, enter a positive value which causes the trace to shift in the positive (up) direction.

Loss @Frequency  Check the box, and enter values for Loss and Frequency

When Loss1 or Loss1/Loss2 are used, a curved-fit algorithm is used as follows:

Loss1 ONLY:

\[ \text{Loss}(f) = \text{Loss1} \times \left(\frac{f}{\text{Freq1}}\right)^{0.5} \]

Loss1 and Loss2:

Set the lower frequency to Loss1, and the higher frequency to Loss2.

\[ \text{Loss}(f) = \text{Loss1} \times \left(\frac{f}{\text{Freq1}}\right)^{n} \]

Where:

\[ n = \frac{\log_{10} \left| \text{abs(\text{Loss1}/\text{Loss2})} \right|}{\log_{10} (\text{Freq1}/\text{Freq2})} \]

Note: \text{abs} = \text{absolute value}

Velocity

Velocity Factor  For each port, sets the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

Couple to system Velocity Factor  When unchecked, the Velocity Factor is set for only the specified port and only for Port Extensions. When checked, sets the Velocity Factor for all ports. In addition, changing this value also changes this setting for the Electrical Delay and Time Domain Distance Marker features.

Media

For each port, select the media of the added transmission line or fixturing.

Coax  Select when the fixture or added transmission line is coax. Also specify the velocity factor of the coax.

Waveguide / Cutoff Frequency  Select when the fixture or added transmission line is waveguide. Also enter cutoff (minimum) frequency of the waveguide.

Note: when using a Waveguide cal Kit, set System Z0 to 1 ohm before calibrating.

Couple to system Media Definition.  When unchecked, the Waveguide Cutoff Frequency is set for only the specified port and only for Port Extensions.  When checked, sets the Waveguide Cutoff Frequency for all

433
ports. In addition, changing this value also changes this setting for the Electrical Delay feature.

**Reset** All port extensions settings are changed to preset values. The Port Extension ON / OFF state is NOT affected.

**Auto Ext.** Starts the Automatic Port Extensions dialog box.

**Note:** Individual receiver port extensions (A,B, and so forth) can no longer be set. (Sept. 2004)

---

**Step Size** dialog box help

Changes the step size that occurs when the Time or Dist up/down arrows are pressed on the Port Extension toolbar. The Units for step size are changed on the Port Extension dialog.

**Auto** Step Size is set to the default value.

**User Defined** Enter a step size value, then click OK.

This value remains the same when the units are changed. For example if a step size of 12 is entered on this dialog, then you change the units from Inches to Feet, the step size of 12 inches becomes 12 feet, not 1 feet. Therefore, change the units first, then set the step size.

Learn about Port Extensions (scroll up)

---

**Automatic Port Extension** dialog box help

Automatic Port Extension AUTOMATICALLY performs the same operation as Manual Port Extension. By
connecting a SHORT or OPEN, the reference plane is automatically moved to the point at which the standard is connected. In addition, Automatic Port Extension will optionally measure and compensate for the loss of the additional transmission line.

Auto Port Extension is NOT available when:

- Sweep type is set to power sweep
- Frequency Offset is ON
- Media is set to Waveguide

**Note:** Turn OFF Equations that may exist on the active trace when using Automatic Port Extensions.

**Auto Port Extensions Procedure**

1. Connect the added transmission line or fixture. Attach an OPEN or SHORT to all affected ports at the new reference plane. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane.

2. On the Port Extension toolbar, click **Auto Port Ext**. Click **Show Configuration** to make additional settings.

3. Click **Measure** to perform the port extension calculations. The resulting delay and loss settings are entered into the port extension toolbar. These settings are saved with Instrument Save or you can manually record the values and enter them again when required.

**Settings**

**Measure either OPEN, SHORT, or both** Press a button to make the measurement of the reflection standard. Measure either OPEN or SHORT depending on which is most convenient. An ideal OPEN and SHORT, with zero loss and delay, is assumed. Therefore, accuracy is most affected by the quality of the standard. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. When measuring both OPEN and SHORT standards, the average of the two is used and will slightly improve accuracy.

**Selected Ports** Indicates the ports that currently have automatic port extension enabled. By default, ALL PNA ports are enabled. To disable a port, see **Measure on Port Number** below.

**Note:** Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

**Show/Hide Configuration** Press to either show or hide the following configuration settings in the dialog box.

**Measure on Port Number**

Select port number to enable or disable automatic port extension.

- **Enable** Check to enable the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

- **Include Loss** Check to automatically measure the loss in the additional transmission line and apply compensation. To calculate loss compensation, frequencies at 1/4 and 3/4 through the frequency range are usually used as Freq1 and Freq2 values. Learn more about Loss Compensation.

- **Adjust for Mismatch** Only available when **Include Loss** is checked. During the measurement of the OPEN or
SHORT standard, mismatch could cause ripple in the magnitude (loss) response. The Loss compensation curved-fit algorithm allows half of the ripple to be positive and half negative. When measuring low-loss devices, it is possible that some magnitude responses could become slightly positive, indicating gain rather than loss.

Check - Offsets the trace to cause all of the data points to be at or below zero.

Clear - Most accurate application of the curve-fit calculation, but allows positive responses.

**Prompt for Each Standard** Check to invoke a prompt when the Measure OPEN or SHORT button is pressed. The prompt will indicate which standard to connect to which port.

**Method**

Select the span of data points which will be used to determine correction values for phase and loss (optional). If a portion of the current frequency span does not have flat or linear response, you can eliminate this portion from the calculations by using a reduced User Span.

To calculate loss compensation, Current Span and User Span methods usually use frequencies at 1/4 and 3/4 through the frequency range as Freq1 and Freq2 values. See Loss Compensation to learn more about how loss is calculated.

- **Current Span** Use the entire frequency span to determine phase and loss values.
- **Active Marker** Use only the frequency at the active marker, and one data point higher in frequency, to calculate phase and loss values. If a marker is not present, one will be created in the center of the frequency span.
- **User Span** Use the following User Span settings to determine phase and loss values.

**User Span**

- **Start** Enter start frequency of the user span.
- **Stop** Enter stop frequency of the user span.

Learn about **Port Extensions** (scroll up).

Characterize Adaptor Macro

This external Macro application creates an S2P file that models a device such as an adaptor, the input OR output side of a test fixture, or an on-wafer probe head. This is done by calculating the four S-parameters of the device from two 1-port calibrations. Such S2P files can be used for embedding or de-embedding the device from S-parameter measurements and FCA calibrations.

This application, along with the FCA Embed/De-embed feature, can be especially useful when performing FCA calibrations.

- An SMC calibration requires a power meter measurement at the port 1 reference plane. This could be very difficult in on-wafer applications where the measurement reference plane is at the tip of a probe. This macro, in conjunction with the FCA Embed/De-embed feature, enables you to model the probe and connect the power sensor at the coax connector where the probe connects.

- Likewise, a VMC calibration requires that a calibration mixer be used for the Thru standard. Again, this can be very difficult in on-wafer applications where the measurement reference plane is at the tip of a probe. This macro, in conjunction with the FCA Embed/De-embed feature, enables you to model the probe and connect the calibration mixer at the coax connectors where the probe connects.

New: Characterize Adaptor Macro - Version A.02.10

- Reverse S2P files
- Loads the PNA Power Loss Table from an existing S2P file.
- This macro update requires PNA firmware version A.08.20.04 or higher

For S-Parameter measurements:

- To Embed or De-embed
- Procedures

How to start the Characterize Adaptor Macro

</tbody>
</table>

Programming Commands
Characterize 2-Port Adaptors, Probes, Fixture Paths (S2P) dialog box help

Important Notes

- The device to be characterized (probe, adapter...) MUST be reciprocal (S21 = S12).
- Two 1-port cals must be performed and saved to Cal Sets BEFORE using the Characterize Adaptor application.
- The frequencies and number of points of the two Cal Sets MUST be identical.
- **CRITICAL**: The calculations that are performed to create the S2P file require that **Calset 1** ALWAYS be from the side closest to the PNA and **Calset 2** ALWAYS be from the other side of the device. If your application that uses the resulting S2P file requires that the ports be reversed, check **Reverse Port Order**. Or learn how to reverse the port order on an existing S2P file.
- The majority of this topic describes the characterization of a 2-port device from two 1-port cal sets. However, you can also use the cal sets from two 2-port calibrations, or one 2-port and two 1-port calibrations. See procedures for both.

Learn more about the Characterize Adaptor Macro.(scroll up)

**Connected** <PNA host name>  The two 1-port Cal Sets can reside in another PNA. Click to connect to another PNA that is DCOM configured. Learn how to configure DCOM.

**Adaptor Type**  Select the type of device to be characterized.

**Note**: The image that appears in the macro does not influence the calculations. It only appears to help you visualize the measurement reference plane of the Cal Sets.
Select Calset 1 and Calset-2  Select a 1-port Cal Set from each list. Although all Cal sets are listed, only the Cal Sets that have error terms to satisfy a 1-port calibration may be used.

Cal Port  Select the port within the selected Cal Set which represents the modeled device. The Cal Ports must be the same for both selected Cal Sets.

Characterize and Save  Calculates four S-parameters, then invokes the Save As dialog with S2P file type. This button is not available until valid Cal Sets and Cal Ports are selected.

Reverse Port Order  By default, the calculations that are performed to create the S2P file require that Calset 1 ALWAYS be from the side closest to the PNA and Calset 2 ALWAYS be from the other side of the device. Check Reverse Port Order to cause the ports to be reversed in the resulting S2P file.

Reverse S2P
Click Actions, then Reverse S2P File
This action causes ports to be reversed on an existing S2P file. For example:

- The data for S11 becomes the data for S22 and vice versa.
- The data for S21 becomes the data for S12 and vice versa.

The resulting file is written in the standard PNA S2P file format.

1. Navigate to the S2P file to be reversed.
2. Navigate to where the new reversed S2P file will be saved. By default, the file is saved to the same folder as: [old filename]_Reversed.s2p.
3. Click OK.

Write to Power Loss Table
Click Actions, then Write to PNA Pwr Loss Table.
**Power Loss Table Setup** dialog box help

Loads the S2P Frequency / Loss pairs into the PNA Power Loss Compensation table to compensate for losses that occur when using the device to connect a power sensor to the measurement port during a Source Power Cal.

**Note:** PNA firmware revisions prior to A.08.33.07 ONLY support up to 100 segments in the power loss table. Therefore, to save data to the power loss table in one of the earlier firmware revs, then the Cal Sets that created the S2P file must contain 100 data points or less. Revision A.08.33.07 and above allows any number of segments.

**Use Selected Calsets** Computes the transmission loss of the fixture based on the selected Cal Sets. This choice is NOT available until two valid Cal Sets are selected.

**Use S2P File** Uses the S21 data in an existing S2P file to build the PNA’s power loss table. Select, then click ... then navigate to the S2P file, then click OK.

**Note:** In the PNA Power Loss Compensation table, loss is expressed as a positive number. The macro assumes that any negative S21 value in the S2P file is a loss and therefore multiplies the S21 values in the file by -1 to express that value as a positive number. This ensures proper handling of the offset during a source power cal.

---

**Change Phase Pivot Point**

Click **File**, then Set Phase Pivot Point.

![Change Phase Pivot Point](image)

- Degrees
- Radians

Enter the Phase Pivot Point Below:

```
0
```

[OK] [Cancel]
Change Phase Pivot Point dialog box help

Before the A.01.50 revision (see Help, About) the Characterize Adaptor macro projected the phase of S21 at DC to cross the X-axis between 0° and -180°, based on the delay of the adapter. For most adapters the value is 0°.

However, when characterizing electrically long cables, cables with significant mismatch, or high noise in the measurements, it is possible that the projection of phase goes above 0°. This results in a 180° phase difference between the results computed by the macro versus the results you might get by measuring the same adapter with a 2-port calibration.

This revision allows you to adjust the center of the 180° phase pivot window. The default value 0° yields a window between +90° to -90° which should be adequate for the majority of adapters.

Enter the value in degrees or radians. This value remains while the application is running.

Restarting the application will result in the Phase Pivot Point to revert back to 0°, the default value.

To Embed or De-embed S-Parameter Measurements

- For FCA measurements, see FCA Embed or De-embed.
- In this section, the term “adapter” can mean any type of 2-port device and its associated S2P file.

To make an accurate measurement, the setup configuration during the DUT measurement MUST exactly match the setup configuration during Calibration. In other words, if you calibrate with an adapter, you must also measure the DUT with the adapter.

However, the PNA provides some flexibility by allowing you to ‘Virtually’ add (embed) or remove (de-embed) an adapter from the measurement. Knowing how to do this can be confusing.

- To perform a calibration WITHOUT the adapter, but make DUT measurements WITH the adapter, then De-embed (remove) the adapter from the DUT measurement.
- To perform a calibration WITH the adapter, but make DUT measurements WITHOUT the adapter then Embed (add) the adapter during the DUT measurement.

Procedures

- Create an S2P file using Characterize Adaptor Macro
- De-embed the S2P file from DUT measurement
- Embed the S2P file in DUT measurement
- De-Embedding a Fixture that has a THRU Standard
- De-Embedding a Fixture with No THRU Standard
Create an S2P file using the Characterize Adaptor Macro

1. Configure your PNA measurement (frequency span, power level, IF bandwidth, and number of points).

2. Perform a 1-port SmartCal at the reference plane. Save the cal to a User Cal Set using a descriptive name (for example, Ref Plane).

3. Connect the adapter to be characterized at the reference plane.

4. Perform another 1-port SmartCal at the end of the adapter. Save it to a User Cal Set using a different descriptive name (for example, Adapt End).

5. Start the Characterize Adaptor Macro.

6. In the Select Calset1 field of the dialog box, select the Cal Set for the reference plane (from step 2 above).

7. In the Select Calset2 field of the dialog box, select the Cal Set for the end of the adapter (from step 4 above).

8. Click Characterize and Save. In the resulting dialog box, enter the .S2P file name and location.

9. Click Close.

De-embed the adapter (S2P file) from subsequent S-parameter measurements

See Fixture De-embedding

Note: Subsequent measurements must have the same or smaller frequency range (within the Start / Stop frequencies) as that of the S2P file.

1. Perform a 2 port SOLT calibration without the adapter/fixture.

2. Select 2-port De-embedding: click Response, then Cal, then More, point to Fixtures, then click 2 port De-embedding.

3. Select the Port to add the adapter to, then select User Defined (S2P file).

4. Click Use S2P file and select the S2P file created using the Characterize Adaptor macro.

5. Check Enable De-embedding, then click Close.

6. Enable Fixturing: click Response, then Cal, then More, point to Fixtures, then click Fixturing on/OFF.

7. Sim appears in the Status Bar to indicate that Fixture Simulation is ON.

Embed the adapter (S2P file) into subsequent S-parameter measurements

The adapter (S2P file) can also be a matching network. Learn more.

1. Perform a 2 port SOLT calibration including the adapter. Note the port number on which the adapter is calibrated.

2. Select Port Matching: click Response, then Cal, then More, point to Fixtures, then click Port Matching
3. Under Choose Circuit Model for Matching, select the Port that the adapter was on during calibration, then select **User Defined (S2P file)**.

4. Press **Use S2P File** and navigate to the S2P file created using the Characterize Adaptor macro.

5. Check **Enable Port Matching**, then click **Close**.

6. Enable Fixturing: click **Response**, then **Cal**, then **More**, point to **Fixtures**, then **Fixturing on/OFF**.

7. **Sim** appears in the Status Bar to indicate that Fixture Simulation is ON.

**De-Embedding a Fixture that has a THRU Standard**

A test fixture is generally regarded as a single 'bed' in which a DUT is placed. However, for modeling purposes such as this, it is separated into two circuits: Fixture A on the input of the DUT, and Fixture B on the output.

Use this procedure to perform calibrations **WITHOUT** the test fixture while making measurements **WITH** the test fixture. A calibration is performed **once WITH** the test fixture, and then again as it wears with use and electrical performance changes. The fixture is de-embedded from subsequent measurements to match the regular calibrations that are performed without the fixture.

If you have a THRU standard for your test fixture, you can perform a full 2-port calibration in the fixture, and from that create the required S2P files for de-embedding.

![Diagram of test fixture and PNA connection](image)

1. Perform a full 2-port **CAL 1** at the connections of the PNA to the fixture as shown above. Save to **MyCalSet1**.

2. Perform a full 2-port **CAL 2** where the DUT is inserted (reference plane). Save to **MyCalSet2**.

Follow the Create an S2P file procedure, beginning with step 6, using the following selections:

1. Create #1 S2P file:
   1. For CalSet1, choose **MyCalSet1** and select **CalPort=1**
   2. For CalSet2, choose **MyCalSet2** and select **CalPort=1**
   3. Save to **FixtureA.s2p**

2. Create #2 S2P file:
   1. For CalSet1, choose **MyCalSet1** and select **CalPort=2**
2. For CalSet2, choose **MyCalSet2** and select **CalPort=2**

3. Save to **FixtureB.s2p**

Follow steps in *To De-embed the adapter...*

Perform these steps TWICE; once for each of the following S2P files:

1. For PNA Port 1, select **FixtureA.s2p**
2. For PNA Port 2, select **FixtureB.s2p**

**De-Embedding a Fixture with No THRU Standard**

This procedure is a slight modification of the above. Cal 2 is performed from two 1-port cals when a THRU standard for the fixture is not readily available.

1. Perform a full 2-port **CAL 1** at the connections of the PNA to the fixture as shown above. Save to **MyCalSet1**.

2. **CAL 2** is performed using two 1 port cals

   - **Cal2A** at the Fixture A / DUT plane. Save to **MyCalSet2A**
   - **Cal2B** at the Fixture B / DUT plane. Save to **MyCalSet2B**

Follow steps in *Create an S2P file...Step 6* above, except:

1. Create #1 S2P file:
   1. For CalSet1, choose **MyCalSet1** and select **CalPort=1**
   2. For CalSet2, choose **MyCalSet2A** and select **CalPort=1**
   3. Save to **FixtureA.s2p**

2. Create #2 S2P file:
   1. For CalSet1, choose **MyCalSet1** and select **CalPort=2**
   2. For CalSet2, choose **MyCalSet2B** and select **CalPort=2**
   3. Save to **FixtureB.s2p**

Follow steps in *To De-embed the adapter* above, except:

1. For PNA Port 1, select **FixtureA.s2p**
2. For PNA Port 2, select **FixtureB.s2p**

CalPod (Opt 301 or 302)

CalPod is a system that simplifies the process of recalibrating the PNA without requiring the removal of the DUT or the physical connection of standards. This allows recalibration from a remote location such as when the DUT is in a temperature chamber.

In this topic:

- Overview
- How to start the CalPod dialog
- CalPod dialog
- CalPod Setup dialog
- CalPod Operational Check

Other Calibration topics

Process Overview

Note: The following overview assumes the CalPod system has been installed and configured. See the CalPod User's Guide for installation instructions at: http://cp.literature.agilent.com/litweb/pdf/85523-90001.pdf

The following process assumes a 2-port DUT connected to the PNA ports 1 and 2 through CalPod modules as follows:

1. After configuring and assigning CalPod modules to PNA ports 1 and 2, connect the CalPod modules to the PNA, directly or using short cables. Learn how to configure CalPod.

2. Setup measurements on a channel. An IFBW of 1 kHz or lower with eight averages is recommended.
CalPod does not support measurements below 100 MHz.

3. Perform a full 2-port calibration for the channel with the CalPod outputs as the reference plane.

4. Click **Initialize Channel** to automatically perform the following steps:

   a. The OPEN, SHORT, AND LOAD states of both Calpod modules are switched in and S11/S22 are measured.

   b. The resulting measurements are stored in the channel's Cal Set as additional standard measurements. These measurements are used to characterize the Calpod states - they are NOT used at this time to change the error correction.

**Notes:**

- Because the OPEN, SHORT, AND LOAD states in the CalPods are measured, it is not important what is connected to the CalPod when Initialize is pressed. Therefore, for highest accuracy, click Initialize IMMEDIATELY and ONLY ONCE after performing the calibration - before causing ANY cable movement.

- If an adapter is required to connect the DUT to a CalPod, use a high-quality adapter. Any temperature drift due to the adapter is NOT recorrected.

- Always connect the DUT as close as possible to the CalPod modules.

5. Connect the DUT to the CalPod outputs.

6. Click **Recorrect Channel** or **Recorrect All Channels** whenever necessary. Any of the following actions will cause the current calibration to become invalid and require recorrection:

   a. Moving the CalPod modules to the ends of long cables.

   b. Changing the cables.

   c. Extreme temperature variations.

   d. Measurement drift over long time periods.

7. The following steps occur automatically during recorrection for the active channel:

   a. The OPEN, SHORT, AND LOAD states of both CalPod modules are switched in and S11/S22 are measured.

   b. Additional (de-embedded) error terms are computed to compensate for changed conditions from the Initialize measurements.

   c. Another Cal Set is created using the original name with the CalPod number appended. The modified error terms are saved to that Cal Set and applied to the channel. The measurements are now fully corrected.
**How to start the CalPod dialog**

**Using front-panel HARDKEY [softkey] buttons**
1. Press `CAL`
2. then `[More]`
3. then `[CalPod]`
4. then `[CalPod...]`

**Using a mouse with PNA Menus**
1. Click `Response`
2. then `Cal`
3. then `CalPod`
4. then `CalPod`

---

**CalPod dialog box help**

**Learn all about the CalPod process (Scroll up)**

**Initialize Channel**  Calibrated measurements of the CalPod states are performed as initial reference data points for the active channel.

**Initialize All Channels**  Calibrated measurements of the CalPod states are performed as initial reference data points for all current channels. This command is not recommended, it is generally preferable to initialize each channel immediately following calibration.

**Recorrect Channel**  Recorrects the active channel Cal Set to match the initial reference.

**Recorrect All Channels**  Recorrects the Cal Sets on ALL channels that were initialized.

**Correct Power**  When checked, the power output at the PNA port is adjusted to compensate for any change in path loss when Recorrect is performed. For example, if the path loss between the PNA port and the CalPod was increased by two dB following initialization, then the PNA output power will be increased by two dB upon recorrection. Do this when you add a significant amount of loss in the calibration path, or when the power level at the DUT is important.

If a Source Power Cal is not present, one is created and the measured loss values are entered to correct the source power. After recorrection, `SrcPwrCal` will appear on the PNA status bar.

When a significant amount of loss is introduced in the calibration path, it may not be possible to increase the source power enough to overcome the loss. In this case, an **Unleveled source** message may appear on the PNA screen.
When the checkbox is cleared, the source power level is not corrected.

**CalPod Assignments**
For each PNA port, select a CalPod module.

**CalPod Setup** Starts the CalPod Setup dialog

**Delete All CalPod Cal Sets** Deletes all recorrection Cal Sets and reinstates the Initialization Cal Set.

---

**CalPod Setup dialog box help**

To start this dialog, click **CalPod Setup** in the CalPod dialog box.

**CalPod Serial Number** Type the CalPod module (without 'sn'), then click **Add CalPod**. The new module is added to the list of available CalPod modules. (The list of available CalPod modules is limited to four entries when option 301 is the only PNA CalPod option.)

**Serial # and CalPod Types**

Shows the list of available CalPod modules. A CalPod module type may be STANDARD or THERMAL. A CalPod module will be listed as a STANDARD type unless two conditions are met: the PNA has option 302 and the thermal characterization data has previously been loaded into the PNA from a USB flash drive.

**Buttons**

**Test** Click to test the connection between the controller and the selected CalPod module. The message box displays the connection status and temperature for both Ambient and Thermal modules. Only the Thermal module will apply test temperature for recorrection.

**Delete** Removes the selected STANDARD CalPod module from the list.
To delete a THERMAL CalPod from the list:

1. Navigate to the c:\e-trak\adapters\itm directory.
2. Delete the .xml file associated with the CalPod serial number.
3. Exit all CalPod dialog boxes and restart the CalPod dialog.
4. The CalPod may now be removed using the **Delete** button.

**About** Shows the CalPod software version information.

For more CalPod Setup information, see the CalPod web site: [http://na.tm.agilent.com/pna/calpod](http://na.tm.agilent.com/pna/calpod). Click **CalPod Controller Configuration**.

### CalPod Operator's Check

This program is provided as a convenience to help determine the operational status of each 855xxA Series CalPod and its associated CalPod Controller. While this check is not intended to be a complete test, it does check each unit enough to provide greater than 95% confidence that the CalPod is functioning properly.

- When the max frequency of the CalPod is higher than the max frequency of the PNA, the full frequency range of the CalPod is not tested.
- Up to four CalPod modules may be checked at once. All four devices must be of the same frequency range.
- The software revision for the Operator’s Check code is displayed in the upper left-hand corner of the window.

### Before running Op Check

The CalPod system must be installed and configured on the PNA. The PNA must have Option 301 or 302 installed. See the **CalPod User's Guide** for instructions at: [http://cp.literature.agilent.com/litweb/pdf/85523-90001.pdf](http://cp.literature.agilent.com/litweb/pdf/85523-90001.pdf)

**Required equipment:**

- An appropriate ECal or mechanical Cal Kit.
- A high-quality cable.
- A female-female adapter of the calibration connector type.
- A fixed attenuator up to 10 dB (3 dB preferred) or other frequency insensitive device with similar loss.

### How to perform CalPod Operators Check

Click **Utilities**, then **System**, then **Service**, then **CalPod**, then **OpCheck**.

For PNA firmware version earlier than A.09.50, create a shortcut on the PNA desktop to C:\Program Files\Agilent\Network Analyzer\Service\CalPodOpChk.exe. (To create a shortcut first navigate to the desired file, right click and hold on the file name, drag to the desktop, release and select “Create Shortcuts Here”.)
Click **Setup Info** to learn more about this dialog.

Also, click **Cal Method** or **Connector** for additional explanation for these areas.

**Configure**

1. Enter information in the “Configure” area.

2. Each time a 2-port cal is performed, the results are saved in a file. The “Use Prior” selection uses the saved calibration.

3. When the calibration connector type does not mate with the CalPod connectors, perform the calibration and then use adapters to connect to the CalPod module.

4. Click **Begin** to start the Op Check.

5. Follow the prompts in the gray box.

**Op Check Results**

- The Results area shows Op Check progress.

- Click a test label for test information.

- When the check has finished, the results are saved to a text file. The default path and filename is: C:\Program Files\Agilent\Network Analyzer\Service\calpodopchklog.txt. To save multiple results, rename the file or save it to a different location.

- For assistance in troubleshooting CalPod Operator's Check failures or for additional information, see the appropriate FAQ at the CalPod web site: [http://na.tm.agilent.com/pna/calpod](http://na.tm.agilent.com/pna/calpod)

5-May-2011 New topic
Delta Match Calibration

A TRL, QSOLT, or Unknown Thru Cal requires a reference receiver for each test port. The 4-port PNA-L model does NOT have a reference receiver for each test port.

A Delta Match Calibration can be thought of as a software method which provides a reference receiver for each test port when not otherwise available in the hardware. The Delta Match Calibration measures the source match and load match of the PNA test ports, and then calculates the differences, or "delta", of the two match terms. The results are then used to correct subsequent TRL, QSOLT, or Unknown Thru calibrations.

There are several ways to acquire the Delta Match Calibration:

1. **From an existing User Cal Set** that meets the following Delta Match criteria: (Not allowed for use with external test sets.)
   - Must have been performed using ECal or as a guided mechanical Cal (not Unguided).
   - Must have the same start frequency, stop frequency, and number of points as the channel being calibrated.
   - Must calibrate the ports that require the delta match terms.

2. **From a Global Delta Match Calibration**.

3. **From a 'Self Delta Match'** when other portions of the calibration fully characterize all ports using SOLT with Defined Thru or Flush Thru. For example, when calibrating all four ports of a PNA-L, perform a SOLT between ports 1 and 2, and also between ports 3 and 4, then Unknown Thru could be used between any combination of the remaining ports. This is allowed with an external test set.

**Which to use?** A Self Delta Match Cal will always be used when possible. Otherwise, the Cal Wizard will use a Global Delta Match Cal when available unless you select Choose Delta Match.

**Global Delta Match Cal**

A Global Delta Match Cal is an "all-inclusive" calibration that can be applied whenever the delta match terms are required.

A Global Delta Match Cal differs from a standard SOLT Cal in the following ways:

- It is always performed using a Flush Thru, a Known Thru, or an insertable ECal module. You can NOT use an Unknown Thru in the calibration process.

- Only two Thru connections are required to characterize the delta match terms on a 4-port PNA. This is less than the minimum number of Thrus of a standard 4-port Cal.

- Upon completion, the Global Delta Match Cal is stored as a special type of Cal Set and should be used ONLY as a Delta Match Cal. It provides Delta Match error terms, but does NOT provide all of the standard error correction terms.

- To attain the highest accuracy, the following settings are automatically used to perform a Global Delta Match Cal. When applied, it will likely be interpolated.
- Performed over the entire frequency range of the PNA.
- Uses very dense data points, particularly at low frequencies.
- Uses 100 Hz IF Bandwidth.

**Note:** For highest accuracy, perform Global Delta Match Cal using an insertable ECal module and select Flush-thru as the Calibration Thru method.

### How to perform a Global Delta Match Cal

These selections will only be available if the PNA hardware requires a Delta Match Calibration.

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[Start Cal]**
3. then **[Global Delta Match]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Cal**
3. then **Start Cal**
4. then **Global Delta Match**

### Delta Match Calibration. Select DUT Connectors and Cal Kit dialog box help

- Only one Cal Kit is specified and necessary to perform a Delta Match Cal. However, ALL of the PNA test ports are calibrated in a Delta Match Cal.

- You must configure ALL test ports to terminate in the specified connector / gender using the necessary adapters. The errors from adapters are removed during calibration, but the Thru connections must be made as specified.

- If you select an ECal module that does NOT cover the entire frequency range of the PNA your selection will change to a different Cal Kit. The Global Delta Match Cal covers the entire frequency range of the PNA. Your selected Cal Kit or ECal module must also cover the frequency range of the PNA.
Guided Calibration Steps dialog box help

Click **Measure** for each standard.
When all standards have been measured, click **Done** to complete the measurement steps.

Delta Match Calibration Complete dialog box help

Click **Finish** to store the Global Delta Match Calibration as a special type of Cal Set.
By default, it will be used when a Delta Match Calibration is required.
It should ONLY be used as a Delta Match Cal. It does NOT provide all of the standard error correction terms.

Markers

Markers provide a numerical readout of measured data, a search capability for specific values, and can change stimulus settings. There are 9 regular markers and one Reference marker (used with Delta markers) available per trace. This topic discusses all aspects of markers.

Note: Marker Readout can be turned ON / OFF and customized from the View/Display menu. Learn more.

How to Create Markers

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press MARKER</td>
<td>1. Click Marker/Analysis</td>
</tr>
<tr>
<td>2. then [Marker n]</td>
<td>2. then Marker</td>
</tr>
<tr>
<td></td>
<td>3. select a marker number</td>
</tr>
</tbody>
</table>

Moving a Marker

To move a marker, make the marker active by selecting its number in any of the previous 3 methods. The active marker appears on the analyzer display as V. All of the other markers are inactive and are represented on the analyzer display as Δ. Then change the stimulus value using any of the following methods:

- Type a value.
- Scroll to a stimulus value using the up / down arrows. The resolution can not be changed.
- Click the stimulus box, then use the front-panel knob.
Click and Drag Markers using a finger (touchscreen) or by left-clicking and holding a marker symbol. Then drag the marker to any point on the trace. This feature is NOT allowed in Smith Chart or Polar display formats or with a Fixed Marker type.

---

**Marker dialog box help**

**Marker**  Specifies the current (active) marker number that you are defining.

**On**  Check to display the marker and corresponding data on the screen.

**Stimulus**  Specifies the X-axis value of the active marker. To change stimulus value, type a value, use the up and down arrows, click in the text box and use the front-panel knob, or drag the marker on the screen.

**Delta Marker**  Check to make the active marker display data that is relative to the reference (R) marker. There is only one reference marker per trace. All nine other markers can be regular markers or delta markers. When a delta marker is created, if not already displayed, the reference marker is displayed automatically. A delta marker can be activated from the Marker dialog box or the Marker Toolbar.

**Discrete Marker**  Check to display values at only the discrete points where data is measured. Clear to display values that are interpolated from the data points. The interpolated marker will report y-axis data from ANY frequency value between the start and stop frequency.

**Fixed**  Check to cause the marker to have a fixed X-axis and Y-axis position based on its placement on the trace when it was set to fixed. It does NOT move with trace data amplitude. It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type to quickly monitor "before and after" changes to your test device. For example, you could use fixed markers to record the difference of test results before and after tuning a filter.

Clear the box to create a **Normal** marker, which has a fixed stimulus position (X-axis) and responds to changes in data amplitude (Y-axis). It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type with one of the marker search types to locate the desired data.

**Coupled Markers**  Check to couple markers by marker number, 1 to 1, 2 to 2 and so forth. The markers will remain coupled until this box is unchecked. Learn more about coupled markers.

**Format**  Displays the marker data in a format that you choose. The marker format could be different from the grid format. The Trace Default setting has the marker and grid formats the same.

**All Off**  Switches OFF all markers on the active trace.

---

**Searching with Markers**

You can use markers to search and return data for the following trace criteria:
• **Max and Min**: find the highest or lowest points on the trace

• **Peak**, then move to other peaks (left, right, next highest)

• **Target Value**: find a specific Y-axis value

• **Bandwidth** (Filters)

• **Compression Point** (Amplifiers)

• **About PSAT and PNOP Markers**
  
  • **Power Saturation** (Amplifiers)
  
  • **Power Normal Operating Point** (Amplifiers)

• **What is a Peak?**

• **Search Domain**

If there is no valid data match for any of the search types, the marker will not move from its current position.

---

**How to Search with Markers**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
</table>

For **PNA-X and 'C' models**  

1. Press **SEARCH**  
2. Then **Marker Search**

---

**Marker Search** dialog box help

**Marker** Specifies the marker that you are defining. Not available for search types that deploy specific markers.

**Search Domain** Defines the area where the marker can move or search. For full span, the marker searches for specified values within the full measurement span. For user span, the marker searches for specified values within a measurement span that you define. [Learn more about Search Domain](#).

**Search Type**
Note  You must either press **Execute** or check **Tracking** to initiate all search types.

- **Execute** Click to cause the marker to search for the specified criteria.

- **Tracking** Check to cause the marker to search for the specified criteria with each new sweep. The searches begin with the first sweep after Tracking has been checked, based on the current search type and domain information. Therefore, make sure that the search criteria are in the desired state before using the data. You cannot manually change the stimulus setting for a marker if Tracking is selected for that marker.

**Maximum** Marker locates the maximum (highest) data value.

**Minimum** Marker locates the minimum (lowest) data value.

**Next Peak** Marker locates the peak with the next lower amplitude value relative to its starting position.

**Peak Right** The marker locates the next valid peak to the right of its starting position on the X-axis.

**Peak Left** The marker locates the next valid peak to the left of its starting position on the X-axis.

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be **above** the threshold level. The valley on either side can be below the threshold level.

- **Excursion** The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must “fall off” from the peak on both sides by the excursion value.

For more information, see **What is a Peak?**

**Target** Enter the Target value. The marker moves to the first occurrence of the Target value to the right of its current position. Subsequent presses of the Execute button cause the marker to move to the next value to the right that meets the Target value. When the marker reaches the upper end of the stimulus range, it will "wrap around" and continue the search from the lower end of the stimulus range (left side of the window).

- If **Discrete Marker** is OFF, the marker locates the interpolated data point that equals the target value.

- If **Discrete Marker** is ON and there are two data points on either side of the target value, the marker locates the data point closest to the Target value.

---

**Bandwidth Markers**

Four markers are automatically deployed to find the first negative or positive bandpass in the selected search domain.

To create Bandwidth markers:

1. Press **SEARCH**, then [Bandwidth]

2. Specify the level in dB from the peak or valley where bandwidth is measured.

- Bandwidth Search can be used ONLY with **Log Mag display format**.

- To use Bandwidth Search on a peak or valley other than the maximum or minimum values, change the
Search Domain.

Enter a **Negative** number to search for a **Peak** bandpass, such as a filter S21 response:

- Marker 1: Maximum value within the **Search Domain**.
- Marker 2: Specified level DOWN the left of the peak.
- Marker 3: Specified level DOWN the right of the peak.
- Marker 4: Center frequency between markers 2 and 3.

Enter a **Positive** number to search for a **Valley** bandpass, such as a filter S11 response:

- Marker 1: Minimum value within the **Search Domain**.
- Marker 2: Specified level UP the left of the valley.
- Marker 3: Specified level UP the right of the valley.
- Marker 4: Center frequency between markers 2 and 3.

The following four values are displayed for Bandwidth Search:

- **BW**: (Marker 3 x-axis value) - (Marker 2 x-axis value) = width of the filter.
- **Center**: Mathematical midpoint between markers 2 and 3.
- **Q**: Ratio of Center Frequency to Bandwidth (Center Frequency / Bandwidth).
- **Loss**: Y-axis value of Marker 4. This is the loss of the filter at its center frequency. The ideal filter has no loss (0 dB) in the passband.

**Compression Markers**

Uses the active marker to find the specified gain **Compression Level**. Learn more about Gain Compression.

**Note**: Valid ONLY for S21 (Gain) measurements with a **Power Sweep**.

To create Compression markers:

1. Press **SEARCH**, then **[Compression]**
2. Specify the compression level in dB,
3. Optionally press **Tracking** to search for the specified compression level with each sweep.

Linear gain is defined as the Y-axis value (gain) of the first data point of the **Search Domain** (Full Span by default).
Marker > N: X-axis value and Y-axis value

Comp Pin: Input power (marker X-axis value)
Comp Pout: Output power (Pin + gain)
Comp Level: Compression level found.

- When **Discrete** is OFF (default setting) the marker finds the exact specified compression, interpolated between the two closest data points and calculates the Comp Pin and Comp Pout value for that point.
- When Discrete is ON (not interpolated), the marker resides on the closest data point to the requested compression level.

Comp. Not Found: Displayed when the requested compression level is not found.

### About PSAT and PNOP Markers

Compression measurements based on the Pout vs Pin curves are common in the satellite test industry. In the case of Travelling Wave Tube (TWT) amplifiers, PSAT markers identify the normal operating point near saturation, and the amplifiers are operated with the power slightly backed-off approximately 0.03 to 0.1 dB. For TWT amplifiers, the saturation curve always "folds over" and produces a maximum power out.

For Solid State Power Amplifiers (SSPA), the saturation is not as well defined. A common reference is the Normal Operating Point, which is a power backed-off by 8 to 10 dB from the maximum power. In this case, the normal operating point marker replaces the Psat with the PNOP values. Also, because the backoff is important, the backoff output and input powers are displayed (PBO Out), (PBO in) as well as gain at back off (PBO Gain).

#### Power Saturation (PSAT) Markers

Uses Markers 1, 2, and 3 to quickly identify output power saturation parameters of an amplifier.

**Note:** Valid ONLY for Power IN vs Power OUT measurements. These markers can also be used on a CompOut trace with **Compression Analysis** mode in the Gain Compression Application.

To make a Power IN (X-axis) vs Power OUT (Y-axis) measurement:

1. **Preset**
2. Set **Sweep Type:** Power Sweep
3. Set Trace Meas to "B" Receiver

4. Connect DUT input to port 1

5. Connect DUT output to port 2

To create PSAT markers:

1. Press search, then [Search...]

2. From Search Type, select Power Saturation

3. For PMax Back-Off, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).

4. Press Execute or check Tracking. Learn more.

This setting uses three markers to calculate and display 10 values.

The three markers:

- Marker 1: Linear gain; the first data point in the sweep.

- Marker 2: Specified output power Back-off from max power.

- Marker 3: Max Power output; usually the last data point.

The 10 displayed values:
Power Normal Operating Point Marker

Uses Markers 1, 2, 3, and 4 to quickly identify Normal Operating Point parameters of an amplifier.

**Note:** Valid ONLY for Power IN vs Power OUT measurements.

These markers can also be used on a CompOut trace with Compression Analysis mode in the Gain Compression Application.

See Power Saturation to learn how to make a Power IN (X-axis) vs Power OUT (Y-axis) measurement.

To create PSAT markers:

1. Press SEARCH, then [Search...]
2. From Search Type, select Normal Operating Pt
3. For Back-Off, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
4. For Pin Offset, enter the X-axis (Power IN) difference between Back-off marker (2) and PNOP marker (4).
5. Press Execute or check Tracking. Learn more.
This setting uses four markers to calculate and display 12 values.

The four markers:

- Marker 1: Linear gain; the first data point in the sweep.
- Marker 2: Max Output Power MINUS the specified Output (Y-axis) Back-off value in dB.
- Marker 3: Max Output Power; usually the last data point in the sweep.
- Marker 4: X-axis value of Back-off (Marker 2) plus the Pin Offset (X-axis) value in dB.

The 12 displayed values:

- >Mkr 4: Marker 4 - X-axis and Y-axis values
- Pnop Out: Marker 4 Y-axis value
- Pnop In: Marker 4 X-axis value
- Pnop Gain: Pnop Out - Pnop In
- Pnop Comp: Pnop Gain - Linear Gain*
- PMax Out: Marker 3 Y-axis value
- PMax In: Marker 3 X-axis value
- Gain Max: PMax Out - PMax In
- Comp Max: Gain Max - Linear Gain*
- PBO Out: Marker 2 Y-axis
- PBO In: Marker 2 X-axis
- PBO Gain: PBO Out - PBO In

*Linear Gain (not shown): Marker 1 - Y-axis value MINUS X-axis value

PNOP Not Found: Displayed when the requested back-off level is not found.

When Discrete marker is NOT selected (the default setting), the four markers each find an interpolated value between the two closest data points.

When Discrete marker is selected (NOT interpolated), the four markers each reside on the closest data point.
What Is a "Peak"?

You define what the analyzer considers a "peak" by selecting the following two peak criteria settings:

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be **above** the threshold level. The valley on either side can be below the threshold level.

- **Excursion** - The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must "fall off" from the peak on both sides by the excursion value.

**Example:**

Threshold Setting: -10dB  
Excursion Setting: 1dB  
Scale = 1 dB / Division

*Mouse over the graphic to find a valid peak.*

- **Peak A** = Valid Peak (Above Threshold and Excursion Settings)  
- **Peak B** = Invalid Peak (Below Excursion Setting)  
- **Peak C** = Invalid Peak (Below Threshold Setting)

**Search Domain**

Search domain settings restrict the stimulus values (X-axis for rectangular format) to a specified span. Set the Start and Stop stimulus settings of these **User** spans. If Start is greater than Stop, the marker will not move. Learn how to set Search Domain.

- The default domain of each new marker is "full span".
- There are 16 user-defined domains for every channel.
- The user-defined domains can overlap.
- More than one marker can use a defined domain.
- Search Domain settings are shared with Trace Statistics User Ranges.
The graphic below shows examples of search domains.

Marker Functions - Change Instrument Settings

The following settings change the relevant PNA settings to the position of the active marker.

How to change instrument settings using markers

<table>
<thead>
<tr>
<th>How to change instrument settings using markers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Using front-panel</strong></td>
</tr>
<tr>
<td>HARDKEY [softkey] buttons</td>
</tr>
<tr>
<td>1. Press <strong>Marker</strong></td>
</tr>
<tr>
<td>2. then <strong>[Marker Function]</strong></td>
</tr>
</tbody>
</table>

[Diagram of search domains with markers labeled: User 1, User 3, User 2]
**Marker Function** dialog box help

Note: Marker Functions do not work with channels that are in CW or Segment Sweep mode.

**Marker =>Start** Sets the start sweep setting to the value of the active marker.

**Marker =>Stop** Sets the stop sweep setting to the value of the active marker.

**Marker =>Center** Sets the center of the sweep to the value of the active marker.

**Marker =>Ref Level** Sets the screen reference level to the value of the active marker.

**Marker =>Delay** The phase slope at the active marker stimulus position is used to adjust the line length to the receiver input. This effectively flattens the phase trace around the active marker. Additional Electrical Delay adjustments are required on devices without constant group delay over the measured frequency span. You can use this to measure the electrical length or deviation from linear phase.

This feature adds phase delay to a variation in phase versus frequency; therefore, it is only applicable for ratioed measurements. See Measurement Parameters.

**Marker =>Span** Sets the sweep span to the span that is defined by the delta marker and the marker that it references. Unavailable if there is no delta marker.

**Marker =>CW Freq** Sets the CW frequency to the frequency of the active marker. NOT available when the channel is in CW or Power Sweep. Use this function to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep Type to Power or CW.

**Coupled Markers**

The coupled markers feature causes markers on different traces to line up with the markers on the selected trace. Markers are coupled by marker number, 1 to 1, 2 to 2, 3 to 3, and so forth. If the x-axis domain is the same (such as frequency or time), coupling occurs across all channels, windows, and traces. Trace markers in a different x-axis domain will not be coupled. If a trace marker has no marker to couple with on the selected trace, the marker remains independent.

**Coupled Markers Model**

This model simulates the use of coupled markers in the PNA:
1. Click **Trace A** or **Trace B**

2. Click **Coupled Markers**

3. Notice the following:
   
   - Markers on the unselected trace move to the x-axis position of the selected trace.
   - If a marker number on the unselected trace has no corresponding marker on the selected trace, no movement occurs for that marker.

4. Click **Reset** to run the model again. There is no Reset for coupled markers on the PNA.

**Marker Display**

The marker display dialog allows you to change how markers and the associated readout is displayed on the PNA screen. Several marker display features also apply to **Statistics** display.

**How to change marker display settings**

Right-click on a marker readout, then click **Marker Display** or:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>MARKER</strong></td>
<td>1. Click <strong>Marker/Analysis</strong></td>
</tr>
<tr>
<td>2. then <strong>[Properties]</strong></td>
<td>2. then <strong>Marker</strong></td>
</tr>
<tr>
<td>3. then <strong>[Marker Display]</strong></td>
<td>3. then <strong>Marker Display</strong></td>
</tr>
</tbody>
</table>
The following settings apply to readouts of ALL currently-displayed marker, bandwidth, and trace statistics. These settings revert to their defaults on Preset but ARE stored with Instrument State and User Preset.

**Marker Readout**
- Checked - Shows readout information.
- Cleared - Shows NO readout information.

**Large Readout**
- Checked - Shows the marker readout in large font size for easy reading. However, all readout lines may not be visible.
- Cleared - Shows the marker readout in normal font size.

**Readouts Per Trace** Choose the quantity of marker readouts to show in the window for each trace. Choose to display up to 10 readouts per trace, up to 20 readouts per window. When more markers are present than the specified quantity of readouts, the marker numbers for which readouts are displayed can change depending on the marker number that is active. Readouts Per Trace can be set independently for each window.

**Symbol** - Choose from the following marker symbols.

- Triangle
- Flag
- Line

Line symbols are NOT used on Smith or Polar display formats.

Symbols can be set independently for each window.

**Decimal Places** Choose the marker readout resolution to display. These values also apply to the readouts that are displayed in the marker table. Decimal Places can be set independently for each window.
- Stimulus (X-axis) - Choose from 2 to 6 places after the decimal point. Default is 3.
- Response (Y-axis) - choose from 1 to 4 places after the decimal point. Default is 2.
**Readout Position** Choose where to place the marker readouts. Marker readouts are right-justified on the specified X-axis and Y-axis position. The default position (10.0, 10.0) is the upper-right corner of the grid. Position (1.0,1.0) is the lower-left corner. Readout position can be set independently for each window.

**Note:** Readout Position can also be changed using a mouse by left-clicking on the top readout and dragging to the new position.

**Marker Colors** Starts the Display Colors dialog with only the marker colors available. [Learn more.](#)

---

**Marker Table**

You can display a table that provides a summary of marker data for the active trace. The marker data is displayed in the specified format for each marker.

**How to view the Marker Table**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **DISPLAY**
2. then **[More]**
3. then **[Tables]**
4. then **[Marker Table]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Display**
3. then **Tables**
4. then **Marker Table**

---

Using Math / Memory Operations

You can perform four types of math on the active trace versus a memory trace. In addition three statistics (Mean, Standard Deviation and Peak to Peak) can be calculated and displayed for the active data trace.

- **Trace Math**
- **Trace Statistics**

Note: Trace Math (described here) allows you to quickly apply one of four math operations using memory traces. Equation Editor allows you to build custom equations using several types of traces from the same, or different channels.

Other Analyze Data topics

Trace Math

To perform any of the math operations, you must first store a trace to memory. You can display the memory trace using the View options.

Trace math is performed on the complex data before it is formatted for display. See the PNA data processing map. Markers can be used while viewing a memory trace.

How to select Trace Math

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press MEMORY</td>
<td>1. Click Marker/Analysis</td>
</tr>
<tr>
<td></td>
<td>2. then Memory</td>
</tr>
<tr>
<td></td>
<td>3. then Memory</td>
</tr>
</tbody>
</table>

Normalize, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as Data=>Memory, then Data / Memory.

Math / Memory dialog box help
Normalize, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as Data=>Memory, then Data / Memory.

Data=>Memory  Puts the active data trace into memory. You can store one memory trace for every displayed trace.

Note: Many PNA features are NOT allowed on Memory traces. For example, Memory traces can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF). However, you can restore a memory trace to a data trace using the Memory-to-Data utility at the http://na.tm.agilent.com/pna/apps/applications.htm website.

Data Math
All math operations are performed on linear (real and imaginary) data before being formatted. See the PNA Data flow (below).

Data (or OFF)  Does no mathematical operation.

Data / Memory - Current measurement data is divided by the data in memory. Use for ratio comparison of two traces, such as measurements of gain or attenuation. Learn more.

Data – Memory - Data in memory is subtracted from the current measurement data. For example, you can use this feature for storing a measured vector error, then subtracting this error from the DUT measurement. Learn more.

Data + Memory - Current measurement data is added to the data in memory. Learn more.

Data * Memory - Current measurement data is multiplied by the data in memory. Learn more.

8510 Mode - Learn more.

Trace View Options

Data Trace  Displays ONLY the Data trace (with selected math operation applied).

Memory Trace  Displays ONLY the trace that was put in memory.

Data and Memory Trace  Displays BOTH the Data trace (with selected math operation applied), and the trace that was put in memory.

Learn more about Trace Math (scroll up)
(Data / Memory) and (Data - Memory)

(Data / Memory) and (Data - Memory) math operations are performed on linear data before it is formatted. Because data is often viewed in log format, it is not always clear which of the two math operations should be used. Remember: dividing linear data is the same as subtracting logarithmic data. The following illustrates, in general, when to use each operation.

Use Data / Memory for normalization purposes, such as when comparing S21 traces “before” and “after” a change is made or measurement of trace noise. In the following table, the Data/Mem values intuitively show the differences between traces. It is not obvious what Data-Mem is displaying.

<table>
<thead>
<tr>
<th>S21 values to compare</th>
<th>Data/Mem</th>
<th>Data-Mem</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5 dB and 0.6 dB</td>
<td>0.1 dB</td>
<td>-39 dB</td>
</tr>
<tr>
<td>0.5 dB and 0.7 dB</td>
<td>0.2 dB</td>
<td>-33 dB</td>
</tr>
</tbody>
</table>

Use Data - Memory to show the relative differences between two signals. Use for comparison of very small signals, such as the S11 match of two connectors.

In the following table, Data/Mem shows both pairs of connectors to have the same 2 dB difference. However, the second pair of connectors have much better S11 performance (-50 and -52) and the relative significance is shown in the Data-Mem values.

<table>
<thead>
<tr>
<th>S11 values to compare</th>
<th>Data/Mem</th>
<th>Data-Mem</th>
</tr>
</thead>
<tbody>
<tr>
<td>-10 dB and -12 dB</td>
<td>2 dB</td>
<td>-24 dB</td>
</tr>
<tr>
<td>-50 dB and -52 dB</td>
<td>2 dB</td>
<td>-64 dB</td>
</tr>
</tbody>
</table>

Data * Memory and Data + Memory

Use Data * Memory and Data + Memory to perform math on an active data trace using data from your own formulas or algorithms rather than data from a measurement. For example, if you want to simulate the gain of a theoretical amplifier placed in series before the DUT, you could do the following:

1. Create an algorithm that would characterize the frequency response of the theoretical amplifier.

2. Enter complex data pairs that correspond to the number of data points for your data trace.

3. Load the data pairs into memory with SCPI or COM commands. The analyzer maps the complex pairs to correspond to the stimulus values at the actual measurement points.

4. Use the data + memory or data * memory function to add or multiply the frequency response data to the measured data from the active data trace.

Note: The data trace must be configured before you attempt to load the memory.

Trace Statistics
You can calculate and display statistics for the active data trace. These statistics are:

- Mean
- Standard deviation
- Peak-to-peak values

You can calculate statistics for the full stimulus span or for part of it by using User Ranges.
You can define up to 16 user ranges per channel. These user ranges are the same as the Search Domain specified for a marker search in that same channel. They use the same memory registers and thus share the same stimulus spans.
The user ranges for a channel can overlap each other.
A convenient use for trace statistics is to find the peak-to-peak value of passband ripple without searching separately for the minimum and maximum values.
The trace statistics are calculated based on the format used to display the data.

- **Rectangular data formats** are calculated from the scalar data represented in the display
- **Polar** or **Smith Chart** formats are calculated from the data as it would be displayed in Log Mag format

See how to make Trace Statistics display settings.

### How to activate Trace Statistics

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>ANALYSIS</strong></td>
<td>1. Click <strong>Marker/Analysis</strong></td>
</tr>
<tr>
<td>2. then <strong>[Statistics]</strong></td>
<td>2. then <strong>Analysis</strong></td>
</tr>
<tr>
<td>3. then <strong>[Trace Statistics]</strong></td>
<td>3. then <strong>Trace Statistics</strong></td>
</tr>
</tbody>
</table>

[Programming Commands]
Trace Statistics dialog box help

See how to make Trace Statistics display settings.

Statistics  Check to display mean, standard deviation, and peak to peak values for the active trace.

Span  Specifies the span of the active trace where data is collected for a math operation. You can select Full Span, or define up to 16 user spans per channel with Start and Stop. You can also define the user spans from the Search Domain selector on the Marker Search dialog box.

Start  Defines the start of a user span.

Stop  Defines the stop of a user span.

Equation Editor

Equation Editor allows you to enter an algebraic equation that can mathematically manipulate measured data. The results are displayed as a data trace. Data that is used in the equation can be from the same or different channels.

**Note:** Equation Editor is now available with ALL PNA Apps.

See Using Noise Power Traces in Equation Editor

- Overview
- How to start Equation Editor
- Using Equation Editor
- Data that is used in Equation Editor
- Trace Settings, Error Correction, and an Example
- Functions and Constants
- Operators
- Example Equations
- Saving Equation Editor Data

**See Also**

Equation Editor Import Functions - create custom functions for use in Equation Editor.

---

**Other 'Analyze Data' topics**

---

**Overview**

Equation Editor allows you to enter an algebraic equation of standard mathematical operators and functions, referencing data that is available in the PNA. Once a valid equation is entered and enabled, the display of the active trace is replaced with the results of the equation, and updated in real-time as new data is acquired. For equations that can be expressed with Equation Editor's supported functions, operators, and data, there is no need for off-line processing in a separate program.

For example, enter the equation S21 / (1 - S11). The resulting trace is computed as each S21 data point divided by one minus the corresponding S11 data point. For a 201 point sweep setup, the computation is repeated 201 times, once for each point.

As another example, suppose you want the PNA to make a directivity measurement of your 3-port DUT. This is not a native PNA measurement, but can be achieved using the Equation Editor. The desired result is the sum and difference of LogMag formatted traces, expressed as: S12 + S23 - S13.

Because Equation Editor operates on unformatted complex data, the required equation is:

\[ \text{DIR} = \frac{S12 \times S23}{S13} \]

DIR becomes a display label to help you identify the computed data trace.
On the equation trace, set the format to LogMag.

### How to start Equation Editor

![Equation Editor dialog box help](image)

**Equation Editor dialog box help**

**Notes**
- **Double-click**, or type, the Functions, Operators, and Data to build an Equation.
- Scroll down to learn more about Using Equation Editor

**Equation:** The field in which equations are built. Click the down arrow to the right to use or modify equations that have been previously saved. This is where equations are saved when you press ‘Store Equation’.

**Enabled** Check this box to enable the equation that is currently in the Equation field. If the Enabled box is not available, then the equation is not valid. If a data trace is used that is from a different channel than the Equation trace, the channels MUST have the same number of data points to be valid.

**<-Backspace** Moves the cursor to the left while erasing characters.

**<-** Moves the cursor to the left without erasing characters.

**->** Moves the cursor to the right without erasing characters.
**Store Equation**  Press to save the current equation. To later recall the equation, click the down arrow to the right of the equation.

**Delete Equation**  Removes the current equation from the drop-down list.

**Functions/Constants:**  See descriptions of Functions.

Select the "library" of functions to view. The "built-in" library appears by default which includes the standard functions of equation editor. Other functions that can appear here are functions that you have written and imported.  Learn more.

**Operators:**  See descriptions of Operators.

**Trace Data:**  Select from ALL of the currently displayed traces on ALL channels.

**Ch Param Data:**  Select from undisplayed data that is available ONLY from the active channel (same channel as the equation trace).

**Note:**  With an external test set enabled, only parameters involving ports 1 through 4 are listed. However, all available parameters can be typed directly into the **Equation** field.

See Data that is used in Equations.

**Keypad:**  Provided to allow navigation of the entire dialog with a mouse.

**Import Functions**  Click to launch the Import Functions Dialog box.

### Using Equation Editor

1. **Pick a trace in which to enter the equation**
   
   - Equation Editor works on the active trace.
   
   - Either create a new trace, or click the **Trace Status** button on an existing trace to make the trace active.

2. **Enter an equation**

   Start Equation Editor See how.

   - The equation text can be in the form of an expression \( \frac{S21}{1-S11} \) or an equation \( \text{DIR} = S12 * S23 / S13 \).
     This topic refers to both types as equations.
   
   - Either type, or double-click the Functions, Operators, and Data to build an equation.
   
   - Functions and Constants ARE case-sensitive; Data names are NOT case sensitive.
   
   - Learn more about referring to data traces.

3. **Check for a valid equation**

   When a valid equation is entered, the Enabled checkbox becomes available for checking. When the Enabled box is checked:

   - The Equation Trace becomes computed data.
The equation is visible on the **Trace Status** (up to about 10 characters).

The equation is visible in the trace **Title** area (up to about 45 characters) when the Equation trace is active.

The equation is visible in the **Status Bar** at the bottom of the display. This is updated only after the equation is entered and the **Trace Status** button is clicked.

If an equation is NOT valid, and a trace from a different channel is used, make sure the number of data points is the same for both channels.

Learn more about the **Functions**, **Operators**, and **Data** that are used in Equation Editor.

**Data that is used in Equation Editor**

**Definitions**

- **Equation trace**  A trace in which an equation resides.
- **Referred trace**  A trace that is used as data in an equation.

  **Example:** \( eq = Tr2 + S11 \) is entered into **Tr1**.
  
  **Tr1** becomes an equation trace.
  
  **Tr2** and **S11** are both referred traces because they are used in the equation trace.

**Notes**

- Referred traces are processed one data point at a time. For example, the expression \( S11/S21 \) means that for each data point in **S11** and **S21**, divide point N of **S11** by point N of **S21**.
- Once an equation is enabled, the trace is no longer identified by its original measurement parameter. It becomes an equation trace.
- An equation trace can NOT refer to itself. For example, an equation in **Tr1** cannot refer to trace **Tr1**.
- Referred traces can be selected from S-Parameters, Receiver data, and **Memory traces**.

  **See note regarding External Test Sets.**

  **See** Using Noise Power Traces in Equation Editor

**There are three ways to refer to traces:**

The following distinction is important when discussing the three ways to refer to traces/data.

- **Trace** - a sequential collection of data points that are displayed on the PNA screen.
- **Data** - PNA measurements that are acquired but not displayed. When an equation trace refers to data that is not displayed, the PNA will automatically acquire the data.
1. Using **TrX** Trace notation (for example, Tr2).

When a trace is created, check "Show Tr Annotation" to see the Tr number of that trace.

- **Simple** - ALWAYS refers to displayed traces.
- Must be used for referring to traces in a different channel as the equation trace.
- All trace settings are preserved in the equation trace. If you do NOT want a trace setting to be used in the equation trace, you must disable it in the referred trace.
- If the referred trace is error corrected, then that data is corrected in the equation trace.
- Used to refer to a memory trace (it must already be stored in memory). Append .MEM to the TrX trace identifier. For example, *Tr2.mem* refers to the memory trace that is stored for Tr2.

2. Using **S-parameter** notation (for example, S11/S21)

- **Convenient** - ALWAYS refers to data that is NOT displayed.
- Refers to data that resides in the same channel as the equation.
- NOT the same as referring to a displayed S11 trace using TrX notation. See Example.

  - The referred data includes NO trace settings.
  - If the channel has error correction available, then it can be applied by turning error correction ON for the Equation trace.

3. Using **Receiver** notation (for example AB_2); NOT case sensitive.

At least one receiver is required, followed by an underscore and a number.

- The **letters** before the underscore refer to the receivers.
  - Letters alone refer to physical receivers.
  - Letters immediately followed by numbers refer to logical receivers. Learn more.
  - If two receivers are referenced, they are ratioed.
- The **number** after the underscore refers to the source port for the measurement.

Examples

- `AR1_2` = physical receiver A / physical receiver R1 with 2 as the source port.
- `a3b4_1` = reference receiver for port 3 / test port receiver for port 4 with 1 as the source port.

Learn more about ratioed and unratioed receiver measurements.

Receiver notation is like S-parameter notation in that:
• Refers to data that is NOT displayed and resides in the same channel as the equation.

• The referred data includes NO trace settings.

• If the channel has error correction available for that receiver, then it can be applied by turning error correction ON for the Equation trace.

**Referring to Traces in a different channel**

When the equation trace refers to a trace on a different channel:

• The trace must already be displayed.

• Must refer to the trace using **TrX** notation.

• The Equation trace and the referred trace MUST have the same number of data points or the Enable checkbox will not be available.

• The Equation trace is updated when the last referred data in the same channel is acquired. Therefore, to prevent 'stale' data from being used, the Equation trace must be on a higher numbered channel than the referred trace. This is because the PNA acquires data in ascending channel number order - first channel 1, then channel 2, and so forth. If the Equation trace is on channel 1, and it refers to a trace on channel 2, the Equation trace will update after channel 1 is finished sweeping, using 'old' data for the channel 2 trace.

**Port Extensions and Equation Editor**

When using port extension with an equation, turn Fixturing ON to ensure that the underlying parameters have port extension properly applied. Learn more.

**Trace Settings, Error Correction, and an Example**

This discussion highlights the differences between using **S-parameter / Receiver** notation and **TrX** notation when referring to traces. The key to understanding the differences is realizing that **S-parameter / Receiver** notation ALWAYS refers to data that is NOT displayed.

- **Trace Settings** Normalization, Trace Math, Gating, Phase and Mag Offset, Electrical Delay, Time Domain.
- **Equation Editor** processing occurs on the *equation trace* immediately after error correction.

- **Referred Data/Trace** (used in the equation) is taken from the following locations:
  - When using **TrX** notation, data is taken immediately before formatting. These traces are always displayed and include **Trace Settings**.
  - When using **S-parameter / Receiver** notation, data is taken immediately after error correction. This data is NOT displayed and includes **NO** trace settings (see example).

See Equation Editor Notes at [GetData Method](#) or [GetDataByString Method](#).

**Error-correction and Equation Editor**

Using **TrX** notation:

- The Trace Settings and Error-correction on the referred trace are used in the Equation trace.
- If error correction is **NOT** ON, then the raw, uncorrected data is used in the equation trace.
- To see if error correction is ON, make the trace active, then see the [Correction level in the status bar](#).
- Turning error correction ON/OFF on the equation trace has no meaning. The referred data that is used in the equation is **ALWAYS** what determines its level of correction.

Using **S-parameter** and **Receiver** notation:

- Because the data is not displayed, NO trace settings are used in the Equation trace.
- Correction can be turned ON/OFF if corrected data is available for the referred data. Exception: When using **S-parameter** and **Receiver** notation to refer to a trace on a channel that has been calibrated with a **Response Cal** or **Receiver Cal**, correction can **NOT** be turned ON, even though the Status Bar indicates otherwise. For example: Tr1 is an S11 measurement with a Response Cal. Tr2 is an equation trace that refers to S11. The Tr2 equation trace is **NOT** corrected, even though the Status Bar may indicate that it is corrected. However, if Tr2 refers to Tr1 (not S11), the Tr2 equation trace is corrected.

**Example**

This example illustrates the differences when referring to a trace using **S-parameter** notation and **TrX** notation:
• **Tr1** is an S11 measurement with no equation, 2-port correction ON, and Time Domain transform ON.

• **Tr2** is an equation trace that refers to **Tr1**. Tr2 is corrected because Tr1 is corrected. Tr2 is transformed because Tr1 is transformed. If transform is turned ON for Tr2, the data will be transformed AGAIN, which results in "unusual" data.

• **Tr3** is an equation trace that refers to **S11**. This is NOT the same as referring to Tr1. The S11 trace that is referred to is a different instance of S11 that is NOT displayed, and has NO trace settings. Notice that Tr3 data is NOT transformed, although Tr1 is transformed. Correction for **Tr3** can be turned ON and OFF because a calibration was performed on the channel in which the S11 trace resides.

• **Note**: X-axis annotation of the Equation trace is completely independent of the data that is presented. ONLY the data values from a referred trace are used. For example, notice that the Equation trace **Tr2** has Frequency on the X-axis although the referred trace **Tr1** is presented in Time.

### Functions and Constants used in Equation Editor

ALL trace data that is used in Equation Editor is unformatted, complex data.

In the following table,

- Function(scalar x) means that an automatic conversion from a complex number to its scalar magnitude is performed before passing the value to the function.

- Function(complex x) means that the entire complex value is used.

- **a, b, c, d** are arguments that are used in the function.

<table>
<thead>

Example Equations

The following examples may help you get started with Equation Editor.

Offset each data point in Tr2 from Tr1 by 2dB

Use the function: pow(complex \(a\), complex \(b\)) -- returns \(a\) to the power \(b\).

\[
\begin{align*}
20\log(a) + 2 &= 20\log(x) \\
\log(a) + 2/20 &= \log(x) \quad \text{// divide all by 20.} \\
x &= 10^{\log(a) + 2/20} \quad \text{// swap sides and take 10 to the power of both sides} \\
x &= 10^{\log(a) \times 10^{(2/20)}} \\
x &= a \times 10^{(2/20)}
\end{align*}
\]

The equation is entered into Tr2 as:

\[
\text{Offset=Tr1*\text{pow}(10, 2/20)}
\]

To offset by 5 dB

\[
\text{Offset=Tr1*\text{pow}(10, 5/20)}.
\]

Balanced Match using a 2-port PNA

\[
S_{DD11} = \frac{(S_{11} - S_{21} - S_{12} + S_{22})}{2}
\]

Conversion loss

\[
B_1/\text{pow}(10, -15/20)
\]

- \(B_1\) is a receiver measurement;
-15 is the input power in dBm

**Third-order intercept point (IP3 or TOI)**

$$ TR1 \cdot \sqrt{Tr1/Tr3} $$

- $Tr1$ = input signal power
- $Tr3$ = intermodulation power (both traces measured with single receivers)

**Harmonics in dBc**

$$ B_1/Tr2 $$

- $B_1$ is tuned to a harmonic frequency
- $Tr2$ = power at fundamental frequency, measured with $B_1$ receiver

**PAE (Power Added Efficiency)**

\[ PAE = 100 \times \frac{(.001 \times \text{pow(mag(Tr1),2)}) - (.001 \times \text{pow(mag(Tr1),2)}/\text{pow(mag(Tr2),2)})}{(Tr3 \times Tr4)} \]

Where:

- $Tr1$ - a trace that measures unratioed B receiver.
- $Tr2$ - a corrected S21 trace (amplifier gain)
- $Tr3$ - a trace that measures ADC voltage (A11) across a sensing resistor.
- $Tr4$ = an equation trace containing Isupp = (Tr3 / value of sensing resistor).

Data is displayed in Real format with units actually being watts.

**1-port Insertion Loss**

When it is not possible to connect both ends of a cable to the PNA, a 1-port insertion loss measurement can be made. However, the measured loss must be divided by 2 because the result includes the loss going down and coming back through the cable. This assumes that the device is terminated with a short or open to reflect all of the power. The 'divide by 2' operation (for dB) is performed as follows using Equation Editor:

- $Tr1$ - an S11 trace in log mag format.
- $Tr2$ - an equation trace containing $\sqrt{Tr1}$

**Max and Min Hold**

These two functions allow you to capture and display either the Maximum or Minimum values for each data point.
over multiple sweeps.

**Maxhold (S21)** - displays the maximum value for each data point until reset. Reset by disabling, then enabling the equation. This example refers to an S21 trace that is not displayed.

### Saving Equation Editor Data

Equation data can be saved to the PNA hard drive in the following formats:

- **Citifile (.cti)** - Equation data is saved and recalled. The file header indicates the "underlying" s-parameter trace type.
- **PRN** - read by Spreadsheet software. Can NOT be recalled by the PNA.
- **CSV** - read by Spreadsheet software. Can NOT be recalled by the PNA.
- **MDIF** - compatible with Agilent ADS (Advanced Design System). Can NOT be recalled by the PNA.
- **Print to File** (bmp, jpg, png) - saves image of PNA screen.

Equation data can NOT be saved in .SnP file format. When attempting to save an Equation trace in .SnP format, the "underlying" S-parameter data is saved; not Equation data.

Last Modified:

- 6-Apr-2011  Replaced 1-port example with JV ex.
- 5-Nov-2010  Edited TR annotation
- 20-Sep-2010  Added file types to save data
- 2-Sep-10  Added link to NF
- 11-Jun-2009  Added link to GetData
- 3-Sep-2008  Removed legacy content
- 22-Aug-2008  Added xAxisArray() Maxhold() and Minhold() function
- 6-May-2008  Added Import functions
- 3-Jul-2007  Added PAE and other notes
- 18-Jun-2007  Added examples
Using Limit Lines

Limit lines allow you to compare measurement data to performance constraints that you define.

- **Overview**
- **Create and Edit Limit Lines**
- **Display and Test with Limit Lines**
- **Testing with Sufficient Data Points**

**Other Analyze Data topics**

**Overview**

Limit lines are visual representations on the PNA screen of the specified limits for a measurement. You can use limit lines to do the following:

- Give the operator **visual guides** when tuning devices.
- Provide **standard criteria** for meeting device specification.
- Show the **comparison** of data versus specifications.

Limit testing compares the measured data with defined limits, and provides optional **Pass or Fail** information for each measured data point.

You can have up to **100** discrete lines for each measurement trace allowing you to test all aspects of your DUT response.

Limit lines and limit testing are NOT available with **Smith Chart** or **Polar** display format. If limit lines are ON and you change to Smith Chart or Polar format, the analyzer will automatically disable the limit lines and limit testing.

**Create and Edit Limit Lines**

You can create limit lines for all measurement traces. The limit lines are the same color as the measurement trace.

Limit lines are made up of discrete lines with four coordinates:

- BEGIN and END stimulus - X-axis values.
- BEGIN and END response - Y-axis values.
How to create, edit, and test with Limit Lines

All limit line settings are made with the limit table. Use one of the following methods to show the limit table:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Analysis</strong></td>
<td>1. Click <strong>Marker/Analysis</strong></td>
</tr>
<tr>
<td>2. then <strong>Limits</strong></td>
<td>2. then <strong>Analysis</strong></td>
</tr>
<tr>
<td>3. then <strong>Limit Test</strong></td>
<td>3. then <strong>Limit Test</strong></td>
</tr>
</tbody>
</table>

Limit Table

<table>
<thead>
<tr>
<th>Type</th>
<th>BEGIN STIMULUS</th>
<th>END STIMULUS</th>
<th>BEGIN RESPONSE</th>
<th>END RESPONSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>MIN</td>
<td>1.90000 MHz</td>
<td>5.00000 dB</td>
<td>0.00000 dB</td>
</tr>
<tr>
<td>2</td>
<td>MAX</td>
<td>1.90000 MHz</td>
<td>60.00000 dB</td>
<td>0.00000 dB</td>
</tr>
<tr>
<td>3</td>
<td>MAX</td>
<td>2.00000 MHz</td>
<td>5.00000 dB</td>
<td>0.00000 dB</td>
</tr>
<tr>
<td>4</td>
<td>OFF</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** To ADD a limit line to the table, change the last limit line to either MAX or MIN.

1. In the **Type** area of the Limit Table, select **MIN** or **MAX** for Limit Line 1.
   - The **MIN** value will fail measurements BELOW this limit.
   - The **MAX** value will fail measurements ABOVE this limit.

2. Click **BEGIN STIMULUS** for Limit Segment 1. Enter the desired value.

3. Click **END STIMULUS** for Limit Segment 1. Enter the desired value.

4. Click **BEGIN RESPONSE** for Limit Segment 1. Enter the desired value.

5. Click **END RESPONSE** for Limit Segment 1. Enter the desired value.

6. Repeat Steps 1-5 for each desired limit line.

Displaying and Testing with Limit Lines

After creating limit lines, you can then choose to **display** or **hide** them for each trace. The specified limits remain valid even if limit lines are not displayed.

Limit testing cannot be performed on memory traces.

You can choose to provide a visual and / or audible **PASS / FAIL** indication.

With limit testing turned ON:

- Any portion of the measurement trace that **fails** is **displayed in red**.
Any portion of the measurement trace that does **NOT fail** remains unchanged and silent.

**Display failed trace points or trace segments**

Beginning with PNA Rev. A.09.00, the new default behavior is to display the data points that fail limit line testing as red dots. This can be changed to the old default behavior (the failed limit line segment is colored red) with a Preference setting. Learn how.

![New default behavior vs Old default behavior](image)

**PASS is the default mode of Pass / Fail testing.**

A data point will **FAIL** only if a measured point falls outside of the limits.

- If the limit line is set to OFF, the entire trace will **PASS**.
- If there is no measured data point at a limit line stimulus setting, that point will **PASS**.
Limit Test dialog box help

**Show Table**  Shows the table that allows you to create and edit limits.

**Hide Table**  Makes the limits table disappear from the screen.

**Note:** To ADD a limit line to the table, change the last limit line to either MAX or MIN

**Limit Test**

- **Limit Test ON**  Check the box to compare the data trace to the limits and display PASS or FAIL.
- **Limit Line ON**  Check the box to make the limits visible on the screen. (Testing still occurs if the limits are not visible.)
- **Sound ON Fail**  Check the box to make the PNA beep when a point on the data trace fails the limit test.

**Global Pass/Fail**

The Pass/Fail indicator provides an easy way to monitor the status of ALL measurements.

- **Global pass/fail display ON**  Check to display the Global Pass/Fail status.

**Policy:**  Choose which of the following must occur for the Global Pass/Fail status to display PASS:

- All Tests (with Limit Test ON) Must Pass - This setting reads the results from the Limit Tests. If all tests (with Limit Test ON) PASS, then the Global Pass/Fail status will PASS.

- All Measurements Must Pass -  This more critical setting shows FAIL unless all measured data points fall within established test limits and Limit Test is ON. **Note:** In this mode, if one measurement does NOT have Limit Test ON, Global Pass/Fail will show FAIL.

Learn more about displaying and testing with Limits (scroll up)

**Testing with Sufficient Data Points**

Limits are checked only at the actual measured data points. Therefore, it is possible for a device to be out of specification without a limit test failure indication if the data point density is insufficient.

The following image is a data trace of an actual filter using 11 data points (approximately one every vertical graticule). The filter is being tested with a minimum limit line (any data point under the limit line fails).

Although the data trace is clearly below the limit line on both sides of the filter skirts, there is a PASS indication because there is no data point being measured at these frequencies.
The following image shows the exact same conditions, except the number of data points is increased to 1601. The filter now fails the minimum limit test indicated by the red data trace.
Save and Recall a File

The PNA allows you to save and recall files to and from an internal or external storage device in a variety of file formats.

- **How to Save PNA Instrument State**
- **How to Save PNA Measurement Data**
- **How to Recall a File**
- **About Instrument State and Calibration Data** (.csa, .cst, .sta, .cal)
- **About Measurement Data Files** (.prn, .snp, .cti, .csv, .mdf)
- **Managing Files without a Mouse**

### Other Data Outputting topics

#### How to Save Instrument State and Calibration Files

Use one of the following methods:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Save</strong></td>
<td>1. Click <strong>File</strong></td>
</tr>
<tr>
<td>2. then <strong>[Save], [Save As], or [Auto Save]</strong></td>
<td>2. then <strong>Save</strong> or <strong>Save As</strong></td>
</tr>
</tbody>
</table>

**Learn all about PNA Instrument State files.**

**Save**  Immediately saves the PNA state and possibly calibration data to the filename and extension you used when you last performed a Save. This file will be overwritten the next time you click **Save**. To prevent this, use one of the following methods.

**Save As**  Starts the **Save As** dialog box.

**Auto Save**  NOT available from the PNA menu. Saves state and calibration data to the internal hard disk in the C:/Program Files/Agilent/Network Analyzer/Documents folder. A filename is generated automatically using the syntax "atxxx.csa"; where xxx is a number that is incremented by one when a new file is Auto Saved.
Save (State and Calibration) As dialog box help

**Save** Allows you to navigate to the directory where you want to save the file.

**File name** Displays the filename that you either typed in or clicked on in the directory contents box.

**Save as type**

The following file types save **Instrument states and Calibration data**. You can save, and later recall, instrument settings and calibration data for **all channels** currently in use on the PNA. These file types are only recognized by Agilent PNA Series analyzers.

Learn more about these file types.

- ***.csa** - save Instrument state and actual Cal Set data (cal/state archive) **Default selection**.
- ***.cst** - save Instrument state and a link to the Cal Set data.
- ***.sta** - save Instrument state ONLY (no calibration data)
- ***.cal** - save actual Calibration data ONLY (no Instrument state)

**Note:** To save the PNA screen as .bmp, .jpg, or .png graphics file types, click File / Print to File. Learn more.

**Save** Saves the file to the specified file name and directory.

---

How to Save Measurement Data

Use one of the following methods:

**Using front-panel HARDKEY [softkey] buttons**

1. Press **SAVE**
2. then **[Save Data As]**

**Using a mouse with PNA Menus**

1. Click **File**
2. then **Save Data As**

**Save Data As** Saves the current trace(s) to the specified type of file.

**Note:** This dialog now contains the settings previously selected from the old Define Data Save dialog.

[Programming Commands]
Save Data As dialog box help

**Note:** Before saving measurement data, always trigger a single measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

**Note:** Memory traces can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

**Save** Allows you to navigate to the directory where you want to save the file.

**File name** Displays the filename that you either typed in or clicked on in the directory contents box.

**Save as type** Choose from: (click each to learn more about each file type): `.prn`, `.SNP`, `.SNPX`, `.cti` (citifile), `.csv`, `.mdf`.

- FCA, GCA, Swept IMD, and Swept IMDx data can be saved to a special csv format. Learn how ([FCA](#), [GCA](#) - Swept IMD)
- To save the PNA screen as .bmp, .jpg, or .png graphics file types, click **File / Print to File**. [Learn more](#).

**Data Scope**
Determines what traces are saved to a file. Available ONLY with `.cti`, `.csv`, and `.mdf`.

- **Auto**
  - When correction is OFF, saves the specified trace.
  - When correction is ON, saves all corrected parameters associated with the calibrated ports in the Cal Set.
    - For GCA and Swept IMD channels, saves the active trace only.
- **Single Trace** - Saves the active trace.
- **Displayed Traces** - Saves all displayed traces for all channels.

**Format**
Determines the format of the data. Available with (CTI Formatted, CSV, SNP, MDIF)

- **Auto** - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.
- **Displayed Format** (CSV and MDIF only) - Data is saved in the format of the displayed trace.
- **LogMag, LinMag, Real/Imag** - Select output format.
• The imaginary portion for all LogMag and LinMag data is saved in degrees.
• Real/Imag data is never smoothed.

Note: .prn files can only save the active trace in the displayed format.
Save Saves the file to the specified file name and directory.

How to Recall (open) a file
Select a file from the 'most recently used' list. The list is saved when the PNA application exits.
Use one of the following methods:

Using front-panel HARDKEY [softkey] buttons
1. Press Recall
2. then [Recall]

Using a mouse with PNA Menus
1. Click File
2. then Recall
Recall dialog box help

**Look in**  Allows you to select the directory that contains the file that you want to recall.

**Filename**  Displays the filename that you either typed in or clicked on in the directory contents box.

**Files of type**  Allows you view and select files that are listed in categories of a file type. The following types of files can be recalled into the PNA: All State files, Citi files, SNP files.

**Recalling PNA State files**

When an Instrument State file is recalled into the PNA, the current state of the instrument is overwritten with the recalled state. A *.cal file does not contain an instrument state, but only calibration data. Learn more about Instrument States.

See also Power ON and OFF during Save / Recall, User Preset, and Preset.

**Recalling Data files into the PNA**

Citi files and SNP files can be recalled and viewed in the PNA.

1. Click **File** then **Recall**.
2. Select **Citifile Data** or **Snp**.
3. Select the file to recall
4. Click **Recall**.

**Note:**  Citi files that were saved in **CW Time sweep** can NOT be recalled into the PNA

Recalled data is ALWAYS displayed on the PNA using **LogMag format**, regardless of how the file was stored. The channel is placed in Trigger Hold. If triggering is resumed, the data will be overwritten.

**SNP files**  are recalled as traces into a single window and channel, beginning at the highest available channel number allowed on the PNA. For multi-port SNP files (greater than 4 ports), if the number of S parameters in the file is beyond the maximum number of traces in a window, then new windows will be created.

**Citi files**  are recalled into the same window and channel configuration as when they were saved. However, the new recalled channel numbers begin with the highest channel number allowed on the PNA and decrement for each additional channel.

For example, when a citi file is saved, two traces are in window 1, channel 1 and two additional traces are in window 2, channel 2. When recalled into a factory preset condition (1 trace in window 1, channel 1), the first two recalled traces appear in window 2, highest channel number, and the second two traces appear in window 3, (highest channel number -1).

See also Traces, Channels, and Windows on the PNA

**Recall**  Recalls the file displayed in the file name box.

**Instrument State / Calibration Files**

You can save, and later recall, instrument settings and calibration data **for all channels** currently in use on the
PNA.

An **Instrument State** contains almost every PNA setting. The following PNA settings are NOT saved and recalled with Instrument State:

- **GPIB address**
- **RF power ON/OFF** (depends on current setting)
- **Test set I/O settings**

The following file types are used to save and recall instrument states and Cal Set information:

<table>
<thead>
<tr>
<th>File Types</th>
<th>Information that is stored for each channel</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

**File Type Descriptions and Recall**

The following describes each file type, and what occurs when the file type is recalled.

***.sta files**

- Contain ONLY instrument state information - NOT Cal data.
- When recalled, they always replace the current instrument state immediately.
*.cst files

- Contain BOTH instrument state and a LINK to the Cal Sets. Learn more about Cal Sets.

- The quickest and most flexible method of saving and recalling a calibrated instrument state.

- Channels need not have cal data to save as .cst file.

- When recalled, the state information is loaded first. Then the PNA tries to apply a Cal Set as you would do manually. If the stimulus settings are different between the instrument state and the linked Cal Set, the usual choice is presented (see Cal Sets). If the linked Cal Set has been deleted, a message is displayed, but the state information remains in place.

- Because only a link to the Cal Set is saved, the Cal Set can be shared with other measurements.

Note: Before saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the calibration. Cal Registers are overwritten with new data whenever a calibration is performed, and may not be accurate cal data when the .cst file is recalled. Learn more about Cal Sets.

*.cal files

- Contain ONLY Cal Set information.

- When recalled, the Cal Set is NOT automatically applied. Apply the calibration data to a channel as you would apply any Cal Set.

- Learn about Recalling

*.csa files

- Contain ALL instrument state and the actual Cal Set; not a link to the Cal Set.

- The safest method of saving and recalling a calibrated instrument state. However, the file size is larger than a *.cst file, and the save and recall times are longer. In addition, because the actual Cal Set is saved, it is very difficult to share the cal data with other measurements.

- Channels need not be calibrated to save as .cst file.

- The Cal Set that is saved could be a Cal Register or a User Cal Set.

- Learn about Recalling
Note: *.pcs files are the internal file format the PNA uses for storing cal sets. There is no reason for users to access or copy these files.

**Recalling Cal Sets**

Both .cal and .csa file types contain whole Cal Sets. When these file types are recalled, the PNA checks to see if the incoming Cal Set GUID matches an existing PNA Cal Set GUID. If it does, and if the rest of the Cal Set contents are different in any way, then both of these Cal Sets can NOT coexist in the PNA and you are offered the following choices.

Because all PNA channels are saved, there could be more than one Cal Set in either of these file types.

- **Overwrite** The incoming Cal Set will replace the existing Cal Set.
- **Duplicate** (Only available with .cal recalls.) Because the Cal Set is not automatically applied, you can choose to apply either the original or duplicate Cal Set. The original Cal Set remains in the .cal file.
- **Cancel** Abandon the recall operation.

The PNA will offer a choice as described in each file type below. Learn more about Cal Sets.

**Measurement Data Files**

Measurement data is saved as ASCII file types for use in a spreadsheet or CAE programs.

**Note:** Before saving measurement data, always trigger a single measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

**Note:** Memory traces can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

The following file types can be saved by the PNA.
*.prn files
*.SNP (Touchstone)
*.cti (Citifile)
*.csv
*.mdf (MDIF)

*.prn Files

Prn files have the following attributes:

- Comma-separated data which can be read into rows and columns by spreadsheet software, such as Microsoft® Excel. To avoid the "delimiting" dialog boxes, change the filename extension from .prn to .csv. Then open directly into Microsoft Excel.
- Contain formatted and corrected stimulus and response data for the current active trace ONLY.
- Are Output only - they cannot be read by the PNA.
- Beginning with PNA Rev 6.2, FCA and Cal Set Viewer data can be saved to *.prn files

Example:

"S11 Log Mag"

"Frequency (Hz)" , "dB"
3.000000e+005 , -3.528682e+001 ,
4.529850e+007 , -2.817913e+001 ,
9.029700e+007 , -3.216808e+001 ,
1.352955e+008 , -3.101017e+001 ,

.SNP Format (*.s1p, *.s2p, *.s3p, *.s4p, and so forth)

Note:
This file format is used by CAE programs such as Agilent's Microwave Design System (MDS) and Advanced Design System (ADS).
Notes
Beginning with PNA Rev. A.09.20...

- *.S2P data can be saved using the File, Save Data As dialog.
- FCA data can be saved to an *.S2P file using the File, Save Data As dialog.
- Balanced parameters can be saved to *.SNP files. See the "Choose Ports " dialog.

Beginning with PNA Rev. A.09.33...

- *.S2PX files are used to save and recall Segmented FCA data. Learn more.
- *.SNP data can be recalled and viewed on the PNA, or read by the PNA embed/de-embed functions.
- The amount of data that is saved depends on the file type that you specify and the amount of data that is available:
  - To save SNP data with an external test set enabled, at the File, Save As dialog, select SNP File(*.s*p), then complete the "Choose Ports " dialog.
  - When Fixturing is enabled, all of the enabled data transforms (De-embedding, Port Z Conversion, and so forth) are applied to saved SNP files.

<table>
<thead>
<tr>
<th>File Type</th>
<th># of Ports</th>
<th># of S-parameters saved</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.s1p</td>
<td>1</td>
<td>1 S-parameter</td>
</tr>
<tr>
<td>*.s2p</td>
<td>2</td>
<td>4 S-parameters</td>
</tr>
<tr>
<td>*.s3p</td>
<td>3</td>
<td>9 S-parameters</td>
</tr>
<tr>
<td>*.s4p</td>
<td>4</td>
<td>16 S-parameters</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>*.SNP</td>
<td>N</td>
<td>N^2 S-parameters</td>
</tr>
</tbody>
</table>

.SNP data is generally used to gather all S-parameters for a fully corrected measurement. The PNA uses the data that is available on the channel of the active measurement.

- If correction is applied, then valid data is returned for all corrected s-parameters.
- If requesting less data than is available, the Choose ports for SNP data dialog appears. Previous to PNA release 6.2, data was returned beginning with the first calibrated ports until your request if fulfilled.
- If correction is NOT applied, the PNA returns as much applicable raw data as possible using S-parameter measurements on the selected channel. Data that is not available is zero-filled. For example, if correction is...
NOT applied and the active measurement is S11, and an S21 measurement also exists on the channel, then
data is returned for the S11 and S21 measurements. Data for S12 and S22 is not available and therefore
returned as zeros in Real/Imaginary format. In Log Mag/Phase format, this appears as -200 dB and 45
degrees.

- **IMPORTANT** - ALL valid data is saved using the same format and settings (trace math, offset, delay, and so forth) as the active measurement. This can cause the data that is saved for the non-active measurements to be dramatically different from the data that is displayed. For example, when saving an S2P file, if the active S11 measurement is set to Data/Mem (data divided by memory), then ALL 4 S-parameters are saved using Data/Mem. The memory trace that is used in the Data/Mem operation is the same as that used in the active (S11) measurement.

- Before saving measurement data, always **trigger a single** measurement, and then allow the PNA channel to go into Hold. This ensures that the entire measurement trace is saved.

- Learn about [FCA parameters that are saved to an S2P file](#).

### .SNP Data Output

.SNP files contain header information, stimulus data, a response data pair for EACH S-parameter measurement. The only difference between .s1p, s2p, and so forth, is the number of S-parameters that are saved.

The following is a sample of **Header information**:

```
!Agilent Technologies,E8362B,US42340026,Q.03.54
!Agilent E8362B: Q.03.54
!Date: Friday, April 25, 2003 13:46:41
!Correction: S11(Full 2 Port SOLT,1,2) S21(Full 2 Port SOLT,1,2) S12(Full 2 Port SOLT,1,2) S22(Full 2 Port SOLT,1,2)
!S2P File: Measurements:S11,S21,S12,S22:
# Hz  S RI R 50
```

**Note:** Although the following shows Real / Imag pairs, the format could also be LogMag / Phase or LinMag / Phase

* .s1p Files
  Each record contains 1 stimulus value and 1 S-parameter (total of 3 values)
  Stim Real(Sxx) Imag(Sxx)

* .s2p Files
  Each record contains 1 stimulus value and 4 S-parameters (total of 9 values)
  Stim Real(S11) Imag(S11) Real(S21) Imag(S21) Real(S12) Imag(S12) Real(S13) Imag(S13)

* .s3p Files
  Each record contains 1 stimulus value and 9 S-parameters (total of 19 values)
  Stim Real(S11) Imag(S11) Real(S12) Imag(S12) Real(S13) Imag(S13) Real(S21) Imag(S21) Real(S22) Imag(S22)

* .s4p Files (and so forth...)
  Each record contains 1 stimulus value and 16 S-parameters (total of 33 values)
  Stim Real(S11) Imag(S11) Real(S12) Imag(S12) Real(S13) Imag(S13) Real(S14) Imag(S14)
.S2PX Data Output

*.S2PX files are used for Segmented Mixer Data. Learn more.

The following ADDITIONAL columns precede parameter data:

SegIndex, InputFreq, OutputFreq, LO1Freq, InputPower, LO1Power, <parameter data>

Choose ports for SNP File dialog box help

This dialog allows you to choose which S-parameter data to save when selecting File, Save As, Trace SNP and any of the following conditions exist:

- you request less data than is available
- you want data for more than 4 ports
- a balanced measurement is active

**Number of ports** Select the number of ports for which data will be saved.

The following buttons appear when a Balanced measurement is displayed.

**Normal** Click to save normal (single-ended) port data.

**Mixed Mode** Click to save balanced (logical) port data. Choices are based on the topology selection for current active parameter:

- **SE-Bal**: Choose from S1, D2, C2 (Single-ended port 1, Differential port 2, Common port 2)
- **SE, SE, Bal**: Choose from S1, S2, D3, C3 (Single-ended port 1, Single-ended port 2, Differential port 3, Common port 3)
Bal-Bal: Choose from D1, C1, D2, C2 (Differential port 1, Common port 1, Differential port 2, Common port 2)

For example, with SE-Bal topology, choose 2 ports, S1 for first, and D2 for second. The following 4 parameters are saved: Sss11, Ssd12, Sds21, Sdd22.

Arrow buttons Click to Add and Remove ports for the following columns:

Available Ports The PNA / External test set ports. There may NOT be valid data available for all of these ports. Learn more.

Chosen Ports When OK is clicked, SNP data is saved for these ports.

OK Becomes available when the number of Chosen ports = the Number of ports to save. Click to save to SNP file.

With Number of ports = 2, .s2p data is saved; with Number of ports = 3, .s3p data is saved, and so forth.

Learn more about SNP files

.cti CitiFiles

CitiFile format is compatible with the Agilent 8510 Network Analyzer and Agilent's Microwave Design System (MDS).

You can do the following using citifiles:

- save the active trace, or all traces.
- save formatted or unformatted citifile data

To save Formatted *.cti data

1. Click File then Save Data As
2. Select Citifile Formatted Data (*.cti)
The above image is a Citifile opened in Notepad. There are two traces in separate channels - one is an FCA trace. Each trace has 3 data points. The save settings = **Displayed Traces** Content, and **Auto** Format.

Format is identified by DBANGLE (log mag), MAGANGLE (Lin Mag), or RI (real, imaginary - NOT shown)

On the data access map, Formatted data is taken from location 2 or 4.

**To save Unformatted *.cti data**

1. Click **File**, then **Save Data As**

2. Select **Citifile Data Data (*.cti)**

On the data access map, Unformatted data is taken from the block just before Format. Citifiles can be recalled and viewed in the PNA. Learn more.

**.csv Files**

**Note:** 2D Gain Compression data is saved as *.csv files using a different format than shown here. Learn more.

CSV files are read by spreadsheet programs such as Microsoft Excel.
To save *.csv files:

1. Click **File**, then **Save Data As**

2. Under **Save as type**, select **CSV Formatted Data**

*.csv files contain: header information and the following **Comma-Separated Values**.

- Stimulus data
- Data pairs for EACH S-parameter

```
!CSV A.01.01
!Agilent Technologies, N5242A, US473000004, A.08.20.01
!Format: LogMag/Phase
!Date: Thursday, October 23, 2008 11:14:01

BEGIN CH1_DATA
!Freq(Hz), S11(DB), S11(DEG), S12(DB), S12(DEG), S21(DB), S21(DEG), S22(DB), S22(DEG)

...
END

BEGIN CH2_DATA
!Freq(Hz), S11(DB), S11(DEG), S12(DB), S12(DEG), S21(DB), S21(DEG), S22(DB), S22(DEG)
1e+009, 0.042540751, -0.024109257, 0.56931657, 0.042540751, -0.024109257, 0.56931657...
...
END
```

**.mdf Files**

MDIF files are compatible with Agilent ADS (Advanced Design System). [Learn more at the Agilent website](https://www.thermal.com).  

To save *.mdf files:

1. Click **File**, then **Save Data As**

2. Under **Save as type**, select **MDIF Data**

*.mdf files contain: header information and space-separated data:

- Stimulus data
- Real and Imaginary data pair for EACH S-parameter measurement
Define Data Saves

Note: Although these settings are still supported, they are no longer necessary to save data files. The *Save Data As* dialog box contains these settings.

### How to select Define Data Saves

**Using front-panel HARDKEY [softkey] buttons**

1. Press `SYSTEM`
2. then [Configure]
3. then [More]
4. then [Preferences]
5. then **Data Saves**

**Using a mouse with PNA Menus**

1. Click **Utility**
2. then **System**
3. then **Configure**
4. then **Preferences**
5. then **Data Saves**
Define Data Saves dialog box help

Note: Although these settings are still supported, they are no longer necessary to save data files. The Save Data As dialog box contains these settings.

The following settings survive an Instrument Preset and PNA Shutdown.

**CitiFile, CSV, and MDIF Contents**

Determines what is saved to a .cti file.

- **Auto** - Saves the active trace. Additional traces are saved if correction is ON. For Full 2-port calibration, 4 traces are saved; for Full 3-port calibration, 9 traces are saved, and so forth.
- **Single Trace** - Saves the active trace.
- **Displayed Traces** - Saves all displayed traces for all channels.

**CitiFile and CSV Format**

- **Auto** - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.
- **LogMag, LinMag, Real/Imag** - Select output format.
  - The imaginary portion for all LogMag and LinMag data is saved in degrees.
  - Real/ Imag data is never smoothed.

**SnP Format (.s1p, .s2p, .s3p)**

- **Auto** - Data is saved in LogMag or LinMag if one of these is the currently selected format. If format is other than these, then data is saved in Real/Imag.
- **LogMag, LinMag, Real/Imag** - Select output format. The imaginary portion for all LogMag and LinMag data is output is in degrees.

Manage Files without a Mouse

The Manage Files dialog box is designed to be used from the front panel. It performs the same function as Windows Explorer, but can be used without the use of a mouse or keyboard.
Manage Files dialog box help

**Recall**  Opens a Network Analyzer file already stored in memory.
**Rename**  Renames a file that is selected in the open folder.
**Delete**  Removes a selected file from the open folder.
**Delete All**  Removes all files of the file type selected that appear in the open folder.
**New folder**  Create a new folder and give it a name.

Last modified:

1-Jun-2011  Added S2PX
20-Sep-2010  Added memory trace notes
11-Nov-2009  Added snp fixturing note
3-Sep-2008  Removed legacy content
22-Aug-2008  Clarified invalid SNP data as -200 dB.
9-Jun-2008  Added no smoothing for real/imag cti files.
12-May-2008  Removed csv detail
17-Apr-2008  Added clarification and image to define data saves.
17-Oct-2007  Added note for MM
10/23/06  Added pcs note

510
9/18/06  MQ Added choose ports for snp

9/12/06  Added link to programming commands
**Drive Mapping**

Drive mapping allows you to share disk drives between the PNA and an external computer. You can either map from the PNA, or from your PC, to the other.

- **From the PNA, map to a drive on an External PC**
- **From an External PC, map to a drive on the PNA**

**To prepare for Drive Mapping:**

1. Both the PC and PNA must be connected to a shared computer network.
2. You must know the full computer name of the PC (or analyzer) you are mapping TO. [Tell me how]
3. Your logon and password on the analyzer must be the same as that on the external PC. You can add your PC logon to the analyzer. [Tell me how]

**Note:** These procedures require a mouse and keyboard. Also, the external PC must have Windows NT 4.0 (or later).

**From the Analyzer, map to a drive on the External PC**

1. On the external computer desktop, go to **Windows Explorer**. In the listing of drives, right click on the drive you want to share. Click **Sharing**.
2. In the dialog box, select **Shared As**. In the **Share Name** box, use the arrow key or type in a share name for the drive. For example: *C*$. Click **OK**.
3. On the analyzer desktop, click **Windows Explorer**. From the **Tools** menu, click **Map Network Drive**. (To get to the analyzer desktop, click **View**, then click **Title Bars**)
4. If you would like to connect to your external PC using a different logon, click **Connect using a different Logon**. This logon must be registered on the analyzer and you must be currently logged on the external PC using this logon.
   1. In the **Connect as** box, type your logon name. The logon name and password must be exactly the same on both the external PC and the analyzer.
   2. In the **Password** box, type the logon password that you use on the external computer. Click **OK**. The logon name and password must be exactly the same on both the external PC and the analyzer.
5. In the **Folder** box, type `//(full computer name of analyzer)/share name (from step 2).` (For example: `/SLT1234/C$`)
6. Click **Finish**.
From an External PC, map to a drive on the Analyzer

1. On the analyzer desktop, click **Windows Explorer**. Right click on the drive you want to share. Click on **Sharing**.

2. In the dialog box, select **Shared this folder**. In the **Share Name** box, type in a share name for the drive. For example: **C$**. Click **OK**.

3. On the external PC desktop, click **Windows Explorer**. From the **Tools** menu, click **Map Network Drive**.

4. If the current logon on your PC is different from the current logon on the analyzer, click **Connect using a different Logon** to connect to using the current analyzer logon. This logon must be registered on the external PC. To see the current logon on either the PC or analyzer, hold **Ctrl - Alt** and press **Delete**.

   1. In the **Connect as** box, type the logon currently being used by the analyzer.

   2. In the **Password** box, type the logon password that you use on the external computer. Click **OK**

5. In the **Folder** box, type ///computername (prep1)/share name (from step 2). (For example: //SLT1234/C$)

6. Click **Finish**.
Print a Displayed Measurement

The analyzer allows you to print a displayed measurement to a printer or to a file. The printer can be either networked or local.

- Connecting a Printer
- Printing

Other Outputting Data topics

Connecting a Printer

You can connect a printer to one of the PNA USB ports or to the LAN connector.

**CAUTION:** Do NOT connect your printer to the 25-pin female port labeled *Ext. Test Set Interface*. Voltage levels of signal lines may damage the printer's I/O.

To Add a Printer

**Note:** If you try to print from the PNA application and the Add Printer Wizard appears, click **Cancel** and add the printer using the following procedure.

1. From the PNA application, click **View** then click **Minimize Application**
2. On the Windows taskbar, click **Start**, point to **Settings**, then click **Printers**.
3. Double-click **Add Printer**.
4. Follow the instructions in the **Add Printer** Wizard.

For more information, refer to Microsoft Windows Help or your printer documentation.

Printing

- **Print a Hardcopy**
- **Page Setup**
- **Print to File**

The measurement information on the screen can be printed to any local or networked printer that is connected to the PNA. The graphic below shows an example of how a screen-capture image appears when printed. The Page Setup settings allows you to customize the printed form of the measurement information.
How to Print a Hardcopy

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press PRINT</td>
<td>1. Click File</td>
</tr>
<tr>
<td>2. then [Print]</td>
<td>2. then Print</td>
</tr>
<tr>
<td></td>
<td>3. then Print</td>
</tr>
</tbody>
</table>

No programming commands are available for this feature.
Page Setup

The Page Setup dialog allows flexibility in the appearance that measurement data is printed. After setting up the page, click **File**, then **Print**... to obtain a hard-copy.

### How to select Page Setup

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press PRINT</td>
<td>1. Click File</td>
</tr>
<tr>
<td>2. then [Page Setup]</td>
<td>2. then Print</td>
</tr>
<tr>
<td></td>
<td>3. then Print Options</td>
</tr>
</tbody>
</table>

**Note:** For information on the choices in the Print dialog box, see Windows Help.
Page Setup dialog box help

Paper, Orientation, and Margins
These settings do NOT survive a PNA shutdown.
See Windows Help for information on these settings.

Windows
The following PNA-specific settings DO survive a PNA shutdown:

Minimum vertical size  Adjust to change the amount of a page that the measurement window fills. The adjustment range is from 40 to 100%.

One window per page  Check to print one window per page. Clear to print all selected windows without a forced page break.

Only active window  Check to print only the active window. Clear to print all windows.

Agilent logo  Check to print the Agilent logo to the header.

Data and Time  Check to add the current date and time to the header.

Global Pass/Fail  Check to add the Global Pass/Fail status to the header.

Page Numbers  Check to add page numbers (1 of n) to the header.

Channel Settings Table

Print  Check to print the channel settings table.

Segment data can no longer be printed.

Trace Attributes Table

Print  Check to print the Trace Attributes Table. The Trace Attributes are measurement type, correction factors ON or OFF, smoothing, options, and marker details. The Trace Attributes are listed by Trace ID# for each window.
Each Trace ID# can have multiple entries depending on the number of markers associated with the trace. The marker details are marker number, position and response. If there are multiple markers on a trace, the trace attributes are only shown for the first marker. However, the trace attributes for the first marker apply to all other markers on that trace.

The options column can have one or more options. D for Delay, M for Marker, G for Gating. Multiple options selected would appear as follows: DMG.

Print marker data Check to print all marker data. The amount of data depends on how many markers are created.

Print to a File
The analyzer can save a screen-capture image in any of the following formats:

- .png (preferred format)
- .bmp (bitmap)
- .jpg

The analyzer automatically saves the file to the current path. If not previously defined, the analyzer automatically selects the default path C:/Program Files/Agilent/Network Analyzer/Documents/

A .bmp file, like a .prn file, can be imported into software applications such as Microsoft Excel, Word, or Paint to display a screen-capture image.

See Save and Recall files for more information.

How to Print to a File

Using front-panel HARDKEY [softkey] buttons

1. Press PRINT
2. then [Print to File]

Using a mouse with PNA Menus

1. Click File
2. then Print
3. then Print to File

Last modified:
13-Apr-2011  Removed segment data checkbox
3-Sep-2008  Removed legacy content
23-Apr-2008  Added preference survive note.
10/19/06  Modified for new print dialog
Two ways to find programming commands:

1. From a simulated PNA User Interface:

Last Modified:

23-May-2011  Added MeasurementClassProperties
1-Dec-2010   Added GuidedPowerSensor(s) and PhaseControl
10-Sep-2010  Added CorrectionMethods
29-Jun-2010  Fixed PathElement object
19-Feb-2010  Added PSAT, PNOP, GDAperture (9.2)
27-Aug-2009  Added External Devices
7-Apr-2009   Added ECalModules/Module
13-Nov-2007  Replaced image with text
              Added NFA, ENRFile, and GCA
Application Object

Description
The Application object is the highest object in the PNA object model. This object presents methods and properties that affect the entire analyzer, rather than a specific channel or measurement. For example, the application object provides the GetIDString method. There’s only one ID string for the instrument, unrelated to the channel or parameter being measured. Likewise, the TriggerSignal Property is global to the instrument. You can elect to use an internally generated (free run) trigger or a manual trigger. Either way, that type of trigger generation will be used on all measurements, on all channels. Therefore, it is under the Application object.

Accessing the Application object
This object is unique in that you must create this object rather than just get a handle to it.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
```

Replace `<analyzerName>` with the full computer name of your PNA. For example, "My PNA". See Change Computer Name.

AuxiliaryTrigger Object

Description
These properties setup Auxiliary triggering on a channel.

Accessing the object
Use chan.AuxTrigger (n) to access the object.
where n= the connector pair to be used for Auxiliary Triggering.

- PNA-X models: Use 1 or 2
- All other PNA models: Use 1 - These models do NOT have an Aux Input; only an Output. Therefore, the following 'Input' commands will return an error when sent to PNA models other than the PNA-X.

Use app.AuxiliaryTriggerCount to determine the number of auxiliary trigger pairs on the rear panel of a PNA.

```
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim AuxTrig as AuxTrigger
AuxTrig = chan.AuxTrigger(2)
```

Calibrator Object

See Also

- Example Programs
- Calibrator Methods and Properties
- ICalData Interface for putting and getting typed Calibration data.
- Superseded commands

Description

The Calibrator object, a child of the channel, is used to perform an **Unguided** calibration.

**Important!**

Do **NOT** use commands from the GuidedCalibration object when performing an Unguided calibration. Use ONLY the Calibrator object.

You can **NOT** perform a full 3 or 4-port using the Calibrator object. You must use the GuidedCalibration object.

There must be a measurement present for the calibrator to use or you will receive a "no measurement found" error. Therefore, to perform a 2-port cal, you must have any S-parameter measurement on the channel. For a 1-port measurement, you must have the measurement (S11 or S22) on the channel. The same is true for a response measurement.

There are a number of approaches to calibration with the calibrator object:

1. You can collect data yourself and download it to the ACQUISITION buffer. The acquisition buffer holds the actual measured data for each standard. See the PNA data map.

   1. Calibrator.SetCalInfo
   2. Connect a standard
   3. Trigger a sweep
   4. Retrieve the data for the standard
   5. Download the data - calibrator.putStandard
   6. Repeat for each standard
   7. Calibrator.CalculateErrorCoefficients

2. You can tell the calibrator to acquire a standard. In this case, the calibrator collects the data and places it in the ACQUISITION buffer.

   1. Calibrator.SetCalInfo
   2. Connect a standard
3. Calibrator.**AcquireCalStandard2**
4. Repeat for each standard
5. Calibrator.**CalculateErrorCoefficients**

- You can put previously-retrieved error terms in the error correction buffer.

1. **PutErrorTerm**
2. Repeat for each term
3. Measurement.**Caltype** = pick one

- You can also "piece together" a 2-port cal from two 1-port cals (S11 and S22) and four response (thru) cals. The system will detect that all the standards needed for a 2-port cal have been acquired even though they may not have gathered at the same time.

**Accessing the Calibrator object**

```vbs
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", < analyzerName >)

Dim cal As ICalibrator
Set cal = app.ActiveChannel.Calibrator
```

The calkit object provides the properties and methods to access and modify a calibration kit.

**Accessing a CalKit object**
The **active** cal kit is the kit that is selected for use in **Unguided** calibrations. To get a handle to the active kit, use the `app.ActiveCalKit` property. To access the CalKit object for a specific cal kit, you must first make that kit the active kit using `app.CalKitType`.

The CalKit object behaves differently from other objects in that you can only have a handle to one cal kit -- the active cal kit. Therefore, when you change the CalKitType from either the Application object or the CalKit object, you may also be changing the object to which you may have other references.

For example, the following example specifies two CalKit type objects and in turn, assigns them to two different variables: ck1 and ck2.

```vba
Dim app As AgilentPNA835x.Application
Dim ck1 As calKit
Dim ck2 As calKit

Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
app.CalKitType = naCalKit_User1
Set ck1 = app.ActiveCalKit
ck1.Name = "My CalKit1"

app.CalKitType = naCalKit_User2
Set ck2 = app.ActiveCalKit
ck2.Name = "My CalKit2"

Print "ck1: " & ck1.Name
Print "ck2: " & ck2.Name
```

When the pointer to each of these kits is read (printed), they each have a pointer to the last kit to be assigned to the active cal kit:

- ck1: My CalKit2
- ck2: My CalKit2

CalManager Object

Description
Use this interface to list, save, and delete Cal Sets.

Accessing the CalManager object
Get a handle to a the CalManager with the app.GetCalManager Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim mgr as ICalManager
Set mgr = app.GetCalManager
```

CalSet Object

See [ICalData Interface](#) for putting and getting typed Cal Set data.

**Description**

Use this interface to query and or change the contents of a Cal Set.

**Accessing the CalSet object**

Get a handle to a CalSet object by using the CalSets collection. This is done through the CalManager object with the app.GetCalManager Method.

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calst As ICalSet
Set calst = app.GetCalManager.CalSets.Item(1)
' OR Get a handle by CalSet Name
Set calst = app.GetCalManager.CalSets.Item("MyCalSet")
```

The original ICalData Interface was introduced with PNA 1.0 on the Calibrator Object.

Last modified:
2-May-2011  Added Get/Put ErrorTermStimulus
1-Nov-2006  New start and stop freq commands added
CalSets Collection

Description
A collection object that provides a mechanism for iterating through all the Cal Sets in the analyzer. There is no ordering to the items in the collection. Therefore make no assumptions about the formatting of the collection.

For the Item and Remove methods, you can specify either the Cal Set string name, or the integer item of the Cal Set in the collection.

Accessing the CalSets collection
Get a handle to the CalSets collection through the CalManager object with the app.GetCalManager Method.

Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calsts As CalSets
Set calsts = app.GetCalManager.CalSets

CalStandard Object

Description
Contains all of the settings that are required to modify a calibration standard.
For more information, read Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers (Application Note 1287-11)

Accessing the CalStandard object
Get a handle to a standard with the calkit.GetCalStandard Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim std As ICalStandard
Set std = app.ActiveCalKit.GetCalStandard(1)
std.Delay = 0.00000003
```

Channel Object

See SourcePowerCalData Interface for putting and getting typed source power calibration data.

Description

The channel object is like the engine that produces data. Channel settings consist of stimulus values like frequency, power, IF bandwidth, and number of points.

Accessing the Channel object

You can get a handle to a channel in a number of ways. But first you have to make sure that the channel exists. When you first startup the analyzer, there is one S11 measurement on channel 1. Thus there is only one channel in existence. You can do the following:

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan As IChannel
Set chan = app.ActiveChannel
```
or

```vba
Set chan = app.Channels(2)
```

The first method returns the channel object that is driving the active measurement. If there is no measurement, there may not be a channel. Once a channel is created, it does not go away. So if there once was a measurement (hence a channel), the channel will still be available.

If there is no channel you can create one in a couple ways. You can do the following:

```vba
Pna.CreateMeasurement( ch1, "S11", port1, window2)
```
or

```vba
Pna.Channels.Add(2)
```

The latter will have no visible effect on the analyzer. It will simply create channel 2 if it does not already exist.

</table>
**DwellTime**  
IChannel  
Sets or returns the dwell time for the channel.  
Shared with the Segment Object

**ErrorCorrection**  
IChannel7  
Attempts to set error correction ON or OFF for all of the measurements on the channel.

**ExternalTriggerDelay**  
IChannel6  
Sets or returns the external trigger delay value for the channel.

**FastCWPointCount**  
IChannel16  
Enables Fast CW sweep and sets the number of data points for the channel.

**Fixturing**  
IChannel6  
Provides access to Port Ext, Embedding, and De-embedding functions.

**FOM Collection**  
IChannel9  
Provides access to Frequency Offset Measurements

**FrequencyOffsetDivisor**  
IChannel2

IChannel2

**FrequencySpan**  
IChannel  
Sets or returns the frequency span of the channel.  
Shared with the Segment Object.

**IFBandwidth**  
IChannel  
Sets or returns the IF Bandwidth of the channel.  
Shared with the Segment Object.

**IFConfiguration**  
IChannel4  
Provides access to the IF gain and source path settings for the H11 Option.

**IsContinuous**  
IChannel3  
Returns whether or not a channel is in continuous mode.

**IsHold**  
IChannel3  
Returns whether or not a channel is in hold mode.

**MeasurementClass**  
IChannel15  
Returns the measurement class name.

**NumberOfPoints**  
IChannel  
Sets or returns the Number of Points of the channel.  
Shared with the Segment Object.

**Parent**  
IChannel  
Returns a handle to the parent object of the channel.

**PathConfiguration**  
IChannel10  
Provides access to path configuration switches and setting.

</tr>
</tbody>
</table>
**StopFrequency**  
*IChannel*  
Sets or returns the stop frequency of the channel.  
Shared with the Segment Object

**StopPower**  
*IChannel*  
Sets the Stop Power of the analyzer when sweep type is set to Power Sweep.

**StopPowerEx**  
*IChannel13*  
Sets and reads the power sweep stop power value for a specific port.

**SweepDelay**  
*IChannel19*  
Sets the time to wait just before acquisition begins for each sweep.

**SweepGenerationMode**  
*IChannel*  
Sets the method used to generate a sweep: continuous ramp (analog) or discrete steps (stepped).

**SweepSpeedMode**  
*IChannel14*  
Set or returns the sweep speed mode.

**SweepTime**  
*IChannel*  
Sets the Sweep time of the analyzer.

**SweepType**  
*IChannel*  
Sets the type of X-axis sweep that is performed on a channel.

**TestPortPower**  
*IChannel*  
Sets or returns the RF power level for the channel.  
Shared with the Segment Object

**TriggerMode**  
*IChannel*  
Determines the measurement that occurs when a trigger signal is sent to the channel.

**UserRangeMax**  
*IChannel*  
*Superseded* - Use meas.**UserRangeMax**  
Sets the stimulus stop value for the specified User Range.

**UserRangeMin**  
*IChannel*  
*Superseded* - Use meas.**UserRangeMin**  
Sets the stimulus start value for the specified User Range.

**XAxisPointSpacing**  
*IChannel*  
Sets X-Axis point spacing for the active channel.

**IChannel History**
### ISourcePowerCalData Interface

**Description**
Contains methods for putting source power calibration data in and getting source power calibration data out of the analyzer using typed data. The methods in this interface transfer data more efficiently than methods that use...
variant data. However, this interfaces is only usable from VB6, C, & C++. All other programming languages must use the methods on the Channel Object.

**Note:** Interface **ISourcePowerCalData** is abbreviated as **ISPCD** in the following table.

<table>
<thead>

Channels Collection

Description
A collection object that provides a mechanism for iterating through the channels.
Collections are, by definition, unordered lists of like objects. You cannot assume that Channels.Item(1) is always Channel 1.

Accessing the Channels collection

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim chans As Channels
Set chans = app.Channels
```

ComColors Object

Description
Provides access to the methods and properties used to modify the PNA Display and Print colors.

Accessing the ComColors object

```vba
Dim app As AgilentPNA835X.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
' or
'Set printColors = app.Preferences.PrintColors
displayColors.ActiveLabels = 657930
```

ComTraceColors Object

Description
Provides access to the methods and properties used to modify the PNA Display and Print colors.

Both the Display and Print ComColor objects contain 8 Trace objects (1 to 8).

'1st Trace' is NOT always Trace1 (Tr1). For example, the first trace in a window might be Tr2 which is drawn with the "1st Trace" pen.

The first 8 traces are drawn with the defined pen colors. The next eight traces reuse the same colors, and so forth. For example, if all traces are numbered sequentially, the 9th and 17th traces are drawn using the same color as the 1st trace.

Accessing the ComTraceColors object

Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
'or
'Set printColors = app.Preferences.PrintColors
dim Trace1

Set Trace1 = displayColors.Trace(1)
Trace1.DataAndLimits = RGB(1,251,1)

Converter Object

**Note:** The Converter Object replaces the IMixer Interface.

**Description**
Contains the methods and properties to setup a mixer for ALL PNA Mixer/Converter applications.

**Accessing the Converter Interface**

```vbscript
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim converter as Converter
Set converter = chan.Converter
```

**Scratch vs Applied Mixer Properties**
Each mixer configuration has two sets of properties:

1. **Scratch mixer** contains the properties that have been set, but NOT YET applied. Send the Apply Method to copy these properties to the Applied mixer.

2. **Applied mixer** contains the properties that makeup the current mixer configuration.

Power settings are immediately applied to both the Scratch and Applied mixer.
A successful Calculate also performs an Apply.

**Note:** Queries always return the Applied mixer properties. Therefore, first send Apply Method before querying new settings.

ConverterEmbeddedLO Object

Description
Provides access to the properties that allow IMDx and IMSpectrum measurements of converters that contain an embedded LO.

This interface contains all the same properties and methods of the Embedded LO interface (used for FCA measurements) EXCEPT access to the EmbeddedLODiagnostic Object.

Accessing the ConverterEmbeddedLO Interface

<table>

CorrectionMethods Object

Description
These methods and properties control various error-correction settings for a channel.

Accessing the object

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim corrMethods as CorrectionMethods
corrMethods = chan.CorrectionMethods
```

E5091Testsets Collection

Description
Two testsets can be connected and controlled by the PNA at any time.

The item number in the testsets collection is set by the DIP switches on the testset rear-panel. The valid item numbers are 1 and 2. If the testset DIP switches are set to 1, then item number in the collection is 1, and so forth. See your E5091A documentation for more information.

If the specified testset is not connected to USB or not ON, then setting Enabled = True will return an error. All other properties can be set when the testset is not connected.

Accessing the E5091Testsets collection
Child of the Application Object. Get a handle to one of the E5091Testset objects by specifying an item of the collection.

```
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim testsets As E5091Testsets
Set testsets = pna.E5091Testsets
Dim tset1 As E5091Testset
Set tset1 = testsets(1)
```

**ECalModule Object**

Allows access to ECal modules that are connected to the PNA.

**Accessing the ECalModule object**

Get a handle to a ECalModule object by using the ECalModules collection. This is done through the CalManager object with the app.GetCalManager Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pna
pna.Preset
Const chanNum = 1
pna.Channels(chanNum).StopFrequency = 20E9 ' for a 20 GHz ECal mod
Const pnaPortNumber = 1
Const ecalCharacterizationNum = 0
Dim calMgr
Set calMgr = pna.GetCalManager
Dim ecalPortNumber ' The returned ECal port number is a 1-based number
' (1 = Port A, 2 = Port B, etc)
ecalPortNumber = calMgr.ECalModules(1).AutoOrient(chanNum, pnaPortNumber, ecalCharacterizationNum)
MsgBox "ECal port number attached to PNA port 1 = " & ecalPortNumber
```

**ECalUserCharacterizer Object**

**Description**
Controls the settings used to perform an ECal User Characterization. An S-Parameter channel must already be calibrated. These commands will then measure the ECal module with adapters, cables, or fixtures to be included in the User Characterization, allow descriptive text to be entered, then save the User Characterization to the ECal module.

Up to 12 User Characterizations can be stored in an ECal module.

You can NOT perform a **remote** User Characterization of a 4-port ECal module using a 2-port PNA. This can only be done from the front panel user interface.

**Accessing the ECalUserCharacterizer Interface**
Access the Interface through the ICalManager Object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")

Dim mgr as ICalManager
Set mgr = app.GetCalManager
Dim ecalCharacterizer
Set ecalCharacterizer = mgr.GetECalUserCharacterizer()
```

**See Also:**
- **Example**: Perform an ECal User Characterization

EmbeddedLO Object

Description
Provides access to the properties that allow measurement of mixers that contain an embedded LO.

Accessing the EmbeddedLO Interface
Access the Interface through the IMixer Object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the
' standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Dim embeddedLO
Set embeddedLO = mixer.EmbeddedLO
```

See an example program that shows how to create and calibrate a standard SMC or VMC measurement or a fixed output SMC measurement.

EmbeddedLODiagnostic Object

Description

Allows access to the properties that provide information about the broadband and precise tuning of an embedded LO.

Accessing the EmbeddedLODiagnostic Interface

Access the Interface through the EmbeddedLO Object.

```vbnet
dim app as agilentPNA835x.application
set app = createobject("agilentPNA835x.application")
app.preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the standard measurement
Dim standardMeas as IMeasurement
set standardMeas = app.activeMeasurement
standardMeas.delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas as IMeasurement
set meas = app.createCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer as IMixer
Dim embeddedLO
set embeddedLO = mixer.EmbeddedLO

Dim embeddedLODiagnostic
set embeddedLODiagnostic = embeddedLO.EmbeddedLODiagnostic
```

ExternalDevices Collection

Description
ExternalDevices collection provides access to an ExternalDevice object.

Accessing the ExternalDevices collection
The ExternalDevices collection is a property of the main Application Object. You can obtain a handle to an External Device by specifying an item in the collection.

```vbnet
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
Dim externalDevices
Set externalDevices = app.ExternalDevices
Dim devicecount
devicecount = externalDevices.count
externalDevices.Add "NewPMAR"
Dim newExternalDevice
Set newExternalDevice = externalDevices.Item("NewPMAR")
newExternalDevice.DeviceType = "Power Meter"
newExternalDevice.IOConfiguration = "GPIB0::14::INSTR"
newExternalDevice.IOEnable = true
```

ExternalSource Object

Description
The ExternalSource object allows you to set unique properties and methods for each external source.

Accessing the ExternalSource Object
You can obtain a handle to an ExternalSource Object through `ExtendedProperties`

```vba
    dim app
    Set app = CreateObject("AgilentPNA835x.Application")
    dim externalDevices
    Set externalDevices = app.ExternalDevices
    dim devicecount
    devicecount = externalDevices.count
    externalDevices.Add "NewPSG"
    dim newExternalDevice
    Set newExternalDevice = externalDevices.Item("NewPSG")
    newExternalDevice.DeviceType = "Source"
    newExternalDevice.IOConfiguration = "GPIB0::14::INSTR"
    dim PSG
    Set PSG = newExternalDevice.ExtendedProperties
    PSG.DwellPerPoint = 5
```

ExternalTestsets Collection

Description
ExternalTestsets collection provides access to a TestsetControl object. Only one external testset can be controlled by the PNA at any time.

Accessing the ExternalTestsets collection
The ExternalTestsets collection is a property of the main Application Object. You can obtain a handle to a testset by specifying an item in the collection.

Visual Basic Example

```vba
Dim pna
Dim testsets As ExternalTestsets
Dim tset1 As TestsetControl
Set pna = CreateObject("AgilentPNA835x.Application")
Set testsets = pna.ExternalTestsets
Set tset1 = testsets(1)
' make COM calls on tset1 object
End Sub
```

**FIFO Object**

**Description**
These properties control the First IN, First OUT (FIFO) buffer settings for the PNA-X and N5264A.
The 4 GB FIFO data buffer is available with Option 118 on the PNA-X and N5264A.

**Accessing the FIFO object**

```vbnet
Dim app as AgilentPNA835x.Application
Dim fifo as IFIFO
Set fifo = app.IFIFO
```

Fixturing Object

Description
Contains the properties for Embedding and De-embedding test fixtures.

Accessing the Fixturing object

```vbnet
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim fixt as Fixturing
Set fixt = chan.Fixturing
```

FOM Collection

Description
The FOM collection provides access to the source and receiver range objects which are used for configuring frequency offset measurements.

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

External devices can appear in the list of range names. Learn more.

Accessing the FOM Collection and FOMRange objects

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel

Dim ifom as FOM
Set ifom = chan.FOM

ifom.item(2).Coupled = false
```

FOMRange Object

Description
The FOM Range object provides access to the properties and methods for configuring a specific Range for frequency offset measurements.

Accessing an FOMRange object
Get a handle to a FOM Range by specifying an item in the FOM collection.
The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

External devices can appear in the list of range names. Learn more.

```vba
Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ranges as FOM
Set ranges = app.ActiveChannel.FOM
ranges.item(2).Coupled = False
```

</tbody>
</table>
**ReverseLinearPowerLevel**  
IGainCompression  
Set and read the reverse power level to the DUT.

**SafeSweepCoarsePowerAdjustment**  
IGainCompression  
Set and read the Safe Sweep COARSE power adjustment.

**SafeSweepEnable**  
IGainCompression  
Set and read the (ON | OFF) state of Safe Sweep mode.

**SafeSweepFinePowerAdjustment**  
IGainCompression  
Set and read the Safe Sweep FINE power adjustment.

**SafeSweepFineThreshold**  
IGainCompression  
Set and read the compression level in which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment.

**SafeSweepMaximumLimit**  
IGainCompression  
When the DUT Output reaches this value, the input power to the DUT is no longer incremented at that frequency.

**SaturationLevel**  
IGainCompression  
Set and read the deviation dB from the maximum Pout.

**SearchFailures**  
IGainCompression  
Read number of points that did not achieve compression.

**SearchSummary**  
IGainCompression  
Returns if a compression search is complete, and if the search was a success or failure.

**SmartSweepMaximumIterations**  
IGainCompression  
Set and read the maximum number of iterations to be used to find the compression level in a SMART sweep.

**SmartSweepSettlingTime**  
IGainCompression  
Set and read SMART sweep settling time.

**SmartSweepShowIterations**  
IGainCompression  
Set and read whether to show results for each SMART sweep iteration.

**SmartSweepTolerance**  
IGainCompression  
Set and read the level of tolerance to be used to find the compression level in a SMART sweep.

**TotalIterations**  
IGainCompression  
Returns the total number of iteration required for the SMART Sweep.

**TotalNumberOfPoints**  
IGainCompression  
Set and read the total number of data points. (Freq x Power)

Gain CompressionCal Object

Description
Sets properties that are unique to a Gain Compression Cal (opt 086).
The remaining commands to perform a GCA Cal use the Guided Calibration commands.

Accessing the GainCompressionCal object

```vba
Dim app as AgilentPNA835x.Application
Set GCAcal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set GCACalExtension = GCAcal.CustomCalConfiguration
GCACalExtension.PowerLevel = 5
```

**GuidedCalibration Object**

**Description**
Contains the methods and properties used to perform a Guided Calibration.

**Important!**
Do *NOT* use commands from the `Calibrator` (Unguided calibration) object when performing a Guided calibration. Use ONLY the `GuidedCalibration` object.

The ONLY exception is:
Use `OrientECalModule_Property` and `ECalPortMapEx_Property` on the `Calibrator Object` to specify orientation for both guided and unguided calibrations.

A Guided Calibration must be performed on the Active Channel. To activate a channel, activate any measurement on that channel. Do this using `meas.Activate`, which requires you already have a handle to the measurement.

**Accessing the GuidedCalibration object**

For standard S-parameter channels:

```vba
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim guidedCal
Set guidedCal = CalMgr.GuidedCalibration
```

To calibrate an `Application` channel, see `CreateCustomCalEx` Method.

**See Also:**

GuidedCalibrationPowerSensor Object

Description
Contains the methods and properties to configure multiple power sensors to be used during a guided power calibration.

Note: These commands are supported ONLY on standard channels.

Accessing the GuidedCalibrationPowerSensor Object
A GuidedCalibrationPowerSensor object is accessed as an item of the GuidedCalibrationPowerSensors Collection.

```vbscript
Option explicit
Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim guidedCal
Set guidedCal = CalMgr.GuidedCalibration
Dim powerSensors
Dim port: port = 1
Set powerSensors = guidedCal.GuidedCalibrationPowerSensors(port)
Dim powerSensor2
Set powerSensor2 = GuidedCalibrationPowerSensors.Item(2)
powerSensor2.Name="26GHzSensor"
```

HWAuxIO Object

Description
Contains the methods and properties that control the rear panel Auxiliary Input / Output connector.

**Note:** PNA-X models do NOT have this connector. However, the get/put Input/Output voltage commands can be used on the PNA-X to control ADC voltages on the Power I/O connector: Sending other Control:AUX commands to a PNA-X may result in unusual behavior.

Accessing the HWAuxIO object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim AuxIO As HWAuxIO
Set AuxIO = app.GetAuxIO
```

See Also:

**IMixer Interface (Option 083) - Superseded**

**Note:** This object and all properties and methods are replaced with Converter Object which can be used for all converter application.

**Description**
Contains the methods and properties to setup FCA Mixer measurements.
For performing calibrations, use either the SMC Type Object or the VMC Type Object.

**Accessing the IMixer Interface**
Access the IMixer Interface through the Measurement Object. If the particular type of Measurement that was created supports IMixer, then the program determines this at run time and can access the functionality exposed by IMixer. Because the determination of IMixer support is not made until runtime, the program should handle the case where IMixer is not supported on the object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Set mixer = meas
```

Calculate
IMixer
Automatically calculate Input and Output frequencies for mixer setup.

LoadFile
IMixer
Loads a previously-configured mixer attributes file (.mxr)

SaveFile
IMixer
Saves the settings for the mixer/converter test setup to a mixer attributes file.

SetDutPorts
IMixer8
Sets the PNA to DUT port mapping.

<table>

Limit Test Collection

Description
Child of the Measurement Object. A collection that provides a mechanism for iterating through the Measurement’s Limit Segment objects (Limit Lines). The collection has 100 limit lines by default.

Accessing the LimitTest collection
Get a handle to an individual limit segment by specifying an item of the LimitTest collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim limSegs As LimitTest
Set limSegs = app.ActiveMeasurement.LimitTest
limSegs.Item(1).BeginStimulus = 1000000000
limSegs.Item(1).EndStimulus = 1000000000
limSegs.Item(1).BeginResponse = 3.5
limSegs.Item(1).EndResponse = 3.5
```

Marker Object

Description
Contains the methods and properties that control Markers. There are 10 markers available per measurement:

- 1 reference marker
- 9 markers for absolute data or data relative to the reference marker (delta markers).

There are two ways to control markers through COM.

1. The Measurement object has properties that apply to ALL of the markers for that measurement. For example, `meas.MarkerFormat = naLinMag` applies formatting to all markers.

2. Marker object properties override the Measurement object properties. For example, you can then override the format setting for an individual marker by specifying `mark.Format = naLogMag` on the marker object.

Note: SearchFilterBandwidth is available through the measurement object.

Accessing the Marker object
To turn ON a marker, get a handle to the marker through the measurement object. If not already activated, this command will turn ON marker 1

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
app.ActiveMeasurement.marker(1).Format = naLinMag
```

You can also set the marker object to an object variable:

```vba
Dim m1 As Marker
Set m1 = app.ActiveMeasurement.Marker(1)
m1.Format = naMarkerFormat_LinMag
```

**SearchCompressionPoint** (IMarker4)
Searches the marker domain for the compression level.

**SearchMax** (IMarker)
Searches the marker domain for the maximum value.

**SearchMin** (IMarker)
Searches the marker domain for the minimum value.

**SearchNextPeak** (IMarker)
Searches the marker's domain for the next largest peak value.

**SearchPeakLeft** (IMarker)
Searches the marker's domain for the next VALID peak to the left of the marker.

**SearchPeakRight** (IMarker)
Searches the marker's domain for the next VALID peak to the right of the marker.

**SearchTarget** (IMarker)
Searches the marker's domain for the target value.

**SearchTargetLeft** (IMarker)
Moving to the left of the marker position, searches the marker's domain for the target value.

**SearchTargetRight** (IMarker)
Moving to the right of the marker position, searches the marker's domain for the target value.

**SetCenter** (IMarker)
Changes the analyzer's center frequency to the X-axis position of the marker.

**SetCW** (IMarker)
Changes the sweep type to CW mode and makes the CW frequency the marker's frequency.

**SetCWFreq** (IMarker3)
Changes the CW frequency to the frequency of the active marker.

**SetElectricalDelay** (IMarker)
Changes the measurement's electrical delay to the marker's delay value.

**SetReferenceLevel** (IMarker)
Changes the measurement's reference level to the marker's Y-axis value.

**SetStart** (IMarker)
Changes the analyzer's start frequency to the X-axis position of the marker.

**SetStop** (IMarker)
Changes the analyzer's stop frequency to the X-axis position of the marker.

</tr>
<tr>
<td><strong>CompressionPin</strong></td>
<td>IMarker4            Reads the input power at the marker compression level.</td>
</tr>
</tbody>
</table>
**CompressionPout**
IMarker4
Reads the output power at the marker compression level.

**DeltaMarker**
IMarker
Makes a marker relative to the reference marker.

**Distance**
IMarker2
Sets or returns distance value for time domain trace.

**Format**
IMarker
Linear, SWR, and so forth

**Interpolated**
IMarker
Turn marker interpolation ON and OFF

**Number**
IMarker
Read the number of the active marker

**PeakExcursion**
IMarker
Sets and reads the peak excursion value for the specified marker.

**PeakThreshold**
IMarker
Sets peak threshold for the specified marker.

**SearchFunction**
IMarker
Emulates the Tracking function in the marker search dialog box.

**Stimulus**
IMarker
Sets and reads the X-Axis value of the marker.

**Target Value**
IMarker
Sets the target value for the marker when doing Target Searches.

**Tracking**
IMarker
The tracking function finds the selected search function every sweep.

**Type**
IMarker
Sets and reads the marker type.

**UserRange**
IMarker
Assigns the marker to the specified User Range.

**UserRangeMax**
IMarker
Sets the stimulus stop value for the specified User Range.

**UserRangeMin**
IMarker
Sets the stimulus start value for the specified User Range.

**Value**
IMarker
Reads the Y-Axis value of the marker.

Measurement Object

See IArrayTransfer Interface for putting and getting typed data.
See IMixer Interface (used with Option 083)

Description
The Measurement object is probably the most used object in the PNA Object Model. A measurement object represents the chain of data processing algorithms that take raw data from the channel and make it ready for display, which then becomes the scope of the Trace object.

A Measurement object is defined by its parameter (S11, S22, A/R1, B and so forth). The measurement object is associated with a channel which drives the hardware that produces the data that feeds the measurement. The root of a measurement is the raw data. This buffer of complex paired data then flows through a number of processing blocks: error-correction, trace math, phase correction, time domain, gating, formatting. All of these are controlled through the measurement object.

The ACTIVE measurement is the measurement that will be acted upon if you make a setting from the front panel. It is the measurement whose "button" is pressed in the window with the red "active window" frame. If you create a new measurement, that measurement becomes the active measurement.

Therefore, all automation methods with the word "Active" in them refer to the object associated with the Active measurement, whether that object is a Channel, Window, Trace or Limit line.

Learn about the IMeasurement2 Interface for reading stimulus properties.

Accessing the Measurement object

Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim meas As IMeasurement
Set meas = app.ActiveMeasurement

or

Set meas = app.Measurements(n)

You can access four other objects through the Measurement object: markers, limit test, transform, and gating. For example, because each measurement has its own set of markers, you can set a marker by doing this:

Dim meas as measurement
Set meas = app.ActiveMeasurement
meas.marker(1).Stimulus = 900e6

IMeasurement2 Interface

Some of the properties and methods for the IMeasurement2 Interface return stimulus values that are set using the channel object. The following is the reason these properties and methods are duplicated.

Every measurement carries with it a snapshot of the stimulus properties of the channel that were in effect when the measurement last acquired data. Therefore, it is the measurement that provides the most accurate stimulus description of its data. Any change made to the channel after the measurement was acquired renders the IChannel interface unreliable in terms of describing the measurement.

<tr>
<td>Trace</td>
<td>IMeasurement</td>
<td>Controls scale, reference position, and reference line.</td>
</tr>
</tbody>
</table>
TraceMath

IMeasurement

Performs math operations on the measurement object and the trace stored in memory.

TraceMax

IMeasurement10

Maximizes the active trace.

TraceTitle

IMeasurement8

Writes and reads a trace title.

TraceTitleState

IMeasurement8

Turns trace title ON and OFF

Transform

IMeasurement

Controls Time Domain transforms.

UserRangeMax

IMeasurement15

Sets the stimulus stop value for the specified User Range.

UserRangeMin

IMeasurement15

Sets the stimulus start value for the specified User Range.

View

IMeasurement

Sets (or returns) the type of trace displayed on the screen.

WGCutoffFreq

IMeasurement2

Sets or returns the value of the waveguide cut off frequency.

**IArrayTransfer Interface**

**Description**
Contains methods for putting data in and getting data out of the analyzer using typed data. This interface transfers data more efficiently than the IMeasurement Interface. However, this interface is only usable from VB6, C, & C++.

<table>
<thead>
<tr>
<th>Methods</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getComplex</td>
<td>Retrieves real and imaginary data from the specified buffer.</td>
</tr>
<tr>
<td>getNAComplex</td>

Measurement Collection

Description
A collection object that provides a mechanism for iterating through the Application measurements.

Accessing the Measurements collection

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim measurements As Measurements
Set measurements = app.Measurements
```

See Also:

</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Returns the number of measurements in the analyzer.</td>
</tr>
<tr>
<td>Parent</td>
<td>Returns a handle to the current Application.</td>
</tr>
</tbody>
</table>
NAWindow Object

Description
The NAWindow object controls the part of the display that contains the graticule, or what is written on the display.

Accessing the NaWindow object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim window As NAWindow
Set window = app.NAWindows(1)
window.AutoScale
```

or

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")

app.NAWindows(1)..AutoScale
```

<th>Superceded with MarkerReadoutsPerTrace Property</th>
</tr>
</thead>
</table>

**ScaleCouplingMethod**  
Sets and returns the method of scale coupling.

**ScaleCouplingState**  
Enables and disables scale coupling for the specified window.

**Title**  
Writes or reads a custom title for the window.

**TitleState**  
Turns ON and OFF the window title.

**Traces**  
Collection for getting a handle to a trace or iterating through the traces in a window.

**WindowNumber**  
Reads the number of the active window.

**WindowState**  
Maximizes or minimizes a window.

Shared with the Application Object

NoiseCal Object

Description
Controls the noise figure calibration settings for amplifiers and converters. These commands supplement the standard calibration commands on the GuidedCalibration Object.

Accessing the NoiseCal object

```vba
Dim app as AgilentPNA835x.Application
Set noisecal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set noiseCalExtension = noisecal.CustomCalConfiguration
noiseCalExtension.NoiseSourceCold = 300
```

<td>INoiseFigure6</td>
<td>Read DUT input port map</td>
</tr>
</tbody>
</table>
**DeviceOutputPort**  
INoiseFigure6  
Read DUT output port map

**ImpedanceStates**  
INoiseFigure  
Sets the number of impedance states to use during calibrated measurements.

**NoiseAverageFactor**  
INoiseFigure  
Set averaging of noise receiver.

**NoiseAverageState**  
INoiseFigure  
Turn noise averaging ON and OFF.

**NoiseBandwidth**  
INoiseFigure  
Set bandwidth of noise receiver.

**NoiseGain**  
INoiseFigure  
Set gain state of noise receiver.

**NoiseReceiver**  
INoiseFigure5  
Sets and returns the receiver to use for noise measurements.

**NoiseReceiverSweepTime**  
INoiseFigure3  
Returns an estimate of sweep time.

**NoiseTuner**  
INoiseFigure  
Sets and returns the noise tuner identifier,

**NoiseTunerIn**  
INoiseFigure  
Sets and returns the port identifier of the ECal noise tuner Input

**NoiseTunerOut**  
INoiseFigure  
Sets and returns the port identifier of the ECal noise tuner Output

**SourcePullForSParameters**  
INoiseFigure4  
Set and read the use of source pull technique to compute S22 on Noise Figure on Converters.

PathConfiguration Object

Description
Provides access to the path configuration currently active on the channel object.
To load, store, or delete a configuration, see ConfigurationManager Object.

Accessing the PathConfiguration object in VB

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan as Channel
Set chan = app.ActiveChannel

Dim pathConfig As PathConfiguration
Set pathConfig = chan.PathConfiguration
```

Accessing the PathConfiguration object in C#

```csharp
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");
AgilentPNA835x.Application pna = (AgilentPNA835x.Application)Activator.CreateInstance(pnaType);
AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;
AgilentPNA835x.PathConfiguration path = (AgilentPNA835x.PathConfiguration)chan.get_PathConfiguration();
```

Note:
To learn how to make configuration (element) settings, see this Path Configuration Example
Also see this list of configurable elements and settings.

PathElement Object

Description
Provides access to the settings for the PathElement object.

Accessing the PathElement object in VB

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pathConfig As PathConfiguration
Set pathConfig = chan.PathConfiguration
Dim element as PathElement
Set element = pathConfig.PathElement("Src1")
```

Accessing the PathElement object in C#

```csharp
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");
AgilentPNA835x.Application pna = (AgilentPNA835x.Application)Activator.CreateInstance(pnaType);
AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;
AgilentPNA835x.PathConfiguration path = (AgilentPNA835x.PathConfiguration)chan.get_PathConfiguration();
path.get_Element("Port1RefMxr").Value = "External";
```

Note:
To learn how to make configuration (element) settings, see this [Path Configuration Example](#).

PowerLossSegment Object

Description
Contains the properties describing a segment of the power loss table used in source power calibration.
You can get a handle to one of these segments through the segments.Item Method of the PowerLossSegments collection.

Accessing the PowerLossSegment object
You can get a handle to one of these segments through  PowerLossSegments.Item(n)

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PwrLossSeg As PowerLossSegment
Set PwrLossSeg = app.SourcePowerCalibrator.PowerLossSegments(1)
```

PowerMeterInterface Object

Description
Contains the properties used to select a power meter and sensor to be used for a source power calibration.

Note: This object replaces the PowerMeterGPIBAddress Property.

Accessing the PowerMeterInterface object
Get a handle to a power meter object using the PowerMeterInterfaces collection.

```vbscript
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pwrMtrInterfaces As PowerMeterInterfaces
Set pwrMtrInterfaces = app.SourcePowerCalibrator.PowerMeterInterfaces
If pwrMtrInterfaces.Count > 0 Then
    Dim pwrMtrInterface As PowerMeterInterface
    Set pwrMtrInterface = pwrMtrInterfaces(1)
pwrMtrInterface.Path = naUSB
    pwrMtrInterface.Locator = "Agilent Technologies,U2000A,MY12345678"
End If
```

PowerMeterInterfaces Collection

Description
A collection object that provides a mechanism for accessing the PowerMeterInterface objects.
The collection size is limited to one PowerMeterInterface object. By default, that PowerMeterInterface object refers
to GPIB, and to the GPIB address that is currently set for the power meter on that PNA.
The power meter is specified by using the Path property.

Accessing the PowerMeterInterfaces collection
Get a handle to a power meter object using the PowerMeterInterfaces collection.

```vbscript
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pwrMtrInterfaces As PowerMeterInterfaces
Set pwrMtrInterfaces = app.SourcePowerCalibrator.PowerMeterInterfaces
If pwrMtrInterfaces.Count > 0 Then
    Dim pwrMtrInterface As PowerMeterInterface
    Set pwrMtrInterface = pwrMtrInterfaces(1)
    pwrMtrInterface.Path = naUSB
    pwrMtrInterface.Locator = "Agilent Technologies,U2000A,MY12345678"
End If
```

PowerSensor Object

Description
Each power sensor connected to the power meter associated with Source Power Calibration will have a PowerSensor object created to represent it. These PowerSensor objects reside in the PowerSensors collection within the SourcePowerCalibrator object. You cannot directly create PowerSensor objects, but can only retrieve existing ones from the PowerSensors collection.

The PowerSensorCalFactorSegment object is also accessed through the PowerSensor object. These are accessed through the CalFactorSegments collection in the PowerSensor object.

Accessing a PowerSensor object

Dim pna As AgilentPNA835x.Application
Set pna = CreateObject("AgilentPNA835x.Application", analyzerName)

Dim powerCalibrator as SourcePowerCalibrator
Dim powerSensor as PowerSensor
Dim calFactorSegment as PowerSensorCalFactorSegment

Set powerCalibrator = pna.SourcePowerCalibrator

' Specify GPIB address of the power meter.
powerCalibrator.PowerMeterGPIBAddress = 13

' Each time the PowerSensors collection is accessed, the power meter is queried to determine which channels have sensors attached. The collection is updated accordingly.
If powerCalibrator.PowerSensors.Count > 0 Then
  ' If channel B of the meter has a sensor attached but channel A does not, then element 1 of the collection is sensor B. Whenever channel A has a sensor, sensor A will be element 1.
  Set powerSensor = powerCalibrator.PowerSensors(1)
  ' Insert one new PowerSensorCalFactorSegment at the beginning of the collection (index 1).
  powerSensor.CalFactorSegments.Add(1)
  ' Assign our variable to refer to that object.
  Set calFactorSegment = powerSensor.CalFactorSegments(1)

  ' Set property values for that object.
  calFactorSegment.Frequency = 300000
  ' frequency in Hz
  calFactorSegment.CalFactor = 98
  ' cal factor in percent
End If

PowerSensors Collection

Description
A collection object that provides a mechanism for iterating through the PowerSensor objects which are connected to the power meter. Each time this collection object is accessed, the power meter is queried to determine how many sensors are connected to it. The collection size and order of objects is then adjusted accordingly before the requested method or property operation is performed. The power meter is specified by using the `PowerMeterGPIBAddress` property of the `SourcePowerCalibrator` object.

Accessing the PowerSensors Collection

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PwrSensors As PowerSensors
Set PwrSensors = app.SourcePowerCalibrator.PowerSensors
```

PowerSensorAsReceiver Object

Description
Provides the settings for configuring a Power Meter to be used as a PNA Receiver (PMAR).

Accessing a PowerSensorAsReceiver object
This object is accessed through ExternalDevice.ExtendedProperties. When an external device is added to the ExternalDevices collection, and the DeviceType property is set to Power Meter, then ExtendedProperties is used to get a handle to this object.

```vba
externalDevices.Add "NewPMAR"
dim newExternalDevice
Set newExternalDevice = externalDevices.Item("NewPMAR")
newExternalDevice.DeviceType = "Power Meter"
dim PMAR
Set PMAR = newExternalDevice.ExtendedProperties
PMAR.ReadingsPerPoint = 10
```

</tbody>
</table>
**PowerMeterChannel**
Identifies which power sensor this object corresponds to (or which channel of the power meter the sensor is connected to).

**ReadingsPerPoint**
Allows for settling of the power sensor READINGS.

**ReadingsTolerance**
Allows for settling of the power sensor READINGS.

**ReferenceCalFactor**
Reference cal factor (%) associated with this power sensor.

**SensorIndex**
Sets the power sensor channel (1 or 2) to be used.

**UsePowerLossSegments**
Specifies if subsequent power readings will use of the loss table.

</tbody>
</table>
**ExternalDeviceDeActivatePolicy**  
IPreferences10  
External Devices remain activated or are deactivated when the PNA is Preset or when an Instrument State is recalled.

**FrequencyOffsetRangeForCalComputations**  
IPreferences10  
Specifies the FOM frequency range to use when performing calibration.

**OffsetReceiverAttenuator**  
IPreferences6  
Mathematically offset the test port receiver.

**OffsetSourceAttenuator**  
IPreferences6  
Mathematically offset the reference receiver.

**Port1NoiseTunerSwitchPresetsToExternal**  
IPreferences8  
Sets default setting for Noise Figure switch.

**PowerOnDuringRetraceMode**  
IPreferences4  
Specify whether to turn RF power ON or OFF during a retrace for single-band frequency or segment sweeps ONLY.

**PowerSweepRetracePowerMode**  
IPreferences3  
At the end of a power sweep, specifies whether to maintain source power at the start or stop power level.

**PreferInternalTriggerOnChannelSingle**  
IPreferences2  
Sets the preference for chan.Single behavior.

**PreferInternalTriggerOnUnguidedCal**  
IPreferences2  
Set the preference for the trigger behavior when performing an Unguided calibration.

**PresetPowerState**  
IPreferences11  
Set and return the Preset Power ON/OFF state.

**PrintColors**  
IPreferences10  
Provides access to the **ComColors** Object.

**RemoteCalStoragePreference**  
IPreferences7  
Specifies the default manner in which calibrations performed via SCPI or COM are to be stored.

**ReportReceiverOverload**  
IPreferences12  
Set whether to display receiver overload warnings.

**RFOffOnReceiverOverload**  
IPreferences12  
Set whether to turn source power OFF when a receiver is overloaded.

**SnPFormat**  
IPreferences  
Specifies the format of subsequent .S1P, .S2P, .S3P file saves.

**TwoPointGroupDelayAperture**  
IPreferences11  
Sets Group Delay Aperture default to 2 points.

PulseGenerator Object

Description
Contains the properties for configuring the five internal pulse generators in the PNA-X.

Learn more about the PNA-X Pulse Generators.

Accessing the PulseGenerator object

Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pulse as PulseGenerator
Set pulse = chan.PulseGenerator

Each pulse generator is specified in the Pulse Generator properties. See below.

Pulse Definitions

- D = Delay; the time before each pulse begins
- W = Width; the time the pulse is ON
- P = Period; one complete pulse cycle
- W/P = Duty Cycle; the ratio of pulse ON/OFF

Important: If D + W is greater than P, then undefined PNA behavior results. There is NO error message or warning.

RxLevelingConfiguration Object

Description
Contains the properties for configuring Receiver Leveling in the PNA.

Accessing the RxLevelingConfiguration object

```vba
Dim app as AgilentPNA835x.Application  
Dim chan as Channel  
Set chan = app.ActiveChannel  
Dim RxLevel as RxLevelingConfiguration  
Set RxLevel = chan.RxLevelingConfiguration
```

**SCPIStringParser Object**

**Description**
Provides the ability to send a SCPI command from within the COM command. The two commands differ in the following ways:

**Execute** - will not return an error unless the Execute command itself fails, which is unlikely. Otherwise, you are required to read the SCPI error queue for errors that were caused by the SCPI command. The Execute command operates with minimal interference between you, the programmer, and the SCPI parser. It does not presume how you want to handle errors: handle by ignore, handle by reading the status byte, etc. This command was defined because automation engines like VB throw runtime errors when a COM method returns a failed HRESULT.

**Parse** - parses the input command, and then reads the SCPI error queue until the queue is empty. If the queue contains errors, Parse returns a failed HRESULT (E_NA_BAD_SCPI_EXECUTE). It then creates an IErrorInfo object and bundles the error numbers and descriptions into the error object. This object is available so that you can detect the failed HRESULT and interrogate the errorInfo object for more details.

**The SCPIStringParser Methods can NOT be used with:**
- SCPI Status Reporting. However, the *OPC? will work.
- Transferring Binary (block) data with commands such as: MMEM:TRAN or CALC:DATA with Format:Data set to Real32 or Real64

**Accessing the ScpiStringParser object**

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim SCPI As IScpiStringParser
Set SCPI = app.ScpiStringParser

See Also:
- PNA Automation Interfaces
- The PNA Object Model
- Example Programs
- See an example of how to return error information when using the Parse method.

Segment Object

Description
Contains the methods and properties that affect a sweep segment.

**Note:** All of these properties are shared with at least one of the following objects: Channel, Cal Set, PowerSensorCalFactorSegment, or PowerLossSegment.

Accessing a Segment object and setting Segment Properties
You can get a handle to a sweep segment through the segments collection.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim segs As ISegments
Set segs = app.ActiveChannel.Segments

segs.Add(1)
segs(1).NumberOfPoints = 30
```

Segments Collection

Description
The segment collection provides a mechanism for iterating through the sweep segments of a channel. Sweep segments are a potentially faster method of sweeping the analyzer through only the frequencies of interest. Learn more about Segment Sweep.

Accessing the Segments collection
There are two paths to the Segments Collection:

1. From the Channel object
2. From the FOMRange object

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim segs As ISegments
Set segs = app.ActiveChannel.Segments

or

Set segs = app.ActiveChannel.FOM.FOMRange(1).Segments
```

See Also:
- Segment Object to learn how to set the properties for individual segments.
- Collections in the Analyzer
- The PNA Object Model
- Example Programs

**SweptIMDCal Object**

**Description**
Sets properties that are unique to a Swept IMD Cal (opt 087).
Use the [Guided Calibration commands](#) for the remaining commands to perform a Swept IMD Cal

**Accessing the SweptIMDCal object**

```vbnet
Dim app as AgilentPNA835x.Application
Set IMDcal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set IMDCalExtension = IMDcal.CustomCalConfiguration
IMDCalExtension.PowerLevel = 5
```

TestsetControl Object

Description
A TestsetControl object is used to control one of the supported test sets. Only one external test set can be controlled by the PNA at any time. The Testset Control object appears as an item in the ExternalTestsets collection, which in turn is a property of the main application object.

If the specified test set is not connected to the PNA or is not ON, then setting Enabled = True will return an error. All other properties can be set even if the test set is not connected.

**Note:** The ONLY way to load a test set configuration file is by sending the testsets.Add method. There is no method to query the test set type. See an example program.

Accessing a TestsetControl object
The ExternalTestsets collection is a property of the main Application Object. You can obtain a handle to a testset object by specifying an item in the collection.

Visual Basic Example

```vbnet
Dim pna
Dim testsets As ExternalTestsets
Dim tset1 As TestsetControl
Set pna = CreateObject("AgilentPNA835x.Application")
Set testsets = pna.ExternalTestsets
Set tset1 = testsets(1)
' make COM calls on tset1 object
End Sub
```

Trace Object

Description
The Trace object controls how the measurement data is displayed. You can control scale, reference position, and value from the Trace Object.

Accessing a Trace object
There are several ways to get a handle to a trace.

```vbscript
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trace As Trace

Then you can do any of the following:

Set trace = app.NAWindows(1).traces(1)
set trace = app.NAWindows.item(1).ActiveTrace
set trace = app.ActiveNAWindow.traces.item(1)
set trace = app.ActiveNAWindow.ActiveTrace
Set trace = app.Measurements(1).trace
Set trace = app.ActiveMeasurement.trace
```

</table>
Traces Collection

Description
Child of the Application Object. A collection that provides a mechanism for getting a handle to a trace or iterating through the traces in a window.

Accessing the Traces collection
Get a handle to the traces collection through the NaWindows collection. The following example sets the variable trcs to the collection of traces in window 1 of the NaWindows collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trcs As traces
Set trcs = app.NAWindows(1).traces
```

<tbody>
<tr>
<td>Count</td>
<td>Returns the number of traces in the collection.</td>
</tr>
<tr>
<td>Parent</td>
<td>Returns a handle to the current Application.</td>
</tr>
</tbody>
</table>
Transform Object

Description
Contains the methods and properties that control Time Domain transforms.

Accessing the Transform Object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trans As Transform
Set trans = app.ActiveMeasurement.Transform
```

VMC Type Object

Description
Contains the methods and properties to perform a Vector Measurement Calibration for the Frequency Converter Application (option 083).

Accessing the VMCType object
See an example which creates and calibrates a VMC measurement.
You can also do the following:

```vbs
Set app = CreateObject("AgilentPNA835x.Application")
Set CalMgr = app.GetCalManager
Set guidedCal = CalMgr.CreateCustomCalEx(1)
Set VMC = guidedCal.CustomCalConfiguration
VMC.ConnectorType(1) = "APC 3.5 male"
```

AcceptTriggerBeforeArmed Property

**Description**
Determines what happens to an EDGE trigger signal if it occurs before the PNA is ready to be triggered. (LEVEL trigger signals are always ignored.) For more information, see [External triggering](#).

**VB Syntax**
```vbnet
trigsetup.AcceptTriggerBeforeArmed = boolean
```

**Variable**
- **trigsetup**
  - A `TriggerSetup2` object
- **boolean**
  - Choose from:
    - **False** - A trigger signal is ignored if it occurs before the PNA is ready to be triggered.
    - **True** - A trigger signal is remembered and then used when the PNA becomes armed (ready to be triggered). The PNA remembers only one trigger signal.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
trigsetup.AcceptTriggerBeforeArmed = True 'Write

atba = trigsetup.AcceptTriggerBeforeArmed 'Read
```

**C++ Syntax**
```cpp
HRESULT get_AcceptTriggerBeforeArmed( BOOL *pVal);
HRESULT put_AcceptTriggerBeforeArmed( BOOL newVal);
```

**Interface**
`ITriggerSetup2`
Read / Write

About Performing a Calibration

AcquisitionDirection Property

Description Specifies the direction of each part of a 2-port calibration.

VB Syntax `cal.AcquisitionDirection = value`

Variable (Type) - Description
- `cal` A Calibrator (object)
- `value` (enum NADirection) - Choose from:
  - 0 - naForward - measures the forward direction
  - 1 - naReverse - measures the reverse direction

Return Type Long Integer

Default naForward

Examples `cal.AcquisitionDirection = naForward`

C++ Syntax `HRESULT AcquisitionDirection(tagNADirection dir);`

Interface ICalibrator
AcquisitionMode Property

**Description**
Set and read the method by which gain compression data is acquired.

**VB Syntax**
gca.AquisitionMode = value

**Variable**
(Variable) - Description

- **gca** A GainCompression (object)

- **value** (NAGCAAcquisitionMode) Choose from:
  - naSmartSweep (0)  Iterate quickly to find compression point
  - naSweepPowerAtEachFreq2D (1)  Sweep power at each frequency
  - naSweepFreqAtEachPower2D (2)  Sweep frequency at each power level

**Return Type**
Enum

**Default**
naSmartSweep

**Examples**
gca.AquisitionMode = naSmartSweep 'Write
acqMode = gca.AquisitionMode 'Read

**C++ Syntax**
HRESULT get_AcquisitionMode(tagNAGCAAcquisitionMode* mode)
HRESULT put_AcquisitionMode(tagNAGCAAcquisitionMode mode)

**Interface**
IGainCompression

**ActiveCalKit Property**

**Description**

Returns a handle to the Active CalKit object. The active cal kit is the kit selected for use in Unguided calibrations.

You can either (1) use the handle directly to access CalKit properties and methods, or (2) set a variable to the CalKit object. The variable retains a handle to the original object if another CalKit becomes active.

**VB Syntax**

1) `app.ActiveCalKit.<setting>`

or

2) `Set cKit = app.ActiveCalKit`

**Variable (Type)** - Description

- `app` - An Application (object)
- `<setting>` - A CalKit property (or method) and arguments
- `cKit` - A CalKit object

**Return Type**

CalKit object

**Default**

None

**Examples**

```vbnet
Public cKit as CalKit
Set cKit = app.ActiveCalKit 'read
```

**C++ Syntax**

```cpp
HRESULT get_ActiveCalKit (ICalkit * kit)
```

**Interface**

IApplication

---

**Last Modified:**

3-Jun-2008   Added Unguided
ActiveChannel Property

Description
Returns a handle to the Active Channel object. You can either (1) use the handle directly to access channel properties and methods, or (2) set a variable to the channel object. The variable retains a handle to the original channel if another channel becomes active.

VB Syntax
(1) `app.ActiveChannel.<setting>`
or
(2) Set `chan = app.ActiveChannel`

Variable (Type) - Description
- `chan`: A Channel (object)
- `app`: An Application (object)
- `<setting>`: A channel property (or method) and arguments

Return Type
Channel object

Default
Not applicable

Examples
1) `app.ActiveChannel.Averaging = 1`
2) `Public chan as Channel
   Set chan = app.ActiveChannel`

C++ Syntax
`HRESULT get_ActiveChannel(IChannel** pVal)`

Interface
`IApplication`
Active (ExtDev) Property

**Description**
Sets and returns the state of activation for an external device. When true, device is available for use in measurements.

**Note:** Send this command AFTER sending other External Device settings to avoid communicating with the device before it has been fully configured.

See Also **ExternalDeviceDeActivatePolicy Property** - Determines whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

**VB Syntax**
```
extDevices.Active = value
```

**Variable**
*(Type)* - Description

- **extDevices** An **ExternalDevice** *(object)*
- **value** (Boolean) Choose from:
  - **True** - Device is active.
  - **False** - Device is NOT active.

**Return Type**
Boolean

**Default**
False - When configured using the front panel user interface, the device is ON (activated) by default.

**Examples**
```
extDevices.Active = True 'Write
bool = extDevices.Active 'Read
See example program to configure PMAR device
See example program to configure External Source
```

**C++ Syntax**
```
HRESULT get_Active( VARIANT_BOOL* value);
HRESULT put_Active( VARIANT_BOOL newVal);
```

**Interface**
IEternalDevices

### ActiveMarker Property

**Description**
Returns a handle to the Active Marker object. You can either (1) use the handle directly to access Marker properties and methods, or (2) set a variable to the Marker object. The variable retains a handle to the original object if another Marker becomes active.

**VB Syntax**
1) `meas.ActiveMarker.<setting>`
   
   or
   
   2) Set `mark = meas.ActiveMarker`

**Variable (Type) - Description**

- **meas (object)** - An Measurement object
- **<setting>** - A marker property (or method) and arguments
- **mark (object)** - A marker object

**Return Type**
marker object

**Default**
None

**Examples**
```vbnet
Public mark as marker
Set mark = meas.ActiveMarker
```

**C++ Syntax**
`HRESULT get_ActiveMarker(IMarker** marker)`

**Interface**
IMeasurement
### ActiveMeasurement Property

**Description**
Returns a handle to the Active Measurement object. You can either (1) use the handle directly to access measurement properties and methods, or (2) set a variable to the measurement object. The variable retains a handle to the original measurement.

**VB Syntax**
1) `app.ActiveMeasurement.<setting>`
   or
2) `Set meas = app.ActiveMeasurement`

**Variable ** *(Type) - Description*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas</td>
<td>A Measurement <em>(object)</em></td>
</tr>
<tr>
<td>app</td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td>&lt;setting&gt;</td>
<td>A measurement property (or method) and arguments</td>
</tr>
</tbody>
</table>

**Return Type**
Measurement object

**Default**
None

**Examples**
1) `app.ActiveMeasurement.Averaging = 1`
2) `Public meas as Measurement
   Set meas = app.ActiveMeasurement`

**C++ Syntax**
`HRESULT get_ActiveMeasurement(IMeasurement **ppMeas)`

**Interface**
IApplication
ActiveNAWindow Property

**Description**
Returns a handle to the Active Window object. You can either (1) use the handle directly to access window properties and methods, or (2) set a variable to the window object. The variable retains a handle to the original window if another window becomes active.

**VB Syntax**
1) `app.ActiveNAWindow.<setting>`
   or
2) Set `win = app.ActiveNAWindow`

**Variable**
- **(Type) - Description**
  - `win` A NAWindow *(object)*
  - `app` An Application *(object)*
  - `<setting>` A NAWindow property (or method) and arguments

**Return Type**
A NAWindow object

**Default**
Not applicable

**Examples**
- Public `win as NAWindow`
- `Set win = app.ActiveWindow`

**C++ Syntax**
```
HRESULT get_ActiveNAWindow(INAWindow **ppWindow)
```

**Interface**
IApplication
**About Traces**

**ActiveTrace Property**

**Description**
Returns a handle to the Active Trace object. You can either (1) use the handle directly to access trace properties and methods, or (2) set a variable to the trace object. The variable retains a handle to the original trace if another trace becomes active.

**VB Syntax**
1) `win.ActiveTrace.<setting>`  
   or  
   2) Set `trce = win.ActiveTrace`

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>trce</code></td>
<td>A Trace <em>(object)</em></td>
</tr>
<tr>
<td><code>win</code></td>
<td>An NAWindow <em>(object)</em></td>
</tr>
<tr>
<td><code>&lt;setting&gt;</code></td>
<td>A trace property (or method) and arguments</td>
</tr>
</tbody>
</table>

**Return Type**
An NAWindow object

**Default**
None

**Examples**
1) `win.ActiveTrace.Autoscale`
2) `Public trce as Trace`  
   `Set trce = Application.ActiveNAWindow.ActiveTrace`

**C++ Syntax**
`HRESULT get_ActiveTrace(ITrace* *pVal)`

**Interface**
INAWindow
ActiveBackground Property

**Description**
Set and return the background color of the active window for the PNA display or hardcopy print.

**VB Syntax**
```vbnet
colors.ActiveBackground = value
```

**Variable (Type) - Description**
- `colors` A `ComColors` (object)
- `value` (Long Integer) - RGB color of the ActiveBackground pen.
  
  Convert the three RGB colors to an integer as follows:
  ```
  RGB = R + (G*2^8) + (B*2^16)
  ```
  To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

**Return Type**
Long

**Default**
Display = 0,0,24

**Examples**
```vbnet
R = 10
G = 10
B = 10
RGB = R + (G*2^8) + (B*2^16)
colors.ActiveBackground = RGB 'Write
color = colors.ActiveBackground 'Read
```

**C++ Syntax**
```csharp
HRESULT get_ActiveBackground(long* pVal);
HRESULT put_ActiveBackground(long newVal);
```

**Interface**
IComColors2

---

Last Modified:
22-Feb-2010   MX New topic
## ActiveLabels Property

**Description**
Set and return the labels and grid frame colors in the active window for the PNA display or hardcopy print. (Active labels, Grid frame)

**VB Syntax**
```vbnet
colors.ActiveLabels = value
```

**Variable**
- **Type**
  - colors: A `ComColors` (object)
- **value**: (Long Integer) - RGB color of the ActiveLabels pen.
  - Convert the three RGB colors to an integer as follows:
    ```
    RGB = R+(G*2^8)+(B*2^16)
    ```
  - To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

**Return Type**
Long

**Default**
- Display = 175,175,175
- Print = 0,0,0 (Black)

**Examples**
```vbnet
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.ActiveLabels = RGB 'Write
color = colors.ActiveLabels 'Read
```

**C++ Syntax**

```
HRESULT get_ActiveLabels(long* pVal);
HRESULT put_ActiveLabels(long newVal);
```

**Interface**
IComColors

**ActiveXAxisRange Property**

**Description**  
For FCA and GCX measurements, sets the swept parameter to display on the X-axis. This command does not change the default setting for new traces.

Use `Converter.ActiveXAxisRange` to change all existing traces and make the setting the default setting for new traces.

This command is NOT used for NFX, IMDX, and IMSX measurements. Use `Converter.ActiveXAxisRange`.

**VB Syntax**  
`mixer.ActiveXAxisRange = value`

**Variable**  
*(Type)* - Description

- `mixer`  
  A Mixer *(object)*

- `value`  
  *(Enum as MixerStimulusRange)* - Parameter to display on the X-axis. Choose from:
  - 0 - `mixINPUT` - Input frequency span
  - 1 - `mixLO_1` - First LO frequency span
  - 2 - `mixLO_2` - Second LO frequency span
  - 3 - `mixOUTPUT` - Output frequency span

**Return Type**  
Enum

**Default**  
OUTPUT

**Examples**  
`mixer.ActiveXAxisRange = 1`  
`variable = mixer.ActiveXAxisRange`

**C++ Syntax**  
`HRESULT get_ActiveXAxisRange(tagMixerStimulusRange *Val)`  
`HRESULT put_ActiveXAxisRange(tagMixerStimulusRange newVal)`

**Interface**  
IMixer3

ActiveXAxisRange Property

**Description**
For all converter applications, sets the swept frequency range to display on the X-axis for all existing traces and sets the default for all future traces.

**VB Syntax**
```
obj.ActiveXAxisRange = value
```

**Variable**
- **obj** (Type) - Description
  - A Converter Object
- **value** (Enum as ConverterStimulusRange)
  - Swept stimulus range to display on the X-axis. Choose from:
    - 0 - naInputRange - Input frequency range
    - 1 - naLO1Range - LO 1 frequency range
    - 2 - naLO2Range - LO 2 frequency range
    - 3 - naOutputRange - Output frequency range
    - 4 - naPerMeasurementRange - reserved for future use.
  - If the specified frequency range is not swept, the default swept range is used.

**Return Type**
Enum

**Default**
Search is performed in the following order until a swept range is found:

1. OUTPUT
2. INPUT (If the OUTPUT is fixed)
3. Number of Points (If ALL ranges are fixed)

**Examples**
```
conv.ActiveXAxisRange = naInputRange 'Write
variable = conv.ActiveXAxisRange 'Read
```

**C++ Syntax**
```
HRESULT get_ActiveXAxisRange(tagConverterStimulusRange range *Val)
HRESULT put_ActiveXAxisRange(tagConverterStimulusRange range newVal)
```

**Interface**
IConverter

Last Modified:
- 9-Sep-2010  Added LO2 range and Modified for all converter apps.
- 2-Feb-2009  Added converter
- 26-Jan-2009  Corrected enums
**ADCCaptureMode Property**

**Description**
Sets and returns the ADC capture mode modeled as a 2-pole switch in the diagram on the SignalProcessingModuleFour page. The switch either bypasses or routes the IF through the 3-stage digital filter.

**VB Syntax**

```
spm4.ADCCaptureMode = value
```

**Variable** *(Typing)* - *Description*

- `spm4` - A SignalProcessingModuleFour (object)
- `value` - (Enum as NAStates) Capture mode.
  - **naOFF (0)** - The digital filters are used to process IF information. The filters can be configured automatically or manually using FilterMode Property.
  - **naON (1)** - The digital filters are bypassed and the raw ADC readings are taken directly. With DSP 4 versions, a maximum of 4096 data points per sweep can be acquired.
  - With DSP 5 versions, the PNA maximum data points per sweep can be acquired. Learn more about DSP Versions.

**Return Type**
Enum

**Default**
OFF

**Examples**

```
spm4.ADCCaptureMode = 0 'Write
mode = spm4.ADCCaptureMode 'Read
```

**C++ Syntax**

```
HRESULT get_ADCCaptureMode(tagNAStates* pCaptureMode);
HRESULT put_ADCCaptureMode(tagNAStates pCaptureMode);
```

**Interface**
ISignalProcessingModuleFour

Sets and returns the ALC mode for the specified channel and port. Use `GetSupportedALCModes` to return a list of valid ALC modes for the PNA.

Learn more about ALC mode.

VB Syntax

```
chan.ALCLevelingMode(sourcePort) = value
```

Variable (Type) - Description

- `chan` (object) - A `Channel` object
- `sourcePort` (long integer) - The source port for which to make this setting. If ports are remapped, specify the logical port number.
  
  **Note**: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- `value` (enum as `naALCLevelingMode`) - Choose from:
  
  - 0 `naALCInternal`
  - 1 `naALCExternal` (E835x Only)
  - 2 `naALCOpenLoop` (PNA-X only)

Return Type

Enum

Default

`naALCInternal`

Examples

```
chan.ALCLevelingMode(1) = 'Write
state = chan.ALCLevelingMode(4) 'Read
```

C++ Syntax

```
HRESULT get_ALCLevelingMode(long port, tagNAALCLevelingMode* pVal);
HRESULT put_ALCLevelingMode(long port,tagNAALCLevelingMode newVal);
```

About Segment Sweep

AllowArbitrarySegments Property

Description
Enables you to setup a segment sweep with arbitrary frequencies. The start and stop frequencies of each segment can overlap other segments. Also, each segment can have a start frequency that is greater than its stop frequency which causes a reverse sweep over that segment. Learn more about Arbitrary Segment Sweep.

VB Syntax
`segs.AllowArbitrarySegments = value`

Variable (Type) - Description
- `segs` A `Segments` collection (object)
- `value` (boolean)
  - `True` - Allows the setup of arbitrary segment sweep.
  - `False` - Prevents the setup of arbitrary segment sweep.

Return Type
Boolean

Default
False

Examples
`segs.AllowArbitrarySegments = True 'Write`

`AllowArbSegs = AllowArbitrarySegments 'Read`

C++ Syntax
- `HRESULT get_AllowArbitrarySegments(VARIANT_BOOL *pVal)`
- `HRESULT put_AllowArbitrarySegments(VARIANT_BOOL newVal)`

Interface
ISegments3
AlternateSweep Property

Description  
Sets sweeps to either alternate or chopped.

VB Syntax  
`object.AlternateSweep = value`

Variable (Type) - Description

- **object**  
  Channel (object)
  
  or
  
  CalSet (object) - Read-only property

- **value** (boolean) - Choose either:
  
  - **False** - Sweep mode set to Chopped - reflection and transmission are measured on the same sweep.
  
  - **True** - Sweep mode set to Alternate - reflection and transmission measured on separate sweeps. Improves Mixer bounce and Isolation measurements. Increases cycle time.

Return Type  
boolean

Default  
False (0)

Examples

`chan.AlternateSweep = True 'Write`

`altSwp = chan.AlternateSweep 'Read`

C++ Syntax

`HRESULT AlternateSweep(VARIANT_BOOL *pVal)`

`HRESULT AlternateSweep(VARIANT_BOOL newVal)`

Interface  
IChannel

ICalSet3
AmbientTemperature Property

**Description**
Sets and returns the temperature at which the current noise measurement is occurring. [Learn more.](#)

**VB Syntax**
noiseCal.AmbientTemperature = value

**Variable**
*noiseCal* (Type) - Description

噪声Cal (object)

*value* (double) Ambient temperature in Kelvin.

**Return Type**
Double

**Default**
295

**Examples**
noise.AmbientTemperature = 289 'Write

temp = noise.AmbientTemperature 'Read

**C++ Syntax**
HRESULT get_AmbientTemperature(Double* pValue)

HRESULT put_AmbientTemperature(Double pNewValue)

**Interface**

Attenuator Property

Description
Sets or returns the value of the source attenuator for the specified port number. Sending this command automatically sets AttenuatorMode to Manual.

VB Syntax
object.Attenuator(portNum) = value

Variable
(Type) - Description
object Channel (object)
or
CalSet (object) - Read-only property

portNum (long integer) - Port number of source attenuator to be changed.

value (double) - Attenuation value. The range of settable values depends on the PNA model. To determine the valid settings, do one of the following:

- See PNA models and options to see the range and step size for each model / option.
- To determine the maximum attenuator value use MaximumSourceStepAttenuator.

If an invalid attenuation setting is entered, the PNA will select the next lower valid value. For example, if 19 is entered, then for an E8361A, 10 dB attenuation will be selected.

Return Type
Double

Default
20 dB

Examples
chan.Attenuator(1) = 20 'Write

attn = chan.Attenuator(cnum) 'Read

C++ Syntax
HRESULT get_Attenuator(long port, double *pVal)
HRESULT put_Attenuator(long port, double newVal)

Interface

### AutoOptimizePRF Property

**Description**
In Narrowband pulse mode, choose to set the Pulse Repetition Frequency automatically or manually. This is labeled "Optimize Pulse Frequency" on the user-interface. To make changes manually, use `MasterFrequency Property` or `MasterPeriod Property`.

**VB Syntax**

```vbnet
pulseMeas.AutoOptimizePRF = bool
```

**Variable**

- **(Type)**: Description
- **pulseMeas**
  - A `PulseMeasurementControl (object)`
  - `bool`: `False` - Manually set the PRF for the measurement.
  - `True` - Automatically set the PRF for the measurement.

**Return Type**

Boolean

**Default**

True

**Examples**

```vbnet
pulse.AutoOptimizePRF = True 'Write
value = pulse.AutoOptimizePRF 'Read
```

**C++ Syntax**

```cpp
HRESULT get_AutoOptimizePRF(VARIANT_BOOL *pVal);
HRESULT put_AutoOptimizePRF(VARIANT_BOOL newVal);
```

AutoPortExtState Property

**Description**
Enables and disables automatic port extensions on the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

**VB Syntax**
```vbnet
fixture.AutoPortExtState(port) = bool
```

**Variable (Type) - Description**
- **fixture** *(object)*
- **port** *(Integer)* Port number to enable or disable.
- **bool** *(Boolean)*
  - **True** - Enables Auto Port Extensions
  - **False** - Disables Auto Port Extensions

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.AutoPortExtState(1) = True
value = fixture.AutoPortExtState(2) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_AutoPortExtState(short port, VARIANT_BOOL *pState);
HRESULT put_AutoPortExtState(short port, VARIANT_BOOL bVal);
```

**Interface**
IFixturing2
### AutoPulseTiming Property

**Description**

In Narrowband pulse mode, choose to set the delay and width automatically or manually. This is labeled "Autoselect Width and Delay" on the user-interface.

**VB Syntax**

```vbnet
pulseMeas.AutoPulseTiming = bool
```

**Variable (Type) - Description**

- `pulseMeas`:
  - A `PulseMeasurementControl (object)`
  - `bool`:
    - **False** - Manually set the delay and width for the measurement.
    - **True** - Automatically set the delay and width for the measurement.

**Return Type**

Boolean

**Default**

True

**Examples**

```vbnet
pulse.AutoPulseTiming = True 'Write
value = pulse.AutoPulseTiming 'Read
```

**C++ Syntax**

```c++
HRESULT get_AutoPulseTiming(VARIANT_BOOL *pVal);
HRESULT put_AutoPulseTiming(VARIANT_BOOL newVal);
```

**Interface**

IPulseMeasurementControl

**AutoSelectPulseGen Property**

**Description**  
In Narrowband pulse mode, choose to set the pulse generator used to drive the source modulation automatically or manually.

**VB Syntax**  
`pulseMeas.AutoSelectPulseGen = bool`

**Variable (Type) - Description**

- `pulseMeas`  
  A `PulseMeasurementControl` *(object)*
  
- `bool`  
  - **False** - Manually set source modulation drive for the measurement.
  - **True** - Automatically set source modulation drive for the measurement.

**Return Type**  
Boolean

**Default**  
True

**Examples**  
`pulse.AutoSelectPulseGen = True`  
`value = pulse.AutoSelectPulseGen`

**C++ Syntax**  
`HRESULT get_AutoSelectPulseGen(VARIANT_BOOL *pVal);`

`HRESULT put_AutoSelectPulseGen(VARIANT_BOOL newVal);`

**Interface**  
`IPulseMeasurementControl`

## AuxiliaryTriggerCount Property

**Description**
Returns the number of aux trigger input / output connector pairs in the PNA

**VB Syntax**
```vbnet
value = app.AuxiliaryTriggerCount
```

**Variable**
- **Value** *(Long Integer)* Variable to store the returned value.
  - 2 = PNA-X models
  - 1 = All other PNA models

- **app** An `Application (object)`

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vbnet
ioConns = app.AuxiliaryTriggerCount
```

**C++ Syntax**
```c++
HRESULT AuxiliaryTriggerCount(long *count);
```

**Interface**
`IApplciation11`

---

**Last Modified:**
- 6-Apr-2009  Replaced N5242A with PNA-X
- 14-Dec-2006  MX New topic
**AuxTriggerScopeIsGlobal Property**

**Description**
Sets the Trigger OUT behavior to either Global or Channel. [Learn more about this setting.](#)

This command will cause the PNA to **Reset**.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

See the [AuxTrigger Object](#).

**VB Syntax**

```
pref.AuxTriggerScopeIsGlobal = value
```

**Variable** *(Type) - Description*

- **pref** - A Preferences *(object)*
- **value** - (Boolean) - Choose from:

  - **True** - Trigger properties apply to ALL channels (Global).
    - Default setting for E836x and PNA-L models.
    - Allows use of command to configure the external trigger properties.
    - "Per Point" trigger property is not settable. Use the channel's Point trigger setting.
  
  - **False** - External Trigger properties apply to each channel independently.
    - Default setting for PNA-X models.
    - Must use AuxTrigger commands to configure the external trigger properties. ExternalTriggerConnectionBehavior Property will NOT work.
    - "Per Point" trigger output property is set using the channel's Point trigger setting AND TriggerOutInterval Property.

**Return Type**

Boolean

**Default**

- **True** - E836xB and PNA-L models
- **False** - PNA-X models

**Examples**

```
pref.AuxTriggerScopeIsGlobal = 1 'Write
auxTrigPref = pref.AuxTriggerScopeIsGlobal 'Read
```

**C++ Syntax**

```
HRESULT get_AuxTriggerScopeIsGlobal(VARIANT_BOOL * pref);
HRESULT put_AuxTriggerScopeIsGlobal(VARIANT_BOOL pref);
```
Interface IPreferences5

AvailableMeasurementClasses Property

**Description**
Returns a list of available measurement classes on the PNA.

**VB Syntax**

```
value = cap.AvailableMeasurementClasses
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value (Variant)</td>
<td>Variable to store the returned list of measurement classes.</td>
</tr>
<tr>
<td>cap A Capabilities (object)</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**

Variant

**Default**
Not Applicable

**Examples**

```
'Read all measurement classes
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
meas=cap.AvailableMeasurementClasses
dim i
For i = 0 To UBound(meas)
    msg = msg & meas(i) & vbCrLf
Next
MsgBox msg
```

**C++ Syntax**

```
HRESULT get_AvailableMeasurementClasses(Variant *value);
```

AverageMode Property

Description  Specifies the type of averaging to perform: Point or Sweep.

VB Syntax  \textit{chan.AverageMode} = \textit{value}

Variable  \textbf{(Type)} - Description

\textit{chan}  A \texttt{Channel} (object)

\textit{value}  \textbf{(Enum as naAverageMode)} - Average Type. Choose from:

0 - \texttt{naPoint}  Averaging measurements are made on each data point before stepping to the next data point. (Not available on 'C' models).

1 - \texttt{naSweep}  Averaging measurements are made on subsequent sweeps until the required number of averaging sweeps are performed.

Return Type  Enum

Default  1 - \texttt{naSweep}

Examples  \texttt{chan.AverageMode = naSweep 'Write}

\texttt{avgType = chan.AverageMode ' Read}

C++ Syntax  HRESULT get_AverageMode(NAAverageMode * mode);

HRESULT put_AverageMode(NAAverageMode mode);

Interface  IChannel16

Last Modified:

8-Jun-2009  Not available on 'C' models.

### AveragingCount Property

**Description**
Returns the number of sweeps that have been acquired and averaged into the measurements on this channel. **AveragingFactor** specifies the number of sweeps to average. **AveragingCount** indicates the progress toward that goal.

**VB Syntax**

```vbnet
value = chan.AveragingCount
```

**Variable (Type) - Description**

- **chan**
  - A Channel (object)
- **value**
  - (Long Integer) - Variable to store the returned count

**Return Type**
Long Integer

**Default**
Not Applicable

**Example**

```
avgcount = chan.AveragingCount
```

**C++ Syntax**

```
HRESULT get_AveragingCount(long* count)
```

**Interface**
IChannel
## AveragingFactor Property

### Description
Specifies the number of measurements to combine for an average. Must also turn averaging ON by setting \texttt{chan.Averaging} = 1.

### VB Syntax
\texttt{chan.AveragingFactor = value}

### Variable (Type) - Description

- \texttt{chan}  A Channel (object)
- \texttt{value} (Long Integer)  - Number of measurement sweeps to average. Choose any number between 1 and 65536 ($2^{16}$).

### Return Type
Long Integer

### Default
1

### Examples
\texttt{chan.AveragingFactor = 5  'Write}

\texttt{avgfact = chan.AveragingFactor  ' Read}

### C++ Syntax
- HRESULT \texttt{get\_AveragingFactor(long *pVal)}
- HRESULT \texttt{put\_AveragingFactor(long newVal)}

### Interface
IChannel

---

**Last Modified:**

16-Apr-2009  Updated for Point Averaging
## Averaging Property

**Description**
Turns trace averaging ON or OFF for all measurements on the channel. Averaging is only allowed on ratioed measurements; not on single input measurements.

**VB Syntax**
```
chan.Averaging = state
```

**Variable**
- **Chan**
  - **chan** (Channel (object))

- **state** (boolean)
  - **False** - Turns averaging OFF
  - **True** - Turns averaging ON

**Return Type**
Boolean

**Default**
False

**Examples**
```
chan.Average = True 'Write

averg = chan.Averaging 'Read
```

**C++ Syntax**
```
HRESULT get_Averaging(BOOL *pVal)
HRESULT put_Averaging(BOOL newVal)
```

**Interface**
IChannel
# AvoidSpurs Property

Sets and returns the state of the avoid spurs feature.

## Description
Sets and returns the state of the avoid spurs feature.

## VB Syntax

```vbnet
mixer.AvoidSpurs = boolean
```

## Variable 

<table>
<thead>
<tr>
<th>Variable</th>

**Background Property**

**Description**  Set and return the background color for the PNA display or hardcopy print.

**VB Syntax**  \texttt{colors.Background = value}

**Variable (Type) - Description**

- **colors**  A \texttt{ComColors} (object)
- **value**  (Long Integer) - RGB color of the Background pen. Convert the three RGB colors to an integer as follows:

\[
\text{RGB} = R + (G*2^8) + (B*2^{16})
\]

To find the three RGB values from the Display Colors dialog, click \texttt{Change Color}, then \texttt{Define Custom Color}.

**Return Type**  Long

**Default**  Display = 0,0,0 (Black)

Print = 255,255,255 (White)

**Examples**

\[
\begin{align*}
R &= 10 \\
G &= 10 \\
B &= 10 \\
\text{RGB} &= R + (G*2^8) + (B*2^{16}) \\
\text{colors.Background} &= \text{RGB} \quad \text{'Write} \\
\text{color} &= \text{colors.Background} \quad \text{'Read}
\end{align*}
\]

**C++ Syntax**

\[
\text{HRESULT get_Background(long* pVal);} \\
\text{HRESULT put_Background(long newVal);} \\
\]

**BackOff Property**

**Description**  
Sets and returns the backoff value used to calculate various PNOP parameters.  
Also set PinOffset Property.

A sweep must be executed (single or continuous) and  
SearchPowerNormalOperatingPoint Method must be sent before reading marker results.  
To turn off the PNOP markers, either turn them off individually or DeleteAllMarkers.

To search a User Range with the PNOP search, first activate marker 1. The user range  
used with the PNOP search only applies to marker 1 searching for the linear gain value.  
The other markers may fall outside the user range.

**VB Syntax**  
`pnop.BackOff = value`

**Variable (Type) - Description**

- **pnop** (object)
- **value** (double) - Backoff value in dB. Choose any number between -500 and 500

**Return Type**  
Double

**Default**  
0 dB

**Examples**  
`backoff = pnop.BackOff `Read

See example program

**C++ Syntax**  
`HRESULT put_BackOff(double newVal);`

`HRESULT get_BackOff(double* pNewVal)`

## BandwidthTarget Property

**Description**  
Sets the insertion loss value at which the bandwidth of a filter is measured (using BandwidthTracking or SearchFilterBandwidth). For example, if you want to determine the filter bandwidth 3 db below the bandpass peak value, set BandwidthTarget to -3.

### VB Syntax

```vbnet
meas.BandwidthTarget = value
```

### Variable  
**Type** - Description

- `meas`  
  A Measurement (object)

- `value`  
  (single) - Target value. Choose any number between -500 and 500

### Return Type

Single

### Default

-3

### Examples

```vbnet
meas.BandwidthTarget = -3 'Write
```

```vbnet
fbw = meas.BandwidthTarget 'Read
```

### C++ Syntax

- HRESULT put_BandwidthTarget(float target)
- HRESULT get_BandwidthTarget(float* target)

### Interface

IMeasurement
**BandwidthTracking Property**

**Description**
Searches continually (every sweep) for the current BandwidthTarget (default is -3). To search the filter bandwidth for ONE SWEEP only (not continually), use meas.SearchFilterBandwidth.

This feature uses markers 1-4. To turn off these markers, either turn them off individually or DeleteAllMarkers.

The bandwidth statistics are displayed on the analyzer screen. To get the bandwidth statistics, use either GetFilterStatistics or FilterBW, FilterCF, FilterLoss, or FilterQ.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To restrict the search to a UserRange with the bandwidth search, first activate marker 1 and set the desired UserRange. Then send the SearchFilterBandwidth command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

**VB Syntax**

```vbnet
meas.BandwidthTracking = value
```

**Variable (Type) - Description**

- **meas**
  A Measurement (object)

- **value**
  (boolean)
  - **True** - Turns bandwidth tracking ON
  - **False** - Turns bandwidth tracking OFF

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
meas.BandwidthTracking = False 'Write
bwtrack = meas.BandwidthTracking 'Read
```

**C++ Syntax**

```cpp
HRESULT put_BandwidthTracking(VARIANT_BOOL state)
HRESULT get_BandwidthTracking(VARIANT_BOOL* state)
```

**Interface**

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```vbnet
variable = balTop.BB_BalPort1Positive 'Read
```

**C++ Syntax**  
```c
HRESULT get_BB_BalPort1Positive(long *bVal)
```

**Interface**  
IBalancedTopology
BB_BalPort2Negative Property

**Description**  
With a Balanced - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT’s logical Port 2.

Use [SetBBPorts Method](#) to set the port mapping for a Balanced - Balanced topology.

**VB Syntax**  
`var = balTopology.BB_BalPort2Negative`

**Variable**  
- **(Type)** - Description
  - `var` (Long Integer) Variable to store the returned value.

**balTopology**  
A [BalancedTopology](#) (object)

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```
variable = balTop.BB_BalPort2Negative  'Read
```

**C++ Syntax**  
`HRESULT get_BB_BalPort2Negative(long *bVal)`

**Interface**  
IBalancedTopology
BB_BalPort2Positive Property

**Description**
With a Balanced - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's logical Port 2.

Use **SetBBPorts Method** to set the port mapping for a Balanced - Balanced topology.

**VB Syntax**
```vbnet
var = balTopology.BB_BalPort2Positive
```

**Variable**
<table>

**balTopology**
A **BalancedTopology (object)**

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vbnet
variable = balTop.BB_BalPort2Positive  'Read
```

**C++ Syntax**
```cpp
HRESULT get_BB_BalPort2Positive(long *bVal)
```

**Interface**
IBalancedTopology
### BBalMeasurement Property

**Description**
Sets and returns the measurement for the Balanced - Balanced topology.

**VB Syntax**

```vbnet
balMeas.BBalMeasurement = value
```

**Variable**

<table>

<td>Imb2</td>
<td>CMRR -(Sdd21/Scc21)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Sdd11

**Examples**

```vbnet
balMeas.BBalMeasurement = "Sdd11"  'Write
variable = balMeas.BBalMeasurement  'Read
```

**C++ Syntax**

```
HRESULT get_BBalMeasurement(BSTR *pVal)  
HRESULT put_BBalMeasurement(BSTR newVal)  
```

**Interface**
`IBalancedMeasurement`
### BeginResponse Property

**Description**
When constructing a limit line, specifies the amplitude value of the start of a limit segment.

**VB Syntax**

```vbnet
limtseg.BeginResponse = value
```

**Variable**

- **Type** - Description
  - `limtseg` A LimitSegment *(object)*
  - `value` *(double)* - Amplitude value. No units

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
Set limtseg = meas.LimitTest(1)
limtseg.BeginResponse = 10 'Write
BegResp = limtseg.BeginResponse 'Read
```

**C++ Syntax**

```
HRESULT get_BeginResponse(double *pVal)
HRESULT put_BeginResponse(double newVal)
```

**Interface**

`ILimitSegment`
### BeginStimulus Property

**Description**
When constructing a limit line, specifies the beginning X-axis value.

**VB Syntax**

```vbnet
limtseg.BeginStimulus = value
```

**Variable**

- **Type**: A LimitSegment *(object)*
- **value**: *(double)* - Stimulus value. No units

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
Set limtseg = meas.LimitTest(1)
limtseg.Type = naLimitSegmentType_Maximum
limtseg.BeginStimulus = 3e9
limtseg.EndStimulus = 4e9
limtseg.BeginResponse = 10
limtseg.EndResponse = 10
```

**C++ Syntax**

- HRESULT get_BeginStimulus(double *pVal)
- HRESULT put_BeginStimulus(double newVal)

**Interface**
ILimitSegment
**Read/Write**

**About Embedded LO**

## BroadbandTuningSpan Property

**Description**
Sets and returns the frequency span for the broadband tuning sweep.

**VB Syntax**

```
obj.BroadbandTuningSpan = value
```

**Variable (Type) - Description**

- **obj**
  - An [EmbeddedLO](#) (object)
  - A [ConverterEmbeddedLO](#) (object)

- **value**
  - (Double) Broadband frequency span in Hz.

**Return Type**
(Double)

**Default**
3 MHz

**Examples**

```
embedLO.BroadbandTuningSpan = 1E6 'write
```

```
value = embedLO.BroadbandTuningSpan 'read
```

**C++ Syntax**

```
HRESULT get_BroadbandTuningSpan(double* span);
HRESULT put_BroadbandTuningSpan(double span);
```

**Interface**
IEmbeddedLO

---

**Last Modified:**
- 12-Aug-2009  Added ConvEmbedLO object
- 18-Apr-2007  MX New topic

840
BucketNumber Property

Description
Sets or returns the bucket number (data point) for the active marker. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

VB Syntax
mark.BucketNumber = value

Variable (Type) - Description
mark A Marker (object)
value (long integer) - Data point. Choose any number between 0 and the measurement's number of data points - 1. For example, with Number of points = 201, choose between 0 and 200

Return Type
Long Integer

Default
The first marker is set to the middle of the span. Subsequent markers are set to the bucket number of the previously active marker.

Examples
mark.BucketNumber = 100 'moves the active marker to data point 100
pointNumber = mark.BucketNumber 'returns the data point number of the marker object. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

C++ Syntax
HRESULT get_BucketNumber(long *pVal)
HRESULT put_BucketNumber(long newVal)

Interface
IMarker
Write/Read

C0 Property

Description
Sets and Returns the C0 (C-zero) value (the first capacitance value) for the calibration standard. To set the other capacitance values, use C1, C2, C3.

VB Syntax
\[ \text{calstd}.C0 = \text{value} \]

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(single) - Value for C0 in femtofarads (1E-15)</td>
</tr>
</tbody>
</table>

Return Type
Single

Default
Not Applicable

Examples
\[ \text{calstd}.C0 = 15 \quad \text{Write the value of C0 to 15femtofarads} \]
\[ \text{cap0} = \text{calstd}.C0 \quad \text{Read the value of C0} \]

C++ Syntax

```c++
HRESULT get_C0(float *pVal)
HRESULT put_C0(float newVal)
```

Interface
ICalStandard
C1 Property

**Description**
Sets and Returns the C1 value (the second capacitance value) for the calibration standard. To set the other capacitance values, use **C0**, **C2**, **C3**.

**VB Syntax**
```
calstd.C1 = value
```

**Variable**

- **calstd** (A CalStandard **object**). Use calKit.GetCalStandard to get a handle to the standard.
- **value** (**single**) - Value for C1.

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
calstd.C1 = 15  'Write the value of C1.
cap1 = calstd.C1  'Read the value of C1.
```

**C++ Syntax**
```
HRESULT get_C1(float *pVal)
HRESULT put_C1(float newVal)
```

**Interface**
ICalStandard
C2 Property

Description  Sets and Returns the C2 value (the third capacitance value) for the calibration standard.
To set the other capacitance values, use C0, C1, C3.

VB Syntax  
\[
\text{calstd.C2} = \text{value}
\]

Variable  

- \text{calstd} - A CalStandard \text{(object)}. Use calKit.GetCalStandard to get a handle to the standard.
- \text{value} - (single) - Value for C2.

Return Type  Single

Default  Not Applicable

Examples  
\[
\text{calstd.C2} = 15 \quad \text{'Write the value of C2.'}
\]
\[
\text{cap2} = \text{calstd.C2} \quad \text{'Read the value of C2'}
\]

C++ Syntax  
HRESULT get_C2(float *pVal)
HRESULT put_C2(float newVal)

Interface  ICalStandard
C3 Property

Description
Sets and Returns the C3 value (the fourth capacitance value) for the calibration standard.
To set the other capacitance values, use C0, C1, C2

VB Syntax

calstd.C3 = value

Variable

(value) (single) - Value for C3.

Return Type
Single

Default
Not Applicable

Examples

calstd.C3 = 15 'Write the value of C3.

cap3 = calstd.C3 'Read the value of C3

C++ Syntax

HRESULT get_C3(float *pVal)
HRESULT put_C3(float newVal)

Interface
ICalStandard
CalFactor Property

**Description**
Sets or returns the cal factor value associated with a power sensor cal factor segment.

**VB Syntax**
`calFactSeg.CalFactor = value`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calFactSeg</code></td>
<td>A PowerSensorCalFactorSegment (Object) or</td>
</tr>
<tr>
<td></td>
<td>A PowerSensorCalFactorSegmentPMAR (Object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) – Cal factor in percent. Choose any value between 1 and 150</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**
```
calFactSeg.CalFactor = 98 'Write
factor = calFactSeg.CalFactor 'Read
```

**C++ Syntax**
```
HRESULT put_CalFactor(Double newVal);
HRESULT get_CalFactor(Double *pVal);
```

**Interface**
IPowerSensorCalFactorSegment
IPowerSensorCalFactorSegmentPMAR
### CalibrationType Property  Superseded

**Description**

Note: This command has been replaced by `CalibrationTypeID_property`, which provides selection of Calibration Type by string.

Specifies the type of calibration to perform or apply to the active S-Parameter measurement. This command determine the ports involved in the CalType by the ports being used by the active measurement.

For example:

- If the measurement is an S23, it uses ports 2 and 3.
- If the measurement is an S22 it will use the legacy load port to figure out which two ports form the caltype. The legacy load port is set using `CreateMeasurement`.
- If `naCalType_ThreePort_SOLT` is specified on a 4-port PNA, an `E_NA_DEPRECATED_COMMAND` error is returned. There is no way to determine the intended three ports.
- If `naCalType_FourPort_SOLT` is specified on a 4-port PNA, it is obvious that the ports involved are ports 1,2,3, and 4.

Note: For FCA measurements, use `CalibrationName` and `CalibrationTypeID`.

---

**VB Syntax**

```vbnet
meas.CalibrationType = type
```

**Variable**  
**Type** - Description

- **meas** A `Measurement` (object)
- **type** (enum `NACalType`) - Calibration type. Choose from:
  - 0 - naCalType_Response_Open
  - 1 - naCalType_Response_Short
  - 2 - naCalType_Response_Thru
  - 3 - naCalType_Response_Thru_And_Isol
  - 4 - naCalType_OnePort
  - 5 - naCalType_TwoPort_SOLT
  - 6 - naCalType_TwoPortTRL
  - 7 - naCalType_None
  - 8 - naCalType_ThreePort_SOLT
  - 9 - Custom
  - 10 - naCalType_FourPort_SOLT

**Return Type**  
`NACalType`
<table>
<thead>
<tr>
<th>Default</th>
<th>naCalType_None</th>
</tr>
</thead>

</tbody>
</table>
Description  

Note: Beginning with Rev 6.0, this command is no longer necessary. Learn more. Because of improved calibration techniques, Both is always selected although a power meter measurement is performed only on port 1.

Specifies which SMC port to calibrate.

VB Syntax  

SMC.CalibrationPort = value

Variable  

(Type) - Description

SMC  SMCType (object)

value  (String) Port number to be calibrated. Choose from:

- 1 - SMC forward
- 2 - SMC reverse
- Both

Return Type  

String

Default  

1

Examples  

value = SMC.CalibrationPort = "Both"

C++ Syntax  

HRESULT put_CalibrationPort(BSTR port);
HRESULT get_CalibrationPort(BSTR *port);

Interface  

SMCType
VMCType
**CalibrationTypeID Property**

**Description**  
*Note: This command replaces Calibration Type Property.*  
Sets or returns the current cal type for the measurement using a Cal Type Name.  
This command is used to set the Cal Type after recalling a Cal Set. Learn more  
You can also use the CLSID or GUID associated with the Cal Type.

**VB Syntax**  
```
meas.CalibrationTypeID = id
```

**Variable**  
(Type) - Description  
meas (Object)  

(id) (String) Cal type. Case sensitive. Use one of the following:

**For Full Calibrations:**  
This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.  
"Full n Port(x,y,z...)
where  

n = the number of ports to calibrate  
x,y,z = the port numbers to calibrate

For example:  
"Full 7 Port (2,3,4,5,6,7,8)"

**For Response Calibrations:**  
"Response(param)" OR  
"ResponseAndIsolation(param)"

Where param =

- S-parameter. For example"
  
  - "Response(S21)"
  - "ResponseAndIsolation(A/R)"

- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:
  
  - "Response(A)"
  - "ResponseAndIsolation(a3/b4)"
For FCA Calibrations:

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.
- "SMCRsp+IN" No Output match. All four sweeps required.
- "SMCRsp+OUT" No Output match. All four sweeps required.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.

For Gain Compression Cal
where \( r \) = receive port; \( s \) = source port

- "GCA 2P (r,s)" - full 2-port cal
- “GCA Enh Resp (r,s)” - Enhanced Response Cal

Return Type  String
Default  Not Applicable

Examples

```vbscript
Dim pna
Dim m

Set pna = CreateObject("AgilentPNA835x.Application")
Set m = pna.ActiveMeasurement
m.CalibrationTypeID = "Scalar Mixer Cal"
m.ErrorCorrection = True
MsgBox m.CalibrationName
```

C++ Syntax

```
HRESULT get_CalibrationTypeID( BSTR* CalibrationTypeID );
HRESULT put_CalibrationTypeID( BSTR CalibrationTypeID );
```

Interface  IMeasurement2

Last modified:

- 22-Sep-2009  Removed VMC strings
- 27-May-2008  Edit channel vs meas
- 11-Feb-2008  Fixed typo
- 9/12/06  MQ Added for multiport.
### CalibrationFrequencies Property

**Description**
Sets and returns the whether to perform the source power cal at the center frequencies midway between the main tones, or at all main tone frequencies.

**VB Syntax**
```vbnet
imd.CalibrationFrequencies = value
```

**Variable**
- **Type**
  - `imd` A `SweptIMD` (object)
  - `value` (Enum as NAIMDCalibrationFrequencies) Choose from:
    - **0 - naIMDCenterFrequencies** - Perform source power calibration at only the center frequencies midway between the main tones.
    - **1 - naIMDALLFrequencies** - Perform source power calibration at all main tone frequencies.

**Return Type**
Enum

**Default**
0 - naIMDCenterFrequencies

**Examples**
```vbnet
imd.CalibrationFrequencies = naIMDALLFrequencies 'Write

calFreq = imd.CalibrationFrequencies 'Read
```

**C++ Syntax**
```csharp
HRESULT get_CalibrationFrequencies(tagNAIMDCalibrationFrequencies * Val)
HRESULT put_CalibrationFrequencies(tagNAIMDCalibrationFrequencies newVal)
```

**Interface**
ISweptIMD

CalKitType Property

**Description**
Sets and returns a calibration kit type for calibration or to be used for kit modification. To get a handle to this kit, use app.ActiveCalKit.

There is also a CalKitType property for use during a Guided, SMC, and VMC Calibration.

**VB Syntax**

```
object .CalKitType = value
```

**Variable**

*(Type) - Description*

- **object**
  - calkit (object) or Application (object)

  **Note:** app.CalKitType and calkit.calKitType perform exactly the same function.

- **value** *(enum naCalKit)*
  - Calibration Kit type. Choose from:
    1 - naCalKit_User1
    2 - naCalKit_User2
    3 - naCalKit_User3
    4 - naCalKit_User4
    ...
    49 - naCalKit_User49
    50 - naCalKit_User50

  These enumerated values correspond with the calibration kit ID on the Advanced Cal Kit Modify dialog box.

  To change the cal kit name, use Name property.

**Return Type**

NACalKit

**Default**
Not Applicable

**Examples**

```
calkit.CalKitType = naCalKit_User27

kitype = app.CalKitType
```

**C++ Syntax**

```
HRESULT get_CalKitType(tagNACalKit *pVal);
HRESULT put_CalKitType(tagNACalKit newVal);
```

**Interface**

IApplication
ICalKit
CalKitType Property

Description
Sets and returns the ECal or mechanical cal kit for the specified port number to be used during the calibration.

There is also a CalKitType Property for use during an Unguided Cal.

Note: Sliding loads are not fully supported from the GuidedCalibration object. The Measure button must be pressed manually on the PNA.

Note: This command replaces Do1PortEcal Property and Do2PortEcal Property for SMC and VMC Calibrations.

VB Syntax
object.CalKitType (port) = value

Variable (Type) - Description
object Any of the following:
GuidedCalibration (object)
SMCType (object)
VMCTYPE (object)

port (Long) Port number to which the cal kit will be assigned.
For Guided Cals and SMC, select port number.
For VMC calibrations:

- 1 - Mixer Input.
- Any unused port can be used for the mixer output.
- Output port of MUT +1 - Output port of the calibration mixer. Generally this is port 3.

value (string) - Calibration Kit type. Case-sensitive.
Use GetCompatibleCalKits to return a list of valid Cal Kits.

Return Type String

Default Not Applicable

Examples
'Note: All of the following specify port 1 only
' Mechanical Cal Kit
guidedCal.CalKitType(1) = "85052C"
' Standard ECal modules
guidedCal.CalKitType(1) = "N4691-60004 ECal"
' Non-factory ECal characterizations are specified as follows:
guidedCal.CalKitType(1) = "N4691-60004 User 1 ECal"
When two or more ECAL modules with the same model number are connected, also specify the serial number as follows:

\[ \text{guidedCal.CalKitType(1) = "N4691-60004 ECAL 01234"} \]

When Disk Memory ECAL user characterizations are used, specify both the User char and the serial number as follows:

\[ \text{guidedCal.CalKitType(1) = "N4691-60004 MyDskChar ECAL 01234"} \]

Turn on auto orientation for the ECAL (default behavior).

\[ \text{value = smc.CalKitType(1)} \]

**C++ Syntax**

`HRESULT get_CalKitType( long port, BSTR *calkit)`

`HRESULT put_CalKitType( long port, BSTR calkit)`

**Interface**

Description
This command is replaced by SetCallInfoEx Method.
Specifies the power level that is expected at the desired reference plane (DUT input or output). This is not used for segment sweep with independent power levels or power sweeps.

VB Syntax
value = powerCalibrator.CalPower (chan, sourcePort)

Variable
(Type) - Description
value (double) - Variable to store the returned Cal power value in dBm.
powerCalibrator (object) - A SourcePowerCalibrator object
chan (long integer) - Channel number of the PNA.
sourcePort (long integer) - Source port number.
Use GetPortNumber to return the port number of a source that only has a string name, such as an External Source.

Return Type
None
Default
0

Examples
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.CalPower = -10 'Write

power = powerCalibrator.CalPower 'Read

C++ Syntax
HRESULT get_CalPower(long channel, long sourcePort, double *pVal);

Interface
ISourcePowerCalibrator

**Write/Read**

**Center Property**

**Description**
Sets or returns the Center time of either Gating or Time Domain transform windows

**VB Syntax**
```
object.Center = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>(object) As Gating or (object) As Transform</td>
</tr>
</tbody>
</table>

**value**

- (double) - Center time in seconds. Choose any number between:
  - ± (points-1) / frequency span

**Return Type**
Double

**Default**
0

**Examples**
```
trans.Center = 4.5e-9 'sets the Center time of a transform window
Write
gate.Center = 4.5e-9 'sets the Center time of a gating window - Write

cnt = trans.Center 'Read
```

**C++ Syntax**
```
HRESULT get_Center(double *pVal)
HRESULT put_Center(double newVal)
```

**Interface**
ITransform
IGating
Center Property

Description Returns the stimulus value of the center data point for the measurement. This function does NOT work for segment sweep measurements. To understand how this property is useful, see IMeasurement2 Interface.

VB Syntax

\[
\text{value} = \text{meas.Center}
\]

Variable (Type) - Description

- **value** (Double) - Variable to store the returned value.
- **meas** A Measurement (object)

Return Type Double

Default Not Applicable

Examples

\[
\text{Print meas.Center 'prints the center data point}
\]

C++ Syntax

HRESULT get_Center(double * Val);

Interface IMeasurement2
Write/Read

CenterFrequency Property

Description
Sets or returns the center frequency of the channel or
Sets or returns the center frequency of the segment.
See the Measurement2 Interface to learn how this method differs from meas.Center.

VB Syntax
object.centerFrequency = value

Variable
(Type) - Description
object  A Channel (object)
or
A Segment (object)

value (double) - Center frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer.

Return Type
Double

Default
Center of the frequency range

Examples
chan.centerFrequency = 4.5e9 'sets the center frequency of a linear sweep for the channel object -Write

centfreq = chan.centerFrequency 'Read

C++ Syntax
HRESULT get_CenterFrequency(double *pVal)
HRESULT put_CenterFrequency(double newVal)

Interface
IChannel
ISegment

CharacterizationNumber Property

**Description**
Sets and reads the number to which the user characterization will be stored in the ECaL module. The number must be set before sending Initialize or the default value (1) will be used.

**VB Syntax**
```vbnet
userChar.CharacterizationNumber = value
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userChar</td>
<td>An ECalUserCharacterizer Object</td>
</tr>
<tr>
<td>value</td>
<td>(Long) User Characterization number. Choose a value between 1 and 12.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vbnet
userChar.CharacterizationNumber = 5
```

**C++ Syntax**
```c++
HRESULT put_CharacterizationNumber(long *Number);
```

**Interface**
IECalUserCharacterizer

2-Nov-2008   New topic (8.33)
CharacterizeMixerOnly Property

Description
Sets and returns whether to perform ONLY a mixer characterization.

VB Syntax
`VMC.CharacterizeMixerOnly = bool`

Variable (Type) - Description
`VMC` (object) `bool` (Boolean)

- **True** - Perform ONLY mixer characterization.
- **False** - Perform both mixer characterization and calibration.

Return Type
Boolean

Default
False

Examples
`value = VMC.CharacterizeMixerOnly`

C++ Syntax
`HRESULT put_CharacterizeMixerOnly(VARIANT_BOOL bCharMixerOnly);`
`HRESULT get_CharacterizeMixerOnly(VARIANT_BOOL *bCharMixerOnly);`

Interface
`VMCType`
CharFileName Property

**Description**
Specifies the mixer characterization (.S2P) file and immediately loads the file. Also specify the use of a characterization file with LoadCharFromFile Property.

**VB Syntax**

```
VMC.CharFileName = value
```

**Variable**

- **(Type)** - Description
  - **VMC**
    - VMCType (object)
  - **value** (String) Full path, file name, and extension of the mixer characterization file.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```
VMC.CharFileName = "C:/Program Files/Agilent/Network Analyzer/Documents/default.S2P"
```

**C++ Syntax**

```
HRESULT put_CharFileName(BSTR filename);
HRESULT get_CharFileName(BSTR *filename);
```

**Interface**
VMCType
**CharMixerReverse Property**

**Description**
Specifies the direction in which to characterize the calibration mixer. [Learn more about the calibration mixer.](#)

**VB Syntax**

```
VMC.CharMixerReverse = bool
```

**Variable**

*(Type)* - Description

- **VMC**
  VMCTYPE (object)

- **bool** (Boolean)
  0 - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.
  1 - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.

**Return Type**
Boolean

**Default**
0

**Examples**

```
VMC.CharMixerReverse = 0
```

**C++ Syntax**

```
HRESULT put_CharMixerReverse(VARIANT_BOOL bcharReverse);
HRESULT get_CharMixerReverse(VARIANT_BOOL *bcharReverse);
```

**Interface**
VMCTYPE2
CitiContents Property - Superseded

Description  This command is replaced with SaveData Method

Specifies the contents of subsequent citifile saves using app. SaveCitiDataData or app. SaveCitiFormattedData

VB Syntax  \texttt{pref.CitiContents = value}

Variable (Type) - Description

\texttt{pref}  A Preferences (object)

\texttt{value}  (string) - Contents that will be saved with subsequent save commands. Choose from:

"Single" - Single trace
"Displayed" - All displayed traces
"Auto" - All displayed traces

Return Type  String

Default  "Auto"

Examples  \texttt{pref.CitiContents = "Single" 'Write}

\texttt{content = pref.CitiContents 'Read}

C++ Syntax  HRESULT get_CitiContents(BSTR *Contents)
            HRESULT put_CitiContents(BSTR Contents)

Interface  IPreferences
CitiFormat Property - Superseded

Description

This command is replaced with SaveData Method

Specifies the format of subsequent citifile saves using app.SaveCitiFormattedData

VB Syntax

`pref.CitiFormat = value`

Variable

(Type) - Description

`pref` A `Preferences` (object)

`value` (string) - Format in which the citifile will be saved with subsequent save commands. Choose from:

"MA" - Linear Magnitude / degrees

"DB" - Log Mag / degrees

"RI" - Real / Imaginary

"Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.

Return Type

String

Default

"Auto"

Examples

`pref.CitiFormat = "MA"` "Write"

`format = pref.CitiFormat` "Read"

C++ Syntax

HRESULT get_CitiFormat(BSTR *Format)

HRESULT put_CitiFormat(BSTR Format)

Interface

IPreferences
CmnModeZConvPortImag Property

Description
Sets the imaginary part of the impedance value for the common port impedance conversion function.

VB Syntax
```
fixture.CmnModeZConvPortImag(portNum) = value
```

Variable (Type) - Description

- **fixture**: A Fixturing (object)
- **portNum**: (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value**: (Double) Imaginary part of the Impedance value. Choose a value between 0 and 1E18.

Return Type
Double

Default
0

Examples
```
fixture.CmnModeZConvPortImag(2) = 75 'Write
value = fixture.CmnModeZConvPortImag(1) 'Read
```

C++ Syntax
```
HRESULT get_CmnModeZConvPortImag( short portNum, double *pVal)
HRESULT put_CmnModeZConvPortImag( short portNum, double newVal)
```

Interface
IFixturing2
## CmnModeZConvPortReal Property

### Description
Sets the real part of the impedance value for the common port impedance conversion function.

### VB Syntax
```
fixture.CmnModeZConvPortReal(portNum) = value
```

### Variable (Type) - Description
- **fixture** (Type):  
  A Fixturing (object)

- **portNum** (Type):  
  Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)

- **value** (Type):  
  Real part of the Impedance value. Choose a value between 0 and 1E18.

### Return Type
Double

### Default
See [Common Mode Port Z Conversion Default](#)

### Examples
```
fixture.CmnModeZConvPortReal(2) = 75 'Write
value = fixture.CmnModeZConvPortReal(1) 'Read
```

### C++ Syntax
```
HRESULT get_CmnModeZConvPortImag( short portNum, double *pVal)
HRESULT put_CmnModeZConvPortImag( short portNum, double newVal)
```

### Interface
IFixturing2
### CmnModeZConvPortZ0 Property

**Description**
Sets the impedance value for the common port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

**VB Syntax**

```vbnet
fixture.CmnModeZConvPortZ0(portNum) = value
```

**Variable**

- **fixture** *(Type): Fixturing (object)*
- **portNum** *(Integer): Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.]*
- **value** *(Double): Impedance value. Choose a value between 0 and 1E7.>*

**Return Type**
Double

**Default**
See [Common Mode Port Z Conversion Default](#)

**Examples**

```vbnet
fixture.CmnModeZConvPortZ0(2) = 75 'Write
value = fixture.CmnModeZConvPortZ0(1) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_CmnModeZConvPortImag( short portNum, double *pVal)
HRESULT put_CmnModeZConvPortImag( short portNum, double newVal)
```

**Interface**
IFixturing2
CmnModeZConvState Property

**Description**
Turns ON or OFF 4-port common port impedance conversion function. Must also set the fixture simulator function to ON using FixturingState Property.

**VB Syntax**
```
fixture.CmnModeZConvState = value
```

**Variable (Type) - Description**
- `fixture` A Fixturing (object)
- `value` (Boolean)
  - **False** - Turns common port impedance conversion OFF
  - **True** - Turns common port impedance conversion ON

**Return Type**
Boolean

**Default**
False

**Examples**
```
fault.CmnModeZConvState = False 'Write

value = fault.CmnModeZConvState 'Read
```

**C++ Syntax**
```
HRESULT get_CmnModeZConvState( VARIANT_BOOL *pVal)
HRESULT put_CmnModeZConvState( VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
**CompatibleCalKits Property**

**Description**
Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the PNA, and all user characterizations stored in PNA disk memory.

**Note:** Beginning with PNA Rev 9.1, the serial number is returned for ALL ECal modules that are connected with the connector type of the specified port. Previously, the returned list would include the serial numbers to distinguish the ECal modules only when two or more identical ECal models were connected to the PNA.

**VB Syntax**
\[
\text{value} = \text{obj}.\text{CompatibleCalKits}\ (\text{port})
\]

**Variable (Type) - Description**
- **value** (Variant) Variable to store the returned list of Cal Kits.
- **obj** Any of the following:
  - GuidedCalibration (object) Superseded Replaced with GetCompatibleCalKits Method
  - SMCTYPE (object)
  - VMCTYPE (object)
- **port** (Long) Port number for which you want compatible kits.
  First set the **ConnectorType** for the port.

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```vbnet
Dim kits As Variant
kits = MySMC.CompatibleCalKits(1)
```

**C++ Syntax**
```
HRESULT get_CompatibleCalKits(long port, VARIANT* Kits);
```

**Interface**
IGuidedCalibration
- SMCTYPE
- VMCTYPE

CompositeNormalizationMode Property

Description
Sets and returns the method by which CTB and CSO calculations are performed.

VB Syntax
```vbnet
imd.CompositeNormalizationMode = value
```

Variable (Type) - Description
- **imd**: A SweptIMD Object
- **value**: (Enum)
  - 0 - **naNone**: the normalized power is not used in calculation
  - 1 - **naNumberOfCarriers**: CTB and CSO is corrected by subtracting 10*log(N/2), where
    - N = # of carriers for CTB
    - N = # of distortion products for CSO
  - 2 - **naPdBm**: the composited normalized power for CTB or CSO is treated as a dBm value
  - 3 - **naPdBmV**: the composited normalized power for CTB or CSO is treated as a dBmV value.

Note: Power values are stored using the currently-set units. Therefore, first set units with this command, then set power values using:
- CompositeNormalizedCSOPower
- CompositeNormalizedCTBPower

Return Type
Enum

Default
**naNumberOfCarriers**

Examples
```vbnet
imd.CompositeNormalizationMode = naNone 'Write
value = imd.CompositeNormalizationMode 'Read
```

C++ Syntax
```cpp
HRESULT get_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode *pVal)
HRESULT put_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode pVal)
```

Interface
ISweptIMD

Last Modified:

CompositeNormalizedCSOPower Property

Sets and returns the CSO Power for POWER normalization mode. Valid only with measurement parameters: CSO2Lo and CSO2Hi and for Normalization Modes dBm and dBmV.

VB Syntax

\[ \text{imd.CompositeNormalizedCSOPower} = \text{value} \]

Variable (Type) - Description

*imd* A SweptIMD Object

*value* (Double) Power level. The units are determined by CompositeNormalizationMode Property, which must be set first.

Return Type

Double

Default

0

Examples

\[ \text{imd.CompositeNormalizedCSOPower} = -5 \]  'Write

value = imd.CompositeNormalizedCSOPower  'Read

C++ Syntax

HRESULT get_CompositeNormalizedCSOPower(double *pVal)
HRESULT put_CompositeNormalizedCSOPower(double  pVal)

Interface

CompressionDeltaX Property

Description
Set and read the ‘X’ value in the delta X/Y compression algorithm.

VB Syntax

```vbnet
(gca.CompressionDeltaX = value
```

Variable (Type) - Description

- **gca**: A `GainCompression` (object)
- **value**: (double) X value in dB. Choose from 30 to (-30)

Return Type
Double

Default
10

Examples
```
gca.CompressionDeltaX = 'Write

xDelta = gca.CompressionDeltaX 'Read
```

C++ Syntax

```cpp
HRESULT get_CompressionDeltaX(double* pVal)
HRESULT put_CompressionDeltaX(double newVal)
```

CompressionInterpolation Property

**Description**
Sets whether or not interpolation should be performed on 2D measured compression data. Applies ONLY to 2D acquisition modes.

**VB Syntax**
```
gca.CompressionInterpolation = value
```

**Variable** *(Type)* - Description
- **gca** A GainCompression *(object)*
- **value** *(boolean)* - Choose from:
  - **True** Interpolate the results
  - **False** Do NOT interpolate the results but return the value closest to compression.

**Return Type**
Boolean

**Default**
False

**Examples**
```
gca.CompressionInterpolation = True 'Write
compInt = gca.CompressionInterpolation 'Read
```

**C++ Syntax**
```
HRESULT get_CompressionInterpolation(VARIANT_BOOL* pVal)
HRESULT put_CompressionInterpolation(VARIANT_BOOL newVal)
```

### CompressionLevel Property

**Description** Set and read the desired gain reduction (from reference gain). This value is used for Compression Methods: Compression from Linear Gain and Compression from Maximum Gain.

**VB Syntax**

```vbnet
gca.CompressionLevel = value
```

**Variable**

- **gca**: A `GainCompression` object
- **value**: (Double) - Compression level in dB. Choose a value greater than 0.1 dB.

**Return Type** Double

**Default** 1

**Examples**

```vbnet
gca.CompressionLevel = 1.5 'Write
compLevel = gca.CompressionLevel 'Read
```

**C++ Syntax**

- `HRESULT get_CompressionLevel(double* pVal)`
- `HRESULT put_CompressionLevel(double newVal)`

**Interface** `IGainCompression`

CompressionSaturation Property

**Description**
Returns the Compression Saturation result of a PSat marker search.
Comp Sat = Gain Sat - Gain Linear

**VB Syntax**
`compSat = pSat.CompressionSaturation`

**Variable**
- **(Type)**: (double)
- **Description**: Variable to store returned value

**Return Type**
Double

**Default**
Not applicable

**Examples**
`compSat = pSat.CompressionSaturation` 'Read

See example program

**C++ Syntax**
`HRESULT get_CompressionSaturation(double* pNewVal)`

**Interface**
IPSaturation

Last Modified:
22-Feb-2010  MX New topic
**Read / Write**

**ConnectorType Property**

**Description**
Sets or queries the connector type for the specified port.

**VB Syntax**
\[ obj.ConnectorType (port) = value \]

**Variable**
**Type** - Description
- **obj** - Any of the following:
  - GuidedCalibration (object)
  - SMCType (object)
  - VMCType (object)
- **port** - (Long) Port number of the connector type.
- **value** - (String) - Connector type. **Case-sensitive.**
  Use [ValidConnectorType Property](#) to list connector types.

**Return Type**
String

**Default**
None

**Examples**
- `SMC.ConnectorType(1) = "APC 3.5 male"`
- `value = SMC.ConnectorType(1)`

**C++ Syntax**
- `HRESULT get_ConnectorType(long port, BSTR *connector)`
- `HRESULT put_ConnectorType(long port, BSTR connector)`

**Interface**
- IGuidedCalibration
- SMCType
- VMCType

---

**Last Modified:**
- 13-Aug-2007  Added detail to port argument
ConnectorType Property

Description  
Sets or queries the connector type for the specified port.

VB Syntax  
`ecalUser.ConnectorType (port) = value`

Variable  
(Type) - Description

`ecalUser` An ECalUserCharacterizer (object)

`port` (Enum) ECal port for which connector type is to be set. Choose from:

1 or `naECalPort_A`
2 or `naECalPort_B`
3 or `naECalPort_C`
4 or `naECalPort_D`

`value` (String) - Connector type.

- When the User Characterization is to be stored in the ECal module, then the connector type is limited to a Factory-defined connector type. See the list.
- When the User Characterization is to be stored in PNA disk memory, then the connector type can also be a User-defined connector type.

Return Type  
String

Default  
"" (Empty String)

Examples

`ecalUser.ConnectorType(naECalPort_B) = "APC 3.5 male" ' Write`

`Value = ecalUser.ConnectorType(naECalPort_B)`

C++ Syntax

HRESULT get_ConnectorType(NAECalPort port, BSTR *connector);
HRESULT put_ConnectorType(NAECalPort port, BSTR connector);

Interface  
IECalUserCharacterizer

Last Modified:

18-Sep-2009  Modified for factory connectors (A.09.00)
5-Nov-2008  New topic (8.33)
ControlLines Property

**Description**
Sets the control lines of the specified test set. Control lines, provided through the front panel connector of a test set, are used to control external equipment such as a part handler. See your test set documentation to learn more about control lines.

**VB Syntax**
`tset.ControlLines (chNum) = value`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tset</code></td>
<td>A <code>TestsetControl</code> object.</td>
</tr>
<tr>
<td><code>OR</code></td>
<td>An <code>E5091Testset</code> object.</td>
</tr>
<tr>
<td><code>chNum</code></td>
<td>(Integer) Channel number of the measurement.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Data value used to set control lines. Values are obtained by adding weights from the following table that correspond to individual lines.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

- The E5091A interprets SENS:MULT1:OUTP 0 as all lines LOW.
- All "Z" and "H" series test sets interpret SENS:MULT1:OUTP 0 as all lines HIGH.

Refer to your test set documentation for setting control line values.

**Return Type**
Variant

**Default**
0
Examples

For a Z5623A K64 test set, the following sets line 3 and 4 OFF; all other lines ON.

testset1.ControlLines(2) = 12

See E5091A Example Program

See External Testset Program

C++ Syntax

HRESULT get_ControlLines(long channelNum, VARIANT *stateByte);
HRESULT put_ControlLines(long channelNum, VARIANT stateByte);

Interface

ITestsetControl

IE5091Testset

Last Modified:

17-Aug-2007 Added different test sets active High and low
Read-only

**Count Property**

**Description**
Returns the number of items in a collection of objects.

**VB Syntax**
`object.Count`

**Variable**
(Type) - Description

- `object` Any of the following (objects):
  - CalFactorSegments Collection
  - CalFactorSegmentsPMAR Collection
  - Cal Sets Collection
  - Channels Collection
  - E5091Testset Collection
  - ExternalDevices Collection
  - ExternalTestsets Collection
  - GuidedCalibrationPowerSensors Collection
  - LimitTest Collection
  - Measurements Collection
  - NaWindows Collection
  - PowerLossSegments Collection
  - PowerLossSegmentsPMAR_Collection.htm
  - PowerSensors Collection
  - Segments Collection
  - Traces Collection
  - PowerMeterInterfaces Collection

**Return Type**
Long Integer

**Default**
Not applicable

**Examples**
```vbnet
numofchans = chans.Count 'return the number of channels
```

**C++ Syntax**
```cpp
HRESULT get_Count(long *pInterface)
```

**Interface**
All listed above
8-Feb-2011  Added GuidedCalibratioPowerSensors (9.33)
31-Jul-2009  Added ExternalDevices (9.0)
6-Mar-2009  PowerMeterInterfaces
### CouplePorts Property

**Description**
Turns ON and OFF port power coupling. ON means the power level is the same for both ports. OFF means the power level may be set independently for each port.

**VB Syntax**

\[ \text{object}.\text{CouplePorts} = \text{value} \]

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Channel (object) or CalSet (object) - Read-only property</td>
</tr>
</tbody>
</table>

**Value**

(enum NAStates) Choose from:

- 0 - NaOff - Turns coupling OFF
- 1 - NaOn - Turns coupling ON

**Return Type**

Long Integer

1 - ON
0 - OFF

**Default**

NaON (1)

**Examples**

\[ \text{chan.CouplePorts} = \text{NaOff} \] `Write`

\[ \text{couplport} = \text{chan.CouplePorts} \] `Read`

**C++ Syntax**

HRESULT get_CouplePorts(tagNAStates *pState)
HRESULT put_CouplePorts(tagNAStates newState)

**Interface**

IChannel | CalSet3
CoupleChannelParams Property

Description
Turns ON and OFF Time Domain Trace Coupling. All of the measurements in the specified channel are coupled.

- To select Transform parameters to couple, use Trans.CoupledParameters Property
- To select Gating parameters to couple, use Gate.CoupledParameters Property

VB Syntax

```vbnet
chan.CoupleChannelParams = state
```

**Variable** *(Type) - Description*

- `chan` A [Channel](object) (object)
- `state` (boolean)
  - `False` - Turns Trace Coupling OFF
  - `True` - Turns Trace Coupling ON

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
chan.CoupleChannelParams = False 'Write
```

```vbnet
couple = chan.CoupleChannelParams 'Read
```

**C++ Syntax**

```c
HRESULT get_CoupleChannelParams(VARIANT_BOOL *isCoupled);
HRESULT put_CoupleChannelParams(VARIANT_BOOL isCoupled);
```

**Interface**
IChannel5
Coupled Property

**Description**
Sets and returns the state of coupling (ON or OFF) of this range to the primary range.

**VB Syntax**

```
FOMRange.Coupled = value
```

**Variable** (Type) - Description

- **object**
  - An `FOMRange` object

- **value** (boolean) - State of coupling.
  - `True` - Couple range to primary range.
  - `False` - Do NOT couple to primary range.

**Return Type**
Boolean

**Default**
True

**Examples**

```
fomRange.Coupled = False 'this range is NOT coupled to the primary range.
coupl = fomRange.Coupled 'Read
```

**C++ Syntax**

```
HRESULT get_Coupled(VARIANT_BOOL *pVal)
HRESULT put_Coupled(VARIANT_BOOL pVal)
```

**Interface**
IFOMRange
**CoupledMarkers Property**

**Description**
Sets and Reads the state of Coupled Markers (ON and OFF)

**VB Syntax**
```vbnet
app.CoupledMarkers = state
```

**Variable**
- **app** (Type) - An Application (object)
- **state** (boolean)
  - False (0) - Turns Coupled Markers OFF
  - True (1) - Turns Coupled Markers ON

**Return Type**
Boolean
- False - OFF
- True - ON

**Default**
False

**Examples**
```vbnet
app.CoupledMarkers = True 'Write
coupl = app.CoupledMarkers 'Read
```

**C++ Syntax**
```cpp
HRESULT put_CoupledMarkers(VARIANT_BOOL bState)
HRESULT get_CoupledMarkers(VARIANT_BOOL *bState)
```

**Interface**
IApplication
**CoupledParameters Property (Gating)**

**Description**
Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use `CoupleChannelParams Property`

To specify Transform parameters to couple, use `Transform.CoupledParameters Property`

**VB Syntax**
```
gate.CoupledParameters = value
```

**Variable**
```
trans A Gating (object)
value (Enum As NAGatingCoupledParams) - Parameters to couple. To specify more than one parameter, add the numbers. Choose from:
1 - naGatingStimulusCoupled (Start, Stop, Center, and Span TIME settings.)
2 - naGateStateCoupled (ON / OFF)
4 - naGatingShapeCoupled (Minimum, Normal, Wide, and Maximum)
8 - naGatingTypeCoupled (Bandpass and Notch)
```

**Return Type**
Enum

**Default**
29

**Examples**
```
gate.CoupledParameters = 15 'Couple all parameters
```

```
CP = gate.CoupledParameters 'Read
```

**C++ Syntax**
```
HRESULT get_CoupledParameters(long *lParams);
HRESULT put_CoupledParameters(long lParams);
```

**Interface**
IGating2
**CoupledParameters Property (Transform)**

**Description**
Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use `CoupleChannelParams Property`

To specify Gating parameters to couple, use `Gate.CoupledParameters Property`

**VB Syntax**
```
trans.CoupledParameters = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>trans</code></td>
<td>Transform (object)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>(Enum As NATransformCoupledParams)</th>
<th>Parameters to couple. To specify more than one parameter, add the numbers. Choose from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - naTransformStimulusCoupled</td>
<td>(Start, Stop, Center, and Span TIME settings.)</td>

<tr>
<td>4 - naTransformWindowCoupled</td>
<td>(Kaiser Beta / Impulse Width)</td>
</tr>
<tr>
<td>8 - naTransformModeCoupled</td>
<td>(Low Pass Impulse, Low Pass Step, Band Pass)</td>
</tr>
<tr>
<td>16 - naTransformDistMkrUnitCoupled</td>
<td>(Distance maker Units)</td>
</tr>
</tbody>
</table>

**Return Type**
Enum

**Default**
29

**Examples**
```
trans.CoupledParameters = 31 'Couple all parameters
```
```
CP = trans.CoupledParameters 'Read
```

**C++ Syntax**
```
HRESULT get_CoupledParameters(long *lParams);
HRESULT put_CoupledParameters(long lParams);
```

**Interface**
ITransform2
### CouplePhasePortSettings Property

**Description**
Sets and returns whether to couple phase control settings (IFBW, Tolerance, Max Iterations).

**VB Syntax**

```vbnet
phase.CouplePhasePortSettings(srcPort) = value
```

**Variable**

- **phase** (Type) - Description
  
  A [PhaseControl](#) Object

- **srcPort** (Long Integer) Source port for which to make phase control settings.
  
  **Note**: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value** (Boolean) Coupling state. Choose from:
  
  - **True** - Couple phase control settings. The phase control settings from <port> are copied to the other phase-controlled ports.
  
  - **False** - Do NOT couple phase control settings. The phase control settings for each phase-controlled port are made independently.

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
phase.CouplePhasePortSettings 1 = True ' Write
value = phase.CouplePhasePortSettings 2 ' Read
```

**C++ Syntax**

```c++
HRESULT get_CouplePhasePortSettings(long port, VARIANT_BOOL* pVal);
HRESULT put_CouplePhasePortSettings(long port, VARIANT_BOOL newVal);
```

**Interface**

IPhaseControl

**CoupleTonePower Property**

**Description**  Sets and returns the ON | OFF state of power coupling for F1 and F2.

**VB Syntax**  
`object.CoupleTonePower = value`

**Variable**  
*object* - A SweptIMD, or IMSpectrum Object

*value* - (Boolean) - Choose from:

- **True** - F1 and F2 power is coupled.
- **False** - F1 and F2 power is NOT coupled. Set power levels individually.

**Return Type**  Boolean

**Default**  True

**Examples**  
`ims.CoupleTonePower = true`  'Write

`value = ims.CoupleTonePower`  'Read

**C++ Syntax**  
- HRESULT get_CoupleTonePower(VARIANT_BOOL* val)
- HRESULT put_CoupleTonePower(VARIANT_BOOL val)

**Interface**  ISweptIMD

IIMSMpectrum

**CpuRevision Property**

**Description**

Returns a number that corresponds to the CPU speed of the PNA.

**VB Syntax**

```vbnet
value = cap.CpuRevision
```

**Variable**

**Type** - Description

- `value` (String) - Variable to store the returned number. Use the following table to learn the CPU speed.

<table>
<thead>
<tr>
<th>Reported CPU version</th>
<th>Clock speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>266 MHz</td>

CSOOffset Property

Description
Sets and returns the offset that is applied to CSO measurements. Valid only with measurement parameters: CSO2Lo and CSO2Hi.

VB Syntax
`imd.CSOOffset = value`

Variable (Type) - Description
`imd` A SweptIMD Object
`value` (Double) Offset value in dBm.

Return Type
Double

Default
0

Examples
`imd.CSOOffset = 2 'Write`
`value = imd.CSOOffset 'Read`

C++ Syntax

CustomChannelConfiguration Property

**Description**
Returns a handle to the custom application object on the active channel. You can either (1) use the handle directly to access measurement properties and methods, or (2) set a variable to the measurement object. The variable retains a handle to the original measurement.

Currently, the custom application objects to which this property provides access are:

- **NoiseFigure Object**
- **GainCompression Object**
- **SweptIMD Object**

**VB Syntax**
1) `set custChan = chan.CustomChannelConfiguration. <setting>`
or
2) `set custChan = app.ActiveChannel.CustomChannelConfiguration`

**Variable (Type) - Description**

- **custChan**
  A variable in which the handle to a custom application is returned. *(object)*

- **chan**
  A Channel *(object)*

- **<setting>**
  A property or method setting on the custom application object.

**Return Type**
Custom application object

**Default**
None

**Examples**
See examples: NoiseFigure GainCompression SweptIMD

**C++ Syntax**
HRESULT CustomChannelConfiguration(IDispatch** value);

**Interface**
IChannel12

Write/Read

CWFrequency Property

Description
Set the Continuous Wave (CW) frequency. Must first send chan.SweepType = naCWTimeSweep.
See Also: calset.CWFrequency Property

VB Syntax
object.CWFrequency = value

Variable (Type) - Description

object One of the following:

- Channel (object)
- FOMRange (object) Range must be UNCOUPLED.

See also Measurement2 interface.

double value CW frequency. Choose any number between:
the minimum and maximum frequency limits of the analyzer
Units are Hz

Return Type Double

Default 1e9

Examples
chan.CWFrequency = 5e9 'Write
cwfreq = chan.CWFrequency 'Read

C++ Syntax
HRESULT put_CWFrequency(double newVal)
HRESULT get_CWFrequency(double *pVal)

Interface IChannel
IFOMRange
Read-only

Data Property

Description
Reads the next specified number of data points from the FIFO buffer. The data is returned in 32 bit real/imaginary pair. Data is cleared as it is read.

Note: This method is the slowest way to transfer data using COM. However, it is supported by all COM client programming languages. For better performance, try using DataInCompactForm.

VB Syntax
array = fifo.Data (count)

Variable
- Description

array (Variant) Variable to store the returned data.

tifo A FIFO Object

count (Long Integer) Number of data points to read.

Return Type
Variant array. Each VARIANT is typed as a 4-byte floating point number.

Default
Not Applicable

Examples
value = fifo.Data(500) 'Read

C++ Syntax
HRESULT get_Data(long count,VARIANT * data);

Interface
IFIFO

Last Modified:
7-Oct-2008    MX New topic
### DataAndLimits Property

**Description**  
Set and return the color of Data and Limit Lines for nth trace in a window.

**VB Syntax**  
\[ trace(n).DataAndLimits = value \]

**Variable**  
**(Type)** - **Description**

- **trace(n)**: One of the 8 ComTraceColors objects
- **value** *(Long Integer)*: RGB color of the DataAndLimits pen.

Convert the three RGB colors to an integer as follows:

\[ \text{RGB} = R + (G \times 2^8) + (B \times 2^{16}) \]

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

**Return Type**  
Long

**Default**  
Varies for each trace.

**Examples**

- \[ R = 10 \]
- \[ G = 10 \]
- \[ B = 10 \]
- \[ \text{RGB} = 10 + (10 \times 2^8) + (10 \times 2^{16}) \]

\[ \text{trace1.DataAndLimits} = \text{RGB} \ 'Write\]

\[ \text{color} = \text{trace1.DataAndLimits} \ 'Read\]

**C++ Syntax**

```cpp
HRESULT get_DataAndLimits(long* pVal);
HRESULT put_DataAndLimits(long newVal);
```

**Interface**  
IComTraceColors

DataCount Property

Description  Returns the total number of data points in the FIFO buffer.

VB Syntax  

\[ value = \text{fifo}.\text{DataCount} \]

Variable (Type) - Description

\begin{itemize}
  \item \textit{value} (Long Integer) Variable to store the returned number of data points.
  \item \textit{fifo} A FIFO Object
\end{itemize}

Return Type  Long Integer

Default  Not Applicable

Examples  

\[ value = \text{fifo}.\text{DataCount} \]

C++ Syntax  

\begin{verbatim}
HRESULT get_DataCount(long *value)
\end{verbatim}

Interface  IFIFO

Last Modified:  

7-Oct-2008  MX New topic
**DataInCompactForm Property**

**Description**  
Reads FIFO data the same as Data Property but returns the data in a more compact form of SAFEARRAY. This is significantly faster but it is not supported in all client environments.

**VB Syntax**  
`array = fifo.DataInCompactForm(count)`

**Variable (Type) - Description**

- **array**  (Variant) Variable to store the returned data
- **fifo**  A FIFO Object
- **count**  (Long Integer) Number of data points to read.

**Return Type**  
Returns an array of 4 byte floating point numbers.

**Default**  
Not Applicable

**Examples**  
`value = fifo.DataInCompactForm(500)`  

**C++ Syntax**  
`HRESULT get_DataInCompactForm(long count, VARIANT * data);`

**Interface**  
IFIFO
**Delay Property**

```
calstd.Delay = 12  'Write 12ps Delay
```

```
stdDelay = calstd.Delay  'Read the value of Delay
```

**Last Modified:** 5-Jan-2007  MX New topic
Delay (pulse) Property

**Description**
Sets the pulse delay - the amount of time before a new pulse begins.

**VB Syntax**
`pulse.Delay(n) = value`

**Variable (Type) - Description**
- `pulse` (PulseGenerator object)
  - n (Integer) Pulse generator number. Choose from 0 to 4. 0 is the generator that pulses the ADC.
  - value (Double) Delay value in seconds. Choose a value from about 33ns to about 70 seconds.

**Return Type**
Double

**Default**
0

**Examples**
```
pulse.Delay(1) = 1ms 'Write
```
```
value = pulse.Delay(4) 'Read
```

**C++ Syntax**
```
HRESULT get_Delay(integer pulse, double* delay);
HRESULT put_Delay(integer pulse, double delay);
```

**Interface**
IPulseGenerator

### Delay Property

**Description**
Specifies the delay that should be applied by the PNA after the aux trigger input is received and before the acquisition is made.

**Note:** Use on PNA-X ONLY. Other models do NOT have an Aux Input.

**VB Syntax**
```vb
auxTrig.Delay = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auxTrig</td>
<td>An <strong>AuxTrigger</strong> (object)</td>
</tr>
<tr>
<td>value</td>
<td>(double) - Delay value in seconds. Choose a value between 0 and 3.0 seconds.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vb
auxTrig.Delay = 1.2 'Write 1.2s Delay
```

```vb
value = auxTrig.Delay 'Read the value
```

**C++ Syntax**
```cpp
HRESULT get_Delay(double *val);
HRESULT put_Delay(double val);
```

**Interface**
IAuxTrigger

DelayCalculationMethod Property

**Description** Set and return the method of setting the delay through the calibration mixer.

**VB Syntax**
```
smc.DelayCalculationMethod = value
```

**Variable (Type) - Description**
- `smc`: An SMCType (object)
- `value`: (Enum as NADelayCalculationMethod)

  0 - `naDelayCalculationMethod_FixedDelay` - use a known delay value set with `FixedDelay Property`
  1 - `naDelayCalculationMethod_MixerCharacterizationFile` - use the S2P file set with `MixerCharacterizationFile Property`

**Return Type** Enum

**Default** 0 - `naDelayCalculationMethod_FixedDelay`

**Example**
```
SMC.DelayCalculationMethod = naDelayCalculationMethod_FixedDelay
```

**C++ Syntax**
```
HRESULT put_DelayCalculationMethod(tagNADelayCalculationMethod Value);
HRESULT get_DelayCalculationMethod(tagNADelayCalculationMethod* Value);
```

**Interface** SMCType5

DelayIncrement Property

Description: Sets the pulse delay increment. The delay increments with each pulse by the <value> amount. For example, in this diagram the delay starts as 1. On the second pulse, delay=2. On the third pulse, delay=3.

Important: If D + W is greater than P, then undefined PNA behavior results. There is NO error message or warning. Delay includes the incremented value.

This is useful for pulse profiling.

VB Syntax: pulse.DelayIncrement(n) = value

Variable: (Type) - Description

pulse: A PulseGenerator (object)

n: (Integer) Pulse generator number. Choose from 0 to 4. 0 is the generator that pulses the ADC.

value: (Double) Delay increment value in seconds.

Return Type: Double

Default: 0

Examples: pulse.DelayIncrement(1) = 1ms 'Write

value = pulse.DelayIncrement(4) 'Read

C++ Syntax: HRESULT get_DelayIncrement(integer pulse, double* dIncr);
HRESULT put_DelayIncrement(integer pulse, double dIncr);

Interface: IPulseGenerator

Write/Read

DeltaFrequency Property

**Description**
Sets and returns the fixed tone spacing value. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`
- `naIMDToneCenterFreqSweep`

**VB Syntax**
```
object.DeltaFrequency = value
```

**Variable**
*(Type) - Description*

- **object**
  A SweptIMD or IMSpectrum Object

- **value**
  (Double) - Tone spacing frequency in Hz. Both the F1 and F2 tones MUST be within the frequency range of the PNA.

**Return Type**
Double

**Default**
1 MHz

**Examples**
```
imd.DeltaFrequency = 1e6 'Write
value = imd.DeltaFrequency 'Read
```

**C++ Syntax**
```
HRESULT get_DeltaFrequency(double *pVal)
HRESULT put_DeltaFrequency(double newVal)
```

**Interface**
ISweptIMD
IMSpectrum

**DeltaFrequencyStart Property**

**Description**  
Sets and returns the starting main tone separation for \(\text{sweep type} = \text{naIMDDeltaFrequencySweep}\)

**VB Syntax**  
\(\text{imd}.\text{DeltaFrequencyStart} = \text{value}\)

**Variable**  
**Type** - Description

- **imd**  
  A **SweptIMD** Object

- **value**  
  (Double) - Starting tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:
  
  \[
  \begin{align*}
  \text{F1 (start)} &= \text{imd.FrequencyCenter} - \text{imd.DeltaFrequencyStart} / 2 \\
  \text{F2 (start)} &= \text{imd.FrequencyCenter} + \text{imd.DeltaFrequencyStart} / 2
  \end{align*}
  \]

**Return Type**  
Double

**Default**  
1 MHz

**Examples**

\[
\begin{align*}
\text{imd.DeltaFrequencyStart} &= 5e6 \quad \text{'Write} \\
\text{value} &= \text{imd.DeltaFrequencyStart} \quad \text{'Read}
\end{align*}
\]

**C++ Syntax**

- HRESULT get_DeltaFrequencyStart(double *pVal))
- HRESULT put_DeltaFrequencyStart(double newVal)

**Interface**  
ISweptIMD

---

**DeltaFrequencyStop Property**

**Description**
Sets and returns the stop spacing of the main tones. Use with `sweep type = naIMDDeltaFrequencySweep`

**VB Syntax**
```
imd.DeltaFrequencyStop = value
```

**Variable (Type) - Description**

`imd` A SweptIMD Object

`value` (Double) - Stopping tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:

- F1 (stop) = `imd.FrequencyCenter – imd.DeltaFrequencyStop / 2`
- F2 (stop) = `imd.FrequencyCenter + imd.DeltaFrequencyStop / 2`

**Return Type**
Double

**Default**
10 MHz

**Examples**
```
imd.DeltaFrequencyStop = 20e6  'Write

value = imd.DeltaFrequencyStop  'Read
```

**C++ Syntax**
```
HRESULT get_DeltaFrequencyStop(double *pVal))
HRESULT put_DeltaFrequencyStop(double newVal)
```

**Description**
Sets a marker as a delta marker. The reference marker must already be turned ON. See `meas.ReferenceMarkerState`.

**VB Syntax**
`mark.DeltaMarker = state`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mark</code></td>
<td>A Marker (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean) -</td>
</tr>
<tr>
<td><strong>True</strong></td>
<td>marker is a delta marker</td>
</tr>
<tr>
<td><strong>False</strong></td>
<td>marker is NOT a delta marker</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**

- `mark.DeltaMarker = True` 'Write
- `delta = mark.DeltaMarker` 'Read

**C++ Syntax**

```
HRESULT get_DeltaMarker(VARIANT_BOOL bState)
HRESULT put_DeltaMarker(VARIANT_BOOL *bState)
```

**Interface**
IMarker
Description Property

Sets or returns the descriptive string assigned to the Cal Set. Change this string so that you can easily identify each Cal Set constructed.

**Description**

VB Syntax:  

```vbnet
CalSet.Description = value
```

Variable (Type) - Description

- **CalSet** (object) - A **Cal Set** object
- **value** (string) – Description of the Cal Set

Return Type

String

Default

“CalSet_n” where n is an integer number.

Examples

- `CalSet.Description = "My Cal Set"` 'Write
- `desc = CalSet.Description` 'Read

C++ Syntax

```cpp
HRESULT get_Description(BSTR *pVal)
HRESULT put_Description(BSTR newVal);
```

Interface

ICalSet

**DescriptiveText Property**

**Description**  Write and read descriptive text associated with the configuration. This text is displayed in the path configuration dialog. Text is generally used to describe external connections that must be made manually to complete the configuration setup.

**VB Syntax**  

```vbnet
pathConfig.DescriptiveText = text
```

**Variable**  

**name**  (String) Variable to store the returned configuration name.

**pathConfig**  A **PathConfiguration** (object)

**text**  (String) Descriptive text enclosed in quotes.

**Return Type**  String

**Default**  Not Applicable

**Examples**  

```vbnet
pathConf.DescriptiveText "here are the instructions for connecting the device for this configuration"
```

**C++ Syntax**  

```c++
HRESULT get_DescriptionText(BSTR* pConnectionText );
HRESULT put_DescriptionText(BSTR connectionText );
```

**Interface**  IPathConfiguration

DeviceInputPort Property

Description
Returns the PNA port number to be used for the DUT input.

VB Syntax
$port = obj.DeviceInputPort$

Variable
$(Type) - Description$

$port$ (long) Variable to store the PNA port number of the DUT input.

$mixer$ A Mixer (object)

Return Type
Long

Default
1

Examples
$value = mixer.DeviceInputPort$

C++ Syntax
HRESULT get_DeviceInputPort(long *pVal)

Interface
IMixer8

Last Modified:
23-Apr-2008   New topic.
### DeviceInputPort Property

**Description**  
Read the PNA port number which is connected to the DUT input. Use `SetPortMap Method` to change the port mapping.

**VB Syntax**  
`obj.DeviceInputPort`

**Variable**  
**(Type) - Description**

- `obj`: A `Converter (object)` or
  - A `GainCompression (object)` or
  - A `SweptIMD (object)` or
  - An `IMSpectrum (object)`
  - A `NoiseFigure (object)`

**Return Type**  
Integer

**Default**  
1

**Examples**  
`inPort = gca.DeviceInputPort` 'Read

**C++ Syntax**  
`HRESULT get_DeviceInputPort(int* pVal)`

**Interface**  
`IGainCompression`
- `ISweptIMD`

### DiffPortMatch_C Property

**Description**  
Sets the Capacitance value of the differential matching circuit.

**VB Syntax**  
`fixture.DiffPortMatch_C(portNum) = value`

**Variable**  
- **Type**: Description  
  - **fixture**: A `Fixturing` object  
  - **portNum**: Integer  
    - Balanced (logical) port number. Choose from logical ports 1, 2, 3. [Learn more about logical ports](#)  
  - **value**: Double  
    - Capacitance value in farads. Choose a value between `-1E18` to `1E18`.

**Return Type**  
Double

**Default**  
0

**Examples**  
- `fixture.DiffPortMatch_C(2) = 1e-6` 'Write
- `value = fixture.DiffPortMatch_C(1)` 'Read

**C++ Syntax**  
- `HRESULT get_DiffPortMatch_C( short portNum, double *pVal)`  
- `HRESULT put_DiffPortMatch_C( short portNum, double newVal)`

**Interface**  
`IFixturing2`
## DiffPortMatch_G Property

**Description**  Sets the Conductance value of the differential matching circuit.

**VB Syntax**  
```vbnet
fixture.DiffPortMatch_G(portNum) = value
```

**Variable**  (Type) - Description

- **fixture**  A Fixturing (object)
- **portNum**  (Integer)  Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value**  (Double)  Conductance value in siemens. Choose a value between -1E18 to 1E18.

**Return Type**  Double

**Default**  0

**Examples**  
```vbnet
fixture.DiffPortMatch_G(2) = 1e-3  'Write
value = fixture.DiffPortMatch_G(1)  'Read
```

**C++ Syntax**  
```cpp
HRESULT get_DiffPortMatch_G( short portNum, double *pVal)
HRESULT put_DiffPortMatch_G( short portNum, double newVal)
```

**Interface**  IFixturing2
**DiffPortMatch_L Property**

**Description**
Sets the Inductance value of the differential matching circuit.

**VB Syntax**
```vbnet
fixture.DiffPortMatch_L(portNum) = value
```

**Variable**
- **Type** - Description
- **fixture** (A Fixturing object)
- **portNum** (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value** (Double) Inductance value in henries. Choose a value between -1E18 to 1E18.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
fixture.DiffPortMatch_L(2) = 1e-3 'Write
value = fixture.DiffPortMatch_L(1) 'Read
```

**C++ Syntax**
```c++
HRESULT get_DiffPortMatch_L( short portNum, double *pVal)
HRESULT put_DiffPortMatch_L( short portNum, double newVal)
```

**Interface**
IFixturing2
# DiffPortMatch_R Property

**Description**
Sets the Resistance value of the differential matching circuit.

**VB Syntax**
```
fixture.DiffPortMatch_R(portNum) = value
```

**Variable**
- **(Type)**: A Fixturing object
- **portNum** (Integer): Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value** (Double): Resistance value in ohms. Choose a value between $-1E18$ to $1E18$.

**Return Type**
Double

**Default**
0

**Examples**
```
fixture.DiffPortMatch_R(2) = 1e3 'Write
value = fixture.DiffPortMatch_R(1) 'Read
```

**C++ Syntax**
```
HRESULT get_DiffPortMatch_R(short portNum, double *pVal)
HRESULT put_DiffPortMatch_R(short portNum, double newVal)
```

**Interface**
IFixturing2
DiffPortMatchMode Property

Description
Sets the differential matching circuit type. To select a user-defined circuit, specify IN ADVANCE the 2-port touchstone filename with DiffPortMatch_UserFilename Property. If you do not specify the appropriate file and you select USER, an error occurs and naNO_CIRCUIT is automatically selected.

VB Syntax
```
fixture.DiffPortMatchMode(pNum) = value
```

Variable (Type) - Description

**fixture**
A Fixturing (object)

**pNum**
(Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.

**value**
(Enum as NADiffPortMatchCircuitMode) Choose from:
- 0 or naSHUNT_L_SHUNT_C_CIRCUIT - Specifies the circuit that consists of shunt L and shunt C.
- 1 or naUSER_FILE_CIRCUIT - Specifies the user-defined circuit.
- 2 or naNO_CIRCUIT - Specifies no-circuit.

Return Type
Enum

Default
naSHUNT_L_SHUNT_C_CIRCUIT

Examples
```
fixture.DiffPortMatchMode(2) = naNO_CIRCUIT 'Write
value = fixture.DiffPortMatchMode(1) 'Read
```

C++ Syntax
```
HRESULT get_DiffPortMatchMode( short port, tagNADiffPortMatchCircuitMode *eVal)
HRESULT put_DiffPortMatchMode( short port, tagNADiffPortMatchCircuitMode eVal)
```

Interface
IFixturing2
### DiffPortMatchState Property

**Description**
Turns ON or OFF 4-port differential port matching function. Must also set the fixture simulator function to ON using **FixturingState Property**.

**VB Syntax**
```vbnet
fixture.DiffPortMatchState = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td><strong>A Fixturing</strong> (object)</td>
</tr>
<tr>
<td>value</td>
<td><strong>Boolean</strong></td>
</tr>
<tr>
<td></td>
<td><em>False</em> - Turns differential port matching OFF</td>
</tr>
<tr>
<td></td>
<td><em>True</em> - Turns differential port matching ON</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.DiffPortMatchState = False 'Write
value = fixture.DiffPortMatchState 'Read
```

**C++ Syntax**
```cpp
HRESULT get_DiffPortMatchState( VARIANT_BOOL *pVal)
HRESULT put_DiffPortMatchState( VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
DiffPortMatchUserFilename Property

**Description**
Specifies the 2-port touchstone file in which the information on the user-defined differential matching circuit is saved. Following this command, send DiffPortMatchCircuit Property. If the specified file does not exist, an error occurs when you set the type of differential matching circuit to USER.

**VB Syntax**
```
fixture.DiffPortMatchUserFilename(pNum) = value
```

**Variable (Type) - Description**
- **fixture** (Fixturing object)
- **pNum** (Integer) Balanced (logical) port number. Choose from logical ports 1, 2 or 3. Learn more about logical ports.
- **value** (String) Full path, file name, and extension (.s2P) of the de-embedding circuit. Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

**Return Type**
String

**Default**
Not Applicable

**Examples**
```vbnet
fixture.DiffPortMatchUserFilename(2) = "C:/Program Files/Agilent/Network Analyzer/Documents/myFile.s4p" 'Write

value = fixture.DiffPortMatchUserFilename(1) 'Read
```

**C++ Syntax**
```
HRESULT get_DiffPortMatchUserFilename( short port, BSTR *bstrFile)
HRESULT put_DiffPortMatchUserFilename( short port, BSTR bstrFile)
```

**Interface**
IFixturing2

</table>

**Return Type**
Double

**Default**
See [Differential Port Z Conversion Default](#)

**Examples**
```vbnet
fixture.DiffZConvPortReal(2) = 75 'Write
value = fixture.DiffZConvPortReal(1) 'Read
```

**C++ Syntax**
```c++
HRESULT get_DiffZConvPortReal( short portNum, double *pVal)
HRESULT put_DiffZConvPortReal( short portNum, double newVal)
```

**Interface**
IFixturing2
Write/Read

DiffZConvPortZ0 Property

Description
Sets the impedance value for the differential port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

VB Syntax
`fixture.DiffZConvPortZ0(portNum) = value`

Variable (Type) - Description

- fixture (A Fixturing object)
- portNum (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- value (Double) Impedance value. Choose a value between 0 and 1E18

Return Type
Double

Default
See Differential Port Z Conversion Default

Examples
```
fixture.DiffZConvPortZ0(2) = 75 'Write
value = fixture.DiffZConvPortZ0(1) 'Read
```

C++ Syntax
```
HRESULT get_DiffZConvPortZ0( short portNum, double *pVal)
HRESULT put_DiffZConvPortZ0( short portNum, double newVal)
```

Interface IFixturing2
**DiffZConvState Property**

**Description**
Turns ON or OFF 4-port differential impedance conversion function. Must also set the fixture simulator function to ON using `FixturingState Property`.

**VB Syntax**
```vbnet
fixture.DiffZConvState = value
```

**Variable**

- `fixture` *(Type)* - Fixturing *(object)*
- `value` *(Boolean)*
  - `False` - Turns differential impedance conversion OFF.
  - `True` - Turns differential impedance conversion ON.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.DiffZConvState = False 'Write
value = fixture.DiffZConvState 'Read
```

**C++ Syntax**
```cpp
HRESULT get_DiffZConvState( VARIANT_BOOL *pVal)
HRESULT put_DiffZConvState( VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
### Format Property

**Description**
Sets or returns the display format of the measurement.

**VB Syntax**
`meas.Format = value`

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>meas</th>
<th>A Measurement (object)</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(enum NADataFormat) - Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naDataFormat_LinMag</td>
</tr>
<tr>
<td></td>
<td>1 - naDataFormat_LogMag</td>
</tr>
<tr>
<td></td>
<td>2 - naDataFormat_Phase</td>
</tr>
<tr>
<td></td>
<td>3 - naDataFormat_Polar</td>
</tr>
<tr>
<td></td>
<td>4 - naDataFormat_Smith</td>
</tr>
<tr>
<td></td>
<td>5 - naDataFormat_Delay</td>
</tr>
<tr>
<td></td>
<td>6 - naDataFormat_Real</td>
</tr>
<tr>
<td></td>
<td>7 - naDataFormat_Imaginary</td>
</tr>
<tr>
<td></td>
<td>8 - naDataFormat_SWR</td>
</tr>
<tr>
<td></td>
<td>9 - naDataFormat_PhaseUnwrapped</td>
</tr>
<tr>
<td></td>
<td>10 - naDataFormat_InverseSmith</td>
</tr>
<tr>
<td></td>
<td>11 - naDataFormat_Kelvin</td>
</tr>
<tr>
<td></td>
<td>12 - naDataFormat_Fahrenheit</td>
</tr>
<tr>
<td></td>
<td>13 - naDataFormat_Celsius</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
1 - naDataFormat_LogMag

**Examples**

```vbnet
meas.Format = naDataFormat_Real 'Write
fmt = meas.Format 'Read
```

**C++ Syntax**

- `HRESULT get_Format(tagDataFormat *pVal)`
- `HRESULT put_Format(tagDataFormat newVal)`

**Interface**
IMeasurement

---

**Last Modified:**
1-Oct-2007 Added temperature formats
Write-Read  
DisplayAutomationErrors Property

**Description**  Enables or disables automation error messages from being displayed on the screen.

**VB Syntax**  
app.DisplayAutomationErrors = value

**Variable**  
* (Type) - Description

- **app**  An Application (object)
- **value**  (Boolean)
  - **True** allows error to show on display,
  - **False** turns error off from display.

**Return Type**  Boolean

**Default**  True

**Examples**

```vbnet
Dim app As Application
Set app = New Application
app.DisplayAutomationErrors = False 'Turns off display
print app.DisplayAutomationErrors 'prints False
```

**C++ Syntax**  
HRESULT get_DisplayAutomationErrors(VARIANT_BOOL * Val);
HRESULT put_DisplayAutomationErrors(VARIANT_BOOL Val);

**Interface**  IApplication2
### DisplayGlobalPassFail Property

**Description**
Shows or hides the dialog which displays global pass/fail results. [Learn more about Global Pass/Fail.](#)

**VB Syntax**
`app.DisplayGlobalPassFail = value`

**Variable (Type) - Description**
- **app** An **Application** *(object)*
- **value** *(Boolean)*
  - **True** - displays the pass/fail dialog.
  - **False** - hides the pass/fail dialog.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
Dim app As Application
Set app = New Application
app.DisplayGlobalPassFail = true 'shows dialog
```

**C++ Syntax**
```cpp
HRESULT get_DisplayGlobalPassFail(VARIANT_BOOL * Val);
HRESULT put_DisplayGlobalPassFail(VARIANT_BOOL Val);
```

**Interface**
IApplication6
DisplayRange Property

Description: Sets or returns the range to be displayed on the PNA x-axis. All traces in the channel have this same x-axis scaling.

VB Syntax: `FOM.DisplayRange = value`

Variable (Type) - Description

- object: An FOM (object)
- value: (string) - Range to be displayed on the PNA x-axis. Case insensitive.

Return Type: String

Default: "Receivers"

Examples:

```
fom.DisplayRange = "Source" 'sets the x-axis to the frequency range of "source"
```

```
disprange = fom.DisplayRange 'Read
```

C++ Syntax:

```
HRESULT get_DisplayRange(BSTR *pDspRange)
HRESULT put_DisplayRange(BSTR pDspRange)
```

Interface: IFOM

Last Modified:

7-Mar-2007 Changed to receivers
**Write/Read**

**Distance Property**

**Description**
Set or query marker distance on a time domain trace.

The Write command moves the marker to the specified distance value. Once moved, you can read the **Y axis** value or **read the X-axis time** value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

**VB Syntax**

```
mark.Distance = value
```

**Variable**

*Type* - Description

- **mark**
  - A **Marker** *(object)*

- **value**
  - **(double)** - Marker distance in the unit of measure specified with **DistanceMarkerUnit Property**

**Return Type**

Double

**Default**

Not Applicable

**Examples**

```
mark.Distance = 3e9 'Write
XVal = mark.Distance 'Read
```

**C++ Syntax**

```
HRESULT get_Distance(double *pVal);
HRESULT put_Distance(double newVal);
```

**Interface**

IMarker2
## DistanceMarkerMode Property

### Description
Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratioed measurements.

This setting affects the display of all markers for only the active measurement.

### VB Syntax
```
trans.DistanceMarkerMode = value
```

### Variable *(Type)* - Description

- **trans** *(Transform)* *(object)*
- **value** *(enum As NADistanceMarkerMode)* - Choose from:
  0 - naDistanceMarkerModeAuto
  1 - naDistanceMarkerModeReflection
  2 - naDistanceMarkerModeTransmission

### Return Type
Enum

### Default
0 - naDistanceMarkerModeAuto

### Examples
```
trans.DistanceMarkerMode = naDistanceMarkerModeReflection 'Write

DMM = trans.DistanceMarkerMode 'Read
```

### C++ Syntax
```
HRESULT get_DistanceMarkerMode(tagNADistanceMarkerMode *pVal);
HRESULT put_DistanceMarkerMode(tagNADistanceMarkerMode newVal);
```

### Interface
ITransform2
DistanceMarkerUnit Property

Description: Specifies the unit of measure for the display of marker distance values. This setting affects the display of ALL markers for only the ACTIVE measurement (unless Distance Marker Units are coupled using CoupledParameters Property).

VB Syntax: `trans.DistanceMarkerUnit = value`

Variable: (Type) - Description
- `trans`: A Transform (object)
- `value`: (Enum As NADistanceMarkerUnit) - Distance Marker Units. Choose from:
  - 0 - naDistanceMarkerUnitMeter
  - 1 - naDistanceMarkerUnitFeet
  - 2 - naDistanceMarkerUnitInch

Return Type: Enum

Default: 0 - naDistanceMarkerUnitMeter

Examples: `trans.DistanceMarkerUnit = naDistanceMarkerUnitFeet 'sets the...`
```
U = trans.DistanceMarkerUnit 'Read
```

C++ Syntax: HRESULT get_DistanceMarkerUnit(tagNADistanceMarkerUnit *pVal);
HRESULT put_DistanceMarkerUnit(tagNADistanceMarkerUnit newVal);

Interface: ITransform2
**Divisor Property**

**Description**
Sets and returns the Divisor value to be used when coupling this range to the primary range.
This setting is valid only if the specified range is coupled to the primary range.

**VB Syntax**
```vbnet
FOMRange.Divisor = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>An FOMRange (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Double) - Divisor value - (Unitless)</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
fomRange.Divisor = .5  'Write
Div = fomRange.Divisor  'Read
```

**C++ Syntax**
```cpp
HRESULT get_Divisor(double *pVal)
HRESULT put_Divisor(double *pVal)
```

**Interface**
IFOMRange
Read-Write

Do1PortEcal Property - Superseded

Description  **Note:** This command is replaced with [CalKitType](#) which sets the ECal module or mechanical cal kit.
Specify ECAL or Mechanical calibration for the mixer characterization portion of a VMC calibration.

VB Syntax  

```
VMC.Do1PortEcal = bool
```

Variable  

**Type** - Description

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>VMC</td>
<td>VMCType (object)</td>
</tr>
<tr>
<td>bool</td>
<td>(Boolean)</td>
</tr>
<tr>
<td>True</td>
<td>- ECAL</td>
</tr>
<tr>
<td>False</td>
<td>- Mechanical</td>
</tr>
</tbody>
</table>

Return Type  Boolean

Default  False

Examples  

```
value = VMC.Do1PortEcal
```

C++ Syntax  

```
HRESULT put_Do1PortEcal(VARIANT_BOOL bDoEcal);
HRESULT get_Do1PortEcal(VARIANT_BOOL *bDoEcal);
```

Interface  VMCType
Read-Write

Do2PortEcal Property - Superseded

Description  Note: This command is replaced with CalKitType which sets the ECal module or mechanical cal kit.

Specify ECAL or Mechanical calibration. For VMC, this selection only applies to the 2-port calibration portion. For mixer characterization (VMC), use Do1PortEcal Property

VB Syntax  object.Do2PortEcal = bool

Variable  (Type) - Description

object  SMCTYPE (object) or VMCTYPE (object)

bool  (Boolean)

True - ECAL
False - Mechanical

Return Type  Boolean

Default  False

Examples  value = VMC.Do2PortEcal

C++ Syntax  HRESULT put_Do2PortEcal(VARIANT_BOOL bDoEcal);
            HRESULT get_Do2PortEcal(VARIANT_BOOL *bDoEcal);

Interface  SMCTYPE
            VMCTYPE
## Domain Property

<table>
<thead>
<tr>

<td>(String) External device driver (model). Choose from the following:</td>
</tr>
<tr>
<td></td>
<td>&quot;AGPM&quot; for all power meters.</td>
</tr>
<tr>
<td></td>
<td>See a list of supported external source drivers.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
"AGGeneric"

**Examples**
```
extDevices.Driver = "AGESG"  'Write
value = extDevices.Driver    'Read
See example program to configure PMAR device
See example program to configure External Source
```

**C++ Syntax**
```
HRESULT get_Driver( BSTR* value);
HRESULT put_Driver( BSTR newVal);
```

**Interface**
`IExternalDevices`

**DwellTime Property**

**Description**
Sets or returns the dwell time at the start of each sweep point for all measurements in a channel. Dwell time is only available with Chan. `SweepGenerationMode` = `naSteppedSweep` (not `naAnalogSweep`).

Sets or returns the dwell time of a specified sweep segment.

**VB Syntax**
```
object.DwellTime = value
```

**Variable**

<table>
<thead>
<tr>
<th><strong>(Type)</strong></th>
<th><strong>- Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>object</strong></td>
<td>A Channel (object)</td>
</tr>
<tr>
<td><strong>or</strong></td>
<td>CalSet (object) - Read-only property</td>
</tr>
<tr>
<td><strong>or</strong></td>
<td>Segment (object)</td>
</tr>
</tbody>
</table>

**value** (double) - Dwell Time in seconds. Choose any number between 0 and 86400

**Return Type**
Double

**Default**
0

**Examples**
```
chan.DwellTime = 3e-3 'sets the dwell time for the channel -Write
segs(3).DwellTime = 1e9 'sets the dwell time of segment 3 -Write
dwell = chan.DwellTime 'Read
```

**C++ Syntax**
```
HRESULT get_DwellTime(double *pVal)
HRESULT put_DwellTime(double newVal)
```

**Interface**

| ISegment |
| CalSet3 |
### DwellPerPoint Property

**Description**
Sets and returns the amount of time the PNA should wait after for an external source to settle before making a measurement at each data point.

**VB Syntax**
```
extSource.DwellPerPoint = value
```

**Variable (Type) - Description**
- `chan` An `ExternalSource` (object)
- `value` (Double) Dwell time in milliseconds.

**Return Type**
Double

**Default**
3

**Examples**
```
extSource.DwellPerPoint = 10 'Write

dpp = extSource.DwellPerPoint 'Read
```

**C++ Syntax**
- HRESULT `get_DwellPerPoint (tagNAExtDevDwellPerPoint *pValue)`
- HRESULT `put_DwellPerPoint (tagNAExtDevDwellPerPoint newVal)`

**Interface**

ECALCharacterization Property - Superseded

Description: This command is replaced with CalKitType which sets the ECal module and User Characterization.

Specifies the characterization data within an ECal module to be used for the SMC calibration.

Learn more about ECal User Characterization.

VB Syntax: \texttt{SMC.ECALCharacterization(mod) = value}

Variable (Type) - Description

- \texttt{SMC SMCTYPE (object)}
- \texttt{module 1 - ECAL module}
- \texttt{value (Long) – Characterization data within the ECAL module to be used for ECAL operations. Choose from:}
  - \texttt{0 – Factory Characterization}
  - \texttt{1 – UserCharacterization1}
  - \texttt{2 – UserCharacterization2}
  - \texttt{3 – UserCharacterization3}
  - \texttt{4 – UserCharacterization4}
  - \texttt{5 – UserCharacterization5}

Return Type: Long

Default: 0 - Factory Characterization

Examples: \texttt{SMC.ECALCharacterization(1) = 2}

C++ Syntax: HRESULT put_ECALCharacterization( long moduleNumber, long characterization); HRESULT get_ECALCharacterization( long moduleNumber, long* characterization);

Interface: ISMCType

ECALCharacterizationEx Property

Description
This property replaces ECALCharacterization Property. Specifies the characterization data within an ECal module to be used for the calibration. Learn more about ECal User Characterization.

VB Syntax
```vbnet
cal.ECALCharacterizationEx (module) = value
```

Variable (Type) - Description
- **cal**: Calibrator (object)
- **module**: (long integer) Optional argument. ECal module. Choose from modules 1 through 8
  - Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
  - Use GetECALModuleInfoEx to returns the model and serial number of each module.
- **value**: (Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:
  - 0 – Factory Characterization
  - 1 – UserCharacterization1
  - 2 – UserCharacterization2
  - ..and so forth up to...
  - 12 – UserCharacterization12

Return Type
Long

Default
0 - Factory Characterization

Examples
```vbnet
cal.ECALCharacterizationEx (4) = 2
```

C++ Syntax
```c++
HRESULT put_ECALCharacterizationEx( long moduleNumber, long characterization);
HRESULT get_ECALCharacterizationEx( long moduleNumber, long* characterization);
```

Interface
ICalibrator4

Last Modified:
15-Jun-10 Updated for 12 User chars
### ECalID Property

**Description**
Selects the model and serial number of the ECal module to be characterized. This command does NOT set the model and serial number of the ECal module.

**VB Syntax**

```vbnet
userChar.ECalID = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userChar</td>
<td>An <strong>ECalUserCharacterizer</strong> Object</td>
</tr>
<tr>
<td>value</td>
<td>(String) Model and serial number of the ECal module to be characterized.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
"" (Empty String)

**Examples**

```vbnet
userChar.ECalID = "N4433A,00001"
```

**C++ Syntax**

```cpp
HRESULT put_ECalID(BSTR id);
```

**Interface**
IECalUserCharacterizer

ECAL Isolation Property

**Description**

*Note:* The inherent isolation of the PNA is better than that attained with this command. ONLY use this command when using an external test set, and ONLY using a 8509x ECal module.

Specifies whether the acquisition of the ECal calibration should include isolation or not.

**VB Syntax**

```
cal.ECALIsolation = value
```

**Variable**

*Type* - Description

- `cal` A Calibrator *(object)*
- `value` *(boolean)*
  - `False` - Exclude Isolation
  - `True` - Include Isolation

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
Dim oPNA as AgilentPNA835x.Application
Dim oCal as Calibrator
Set oPNA = CreateObject("AgilentPNA835x.Application", "MachineName")
Set oCal = oPNA.ActiveChannel.Calibrator
' Uncomment the following line to have the cal include isolation
' oCal.ECALIsolation = True
' Uncomment the following line to have the cal omit isolation
' oCal.ECALIsolation = False
oCal.DoECAL2Port ' Do the cal
```

**C++ Syntax**

```cpp
HRESULT put_ECALIsolation ( VARIANT_BOOL bIsolationState );
HRESULT get_ECALIsolation ( VARIANT_BOOL *bIsolationState );
```

**Interface**

Calibrator

**ECALModuleNumberList Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of index numbers to be used for referring to the ECal modules that are currently attached to the PNA.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>clist = cal.ECALModuleNumberList</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>
</tr>
<tr>
<td><code>- clist</code></td>
<td>Variable to store the returned list of index numbers.</td>
</tr>
<tr>
<td><code>- cal</code></td>
<td><strong>Calibrator</strong> (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Variant</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>clist = cal.ECALModuleNumberList</code></td>
</tr>
<tr>
<td></td>
<td>'If 2 modules are attached to the PNA`</td>
</tr>
<tr>
<td></td>
<td>'then the returned list will be: <code>1,2</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_ECALModuleNumberList(VARIANT *modules);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td><code>ICalibrator6</code></td>
</tr>
</tbody>
</table>
### EcalOrientation Property

**Description**
Specifies which port of the ECAL module is connected to which port of the PNA when the `AutoOrient` property = False.

**VB Syntax**

```vb
SMC.EcalOrientation (mod) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SMC</code></td>
<td><code>SMCType</code> (object)</td>
</tr>
<tr>
<td><code>mod</code></td>
<td>(Long)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(string) - Format this parameter in the following manner:</td>
</tr>
<tr>
<td></td>
<td>Aw,Bx,Cy,Dz</td>
</tr>
<tr>
<td></td>
<td>where</td>
</tr>
<tr>
<td></td>
<td>• A, B, C, and D are literal ports on the ECAL module</td>
</tr>
<tr>
<td></td>
<td>• w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.</td>
</tr>
</tbody>
</table>

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: A2,B3,D1

**Return Type**
String

**Default**
"A1,B2"

**Examples**

```vb
SMC.EcalOrientation (1) = "A2,B1"
```

**C++ Syntax**

```cpp
HRESULT put_EcalOrientation(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation(long lModuleNum, BSTR *orientation);
```

Read/Write

EcalOrientation1Port Property

**Description**: For Mixer Characterization ONLY. Specifies which port of the ECal module is connected to which port of the PNA for the **Do1PortECAL** property when the **AutoOrient** property = False.

**VB Syntax**: `VMC.EcalOrientation1Port (mod) = value`

**Variable** *(Type)* - Description

*VMC* `VMCType (object)`

*mod* *(Long)*

1 - Use ECAL Module for the calibration.

*value* *(string)* - Choose from:

"A1" - ECAL module port A is connected to PNA port 1

"B1" - ECAL module port A is connected to PNA port 1

**Return Type**: String

**Default**: "A1"

If anything other than port 1 is specified, "B1" will be used. For example, if "A2" is specified, "B1" is used.

**Examples**: `VMC.EcalOrientation1Port(1) = "B1"`

**C++ Syntax**: `HRESULT put_EcalOrientation1Port(long lModuleNum, BSTR orientation);`  
`HRESULT get_EcalOrientation1Port(long lModuleNum, BSTR`
Read/Write

EcalOrientation2Port Property

Description
Specifies which port of the ECal module is connected to which port of the PNA for the Do2PortECAL property when the AutoOrient property = False.

VB Syntax
VMC.EcalOrientation2Port (mod) = value

Variable (Type) - Description
VMC VMCTYPE (object)

mod (Long) Module being used for the calibration.
Choose from 1 or 2.

value (string) - Format this parameter in the following manner:
Aw,Bx,Cy,Dz
where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.
For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: A2,B3,D1

Return Type String

Default "A1,B2"

Examples
VMC.EcalOrientation1Port(1) = "A2,B1"

C++ Syntax
HRESULT put_EcalOrientation2Port(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation2Port(long lModuleNum, BSTR *orientation);
| Interface | VMCType |
**ECALPortMapEx Property**

**Description**
This property replaces ECALPortMap Property. Specifies which ports of the ECal module are connected to which ports of the PNA for the DoECAL1PortEx and DoECAL2PortEx methods when the OrientECALModule property = False.

This setting remains until the PNA is restarted or this command is sent again.

**Note:** For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the PNA determines the orientation. The PNA does not verify that you made the connection properly.

This command, and OrientECALModule_Property, can be used to perform ECal orientation using the Guided Calibration interface.

**VB Syntax**
```
cal.ECALPortMapEx (module) = value
```

**Variable (Type) - Description**
- **cal** A Calibrator (object)
- **module** (long integer) Optional argument. ECal module. Choose from modules 1 through 8
  - Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
  - Use GetECALModuleInfoEx to return the model and serial number of each module.
- **value** (string) - Format this parameter in the following manner:
  - Aw,Bx,Cy,Dz
  - where
    - A, B, C, and D are literal ports on the ECAL module
    - w,x,y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with
- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1
the string would be: A2,B3,D1

DoECAL1PortEx or DoECAL2PortEx methods will fail if the port numbers passed to those methods are not in the string of this property and OrientECALModule property = False.

**Return Type**  String

**Default**  Not Applicable

**Examples**

```vbs
Dim cal As Calibrator
Dim sPortMap As String
Set cal = PNAapp.ActiveChannel.Calibrator
cal.ECALPortMapEx = "a2,b1" 'Write
sPortMap = cal.ECALPortMap 'Read
```

**C++ Syntax**

```cpp
HRESULT put_ECALPortMapEx( long moduleNumber, BSTR strPortMap);
HRESULT get_ECALPortMapEx( long moduleNumber, BSTR *strPortMap);
```

**Interface**  ICalibrator4

### ElecDelayMedium Property

#### Description
Sets or returns the electrical delay medium.

#### VB Syntax
```vbnet
meas.ElecDelayMedium = value
```

#### Variable *(Type) - Description*
- **meas**: A Measurement *(object)*
- **value**: *(enum NACalStandardMedium)* choose from
  - 0 - naCoax
  - 1 - naWaveGuide

#### Return Type
NACalStandardMedium

#### Default
Not Applicable

#### Examples
```vbnet
Print meas.ElecDelayMedium 'prints the value of the electrical
delay medium
```

#### C++ Syntax
```cpp
HRESULT get_ElecDelayMedium(tagNACalStandardMedium *pVal);
HRESULT put_ElecDelayMedium(tagNACalStandardMedium newVal);
```

#### Interface
IMeasurement2
### ElecDistanceDelay Property

**Description**
Sets the electrical delay in physical length (distance) for the selected measurement.

**VB Syntax**

```
meas.ElecDistanceDelay = value
```

**Variable (Type) - Description**

- **meas**
  A Measurement (object)

- **value**
  (double) - Electrical Delay in distance. Set units using ElecDistanceDelayUnit.

**Return Type**
Double

**Default**
0

**VB Examples**
```
meas.ElecDistanceDelay = 1e-3 'Write
edelay = meas.ElecDistanceDelay 'Read
```

**C# Examples**
```
Meas.ElecDistanceDelay = 1e-3 'Write

// This property returns an object, and the object must be cast to a double to access the value.
Edelay = (double)meas.ElecDistanceDelay 'read
```

**C++ Syntax**

```
HRESULT get_ElecDistanceDelay(VARIANT *pVal)
HRESULT put_ElecDistanceDelay(VARIANT newVal)
```

**Interface**
IMeasurement11

### ElecDistanceDelayUnit Property

**Description**
Sets and returns the units for specifying electrical delay in physical length (distance).

**VB Syntax**
```vbnet
meas.ElecDistanceDelayUnit = value
```

**Variable**
- **meas** (Type) - Description
  - A `Measurement` (object)
- **value** (enum `naDistanceUnit`) Choose from:
  - 0 – `naDistanceUnit_Meter`
  - 1 – `naDistanceUnit_Feet`
  - 2 – `naDistanceUnit_Inch`

**Return Type**
Enum

**Default**
0 – `naDistanceUnit_Meter`

**Examples**
```vbnet
meas.ElecDistanceDelayUnit = naDistanceUnit_Meter 'Write

edelay = meas.ElecDistanceDelayUnit 'Read
```

**C++ Syntax**
```csharp
HRESULT get_ElecDistanceDelayUnit(tagNADistanceUnit *pVal)
HRESULT put_ElecDistanceDelayUnit(tagNADistanceUnit newVal)
```

**Interface**
`IMeasurement11`

---

**Last Modified:**

**ElectricalDelay Property**

**Description**
Sets the Electrical Delay for the active channel.

**VB Syntax**
```
meas.ElectricalDelay = value
```

**Variable**
- **meas** - A Measurement (object)
- **value** - (double) - Electrical Delay in seconds. Choose any number between -9.99 and 9.99

**Return Type**
Double

**Default**
0

**Examples**
```
meas.ElectricalDelay = 1e-3 'Write

edelay = meas.ElectricalDelay 'Read
```

**C++ Syntax**
```
HRESULT get_ElectricalDelay(double *pVal)
HRESULT put_ElectricalDelay(double newVal)
```

**Interface**
IMeasurement
Element Property

Description
Returns a handle to the specified PathElement object. Each element object contains a unique set of values.

The Value Property is used to set the value for each element.
See a list of configurable elements and values for various PNA models.

VB Syntax
Set elem = pathConfig.Element (element)

Variable (Type) - Description

elem (Object) IPathElement

pathConfig A PathConfiguration (object)

element (String) Configurable element. Use pathConfig.Elements to return a list of configurable elements or see a list of configurable elements for various PNA models.

Return Type Object

Default Not Applicable

Examples
Dim elem as PathElement
Set elem = app.ActiveChannel.PathConfiguration.Element("Src1")

C++ Syntax
HRESULT Element(BSTR elemName, IPathElement** ppElement);

Interface IPathConfiguration

Last Modified:
14-Dec-2006 MX New topic
**Elements Property**

**Description**
Returns an array containing the names of configurable elements.

See a list of configurable elements and settings for various PNA models.

**VB Syntax**
```vbnet
values = pathConfig.Elements
```

**Variable**

- **values** *(Variant array)* Variable to store the array of configurable elements.

- **pathConfig** A PathConfiguration *(object)*

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```vbnet
elems = pathConfig.Elements
```

**C++ Syntax**
```cpp
HRESULT Elements( VARIANT* pElements );
```

**Interface**
IPathConfiguration

**Embed4PortA Property**

**Description**
Returns the PNA port number associated with 'a' based on the device topology.

To see 'a' for all topologies, and to specify the port connections, use [Embed4PortList Property](#).

Specify topology using [Embed4PortTopology Property](#).

**VB Syntax**
```vbnet
default_value = fixture.Embed4PortA
```

**Variable**
- **value** (Type): Short Integer
  - Description: Variable to store the returned PNA port number.
- **fixture** (Type): Fixturing (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**
```vbnet
default_value = fixture.Embed4PortA
```

**C++ Syntax**
```cpp
HRESULT get_Embed4PortA(short *portA);
```

**Interface**
IFixturing2
## Embed4PortB Property

**Description**
Returns the PNA port number associated with 'b' based on the device topology. To see 'b' for all topologies, and to specify the port connections, use Embed4PortList Property.

Specify topology using Embed4PortTopology Property.

**VB Syntax**
```
value = fixture.Embed4PortB
```

**Variable**
- **(Type)**: Short Integer
  - **Description**: Variable to store the returned PNA port number.

**fixture**
- A Fixturing (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**
```
value = fixture.Embed4PortB 'Read
```

**C++ Syntax**
```
HRESULT get_Embed4PortB(short *portB );
```

**Interface**
IFixturing2
**Embed4PortC Property**

**Description**
Returns the PNA port number associated with 'c' based on the device topology.

To see 'c' for all topologies, and to specify the port connections, use **Embed4PortList Property**.

Specify topology using **Embed4PortTopology Property**

**VB Syntax**

```vbnet
value = fixture.Embed4PortC
```

**Variable (Type) Description**

- **value** (Short Integer) Variable to store the returned PNA port number.

- **fixture** A **Fixturing** (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**

```vbnet
value = fixture.Embed4PortC 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Embed4PortC(short *portC);
```

**Interface**
IFixturing2
Embed4PortD Property

Description
Returns the PNA port number associated with 'd' based on the device topology.
To see 'd' for all topologies, and to specify the port connections, use Embed4PortList Property.
Specify topology using Embed4PortTopology Property.

VB Syntax
value = fixture.Embed4PortD

Variable (Type) - Description
value  (Short Integer) Variable to store the returned PNA port number.
fixture  A Fixturing (object)

Return Type
Integer

Default
Not Applicable

Examples
value = fixture.Embed4PortD  'Read

C++ Syntax
HRESULT get_Embed4PortD(short *portD );

Interface
IFixturing2
**Description**

Specifies the PNA port connections for ALL topologies. The port assignment is dependent on the DUT topology. All four port numbers are required. However, for:

- Topology A, only the first **two** arguments are valid,
- Topology B, only the first **three** arguments are valid,
- Topology C, **ALL** arguments are valid.

Specify topology using **Embed4PortTopology Property**.

Read the port assignments using the following commands. A, B, C, and D, refer to the port; NOT the topology.

- **Embed4PortA Property**
- **Embed4PortB Property**
- **Embed4PortC Property**
- **Embed4PortD Property**

![Topology A Diagram](image1)

![Topology B Diagram](image2)
### VB Syntax

```vbnet
fixture.Embed4PortList = p1, p2, p3, p4
```

### Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td><em>Fixturing</em> (object)</td>
<td></td>
</tr>
<tr>
<td>p1</td>
<td></td>
<td>PNA Port number assigned to a in above graphic.</td>
</tr>
<tr>
<td>p2</td>
<td></td>
<td>PNA Port number assigned to b in above graphic.</td>
</tr>
<tr>
<td>p3</td>
<td></td>
<td>PNA Port number assigned to c in above graphic.</td>
</tr>
<tr>
<td>p4</td>
<td></td>
<td>PNA Port number assigned to d in above graphic.</td>
</tr>
</tbody>
</table>

### Return Type

Four Integers

### Default

1, 2, 3, 4

### Examples

```vbnet
fixture.4PortNetworkTopoCPorts = 4, 3, 2, 1 'Write
```

### C++ Syntax

```cpp
HRESULT put_4PortNetworkTopoCPorts(short ChannelNum, short pPortA, short pPortB, short pPortC, short pPortD)
```

### Interface

IFxturing2
**Embed4PortNetworkFilename Property**

**Description**
Specifies the 4-port touchstone file (*.s4p) in which the network to embed or de-embed resides. If the specified file does not exist, an error occurs when type command is sent. Following this command, send **Embed4PortNetworkMode Property**.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```vbnet
fixture.Embed4PortNetworkFilename(netNum) = value
```

**Variable (Type) - Description**

- `fixture` A Fixturing (object)
- `netNum` (Integer) Network position. Choose from 1 or 2. See **Embed4PortTopology Property**
- `value` (String) Full path, file name, and extension (.s4P) of the circuit.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

**Return Type**
String

**Default**
Not Applicable

**Examples**
```vbnet
fixture.Embed4PortNetworkFilename(2) = "C:/Program Files/Agilent/Network Analyzer/Documents/myFile.s4p" 'Write
```

```vbnet
value = fixture.Embed4PortNetworkFilename(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Embed4PortNetworkFilename( short networkNum, BSTR *filename);
HRESULT put_Embed4PortNetworkFilename( short networkNum, BSTR filename);
```

**Interface**
IFixturing2
Write/Read

Embed4PortNetworkMode Property

Description
Specify the type of processing to take place on the specified 4-port network. First specify the network filename with FSim.Embed4PortNetworkFilename Property.

VB Syntax
fixture.Embed4PortNetworkMode(netNum) = value

Variable (Type) - Description
fixture A Fixturing (object)

netNum (Integer) Network position. Choose from 1 or 2. See Embed4PortTopology Property

value (Enum as NA4PortEmbedNetworkMode) Processing mode. Choose from:

- 0 or naNO_NETWORK - The same as disabling.
- 1 or naEMBED_NETWORK - Add Network circuit.
- 2 or naDEEMBED_NETWORK - Remove Network circuit

Return Type
Enum

Default naNO_NETWORK

Examples
fixture.Embed4PortNetworkMode(1) = naNO_NETWORK 'Write

value = fixture.Embed4PortNetworkMode(2) 'Read

C++ Syntax
HRESULT get_Embed4PortNetworkMode( short networkNum, tagNA4PortEmbedNetworkMode *eVal );
HRESULT put_Embed4PortNetworkMode( short networkNum, tagNA4PortEmbedNetworkMode eVal );

Interface IFixturing2
**Embed4PortState Property**

**Description**  
Turns ON or OFF 4-port Network embedding for all ports on the channel.

**VB Syntax**  
`fixture.Embed4PortState = value`

**Variable**  
(Type) - Description

*fixture*  
A `Fixturing` (object)

*value*  
(Boolean)

- **False** - Turns Embedding OFF
- **True** - Turns Embedding ON

**Return Type**  
Boolean

**Default**  
False (OFF)

**Examples**  
```
fixture.Embed4PortState = False  'Write
value = fixture.Embed4PortState  'Read
```

**C++ Syntax**  
```
HRESULT get_Embed4PortState(VARIANT_BOOL *pVal)
HRESULT put_Embed4PortState(VARIANT_BOOL newVal)
```

**Interface**  
IFixturing2
### Embed4PortTopology Property

**Description**
Specifies the PNA / DUT topology. [Learn more about these and other PNA/DUT configurations.](#)

**VB Syntax**
```vbnet
fixture.Embed4PortTopology = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td>A Fixturing (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Enum as NA4PortEmbedTopology) PNA / DUT topology. Choose from:</td>

<tr>
<td>1</td>
<td>or naTOPOLOGY_B - 3 PNA/DUT Ports</td>
</tr>
<tr>
<td>2</td>
<td>or naTOPOLOGY_C - 4 PNA/DUT Ports</td>
</tr>
</tbody>
</table>

**Return Type**
Enum

**Default**
naTOPOLOGY_A (2 PNA/DUT Ports)

**Examples**
```vbnet
fixture.Embed4PortTopology = naTOPOLOGY_A 'Write
value = fixture.Embed4PortTopology 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Embed4PortTopology( tagNA4PortEmbedTopology *eVal );
HRESULT put_Embed4PortTopology( tagNA4PortEmbedTopology eVal );
```

**Interface**
IFixturing2

Enabled Property

Description
Enables and disables (ON/OFF) the port mapping and control line output of the specified test set.

If the specified test set is not connected or not ON, then setting Enabled = True will report an error. All other properties can be set when the test set is not connected.

When this command is set to ON or OFF, then the display of the test set status bar (ShowProperties Property) is also set to ON or OFF.

VB Syntax
\[ tset.Enabled = value \]

Variable (Type) - Description

\[ tset \]
A TestsetControl object
OR
An E5091Testset object

\[ value \] (Boolean)
True Enables test set control.
False Disables test set control.

Return Type
Boolean

Default
False

Examples
See E5091A Example Program
See External Testset Program

C++ Syntax
HRESULT get_Enabled(VARIANT_BOOL *state);
HRESULT put_Enabled(VARIANT_BOOL state);

Interface
ITestsetControl
IE5091Testsets
EnableLOPowerCal Property

Description
Sets and returns whether or not the LO power cal step is included in the cal steps when an IMDX Cal or NFX Cal is performed.

VB Syntax

\[ \text{obj}.\text{EnableLOPowerCal}(n) = \text{value} \]

Variable (Type) - Description

\[ \text{obj} \]
A SweptIMDCal (object)
A NoiseCal (object)

\[ \text{n} \]
LO Stage. Choose 1. (Only single LO allowed)

\[ \text{value} \]
(Boolean) Choose from:

- **False** - Skips over the LO Power Cal when calibrating.
- **True** - Includes a step for LO Power Cal when calibrating.

Return Type
Boolean

Default
PNA Rev. 9.1 and above: **False**
Before Rev 9.1: **True**

Examples

\[ \text{imd}.\text{EnableLOPowerCal}(1) = \text{true} \]

\[ \text{loPwrCal} = \text{imd}.\text{EnableLOPowerCal}(1) \]

C++ Syntax

HRESULT get_EnableLOPowerCal (long stage, BOOL *enable)
HRESULT put_EnableLOPowerCal (long stage, BOOL enable)

Interface
ISweptIMD2
INoiseCal2

### EnablePhase Property

**Description**
Sets and returns the state of SMC Phase measurements.

In the User Interface, there are two "enable phase" checkboxes: in the Phase Settings dialog and in the Calibration Wizard. Checking one enables both. This single command also enables both.

**VB Syntax**
```
obj.EnablePhase = bool
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Mixer Interface pointer to the Measurement (object)</td>
</tr>
<tr>
<td>A Converter (Object)</td>
<td></td>
</tr>
<tr>
<td><code>bool</code></td>
<td>(Boolean) -</td>
</tr>
<tr>
<td>True</td>
<td>Include phase in SMC measurements</td>
</tr>
<tr>
<td>False</td>
<td>Do NOT include phase in SMC measurements</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```
mixer.EnablePhase = True
```

**C++ Syntax**
```c
HRESULT get_EnablePhase(VARIANT_BOOL * val);
HRESULT put_EnablePhase(VARIANT_BOOL val);
```

**Interface**

EnablePowerCompensation Property

**Description**
Adjusts the source power at the specified port by the combined amount of loss through ALL enabled fixturing operations. Use this function to set the power level at the DUT input. Learn more.

**Note:** This command affects ALL measurements on the specified channel.

**VB Syntax**

```vbnet
fixture.EnablePowerCompensation (port) = bool
```

**Variable**

- `fixture` (Type) - A Fixturing (object)
- `port` (Integer) - Port number to receive power compensation.
- `bool` (Boolean)
  - `True` - Compensate source power
  - `False` - Do NOT compensate source power

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
fixture.EnablePowerCompensation(1) = True
value = fixture.EnablePowerCompensation(2) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_EnablePowerCompensation(short port, VARIANT_BOOL *pState );
HRESULT put_EnablePowerCompensation(short port, VARIANT_BOOL bVal);

EnableSnPDataExtrapolation

**Description**
Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding.

**VB Syntax**
`fixture.EnableSnPDataExtrapolation = bool`

**Variable** *(Type) - Description*

- `fixture` - A Fixturing *(object)*
- `bool` - **True** - Turns Extrapolation ON
  
  **False** - Turns Extrapolation OFF

**Return Type**
Boolean

**Default**
False

**Examples**
`fixture.EnableSnPDataExtrapolation = True`

`value = fixture.EnableSnPDataExtrapolation ` *Read*

**C++ Syntax**
```cpp
HRESULT get_EnableSnPDataExtrapolation(VARIANT_BOOL *pExtrap);
HRESULT put_EnableSnPDataExtrapolation(VARIANT_BOOL bExtrap);
```

### EnableSourceUnleveledEvents Property

**Description**
Specifies whether or not to report [Source Unleveled](#) errors as system events. These events can trigger an [OnSystemEvent](#) call.

This setting will revert to the default (False) setting on Instrument Preset.

**VB Syntax**

```vb
pref.EnableSourceUnleveledEvents = bool
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pref</td>
<td>A <a href="#">Preferences</a> (object)</td>
</tr>
<tr>
<td>bool</td>
<td>(Boolean) - Choose from:</td>
</tr>
<tr>
<td>False</td>
<td>Do NOT report Source Unleveled Errors.</td>
</tr>
<tr>
<td>True</td>
<td>Report Source Unleveled Errors.</td>
</tr>
</tbody>
</table>

**Return Type**

Boolean

**Default**

False

**Examples**

```vb
pref.EnableSourceUnleveledEvents = False 'Write
prefer = pref.EnableSourceUnleveledEvents 'Read
```

**C++ Syntax**

```c++
HRESULT put_EnableSourceUnleveledEvents( VARIANT_BOOL bsourcUnlEnable)
HRESULT get_EnableSourceUnleveledEvents( VARIANT_BOOL *bsourcUnlEnable)
```

Write/Read

EndOfSweepOperation Property

Description
Set and read the action which should be taken at the end of the last frequency or power sweep in the measurement. This setting is used to protect a sensitive device from too much power during the sweep retrace.

VB Syntax

```vbnet
(gca.EndOfSweepOperation = value
```

Variable (Type) - Description

gca A GainCompression (object)

value (NAGCAEndOfSweepOperation)

- naStandard (0) Use the default PNA method. Learn more.
- naSetToStartPower (1) Sweep Start power
- naSetToStopPower (2) Sweep Stop power.
- naSetRFOff (3) Always turn power OFF while waiting.

Return Type
Enum

Default
naStandard

Examples

```vbnet
gca.EndOfSweepOperation = naSetToStartPower 'Write

eos = gca.EndOfSweepOperation 'Read
```

C++ Syntax

```cpp
HRESULT get_EndOfSweepOperation(tagNAGCAEndOfSweepOperation* pVal)

### ENRId Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns ID of ENR table.</th>
</tr>
</thead>
</table>

#### VB Syntax

```
enr.ENRSN = ID
```

#### Variable *(Type) - Description*

<table>
<thead>
<tr>
<th>enr</th>
<th>An <strong>ENRFile</strong> <em>(object)</em></th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Identifier for the ENR table</td>
</tr>
</tbody>
</table>

#### Return Type

*String*

#### Default

*Not Applicable*

#### Examples

*See example program*

#### C++ Syntax

```c++
HRESULT get_ENRId(BSTR *Val);
HRESULT put_ENRId(BSTR Val);
```

#### Interface

*IENRFile*

ENRSN Property

Description  Sets and returns the serial number of the noise source for which the ENR file applies.

VB Syntax  
```
enr.ENRSN = serialNumber
```

Variable  
*enr* An [ENRFile](#) (object)

*serialNumber* (String) Serial number of the noise source.

Return Type  String

Default  Not Applicable

Examples See example program

C++ Syntax  
```
HRESULT get_ENRSNBSTR *Val);
HRESULT put_ENRSN(BSTR Val);
```

Interface  IENRFile

### ErrorCorrection Property

**Description**
Sets (or returns) error correction ON or OFF for the measurement.

**VB Syntax**
```
meas.ErrorCorrection = value
```

**Variable**
- **meas** *(Type)* - Description
  - A Measurement *(object)*
- **value** *(boolean)*
  - **False** - Turns error correction OFF
  - **True** - Turns error correction ON

**Return Type**
Boolean

**Default**
See Error Correction

**Examples**
```
meas.ErrorCorrection = True 'Write
errcorr = meas.ErrorCorrection 'Read
```

**C++ Syntax**
```
HRESULT put_ErrorCorrection (VARIANT_BOOL bState)
HRESULT get_ErrorCorrection (VARIANT_BOOL *bState)
```

**Interface**
IMeasurement
ErrorCorrection (Channel) Property

Description
Attempts to sets error correction ON or OFF for all of the measurements on the channel. This setting may not be successful for some measurements because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use Error Correction Property.

VB Syntax
chan.ErrorCorrection = value

Variable (Type) - Description
chan A Channel (object)
value (boolean)
False - Turns error correction OFF
True - Turns error correction ON

Return Type
Boolean

Default
About Error Correction

Examples
chan.ErrorCorrection = True

C++ Syntax
HRESULT put_ErrorCorrection (VARIANT_BOOL bState)

Interface
IChannel7
**ErrorCorrectionIndicator Property**

**Description**
Returns the error correction state for the measurement.

**VB Syntax**
```
value = meas.ErrorCorrectionIndicator
```

**Variable**
(Type)  - Description

- `value`  (Enum)  Error correction state.

- 0 - `naErrorCorrectionIndicator_None`  - No error correction
- 1 - `naErrorCorrectionIndicator_Master`  - Original error correction terms applied.
- 2 - `naErrorCorrectionIndicator_Interpolated`  - Error terms are interpolated.  Learn more
- 3 - `naErrorCorrectionIndicator_Delta`  - Delta Match calibration terms.  Learn more
- 4 - `naErrorCorrectionIndicator_Invalid`  Error terms are not valid.

**meas**  A Measurement (object)

**Return Type**
Enum as `NAErrorCorrectionIndicator`

**Default**
See Error Correction

**Examples**
```vbnet
errcorr = meas.ErrorCorrectionIndicator  'Read
```

**C++ Syntax**
```csharp
HRESULT get_ErrorCorrectionIndicator (enum NAErrorCorrectionIndicator *pIndicator);
```

**Interface**
`IMeasurement14`

**ExtendedProperties Property**

**Description**
Provides access to the custom properties and methods of an external device.

**VB Syntax**
Set \( PSG = ExtDev.ExtendedProperties \)

**Variable** (Type) - Description

\( PSG \) (Object) Variable to store the returned handle to an external device.

\( ExtDev \) An [ExternalDevice](#) (object)

**Return Type**
Object

**Default**
Not Applicable

**Examples** See Example

**C++ Syntax**
HRESULT get_ExtendedProperties(IDispatch** ppObject);

**Interface** IExternalDevice

---

Last Modified:

Write/Read
ExternalALC Property

Description  Sets or returns the source of the analyzer leveling control.

VB Syntax  app.ExternalALC = value

Variable  (Type) - Description
app  An Application (object)
value  (boolean) - Choose from:
   True  - Leveling control supplied through the rear panel.
   False  - Leveling control supplied inside the analyzer

Return Type  Boolean

Default  False

Examples  app.ExternalALC = True 'Write
           extALC = app.ExternalALC 'Read

C++ Syntax  HRESULT get_ExternalALC(VARIANT_BOOL *pVal)
             HRESULT put_ExternalALC(VARIANT_BOOL newVal)

Interface  IApplication
Write/Read

ExternalDeviceDeActivatePolicy Property

Description
Set and return whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

See the ExternalDevices collection.

VB Syntax

\[
pref.ExternalDeviceDeActivatePolicy = value
\]

Variable (Type) - Description

- **pref** A Preferences (object)
- **value** (Boolean) - Choose from:

  - **True** - External device are de-activated when the PNA is Preset or when a Instrument State is recalled.
  - **False** - External devices remain active when the PNA is Preset or when a Instrument State is recalled.

Return Type
Boolean

Default
True

Examples

\[
pref.ExternalDeviceDeActivatePolicy = 1 \ 'Write
\]

\[
dDevPolicy = pref.ExternalDeviceDeActivatePolicy \ 'Read
\]

C++ Syntax

HRESULT get_ExternalDeviceDeActivatePolicy(VARIANT_BOOL * pref);
HRESULT put_ExternalDeviceDeActivatePolicy(VARIANT_BOOL pref);

Interface
IPreferences10

ExternalTriggerConnectionBehavior Property

Description

Configures the external triggering signal for the PNA.

- To control BNC1 and BNC2 with this command, then you MUST have AuxTriggerScopeIsGlobal = True.
- TriggerSource Property is automatically set to External when ExternalTriggerConnectionBehavior is sent.
- Edge triggering is only available on some PNA models.
- For more information, see External Triggering.

VB Syntax

trigsetup.ExternalTriggerConnectionBehavior (conn) = value

Variable (Type) - Description

trigsetup A TriggerSetup (object)

conn (enum NATriggerConnection) Rear Panel connector to send or receive trigger signals. Choose from:

Only one of the input connectors is active at a time. When a command is sent to one, the PNA automatically makes the other INACTIVE.

0 - naTriggerConnectionAUXT Trigger IN from rear-panel AUX IO connector Pin 19
1 - naTriggerConnectionBNC1 Trigger IN from rear-panel Trigger IN BNC connector
2 - naTriggerConnectionBNC2 Trigger OUT to rear-panel Trigger OUT BNC connector. Only useful in point sweep mode.
3 - naTriggerConnectionMATH Trigger IN from rear-panel Material Handler connector Pin 18

value (enum NAExternalTriggerBehavior) -

0 - naTriggerInactive - Disables the specified connector.

Choose from ONLY 1 through 4 when <conn> is set to either naTriggerConnectionBNC1 or naTriggerConnectionAUXT

1 - naTriggerInEdgeNegative - Triggers the PNA when receiving a negative going signal
2 - naTriggerInEdgePositive - Triggers the PNA when receiving a positive going signal
3 - naTriggerInLevelLow - Triggers the PNA when receiving a low level signal
4 - naTriggerInLevelHigh - Triggers the PNA when receiving a High-level signal

Choose from ONLY 5 through 8 when <conn> is set to naTriggerConnectionBNC2.

In addition to sending this command, you must also use TriggerOutputEnabled Property to enable
the BNC2 output.

5 - **naTriggerOutPulsePositiveAfter** - Sends a POSITIVE going TTL pulse at the END of each point during the sweep.

6 - **naTriggerOutPulsePositiveBefore** - Sends a POSITIVE going TTL pulse at the START of each point during the sweep.

7 - **naTriggerOutPulseNegativeAfter** - Sends a NEGATIVE going TTL pulse at the END of each point during the sweep.

8 - **naTriggerOutPulseNegativeBefore** - Sends a NEGATIVE going TTL pulse at the START of each point during the sweep.

**Return Type**: Enum as NAExternalTriggerBehavior

**Default**

BNC1 = **naTriggerInactive**

BNC2 = **naTriggerInactive**

AUXT = **naTriggerInLevelHigh**

When **Output is enabled**

BNC1 = **naTriggerInactive**

BNC2 = **naTriggerOutPulsePositiveAfter**

AUXT = **naTriggerInLevelHigh**

**Examples**

```c
trigsetup.ExternalTriggerConnectionBehavior (naTriggerConnectionAUXT) = naTriggerInLevelLow  'Write

trigBehav = trigsetup.ExternalTriggerConnectionBehavior (naTriggerConnectionAUXT)  'Read
```

**C++ Syntax**

```cpp
HRESULT get_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior *trigger);

HRESULT put_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior trigger);
```

**Interface**

ITriggerSetup

---

**Last Modified:**

25-Feb-2008   Added 'Global' note
ExternalTriggerDelay Property

**Description**
Sets and reads the trigger delay for all measurements in the CHANNEL. This delay is only applied while 
app.Source = naTriggerSourceExternal and 
trigsetup.Scope = naChannelTrigger. After an external trigger is applied, the start of the sweep is 
delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for all channels (Global), use TriggerDelay Property.

**VB Syntax**

```vb
chan.ExternalTriggerDelay = value
```

**Variable**

- **Type** - Description

  - `chan` A Channel (object)

  - `value` Double - Trigger delay value in seconds. Range is from 0 to 107 seconds

**Return Type**

- Double

**Default**

- 0

**Examples**

```vb
chan.ExternalTriggerDelay = .003  'Write

delay = chan.ExternalTriggerDelay  'Read
```

**C++ Syntax**

- HRESULT get_ExternalTriggerDelay(double *delay);
- HRESULT put_ExternalTriggerDelay(double delay)

**Interface**

IChannel6
**F1Frequency Property**

**Description**
Sets and returns the frequency of the F1 tone. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`

**VB Syntax**

```vbnet
object.F1Frequency = value
```

**Variable (Type) - Description**

- `object` A `SweptIMD` or `IMSpectrum` Object

- `value` (Double) F1 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Return Type**
Double

**Default**
.9995 GHz

**Examples**

```vbnet
imd.F1Frequency = 100e6 'Write
```

```vbnet
value = imd.F1Frequency 'Read
```

**C++ Syntax**

```csharp
HRESULT get_F1Frequency(double *pVal)
HRESULT put_F1Frequency(double newVal)
```

**Interface**
`ISweptIMD`
`IMSpectrum`

---

**Last Modified:**

19-Aug-2008   MX New topic
F2Frequency Property

**Description**
Sets and returns the frequency of the F2 tone. Use with IMD sweep types:

- naIMDToneCWSweep
- naIMDTonePowerSweep

**VB Syntax**
`object.F2Frequency = value`

**Variable**
*Type* - Description

`object` A SweptIMD or IMSpectrum Object

`value` (Double) F2 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Return Type**
Double

**Default**
1.0005 GHz

**Examples**
```
imd.F2Frequency = 200e9 'Write
value = imd.F2Frequency 'Read
```

**C++ Syntax**

```
HRESULT get_F2Frequency(double *pVal)
HRESULT put_F2Frequency(double newVal)
```

**Interface**
ISweptIMD

FailedTraces Property

Description
Set and return the limit line color of failed traces or failure indicators (dots) and the word Fail.

VB Syntax
`colors.FailedTraces = value`

Variable (Type) - Description
- `colors` A `ComColors` (object)
- `value` (Long Integer) - RGB color of the FailedTraces pen.
  Convert the three RGB colors to an integer as follows:
  \[ \text{RGB} = R + (G \times 2^8) + (B \times 2^{16}) \]
  To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

Return Type
Long

Default
Display = 255,20,20
Print = 255,20,20

Examples
```
R = 10
G = 10
B = 10
\text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
```
```
\text{colors.FailedTraces} = \text{RGB} \ 'Write
\text{color} = \text{colors.FailedTraces} \ 'Read
```

C++ Syntax
```
HRESULT get_FailedTraces(long* pVal);
HRESULT put_FailedTraces(long newVal);
```

Interface
IComColors

FastCWPointCount Property

**Description**

Enables Fast CW sweep and sets the number of data points for the channel. **Sweep Type** must already be set to CWTime and FIFO must already be enabled.

**See Also**

FIFO and other Antenna Features
FIFO Object
Example program
N5264A Measurement Receiver

**VB Syntax**

```
chan.FastCWPointCount = value
```

**Variable (Type) - Description**

- **chan**
  - A Channel Object

- **value**
  - (Long Integer) Number of data points to measure in Fast CW mode. This setting overwrites the standard number of points setting for the channel.
  - Set to 0 to disable Fast CW.

**Return Type**

Long Integer

**Default**

0

**Examples**

```
chan.FastCWPointCount = 1e3 'Write

value = chan.FastCWPointCount 'Read
```

**C++ Syntax**

```
HRESULT get_FastCWPointCount(long *value)
HRESULT put_FastCWPointCount(long value)
```

FastMode Property

**Description**
Sets and returns the state of a separate IFBW setting for leveling sweeps. ON allows a higher (faster) IFBW than the measurement sweep. It also causes leveling sweeps to be noisier.

**VB Syntax**
```
RxLevel.FastMode(srcPort) = value
```

**Variable**

- **RxLevel**
  - (Type) A *ReceiverLeveling* Object

- **srcPort**
  - (Long Integer) Source port for which to set Fast Mode for Receiver Leveling.

  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**
  - (Boolean) Separate IFBW setting state. Choose from:
    - **True** - Use separate IFBW setting. Specify IFBW using *LevelingIFBW*.
    - **False** - Use same IFBW as the measurement sweep. Specify IFBW using *IF Bandwidth*.

**Return Type**
Variant Boolean

**Default**
True

**Examples**
```
rxLevel.FastMode (1) = True ' Write

value = rxLevel.FastMode 2' Read
```

**C++ Syntax**
```
HRESULT get_FastMode(long port, VARIANT_BOOL* pVal);
HRESULT put_FastMode(long port, VARIANT_BOOL newVal);
```

FilterBW Property

**Description**
Returns the results of the SearchBandwidth method.

**VB Syntax**
filtBW = meas.FilterBW

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>- Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filtBW</td>
<td>(single) - Variable to store bandwidth data</td>
</tr>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Single

**Default**
Not applicable

**Examples**
filterBW = meas.FilterBW 'Read

**C++ Syntax**
HRESULT get_FilterBW(float* bw)

**Interface**
IMeasurement
FilterCF Property

Description  Returns the Center Frequency result of the SearchBandwidth method.

VB Syntax  \[ filtCF = meas.FilterCF \]

Variable  \( \text{(Type)} \)  -  \( \text{Description} \)

\( filtCF \)  \( \text{(double)} \) - Variable to store bandwidth CF data

\( meas \)  A Measurement \( \text{(object)} \)

Return Type  Double

Default  Not applicable

Examples  \[ filtCF = meas.FilterCF \]  'Read

C++ Syntax  HRESULT get_FilterCF(double* centerFrequency)

Interface  IMeasurement
FilterLoss Property

Description  Returns the Loss value of the SearchBandwidth method.

VB Syntax  \texttt{filtLoss = meas.FilterLoss}

Variable  \textbf{Type} - Description

\textit{filtLoss} (\textit{single}) - Variable to store bandwidth Loss data

\textit{meas} A Measurement (\textit{object})

Return Type  Single

Default  Not applicable

Examples  \texttt{filterLoss = meas.FilterLoss 'Read}

C++ Syntax  \texttt{HR\_RESULT get\_FilterLoss(float* loss)}

Interface  IMeasurement
**FilterQ Property**

**Description**
Returns the Q (quality factor) result of the SearchBandwidth method.

**VB Syntax**
\[filtQ = meas.FilterQ\]

**Variable**
- \(filtQ\) *(single)* - Variable to store bandwidth Q data
- \(meas\) A Measurement *(object)*

**Return Type**
Single

**Default**
Not applicable

**Examples**
\[filtQ = meas.FilterQ\] 'Read

**C++ Syntax**
HRESULT get_FilterQ(float* quality)

**Interface**
IMeasurement
FilterErrors Property

Description
Returns the error string associated with the digital filters. The return string has three fields separated by commas: "stage1 status, stage2 status, stage3 status"

Each of these fields can contain one or more of the following error codes:

- **NO ERROR**
- **NUMBER-OF-COEFFICIENTS** - the number of coefficients is excessive for that filter-stage
- **COEFFICIENT VALUE** - one or more coefficients are out of range for that filter-stage
- **SUM-OF-COEFFICIENTS** - the sum of all coefficients is excessive for that filter-stage,
- **FREQUENCY** - the frequency for Stage 1 is out of range (only applies stage1 field),
- **PARAMETER** - one or more parameters are out of range (only applies to stage 3 field)

VB Syntax

```vbnet
value = spm4.FilterErrors
```

Variable (Type) - Description

- **value** Variable to store the returned errors.
- **spm4** A SignalProcessingModuleFour (object)

Return Type String

Default Not Applicable

Examples

```vbnet
mode = spm4.FilterErrors 'Read
'example return strings"

NO ERROR, NO ERROR, NO ERROR
indicates no errors,

*SUM-OF-COEFFICIENTS, NO ERROR, NO ERROR
indicates that the sum of all filter coefficients exceed the maximum value for the Stage-1 filter,

*COEFFICIENT *SUM-OF-COEFFICIENTS, NO ERROR, *PARAMETER
indicates a problems with Stage 1 coefficients and a problem with one or more of the parameters associated with the Stage 3 filter.
```

C++ Syntax

```cpp
HRESULT get_FilterErrors(BSTR* dspErrors);
```
Interface  ISignalProcessingModuleFour

Last Modified:

1-Jan-2007  MX New topic
FilterMode Property

Description
Sets and returns whether the PNA configures the 3-stage digital filter settings or they will be configured manually. When making manual settings, also send ADCCaptureMode Property which routes the IF through the 3-stage filter.

VB Syntax

```
spm4.FilterMode = value
```

Variable

(Line) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spm4</td>
<td>A SignalProcessingModuleFour (object)</td>
</tr>
<tr>
<td>value</td>
<td>(enum as NAModes) Filter mode. Choose from:</td>
</tr>
<tr>
<td></td>
<td>naAUTO  PNA controls digital filter settings.</td>
</tr>
<tr>
<td></td>
<td>naMANUAL You control digital filter settings using other SignalProcessingModuleFour commands.</td>
</tr>
</tbody>
</table>

Return Type

Enum

Default

naAUTO

Examples

```
spm4.FilterMode = naAUTO 'Write
mode = spm4.FilterMode 'Read
```

C++ Syntax

```
HRESULT get_FilterMode(tagNAModes* dspMode);
HRESULT put_FilterMode(tagNAModes dspMode);
```

Interface

FirmwareMajorRevision Property

**Description**
Returns the major firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 3.

**VB Syntax**
```vbnet
value = cap.FirmwareMajorRevision
```

**Variable**
- **value** (Long) - Variable to store the returned integer value of the firmware revision number.
- **cap** A Capabilities (object)

**Return Type**
Long

**Default**
Not Applicable

**Examples**
```vbnet
value = cap.FirmwareMajorRevision 'Read
```

**C++ Syntax**
```csharp
HRESULT get_FirmwareMajorRevision(long * majorRev);
```

**Interface**
ICapabilities
FirmwareMinorRevision Property

**Description**
Returns the minor firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 30.

**VB Syntax**

\[
\text{value} = \text{cap}.\text{FirmwareMinorRevision}
\]

**Variable (Type) - Description**

- **value** (Long) - Variable to store the returned decimal value of the firmware revision number.
- **cap** A Capabilities (object)

**Return Type**
Long

**Default**
Not Applicable

**Examples**

value = cap.FirmwareMinorRevision 'Read

**C++ Syntax**

HRESULT get_FirmwareMinorRevision(long * minorRev );

**Interface**
ICapabilities
FirmwareSeries Property

**Description**
Returns the alpha portion of the firmware revision number. For example, given a firmware revision number A.03.30, this command returns A.

**VB Syntax**
```
value = cap.FirmwareSeries
```

**Variable (Type) - Description**
- **value** (String) - Variable to store the returned alpha value of the firmware revision number.
- **cap** A Capabilities (object)

**Return Type**
String

**Default**
Not Applicable

**Examples**
```
value = cap.FirmwareSeries 'Read
```

**C++ Syntax**
```
HRESULT get_FirmwareSeries(BSTR * series);
```

**Interface**
ICapabilities
FixedDelay Property

Description: Set and return the known delay through the calibration mixer.

VB Syntax: `smc.FixedDelay = value`

Variable (Type) - Description
- `smc` An `SMCType` (object)
- `value` (Double) Known delay through the calibration mixer in seconds.

Return Type: Double

Default: 0 seconds

Example:
```vbnet
SMC.FixedDelay = 12e-9  'Write
value = SMC.FixedDelay   'Read
```

C++ Syntax:
```
HRESULT put_FixedDelay(Double Value);
HRESULT get_FixedDelay(Double* Value);
```

Interface: `SMCType5`

Last Modified:
25-Mar-2010   MX New topic
FixedPhase Property

Description  Write and read the fixed phase value. Must not be logarithmic sweep type.

VB Syntax  
```
phase.FixedPhase(srcPort) = value
```

Variable  
**variable** (Type) - Description

- **phase**  A [PhaseControl] Object
- **srcPort**  (Long Integer) Source port for which to make phase control settings.
  
  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

- **value**  (Double) Phase value in degrees. Choose a value between -360 and 360.

Return Type  Double

Default  0 degrees

Examples  
```
phase.FixedPhase 1 = 15 ' Write
```

```
value = phase.FixedPhase 2' Read
```

C++ Syntax  
```
HRESULT get_FixedPhase(long port, double* pVal);
HRESULT put_FixedPhase(long port, double newVal);
```

Interface  IPhaseControl

Last Modified:  8-Dec-2010  MX New topic
### FixedRatioedPower Property

**Description**
Write and read the fixed power ratioed value. Must NOT be in power sweep to use this value during phase control.

**VB Syntax**

```vbnet
phase.FixedRatioedPower(srcPort) = value
```

**Variable (Type) - Description**

- **phase**
  A `PhaseControl` Object

- **srcPort**
  (Long Integer) Source port for which to make phase control settings.

  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**
  (Double) Fixed power ratio value in dBc within the allowable range of the PNA.

**Return Type**
Double

**Default**
0 dBc

**Examples**

```vbnet
phase.FixedRatioedPower 1 = -1 ' Write
value = phase.FixedRatioedPower 2' Read
```

**C++ Syntax**

```cpp
HRESULT get_FixedRatioedPower(long port, double* pVal);
HRESULT put_FixedRatioedPower(long port, double newVal);
```

**Interface**

**FixturingState Property**

**Description**
Turns all three fixturing functions (de-embedding, port matching, impedance conversion) ON or OFF for all ports on the specified channel. This does NOT affect port extensions.

**VB Syntax**
`fixture.FixturingState = value`

**Variable (Type) - Description**

- `fixture` A Fixturing (object)
- `value` (boolean)
  - `True` - Turns Fixturing ON
  - `False` - Turns Fixturing OFF

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
fixture.FixturingState = True 'Write
value = fixture.FixturingState 'Read
```

**C++ Syntax**

```cpp
HRESULT get_FixturingState(VARIANT_BOOL *pVal)
HRESULT put_FixturingState(VARIANT_BOOL newVal)
```

**Interface**
IFixturing
Read-only

FootSwitch Property

**Description**
Reads the Footswitch Input (pin 20 of the AUX IO connector).

**VB Syntax**

```vbnet
value = AuxIO.Footswitch
```

**Variable (Type) - Description**

- **value** (boolean) - Variable to store the returned value
  - **False** - foot switch is released
  - **True** - footswitch is depressed

- **AuxIO** (object) - A Hardware Aux I/O object

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
fs = aux.Footswitch
```

**C++ Syntax**

```cpp
HRESULT get_FootSwitch ( VARIANT_BOOL* State );
```

### About the Aux I/O Connector

#### FootswitchMode Property

**Description**
Determines what occurs when the footswitch is pressed. For more information see the FootSwitch In pin description in the Auxiliary IO connector.

**VB Syntax**

```vbnet
AuxIo.FootSwitchMode = value
```

**Variable**  
**(Type)** - Description

<table>
<thead>
<tr>
<th>value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - naIgnoreFootswitch</td>
<td>Footswitch presses are ignored.</td>
</tr>
<tr>
<td>1 - naSweepTrigger</td>
<td>Footswitch presses trigger a sweep. The PNA must be in Manual Trigger Mode.</td>
</tr>
<tr>
<td>2 - naRecallNextState</td>
<td>Footswitch presses recall an instrument state. When more than one state is available, then each footswitch press recalls the next state, then starts over from the beginning. It is possible for a recalled state to override the current mode. If the recalled state is IGNore, then mode changes and additional footswitch presses are ignored.</td>
</tr>
<tr>
<td>3 - naRunMacro</td>
<td>Footswitch presses load and run a macro. When more than one macro is available, then each footswitch press loads and runs the next macro, then starts over from the beginning. It is possible for a Macro to override the current mode. If the macro contains a Preset, then the mode changes to the default setting IGNore and additional footswitch presses are ignored.</td>
</tr>
</tbody>
</table>

**AuxIO**  
**(object)** - A Hardware Aux I/O object

**Return Type**
NAFootSwitchMode

**Default**
0 - naIgnoreFootswitch

**Examples**

```vbnet
auxIo.FootSwitchMode = naIgnoreFootSwitch 'Write
```

**C++ Syntax**

```cpp
HRESULT get_FootSwitchMode(NAFootSwitchMode *pFootSwitchMode )
HRESULT put_FootSwitchMode(NAFootSwitchMode newFootSwitchMode)
```

**Interface**
IHWAuxIO3
### ForceDeEmbedENRAdapter Property

**Description**
Set and read the De-embedENRAdapter state. [Learn more](#).

**VB Syntax**

```vbnet
noiseCal.ForceDeEmbedENRAdapter = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noiseCal</td>
<td>A NoiseCal (object)</td>
</tr>
<tr>
<td>value</td>
<td>(boolean) - ENR Adapter de-embed state.</td>
</tr>
<tr>
<td>False</td>
<td>False - Do not Force de-embedding.</td>
</tr>
<tr>
<td>True</td>
<td>True - Force de-embedding.</td>
</tr>
</tbody>
</table>

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
noiseCal.ForceDeEmbedENRAdapter = False 'Write
AdapterDembed = noiseCal.ForceDeEmbedENRAdapter 'Read
```

**C++ Syntax**

```cpp
HRESULT get_ForceDeEmbedENRAdapter(VARIANT_BOOL* on);
HRESULT put_ForceDeEmbedENRAdapter(VARIANT_BOOL on);
```

Format Property (marker)

**Description**
Sets (or returns) the format of the marker.

**VB Syntax**
```
mark.Format = value
```

**Variable**
(Type) - Description

`mark` A [Marker](#) (object)

`value` (enum NAMarkerFormat) - Choose from:

- 0 - naMarkerFormat_LinMag
- 1 - naMarkerFormat_LogMag
- 2 - naMarkerFormat_Phase
- 3 - naMarkerFormat_Delay
- 4 - naMarkerFormat_Real
- 5 - naMarkerFormat_Imaginary
- 6 - naMarkerFormat_SWR
- 7 - naMarkerFormat_LinMagPhase
- 8 - naMarkerFormat_LogMagPhase
- 9 - naMarkerFormat_RealImaginary
- 10 - naMarkerFormat_ComplexImpedance
- 11 - naMarkerFormat_ComplexAdmittance
- 12 - naMarkerFormat_Kelvin
- 13 - naMarkerFormat_Fahrenheit
- 14 - naMarkerFormat_Celsius

**Return Type**
NAMarkerFormat

**Default**
1 - naMarkerFormat_LogMag

**Examples**
```
mark.Format = naMarkerFormat_SWR 'Write
fmt = mark.Format 'Read
```

**C++ Syntax**
```
HRESULT get_Format(tagNAMarkerFormat *pVal)
HRESULT put_Format(tagNAMarkerFormat newVal)
```

**Interface**
IMarker

Last Modified:
1-Oct-2007   Added temperature formats
**FormatUnit Property**

**Description**
Sets and returns the units for the specified data format. Measurements with display formats other than those specified are not affected.

**VB Syntax**
```
meas.FormatUnit (format) = value
```

**Variable**
**Type** - Description

<table>
<thead>
<tr>
<th>meas</th>
<th>A Measurement (object)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>format</th>
<th>(enum NADataFormat) - Choose:</th>

Write/Read

Frequency Property

**Description**
Sets group delay aperture using a fixed frequency range.

**VB Syntax**
`gdAperture.Frequency = value`

**Variable**
*(Type)* - Description

- `gdAperture` A GroupDelayAperture *(object)*
- `value` *(Double)* Frequency range (in Hz) to use for the aperture setting.

**Return Type**
Double

**Default**
Frequency range that equates to 11 points.
This can be changed to two points with a preference setting.

**Examples**

```vbnet
gdAperture.Frequency = 1e6 'Write
aperture = gdAperture.Frequency 'Read
```

**C++ Syntax**

```c++
HRESULT get_Frequency(double Frequency *pVal)
HRESULT put_Frequency(double Frequency newVal)
```

Frequency Property

**Description**
Sets or returns the frequency associated with a Power Sensor CalFactor Segment or
Sets or returns the frequency associated with a Power Loss Segment.

**VB Syntax**

```
object.Frequency = value
```

**Variable** *(Type)* - Description

- **object**
  One of the following objects:
  - `PowerSensorCalFactorSegment`
  - `PowerSensorCalFactorSegmentPMAR`
  - `PowerLossSegment`
  - `PowerLossSegmentPMAR`

- **value** *(double)* – Frequency in units of Hz. This can be any non-negative value (limited by the maximum value of double).

**Return Type**
Double

**Default**
0

**Examples**

```
seg.Frequency = 6e9 'Write
freq = seg.Frequency 'Read
```

**C++ Syntax**

```
HRESULT put_Frequency(double newVal);
HRESULT get_Frequency(double *pVal);
```

**Interface**
One of the above objects.

**About Frequency Offset**

**FrequencyOffsetDivisor Property Superseded**

### Description
This method is replaced by properties on the [FOMRange Object](#).

Specifies (along with [FrequencyOffsetMultiplier](#)) the value to multiply by the stimulus.

See other Frequency Offset properties.

### VB Syntax

```vbnet
object.FrequencyOffsetDivisor = value
```

### Variable

**Type** - Description

- `object` Channel *(object)*
- `or`
- `CalSet` *(object)* - Read-only property

**value** *(Double)* - Divisor value. Range is 1 to 1000

### Return Type

Double

### Default

1

### Examples

```vbnet
chan.FrequencyOffsetDivisor = 2 'Write
fOffsetDiv = chan.FrequencyOffsetDivisor 'Read
```

### C++ Syntax

```cpp
HRESULT get_FrequencyOffsetDivisor(double*pval)
HRESULT put_FrequencyOffsetDivisor(double newVal)
```

### Interface

- [IChannel2](#)
- [CalSet3](#)
FrequencyOffsetFrequency Property  Superseded

Description  This method is replaced by properties on the FOMRange Object.

Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency. See other Frequency Offset properties.

VB Syntax  

```
object.FrequencyOffsetFrequency = value
```

Variable  (Type) - Description

- **object**  Channel *(object)*
  or  CalSet *(object)* - Read-only property

- **value**  (Double) - Offset value. Range is +/- 1000 GHz. (Offsets can be positive or negative.)

Return Type  Double

Default  0 Hz

Examples  

```
chan.FrequencyOffsetFrequency = 2 'Write

fOffsetFreq = chan.FrequencyOffsetFrequency 'Read
```

C++ Syntax  

```
HRESULT get_FrequencyOffsetFrequency(double*pval)
HRESULT put_FrequencyOffsetFrequency(double newVal)
```

Interface  IChannel2  |CalSet3
FrequencyOffsetMultiplier Property  Superseded

**Description**
This method is replaced by properties on the FOMRange Object. Specifies (along with FrequencyOffsetDivisor) the value to multiply by the stimulus. See other Frequency Offset properties.

**VB Syntax**

Write/Read

FrequencyOffsetCWOverride Property  Superseded

This method is replaced by properties on the FOMRange Object.

Establishes a fixed (CW) stimulus frequency while measuring the Response over a swept frequency range. For example, a fixed-frequency PNA stimulus may be applied to the RF input of a mixer whose local oscillator (LO) is being swept. Because the IF output of the mixer will be swept, the PNA receivers must also be swept.

See other Frequency Offset properties.

VB Syntax

object.FrequencyOffsetCWOverride = value

Variable  (Type) - Description

object  Channel (object)

or

CalSet (object) - Read-only property

value  (Enum as NaStates) - Choose from:

naOFF (0) - Turns CW override OFF
naON (1) - Turns CW override ON

Return Type  Enum

Default  0 Hz

Examples

chan.FrequencyOffsetCWOverride = 1 'Write

fOffsetOV = chan.FrequencyOffsetCWOverride 'Read

C++ Syntax

HRESULT get_FrequencyOffsetCWOverride (tagNAStates *pstate)
HRESULT put_FrequencyOffsetCWOverride (tagNAStates newState)

Interface

IChannel2
|CalSet3
About Frequency Offset

FrequencyOffsetState Property  Superseded

Description
This method is replaced by properties on the FOMRange Object.

Enables Frequency Offset on ALL measurements that are present on the active channel. This immediately causes the source and receiver to tune to separate frequencies. The receiver frequencies are specified with other channel and offset settings. To make the stimulus settings, use Channel Start, Stop Frequency properties. See other Frequency Offset properties.

Tip: To avoid unnecessary errors, first make other frequency offset settings. Then turn Frequency Offset ON.

VB Syntax
object.FrequencyOffsetState = value

Variable (Type) - Description

object Channel (object)

or
CalSet (object) - Read-only property

value (Enum as NaStates) - Choose from:

naOFF (0) - Turns Frequency Offset OFF

naON (1) - Turns Frequency Offset ON

Return Type
Enum

Default
naOFF (0)

Examples
chan.FrequencyOffsetState = naON  'Write

Foffset = chan.FrequencyOffsetState  'Read

C++ Syntax
HRESULT FrequencyOffsetState (tag NAStates *pState);
HRESULT FrequencyOffsetState (tag NAStates newState)

Interface
|Channel2
|CalSet3
**Gain Property**

**Description**

Returns the Gain result of the PNOP marker search.

\[ \text{Pnop Gain} = \text{Pnop Out} - \text{Pnop In.} \]

**VB Syntax**

\[ \text{gain} = \text{pnop.Gain} \]

**Variable**

- **Type** - Description
  - `gain` (double) - Variable to store returned value
  - `pnop` A PNOP (object)

**Return Type**

Double

**Default**

Not applicable

**Examples**

\[ \text{gain} = \text{pnop.Gain} \]

See example program

## FrequencySpan Property

**Description**
Sets or returns the frequency span of the channel.
Sets or returns the frequency span of the segment.

**VB Syntax**
```
object.FrequencySpan = value
```

**Variable**
- **object**
  - A Channel *(object)*
  - or
  - A Segment *(object)*

- **value** *(double)* - Frequency span in Hertz. Choose any number between the `minimum` and `maximum` frequencies of the analyzer.

**Return Type**
Double

**Default**
Full frequency span of the analyzer

**Examples**
```
chan.FrequencySpan = 4.5e9 'sets the frequency span of a linear sweep for the channel object -Write

freqspan = chan.FrequencySpan 'Read
```

**C++ Syntax**
```
HRESULT get_FrequencySpan(double *pVal)
HRESULT put_FrequencySpan(double newVal)
```

**Interface**
IChannel
ISegment
**Shape Property**

**Description**
Specifies the shape of the gate filter.

**VB Syntax**
`gat.Shape = value`

**Variable**
- **(Type)**: A Gating (object)
- **(Type)**: (enum NAGateShape)
  - Choose from:
    0 - naGateShapeMaximum
    1 - naGateShapeWide
    2 - naGateShapeNormal
    3 - naGateShapeMinimum

**Return Type**
NAGateShape

**Default**
2 - Normal

**Examples**
```
gat.Shape = naGateShapeMaximum 'Write
```
```
filterShape = gat.Shape 'Read
```

**C++ Syntax**
- HRESULT get_Shape(tagNAGateShape *pVal)
- HRESULT put_Shape(tagNAGateShape newVal)

**Interface**
IGating
Type (gate) Property

**Description**
Specifies the type of gate filter used.

**VB Syntax**
gat.Type = value

**Variable**
* (Type) - Description

gat - A Gating (object)

*value* (enum NAGateType) - Choose from:

0 - naGateTypeBandpass - Includes (passes) the range between the start and stop times.
1 - naGateTypeNotch - Excludes (attenuates) the range between the start and stop times.

**Return Type**
NAGateType

**Default**
Bandpass

**Examples**

<table>
<thead>
<tr>
<th>Write</th>
<th>Read</th>
</tr>
</thead>
<tbody>
<tr>
<td>gate.Type = naGateTypeNotch</td>
<td>filterType = gate.Type</td>
</tr>
</tbody>
</table>

**C++ Syntax**

HRESULT get_Type(tagNAGateType *pVal)
HRESULT put_Type(tagNAGateType newVal)

**Interface**

<td></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Short Integer) GPIB Address on the PNA. Choose a value between 0 and 30.</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
Short Integer

**Default**
16

**Examples**
```
address=app.GPIBAddress(0) 'Read
app.GPIBAddress(0)=16 'Write
```

**C++ Syntax**
```cpp
HRESULT get_GPIBAddress(short busIndex, short* address);
HRESULT put_GPIBAddress(short busIndex,short address);
```

**Interface**
IApplication8

---

**Last Modified:**

16-Mar-2011    Add talker/listener
GPIBMode Property

Description: Changes the analyzer to a GPIB system controller or a talker/listener on the bus. The analyzer must be the controller if you want to use it to send commands to other instruments. The analyzer must be a talker/listener if you want to send it commands from another PC.

Note: This command has no affect in PNAs with dedicated Controller and Talker/Listener GPIB connectors.

VB Syntax: app.GPIBMode value

Variable: (Type) - Description
- app: An Application (object)
- value: (enum NAGPIBMode) - Choose either:
  0 - naTalkerListener - the analyzer is a talker/listener
  1 - naSystemController - the analyzer is the system controller

Return Type: Long Integer
Default: 0 - naTalkerListener

Examples:
- app.GPIBMode = naTalkerListener 'Write
- mode = app.GPIBMode 'Read

C++ Syntax:
- HRESULT get_GPIBMode(tagGPIBModeEnum* eGpibMode)
- HRESULT put_GPIBMode(tagGPIBModeEnum eGpibMode)

Interface: IApplication

Last Modified: 10-Nov-2008 Removed link to obsolete topic.
GPIBPortCount Property

Description
Returns the number of GPIB ports that are present on the PNA rear-panel.

VB Syntax
\[ value = cap.GPIBPortCount \]

Variable (Type) - Description
\[ value \] (Long) - Variable to store the returned integer value of the number of GPIB ports.
\[ cap \] A Capabilities (object)

Return Type
Long

Default
Not Applicable

Examples
\[ value = cap.GPIBPortCount \]

C++ Syntax
HRESULT get_GPIBPortCount(long * gpibPorts);

Interface
ICapabilities3

Last Modified:
23-Oct-2008   Removed 1.1 GHz description
Grid Property

**Description**  Set and return the inner lines of all grid in all windows, and the grid frame in inactive windows for the PNA display or hardcopy print.

**VB Syntax**  
```
colors.Grid = value
```

**Variable**  

- **colors**  A [ComColors](#) (object)
- **value**  (Long Integer) - RGB color of the Grid pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

**Return Type**  Long

**Default**  
- Display = 175,175,175
- Print = 0,0,0 (Black)

**Examples**

R = 10
G = 10
B = 10

```
RGB = R+(G*2^8)+(B*2^16)
```

```
colors.Grid = RGB 'Write
color = colors.Grid 'Read
```

**C++ Syntax**

```
HRESULT get_Grid(long* pVal);
HRESULT put_Grid(long newVal);
```

**Interface**  IComColors

---

GridLineType Property

Description
Set and return whether the grid lines are displayed in solid or dotted lines for all open windows. Grid lines are returned to solid when the PNA is Preset.

VB Syntax
app.GridLineType = value

Variable
(Type) - Description
app A Application Object (object)
value (Enum as naLineType) - Choose from:
0 - naLineTypeSolid
1 - naLineTypeDotted

Return Type
Enum

Default
naLineTypeSolid

Examples
app.GridLineType = naLineTypeSolid 'Write
grid = app.GridLineType 'Read

C++ Syntax
HRESULT get_GridLineType(tag naLineType* pVal);
HRESULT put_GridLineType(tag naLineType newVal);

Interface
IApplication

Last Modified:

HandshakeEnable Property

**Description**

Turns handshake ON/OFF.

To enable handshake, the main trigger enable must ALSO be set using `Enable`.

When ON, PNA acquisition waits indefinitely for the input line to be asserted before continuing with the acquisition.

*Note:* Use on PNA-X ONLY. Other models do NOT have an Aux Input.

**VB Syntax**

```
 auxTrig.HandshakeEnable = state
```

**Variable**

*Type* - Description

- `auxTrig` An `AuxTrigger` *(object)*
- `state` *(boolean)* -
  - `True` - Handshake enabled
  - `False` - Handshake NOT enabled

**Return Type**

Boolean

**Default**

False

**Examples**

```
 auxTrig.HandshakeEnable = True 'Write

value = auxTrig.HandshakeEnable 'Read
```

**C++ Syntax**

```
HRESULT get_HandshakeEnable(VARIANT_BOOL * enable);
HRESULT put_HandshakeEnable(VARIANT_BOOL enable);
```

**Interface**

`IAuxTrigger`

HasItem Property

Description
Returns a value indicating whether the specified external devices is configured.

VB Syntax
value = extDevices.HasItem(name:driver)

Variable (Type) - Description
value (Boolean) Variable to store one of the following returned values.
False - Item (name:driver) is NOT present in the External Devices collection.
True - Item (name:driver) IS present in the External Devices collection.

extDevices An ExternalDevices (collection)

name:driver (String) External Device for which to search the collection in the form (name:driver) where:
- name = name of the external device
- driver = See a list of supported drivers

Return Type Boolean

Default Not Applicable

Examples
has = extDevices.HasItem('mysource':ESG) 'Read

NOTE: the example on the collections page does not include the 'driver as part of this commands

C++ Syntax
HRESULT get_HasItem( VARIANT Index, BOOL *pVal);

Interface IExternalDevices

# HighestOrderProduct Property

**Description**
Returns the highest order product that can be measured by SweptIMD.

**VB Syntax**
```vbnet
value = imd.HighestOrderProduct
```

**Variable**
- **Type**: Long Integer
- **Description**: Variable in which to store the returned value.

```vbnet
value
```

*imd*  
A [SweptIMD](#) Object

**Return Type**
Integer

**Default**
Always returns 9

**Examples**
```vbnet
value = imd.HighestOrderProduct  'Read
```

**C++ Syntax**
```cpp
HRESULT get_HighestOrderProduct(long *pVal)
```

**Interface**
ISweptIMD

---

**Last Modified:**
- 19-Sep-2008

## ID Property

**Description**
Returns the test set ID number. For GPIB testsets, the ID is equivalent to the GPIB address. For testset I/O testsets, the ID is the base address of the testset (0 for the first testset, 1 for the second, and so on).

**VB Syntax**
```vbnet
value = tset.ID
```

**Variable (Type) - Description**
- `value` (Long) variable to store the returned information.
- `tsets(1)` A `TestsetControl` object.
  OR
  An `E5091Testset` object.

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vbnet
value = testset1.ID
```

See E5091A Example Program
See External Testset Program

**C++ Syntax**
```cpp
HRESULT get_ID(long *idNumber);
```

**Interface**
- `ITestsetControl`
- `IE5091Testset`
Read-only

IDString Property

Description
Returns the ID of the analyzer, including the Model number, Serial Number, and the Software revision number.

Note: Beginning with Rev 6.01, this command now returns the software revision with 6 digits instead of 4. For example, A.06.01.02.

VB Syntax
value = app.IDString

Variable (Type) - Description
app  An Application (object)
value (string) - variable to contain the returned ID string

Return Type
String

Default
Not Applicable

Examples
id = app.IDString

C++ Syntax
HRESULT IDString(BSTR* IDString)

Interface
IApplication
### IFBandwidthOption Property

**Description**
Enables the IFBandwidth to be set on individual sweep segments. This property must be set True before `seg.IFBandwidth = value` is sent. Otherwise, this command will be ignored.

**VB Syntax**
```
segs.IFBandwidthOption = value
```

**Variable (Type) - Description**

- **segs**
  A Segments collection (`object`)

- **value**
  (boolean)
  - **True** - Enables variable IFBandwidth setting for segment sweep
  - **False** - Disables variable IFBandwidth setting for segment sweep

**Return Type**
Boolean

**Default**
False

**Examples**
```
segs.IFBandwidthOption = True  'Write
IFOption = IFBandwidthOption  'Read
```

**C++ Syntax**
- `HRESULT get_IFBandwidthOption(VARIANT_BOOL *pVal)`
- `HRESULT put_IFBandwidthOption(VARIANT_BOOL newVal)`

**Interface**
`ISegments`
IFBandwidth Property

Description
Sets or returns the IF Bandwidth of the channel.
Sets or returns the IF Bandwidth of the segment.
Returns the IF Bandwidth used in the Cal Set

VB Syntax
object. IFBandwidth = value

Variable (Type) - Description
object
Channel (object)
or
Segment (object)
or
CalSet (object) - Read-only property

value (double) - IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

Return Type
Double

Default
See Preset IFBW for your PNA model.

Examples
chan. IFBandwidth = 3e3 'sets the IF Bandwidth of for the channel object to 3 kHz. -Write
seg. IFBandwidth = 5 'sets the IF Bandwidth of the segment to 5 Hz. -Write

ifbw = chan. IFBandwidth -Read

C++ Syntax
HRESULT get_IFBandwidth(double *pVal);
HRESULT put_IFBandwidth(double newVal);

Interface
IChannel
ISegment
ICalSet3
### IFDenominator Property

**Description**
Sets or returns the denominator value of the IF Fractional Multiplier. Only applies to 2 stage mixers. If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```vbnet
conv.IFDenominator = value
```

**Variable**

- **Type** - Description
  - `conv` A `Converter` (object)
  - `value` (long) IF Denominator value.

**Return Type**
Long

**Default**
1

**Examples**

```
Print mixer.IFDenominator 'prints the value of the IFDenominator
```

**C++ Syntax**

```
HRESULT get_IFDenominator(long *pVal)
HRESULT put_IFDenominator(long newVal)
```

**Interface**
IConverter4

## IFFilterSampleCount Property

### Description

**Note:** This setting applies only to the E836X Opt. H11.

Sets or retrieves the number of taps in the IF filter when the IFFilterSource property is set to \(\text{IFFilterSourceManual}\.\)

### VB Syntax

\[ \text{IfConfig.IFFilterSampleCount} = \text{value} \]

### Variable (Type) - Description

**IfConfig**  
\(\text{IFConfiguration} \) (object)

**value**  
\(\text{(long)}\) – The IF filter sample count. The minimum and maximum allowed values for this property can vary by model number, but can be queried using the MinimumIFFilterSampleCount and MaximumIFFilterSampleCount properties.

### Return Type

Long Integer

### Default

PNA Model number dependent

### Examples

\[\text{App.ActiveChannel.IFConfiguration.IFFilterSampleCount} = 200 \ \text{Write}\]

\[\text{variable} = \text{App.ActiveChannel.IFConfiguration.IFFilterSampleCount} \ \text{Read}\]

See an example program

### C++ Syntax

HRESULT get_IFFilterSampleCount( long * pSampleCount )

HRESULT put_IFFilterSampleCount( long sampleCount )

### Interface

IIFConfiguration2
### IFFilterSamplePeriod Property

**Description**  
**Note**: This setting applies only to the E836X Opt. H11.

Sets or returns the IF filter sample period time. This time is only used if the `IFFilterSamplePeriodMode` is set to `naManual`.

**VB Syntax**  
`IfConfig.IFFilterSamplePeriod = value`

**Variable (Type) - Description**

- **IfConfig**  
  `IFConfiguration` (object)

- **value**  
  (double) – The sample period time in seconds. Valid sample period times can be queried using the `IFFilterSamplePeriodList` property.

**Return Type**
Double

**Default**
PNA Model number dependent.

**Examples**

- `App.ActiveChannel.IFConfiguration.IFFilterSamplePeriod = .000006 'Write`

- `variable = App.ActiveChannel.IFConfiguration.IFFilterSamplePeriod 'Read`

See an example program

**C++ Syntax**

```cpp
HRESULT get_IFFilterSamplePeriod( double * pSamplePeriod );
HRESULT put_IFFilterSamplePeriod( double samplePeriod );
```

**Interface**
`IIFConfiguration2`
**Read-only**

**IFFilterSamplePeriodList Property**

**Description**
Retrieves the list of available IF filter sample periods for the instrument.

*Note:* This setting applies only to the E836X Opt. H11.

**VB Syntax**
```
variable = IfConfig.IFFilterSamplePeriodList
```

**Variable**
*Type* - Description

variable (Array) An array of permissible values that can be passed to the IFFilterSamplePeriod property.

**IfConfig**
IFConfiguration (object)

**Return Type**
Array

**Default**
Not applicable

**Examples**
```
Dim Variable
Variable = App.ActiveChannel.IFConfiguration.IFFilterSamplePeriodList 'Read
MsgBox "First IF Sample Period Value: " & Variable(0)
```

See an example program

**C++ Syntax**
```
HRESULT get_IFFilterSamplePeriodList( SAFEARRAY ** ppSamplePeriodList );
```

**Interface**
IIFConfiguration2
**IFFilterSamplePeriodMode Property**

**Description**
Sets or returns the IF filter sample period mode.

*Note:* This setting applies only to the E836X Opt. H11.

**VB Syntax**

```vbnet
IfConfig.IFFilterSamplePeriodMode = value
```

**Variable**

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>

<td>0 - naAuto - IF filter sample period is chosen automatically.</td>
</tr>
<tr>
<td></td>
<td>1 - naManual - the IF filter sample period is the value specified by the IFSamplePeriod property.</td>
</tr>
</tbody>
</table>

**Return Type**
NAModes

**Default**
0 - naAuto

**Examples**

```vbnet
App.ActiveChannel.IFConfiguration.IFFilterSamplePeriodMode = naAuto
'Write

variable = App.ActiveChannel.IFConfiguration.IFFilterSamplePeriodMode
'Read

See an example program
```

**C++ Syntax**

```c
HRESULT get_IFFilterSamplePeriodMode( tagNAModes * pMode);
HRESULT put_IFFilterSamplePeriodMode ( tagNAModes mode );
```

**Interface**
IIFConfiguration2
# IFFilterSource Property

**Description**
Sets or retrieves type of IF filter to be used.

**Note:** This setting applies only to the E836X Opt. H11.

**VB Syntax**
```vbnet
IfConfig.IFFilterSource = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

<td>The IF filter type is automatically chosen.</td>
</tr>
<tr>
<td>naIFFilterSourceManual</td>
<td>The IF filter is a predetermined shape where the IFFilterSampleCount determines the number of taps in the filter.</td>
</tr>
</tbody>
</table>

**Return Type**
NAIFFilterSource

**Default**
naIFFilterSourceAuto

**Examples**
```vbnet
App.ActiveChannel.IFConfiguration.IFFilterSource = naIFFilterSourceManual 'Write
Variable = App.ActiveChannel.IFConfiguration.IFFilterSource 'Read
```

See an example program

**C++ Syntax**
```c
HRESULT get_IFFilterSource( tagNAIFFilterSource * pFilterSource );
HRESULT put_IFFilterSource(tagNAIFFilterSource filterSource );
```

**Interface**
IIFConfiguration2
IFGainLevel Property

Description  
**Note:** This setting applies only to the E836x and selected N5230A models.
Manually sets the gain level for the specified receiver.

VB Syntax  
`IfConfig.IFGainLevel (id) = value`

Variable  
(Type) - Description
`IfConfig`  An **IFConfiguration** (object)
`id`  Receiver for which to set the gain level. Choose from: 'A', 'B', 'R1', 'R2'.
`value`  (long Integer) Gain Level. Choose from:
0 - Lowest gain setting
1
2 - Highest gain setting

Return Type  Long Integer

Default  0 (Lowest setting)

Examples  
`IfConfig.IFGainLevel("A") = 1`

C++ Syntax  
HRESULT get_IFGainLevel (BSTR IDString, *GainLevel)
HRESULT put_IFGainLevel (BSTR IDString, GainLevel)

Interface  IFConfiguration

Last Modified:
14-Apr-2008  Clarified models

**IFGainMode Property**

**Description**  
*Note:* This setting applies only to the E836x and selected N5230A models.  
Sets the gain state for ALL receivers to Auto or Manual.

**VB Syntax**  
`IfConfig.IFGainMode (id) = value`

**Variable (Type) - Description**

- **IfConfig**  
  An `IFConfiguration` (object)
- **id**  
  Receivers for which to set the state. Choose 'ALL'.
- **value**  
  (enum as NAModes)  
  Choose from:
  - 0 - naAUTO
  - 1 - naMANUAL (use `IFGainLevel Property` to manually set gain level)

**Return Type**  
NAModes

**Default**  
0 - naAUTO

**Examples**  
`IfConfig.IFGainMode("ALL") = naAUTO`

**C++ Syntax**

- HRESULT `get_IFGainMode` (BSTR IDString, NAModes *gainMode)
- HRESULT `put_IFGainMode` (BSTR IDString, NAModes gainMode)

IFGateEnable Property

Description
Sets or retrieves the state of the IF Gate.

*Note:* This setting applies only to the E836X Opt. H11.

VB Syntax
`IfConfig.IFGateEnable = value`

Variable *(Type)* - Description

`IfConfig` *IFConfiguration (object)*

`value` *(Boolean)* – The state of the IF Gate.

*True* – The IF Gate is in use.

*False* – The IF Gate is not in use.

Return Type
Boolean

Default
False

Examples
`App.ActiveChannel.IFConfiguration.IFGateEnable = True 'Write`

`variable = App.ActiveChannel.IFConfiguration.IFGateEnable 'Read`

See an example program

C++ Syntax
`HRESULT get_IFGateEnable( VARIANT_BOOL * pGateEnabled );`

`HRESULT put_IFGateEnable( VARIANT_BOOL gateEnabled );`

Interface
*IIFConfiguration*
IFNumerator Property

Description
Sets or returns the numerator value of the IF Fractional Multiplier.
Only applies to 2 stage mixers.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax
conv.IFNumerator = value

Variable
(Type) - Description
conv  A Converter (object)
value  (Long) IF Numerator value.

Return Type
long
Default
1

Examples
Print mixer.IFNumerator 'prints the value of the IFNumerator

C++ Syntax
HRESULT get_IFNumerator(long *pVal)
HRESULT put_IFNumerator(long newVal)

Interface
IConverter4

Last Modified:
29-Oct-2010  New topic
**Description**
Sets and returns the IF frequency for ALL receiver paths being used for the specified channel. To set this frequency, `IFFrequencyMode Property` must be set to OFF (Manual).

**VB Syntax**
```
IfConfig.IFFrequency = value
```

**Variable**
(Type) - Description

IfConfig  An IFConfiguration (object)

value  (double) IF Frequency. Use `MaximumIFFrequency` and `MinimumIFFrequency` to determine the range of value for this command.

**Return Type**
Double

**Default**  9 MHz

**Examples**
```
IfConfig.IFFrequency = 9.3e6
```

**C++ Syntax**
```
HRESULT get_IFFrequency (double *pVal);
HRESULT put_IFFrequency (double pVal);
```

**Interface**
IFConfiguration3
Write/Read

IFFrequencyMode Property

Description
Sets and returns method for specifying the way the IF Frequency is determined.

VB Syntax
IfConfig.IFFrequencyMode = value

Variable (Type) - Description
IfConfig An IFConfiguration (object)

value (enum as NAModes) IF Frequency mode. Choose from:

0 - naAUTO The PNA determines the setting for the IF frequency. The IF frequency is based on many PNA settings, including measurement frequency. Therefore, it is NOT possible to read the IF frequency that is being used.

1 - naMANUAL (use IFFrequency Property to manually set frequency.

Return Type Enum

Default 0 naAuto

Examples
IfConfig.IFFrequencyMode = naMANUAL

C++ Syntax
HRESULT get_IFFrequencyMode (tagNAModes* pdspMode);
HRESULT put_IFFrequencyMode (tagNAModes* pdspMode);

Interface IFConfiguration3

About Mixer Configuration

IFSideband Property

Description
When two LOs are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the + buttons on LO1.
- Also set OutputSideband to LOW or HIGH to determine the output frequency of the mixer.
- This setting is ignored when ONE LO is used.
- If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

Note: There is also an IFSideband_Property on the Mixer Interface.

VB Syntax

obj.IFSideband = value

Variable (Type) - Description

obj A Converter Object

value (enum as ConverterSideBand) - Choose from:
0 or naLowSide Minus (-) on the Mixer setup dialog
1 or naHighSide Plus (+) on the Mixer setup dialog

Return Type
Enum as ConverterSideBand

Default
0 - naLowSide

Examples

conv.IFSideband = naLowSide

C++ Syntax

HRESULT get_IFSideband(ConverterSideBand *pVal)
HRESULT put_IFSideband(ConverterSideBand newVal)

Interface
IConverter

IFSourcePath Property

Description

Note: This setting applies only to the E836X Opt. H11.

Sets the source path of the specified receiver. An error is returned if <id> is not valid, or if <value> is not valid for the specified <id>.

VB Syntax

IfConfig.IFSourcePath (id) = value

Variable (Type) - Description

IfConfig An IFCOnfiguration (object)

id Receiver for which to set the gain level. Choose from: 'A', 'B', 'R1', 'R2'.

Note: The A and R1 receivers are always switched together. B and R2 are also always switched together. For example, if you specify "A", R1 will also be switched.

value (Enum as NAIFSourcePath) Source path. Choose from:

0 - naNormalIFPath - the PNA decides the appropriate IF input paths.
1 - naExternalIFPath - always use the rear panel IF inputs.

Return Type NAIFSourcePath

Default 0 - naNormalIFPath

Examples IfConfig.IFSourcePath('A') = naNormalIFPath

C++ Syntax

HRESULT get_IFSourcePath (BSTR IDString, naiFSourcePath *IFSourcePath)
HRESULT put_IFSourcePath (BSTR IDString, naiFSourcePath IFSourcePath)

Interface IIFConfiguration
About Mixer Configuration

IFStartFrequency Property

Description
Sets or returns the start frequency value of the mixer IF frequency.
Only applies to 2 stage mixers.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

```vbnet
mixer.IFStartFrequency = value
```

Variable (Type) - Description

- `mixer` A Mixer (object)
- `value` (double) - Frequency in Hertz.

Return Type
Double

Default
Not Applicable

Examples
Print mixer.IFStartFrequency 'prints the value of the IFStartFrequency

C++ Syntax

```cpp
HRESULT get_IFStartFrequency(double *pVal)
HRESULT put_IFStartFrequency(double newVal)
```

Interface
IMixer

Last Modified:
4-Mar-2008  Added note.
**IFStopFrequency Property**

**Description**
Sets or returns the stop frequency value of the mixer IF frequency. Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```
mixer.IFStopFrequency = value
```

**Variable**

- **mixer**: A Mixer (object)
- **value**: (double) - IF stop frequency in Hertz.

**Return Type**

Double

**Default**

Not Applicable

**Examples**

Print mixer.IFStopFrequency 'prints the value of the IFStopFrequency

**C++ Syntax**

```
HRESULT get_IFStopFrequency(double *pVal)
HRESULT put_IFStopFrequency(double newVal)
```

**Interface**

ImpulseWidth Property

**Description**
Sets or returns the Impulse Width of Time Domain transform windows

**VB Syntax**
`trans.ImpulseWidth = value`

**Variable**
- **trans** (Type) - A Transform (object)
- **value** (double) - Impulse Width in seconds. Range of settings depends on the frequency range of your analyzer.

**Return Type**
Double

**Default**
.98 / Default Span

**Examples**
```
trans.ImpulseWidth = 200e-12 'sets the Impulse width of a transform window -Write
IW = trans.ImpulseWidth 'Read
```

**C++ Syntax**
```
HRESULT get_ImpulseWidth(double *pVal)
HRESULT put_ImpulseWidth(double newVal)
```

**Interface**
ITransform
# IMToneIFBandwidth Property

**Description**
Sets and returns the IF Bandwidth for measurement of the intermodulation products.

**VB Syntax**
```vbnet
imd.IMToneIFBandwidth = value
```

**Variable** (Type) - Description

<table>
<thead>
<tr>
<th>Variable (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imd</td>
<td>A SweptIMD Object</td>
</tr>
<tr>
<td>value</td>
<td>(Double) IF Bandwidth in Hz. Choose from: 1</td>
</tr>
</tbody>
</table>

Learn more about setting IFBW for IMD.

If an invalid number is specified, the analyzer will round up to the closest valid number.

**Return Type**
Double

**Default**
1 kHz

**Examples**

```vbnet
imd.IMToneIFBandwidth = 2e3 'Write
```

```vbnet
value = imd.IMToneIFBandwidth 'Read
```

**C++ Syntax**

```c++
HRESULT get_IMToneIFBandwidth(double *pVal)
HRESULT put_IMToneIFBandwidth(double newVal)
```

**Interface**
ISweptIMD

InactiveLabels Property

Description  Set and return the Inactive (not selected) Window Labels for the PNA display or hardcopy print.

VB Syntax  \textit{colors.InactiveLabels} = \textit{value}

Variable  \begin{itemize}  
\item \textit{colors} (Type) - Description
\item \textit{value} (Long Integer) - RGB color of the Inactive Labels pen.
\end{itemize}

\begin{itemize}  
\item Convert the three RGB colors to an integer as follows:
\begin{equation*}
\text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
\end{equation*}
\item To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.
\end{itemize}

Return Type  Long

Default  Display = 160,160,160  
Print = 0,0,0 (Black)

Examples  \begin{itemize}  
\item R = 10
\item G = 10
\item B = 10
\item \text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
\end{itemize}

\textit{colors.InactiveLabels} = \text{RGB} \quad \text{'Write}

\textit{color} = \textit{colors.InactiveLabels} \quad \text{'Read}

C++ Syntax  \begin{itemize}  
\item HRESULT get_InactiveLabels(long* pVal);
\item HRESULT put_InactiveLabels(long newVal);
\end{itemize}

Interface  IComColors

Include2ndOrderProduct Property

Description
Sets and returns whether to include the second order products in the calibration. These frequencies of these products can be far from the main tones.

VB Syntax
\textit{imd.Include2ndOrderProduct} = \textit{value}

Variable (Type) - Description
\begin{itemize}
  \item \textit{imd} - A \texttt{SweptIMDCal} (object)
  \item \textit{value} - (Boolean) Choose from:
    \begin{itemize}
      \item \texttt{False} - Do NOT include 2nd order products
      \item \texttt{True} - Include 2nd order products
    \end{itemize}
\end{itemize}

Return Type
Boolean

Default
\texttt{False} - Do NOT include 2nd order products

Examples
\begin{itemize}
  \item \texttt{imd.Include2ndOrderProduct} = \texttt{true} 'Write
  \item incl = \texttt{imd.Include2ndOrderProduct} 'Read
\end{itemize}

C++ Syntax
\begin{itemize}
  \item HRESULT get_Include2ndOrderProduct(VARIANT_BOOL * Val)
  \item HRESULT put_Include2ndOrderProduct(VARIANT_BOOL newVal)
\end{itemize}

Interface
ISweptIMD

IncludeReverseSweep Property

**Description**
Sets whether to include SC12 sweeps during measurements.

**VB Syntax**
`obj.IncludeReverseSweep = bool`

**Variable (Type) - Description**
- `obj`: A `Mixer Interface` pointer to the `Measurement` (object)
- `bool`: (Boolean) -
  - `True`: Include the SC12 (reverse) sweep.
  - `False`: Do NOT Include the SC12 (reverse) sweep.

**Return Type**
Boolean

**Default**
True

**Examples**
`obj.IncludeReverseSweep = True`

**C++ Syntax**
```cpp
HRESULT get_IncludeReverseSweep(VARIANT_BOOL * val);
HRESULT put_IncludeReverseSweep(VARIANT_BOOL val);
```

**Interface**
IMixer12

## IndexState Property

**Description**
Determines the control of Material Handler connector Pin 20.

**VB Syntax**
handler.IndexState = value

**Variable**
- **(Type)**: Description
- **handler** (object) - A Handler I/O object
- **value** (boolean)
  - False - Pin 20 is controlled by Output Port B6
  - True - Pin 20 is controlled by the Index signal

**Return Type**
Boolean

**Default**
False

**Examples**
- handler.IndexState = False  'Write
- bState = handler.IndexState  'Read

**C++ Syntax**
HRESULT put_IndexState (BOOL *pVal);
HRESULT get_IndexState (BOOL newVal);

**Interface**
IHWMaterialHandlerIO2
### InputA Property - Obsolete

**Description**
This property has NO replacement and no longer works correctly. (Sept. 2004)
Sets a Port Extension value for Receiver A

**VB Syntax**

```vbnet
portExt.InputA = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>portExt</code></td>
<td>A Port Extension (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) - Port Extension value in seconds. Choose any number between -10 and 10</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
portExt.InputA = 10e-6  'Write
inA = portExt.InputA  'Read
```

**C++ Syntax**

```cpp
HRESULT get_InputA(double *pVal)
HRESULT put_InputA(double newVal)
```

**Interface**
IPortExtension
## InputB Property - Obsolete

**Description**  
This property has NO replacement and no longer works correctly. (Sept. 2004)

Sets the Port Extension value for Receiver B

**VB Syntax**  
`portExt.InputB = value`

**Variable**  
*portExt* - A Port Extension *(object)*  
*value* - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**  
Double

**Default**  
0

**Examples**  
```vbnet
portExt.InputB = 10e-6 'Write
inB = portExt.InputB 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_InputB(double *pVal)
HRESULT put_InputB(double newVal)
```

**Interface**  
IPortExtension
### InputC Property  Obsolete

**Description**  This property has NO replacement and no longer works correctly. (Sept. 2004)

Sets the Port Extension value for Receiver C

**VB Syntax**  
```vbnet
portExt.InputC = value
```

**Variable**  
**Type** - Description

- `portExt`  A Port Extension (object)
- `value`  (double) - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**  Double

**Default**  0

**Examples**  
```vbnet
portExt.InputC = 10e-6 'Write

inC = portExt.InputC 'Read
```

**C++ Syntax**  
HRESULT get_InputC(double *pVal)
HRESULT put_InputC(double newVal)

**Interface**  IPortExtension
Write/Read

About Mixer Configuration

InputDenominator Property

Description
Sets or returns the denominator value of the Input Fractional Multiplier.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

\texttt{obj.InputDenominator = value}

Variable (Type) - Description

\textit{obj} A \texttt{Mixer Interface} pointer to the \texttt{Measurement} (object)
Or
A \texttt{Converter Object}

\textit{value} \texttt{(Long)} - Input denominator value.

Return Type
Long

Default
1

Examples
Print mixer.InputDenominator 'prints the value of the InputDenominator

C++ Syntax

\texttt{HRESULT get\_InputDenominator(long \*pVal)}
\texttt{HRESULT put\_InputDenominator(long newVal)}

Interface
IMixer
IConverter

Last Modified:
2-Feb-2009 Added converter
4-Mar-2008 Added note.
**InputFixedFrequency Property**

**Description**
Sets or returns the mixer fixed Input frequency value.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**
```vbnet
obj.InputFixedFrequency = value
```

**Variable**
- **(Type)** - **Description**
  - `obj` A **Mixer Interface** pointer to the **Measurement** (object)
  - Or
  - A **Converter Object**

  - `value` **(double)** - Input Fixed Frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
mixer.InputFixedFrequency = 1e9
```

**C++ Syntax**
```cpp
HRESULT get_InputFixedFrequency(double *pVal)
HRESULT put_InputFixedFrequency(double newVal)
```

**Interface**
- IMixer6
- IConverter

---

**Last Modified:**
- 2-Feb-2009  Added converter
- 4-Mar-2008  Added note.
IsInputGreaterThanLO Property

Description
Specifies whether to use the Input frequency that is greater than the LO or less than the LO. To learn more, see the mixer setup dialog box help.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax
obj.IsInputGreaterThanLO (LO) = bool

Variable (Type) - Description

obj A Mixer Interface pointer to the Measurement (object)
Or
A Converter Object

LO (Integer) - LO stage number
Choose from 1 (default) or 2

bool (Boolean) -
True - Use the Input that is Greater than the specified LO.
False - Use the Input that is Less than the specified LO.

Return Type
Boolean

Default
True

Examples
mixer.IsInputGreaterThanLO(1) = True

C++ Syntax
HRESULT get_IsInputGreaterThanLO(VARIANT_BOOL * val);
HRESULT put_IsInputGreaterThanLO(VARIANT_BOOL val);

Interface
IMixer2
ICONverter

Last Modified:
2-Feb-2009 Added Converter
4-Mar-2008 Added note.
InputNumerator Property

Description  Sets or returns the numerator value of the Input Fractional Multiplier. If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax  

\[ \text{obj}.\text{InputNumerator} = \text{value} \]

Variable  

(obj) - Description

(obj) A **Mixer Interface** pointer to the **Measurement** (object)
Or
A **Converter Object**

(value) (Long) - Input numerator value.

Return Type  Long

Default  1

Examples  

Print mixer.InputNumerator 'prints the value of the InputNumerator

C++ Syntax  

HRESULT get_InputNumerator(long *pVal)
HRESULT put_InputNumerator(long newVal)

Interface  

IMixer
IConverter

Last Modified:

2-Feb-2009  Added converter
4-Mar-2008  Added note.
InputPower Property

**Description**
Sets or returns the value of the Input Power.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**
`obj.InputPower = value`

**Variable** (Type) - Description
- `obj` A Mixer Interface pointer to the Measurement (object)
  Or
  A Converter Object
- `value (double)` - Input power in dBm.

**Return Type**
Double

**Default**
-15 dBm for IMixer
-20 dBm for IConverter

**Examples**
Print mixer.InputPower 'prints the value of the InputPower

**C++ Syntax**
HRESULT get_InputPower(double *pVal)
HRESULT put_InputPower(double newVal)

**Interface**
IMixer
IConverter

---

Last Modified:

- 2-Feb-2009 Added converter
- 4-Mar-2008 Added note.
InputRangeMode Property

**Description**
Sets or returns the Input sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**Note:** There is also a **InputRangeMode Property** on the Converter Object.

**VB Syntax**
```
obj.InputRangeMode = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A <strong>Mixer Interface</strong> pointer to the <strong>Measurement</strong> (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Enum as <strong>MixerRangeMode</strong>) - Input sweep mode. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - <strong>mixSwept</strong></td>
</tr>
<tr>
<td></td>
<td>1 - <strong>mixFixed</strong></td>
</tr>
</tbody>
</table>

**Return Type**
Enum

**Default**
0 - mixSwept

**Examples**
```
mixer.InputRangeMode = mixSwept
```

**C++ Syntax**
```
HRESULT get_InputRangeMode(long *pVal)
HRESULT put_InputRangeMode(long newVal)
```

**Interface**
IMixer6

---

Last Modified:

4-Mar-2008 Added note.
**InputStartFrequency Property**

**Description**
Sets and returns the start frequency value of the mixer Input frequency. If you are changing several mixer configuration settings, you can make all the changes first and then issue the [Calculate](#) and [Apply](#) commands as you would do from the user interface.

**VB Syntax**
```
obj.InputStartFrequency = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A Mixer Interface pointer to the Measurement (object) Or A Converter Object</td>
</tr>
</tbody>
</table>

| value | (double) - Input start frequency in Hertz. |

**Return Type**
Double

**Default**
Start frequency of the PNA

**Examples**
```
mixer.InputStartFrequency = Start_Freq
```

**C++ Syntax**
```
HRESULT get_InputStartFrequency(double *pVal)
HRESULT put_InputStartFrequency(double newVal)
```

**Interface**
IMixer
IConverter

---

Last Modified:

- 2-Feb-2009 Added converter
- 4-Mar-2008 Added note.
InputStartPower Property

Description
Sets and returns the Start Power value of the mixer Input Power.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

```
obj.InputStartPower = value
```

Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>obj</td>
<td>A Converter Object</td>
</tr>
<tr>
<td>value</td>
<td>(double) - Input start Power in dBm.</td>
</tr>
</tbody>
</table>

Return Type
Double

Default
Start Power of the PNA

Examples

```plaintext
mixer.InputStartPower = 0
```

C++ Syntax

```c++
HRESULT get_InputStartPower(double *pVal)
HRESULT put_InputStartPower(double newVal)
```

Interface
IConverter

### InputStopFrequency Property

**Description**
Sets and returns the stop frequency value of the mixer Input frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.InputStopFrequency = value
```

**Variable**

- **Type** - Description
  - `obj` A [Mixer Interface](#) pointer to the [Measurement](#) object
  - Or
  - A [Converter Object](#)

- **value** *(double)* - Input stop frequency in Hertz.

**Return Type**
Double

**Default**
Stop frequency of the PNA

**Examples**

```vbnet
mixer.InputStopFrequency = Stop_Freq
```

**C++ Syntax**

```cpp
HRESULT get_InputStopFrequency(double *pVal)
HRESULT put_InputStopFrequency(double newVal)
```

**Interface**
- IMixer
- IConverter

---

**Last Modified:**

- **2-Feb-2009**  Added Converter
- **4-Mar-2008**  Added note.
InputStopPower Property

Description: Sets and returns the Stop Power value of the mixer Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**: `obj.InputStopPower = value`

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Converter Object</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) - Input Stop Power in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**: Double

**Default**: Stop Power of the PNA

**Examples**: `mixer.InputStopPower = 0`

**C++ Syntax**:

```cpp
HRESULT get_InputStopPower(double *pVal)
HRESULT put_InputStopPower(double newVal)
```

**Interface**: IConverter

Last Modified: 2-Feb-2009   New topic
**InternalTestsetPortCount Property**

**Description**  Returns the number of PNA test ports. This does not include the ports on an external test set.

**VB Syntax**  

```
value = cap.InternalTestsetPortCount
```

**Variable (Type) - Description**

- `value` (Long) - Variable to store the returned number of PNA test ports.
- `cap` A `Capabilities` (object)

**Return Type**  Long

**Default**  Not Applicable

**Examples**  

```
value = cap.InternalTestsetPortCount 'Read
```

**C++ Syntax**  

```
HRESULT get_InternalTestsetPortCount(long *numPorts);
```

**Interface**  ICapabilities
Interpolate Correction Property

**Description**
Turns ON and OFF correction interpolation which calculates new error terms when stimulus values change after calibration.

When this property is ON and error correction is being applied, the calibration subsystem attempts to interpolate the error terms whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, error correction is turned OFF.

**VB Syntax**
```
meas.InterpolateCorrection = value
```

**Variable**
- **meas** (A Measurement object)
- **value** (boolean) - Choose from:
  - **True** - Turns correction interpolation ON
  - **False** - Turns correction interpolation OFF

**Return Type**
Boolean

**Default**
True

**Examples**
```
meas.InterpolateCorrection = False
```
```
calInterpolate = InterpolateCorrection 'Read
```

**C++ Syntax**
```
HRESULT get_InterpolateCorrection(boolean *pVal)
HRESULT put_InterpolateCorrection(boolean newVal)
```

**Interface**
IMeasurement
## Interpolated Property

**Description**

Turns marker Interpolation ON and OFF. Marker interpolation enables X-axis resolution beyond the discrete data values. The analyzer will calculate the x and y-axis data values between discrete data points. Use meas.**Interpolate** to change interpolation of **all** markers in a measurement. This command will override the measurement setting.

**VB Syntax**

```
mark.Interpolated = value
```

**Variable**

**Type** - Description

- **mark**
  - A **Marker** (object)

- **value**
  - **(boolean)**
    - **False** - Turns interpolation OFF
    - **True** - Turns interpolation ON

**Return Type**

Boolean

**Default**

True

**Examples**

```
mark.Interpolated = True 'Write
interpolate = mark.Interpolated 'Read
```

**C++ Syntax**

```
HRESULT get_Interpolated(VARIANT_BOOL *pVal)
HRESULT put_Interpolated(VARIANT_BOOL newVal)
```

**Interface**

IMarker
InterpolateNormalization Property  Superseded

Description  
**Note:** This property is replaced by DoReceiverPowerCal Method.

Turns ON and OFF normalization interpolation which calculates new divisor data when stimulus values change after normalization.

When this property is ON and normalization is being applied, the Normalization algorithm attempts to interpolate the divisor data whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, normalization is turned OFF.

Normalization is currently supported only on measurements of unratioed power for the purpose of performing a receiver power calibration.

**VB Syntax**  
`meas.InterpolateNormalization = value`

**Variable**  
*(Type)* - Description

`meas` *(object)* - A Measurement object

`value` *(boolean)*

False – Turns normalization interpolation OFF  
True – Turns normalization interpolation ON

**Return Type**  
Boolean

**Default**  
False -OFF

**Examples**  
`meas.InterpolateNormalization = False`  
*Write*

`normalized = meas.InterpolateNormalization`  
*Read*

**C++ Syntax**  
`HRESULT put_InterpolateNormalization(VARIANT_BOOL bState);`

`HRESULT get_InterpolateNormalization(VARIANT_BOOL *bState);`

**Interface**  
IMeasurement
## Interrupt Property

**Description**
Reads the boolean that represents the state of the Interrupt In line (pin 13) on the external test set connector.

**VB Syntax**
```vbnet
value = ExtIO.Interrupt
```

**Variable**
- **Type**: Description
  - `value`: boolean - Variable to store the returned data
  - `ExtIO`: object - An ExternalTestSetIO object

**Return Type**
Boolean
- **False**: indicates the line is being held at a TTL High
- **True**: indicates the line is being held at a TTL Low

**Default**
Not Applicable

**Examples**
```vbnet
value = ExtIO.Interrupt
```

**C++ Syntax**
```cpp
HRESULT get_Interrupt( VARIANT_BOOL* bValue);
```

**Interface**
IHWExternalTestSetIO
### Invert Property

**Description**
Sets whether to invert the polarity of the pulse.

**VB Syntax**

```vbnet
pulse.Invert (n) = value
```

**Variable**  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pulse</td>
<td>A <strong>PulseGenerator</strong> (object)</td>
</tr>
</tbody>
</table>

- **n** *(Integer)*
  Pulse generator number. Choose from 0 to 4.  
  0 is the generator that pulses the ADC.

- **value**
  - **True** - Invert the pulse generator polarity. This causes the pulse ON time to be active low and OFF be active high.
  - **False** - Do NOT Invert the pulse generator polarity.

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
pulse.Invert(1) = True 'Write
value = pulse.Invert(4) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Invert(VARIANT_BOOL *pVal);
HRESULT put_Invert(VARIANT_BOOL newVal);
```

**Interface**

IPulseGenerator3

# IOConfiguration Property

**Description**
Sets and returns the method of communication and address for the external device.

**VB Syntax**
```vbnet
extDevices.IOConfiguration = value
```

**Variable** *(Type) - Description*
- **extDevices** (Type) - ExternalDevice (object)
- **value** (String) - Configuration path. Any valid VISA resource shown in the IO Configuration field of the External Devices dialog, enclosed in quotes.
  
  Do NOT use the ID string of a PMAR USB power sensor as the resource string. The ID string is returned by the USBPowerMeterCatalog Property

**Return Type**
String

**Default**
" " Empty String

**Examples**
```vbnet
extDevices.IOConfiguration = "TCP/IP::141.121.76.239::inst0::INSTR" Write
value = extDevices.IOConfiguration 'Read
See example program to configure PMAR device
See example program to configure External Source
```

**C++ Syntax**
```cpp
HRESULT get_IOConfiguration( BSTR* value);
HRESULT put_IOConfiguration( BSTR newVal);
```

**Interface**
IExternalDevices

_Last Modified:_

IOEnable Property

**Description**
Sets and returns whether an external device is enabled for IO communication with the PNA.

**VB Syntax**
```vbscript
extDevices.IOEnable = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extDevices</code></td>
<td>An ExternalDevice (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Boolean) Choose from:</td>
</tr>
<tr>
<td></td>
<td>True - Device is available for IO communication.</td>
</tr>
<tr>
<td></td>
<td>False - Device is NOT available for IO communication.</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```vbscript
extDevices.IOEnable = True 'Write
bool = extDevices.IOEnable 'Read
See example program to configure PMAR device
See example program to configure External Source
```

**C++ Syntax**
```c#
HRESULT get_IOEnable( VARIANT_BOOL* value);
HRESULT put_IOEnable( VARIANT_BOOL newVal);
```

**Interface**
IExternalDevices

Read-only

IsContinuous Property

Description
Returns whether or not a channel is in continuous mode. To set the channel to continuous mode, use Continuous Method.

VB Syntax
value = chan.IsContinuous

Variable (Type) - Description
value (boolean) - Choose either:
False - Channel trigger is NOT set to continuous.
True - Channel trigger IS set to continuous.

chan Channel (object)

Return Type
Boolean

Default
Not Applicable

Examples
trig = chan.IsContinuous 'Read

C++ Syntax
HRESULT get_IsContinuous ( VARIANT_BOOL *bContinuous);

Interface IChannel3
IsECALModuleFoundEx Property

Description
This property replaces IsECALModuleFound Property. Returns true or false depending on whether communication was established between the PNA and the specified ECal module.

VB Syntax
modFound = cal.IsECALModuleFoundEx(module)

Variable (Type) - Description
modFound (boolean) - Variable to store the returned test result.
- True - The PNA identified the presence of the specified ECal module.
- False - The PNA did NOT identify the presence of the specified ECal module.

cal (object) - A Calibrator object

module (long integer) - ECal module. Choose from modules 1 through 8

Use GetECALModuleInfoEx to return the model and serial number of each module.

Return Type
Boolean

Default
Not applicable

Examples
Set cal = pna.ActiveChannel.Calibrator
moduleFound = cal.IsECALModuleFoundEx(1)

C++ Syntax
HRESULT get_IsECALModuleFoundEx(long moduleNumber, VARIANT_BOOL *bModuleFound);

Interface
ICalibrator4
IsFrequencyOffsetPresent Property

Description  Returns a value indicating the presence of Frequency Offset Option 080 in the remote PNA.

VB Syntax  

\[ value = cap.IsFrequencyOffsetPresent \]

Variable  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Boolean) - Variable to store the returned value</td>
</tr>
<tr>
<td></td>
<td>True - Frequency Offset Option 080 is present</td>
</tr>
<tr>
<td></td>
<td>False - Frequency Offset Option 080 is not present</td>

IsMarkerOn Property

Description
Returns whether or not a marker was used for the specified tuning sweep.

VB Syntax
value = embedLODiag.IsMarkerOn (n)

Variable (Type) - Description
value (Boolean) Variable to store the returned data.

embedLODiag An EmbeddedLODiagnostic (object)

n Tuning sweep number. Use NumberOfSweeps to find the number of sweeps taken.

Return Type (String)

Default Not Applicable

Examples
data= embedLO.IsMarkerOn 3 'read

C++ Syntax
HRESULT IsMarkerOn(long sweep, VARIANT_BOOL* markerOn);

Interface IEmbeddedLODiagnostic

IsolationIncrementAveraging Property

Description
Value by which to increment (increase) the channel's averaging factor during measurement of isolation in an ECal calibration.

Note: If <value> is greater than 1 and the channel currently has averaging turned OFF, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to <value>.

VB Syntax
`cal.IsolationIncrementAveraging = value`

Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Long) Incremental Averaging factor. The maximum averaging factor is 65536 (2^16).</td>
</tr>
</tbody>
</table>

Return Type
Long Integer

Default
8

Examples
```vbnet
oCal.IsolationAveragingIncrement = 16 'Write
avgIncr = oCal.IsolationAveragingIncrement ' Read
```

C++ Syntax
```cpp
HRESULT get_IsolationAveragingIncrement(long *pVal);
HRESULT put_IsolationAveragingIncrement(long newVal);
```

Interface
ICalibrator7

IsOn Property

**Description**
Sets and returns the ON/OFF state of Embedded LO.

**VB Syntax**

```vbnet
obj.IsOn = value
```

**Variable**

**Type** - Description

- `obj` An **EmbeddedLO** *(object)* or A **ConverterEmbeddedLO**(object)

- `value` *(Boolean)*
  - **False** - Turns Embedded LO OFF
  - **True** - Turns Embedded LO ON

**Return Type** *(Boolean)*

**Default**
False (OFF)

**Examples**

```vbnet
eembedLO.IsOn = True 'write

data= embedLO.IsOn 'read
```

**C++ Syntax**

```c++
HRESULT get_IsOn( VARIANT_BOOL* IsOn);
HRESULT put_IsOn( VARIANT_BOOL IsOn);
```

IsReceiverStepAttenuatorPresent Property

**Description**
Returns a value indicating the presence of Receiver step attenuators in the remote PNA.

**VB Syntax**

\[\text{value} = \text{cap}.\text{IsReceiverStepAttenuatorPresent}(n)\]

**Variable**

- **value** *(Boolean)* - Variable to store the returned value.
  - True - Receiver step attenuators are present.
  - False - Receiver step attenuators are not present.
- **cap** A [Capabilities](#) *(object)*
- **n** *(Long)* - Port number to query for step attenuators

**Return Type**
Boolean

**Default**
Not Applicable

**Examples**

\[\text{value} = \text{cap}.\text{IsReceiverStepAttenuatorPresent}(1)\]

**C++ Syntax**

```cpp
HRESULT get_IsReceiverStepAttenuatorPresent(long portNumber, VARIANT_BOOL *present );
```

Read-only

**IsSParameter Property**

**Description**  Returns true if measurement represents an S-Parameter

**VB Syntax**  
```
value = meas.IsSparameter
```

**Variable (Type) - Description**

- **meas**  A Measurement (object)
- **value (Boolean)**
  - True - measurement is an S-Parameter
  - False - measurement is NOT an S-Parameter

**Return Type**  Boolean

**Default**  True

**Examples**  
```
print app.IsSparameter
```

**C++ Syntax**  
```
HRESULT IsSparameter( [out, retval] VARIANT_BOOL * bVal);
```

**Interface**  IMeasurement2
### Item Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Add or change a name-value pair in the Cal Set, or read the value associated with a name. After editing, <strong>Save</strong> the CalSet to the PNA.</th>
</tr>
</thead>
</table>

#### About Name-Value pairs

A Cal Set name-value pair is a general purpose data structure that maps a name to a value. This property allows you to associate a name with a value. Then, using this same property, you can read the value using the name.

For example, one of the items added by the PNA firmware to every Cal Set is named 'Created By'. The value attached to this item is the name of the PNA App that created the Cal Set. When an SMC cal is performed, you can query the Cal Set for the 'Create By' item, and it will return 'Scalar Mixer/Converter'. The same query on an NFx channel returns 'Noise Figure Converters'.

**Warning** - Do NOT change the name or value of any Items that you did NOT create. Otherwise, the PNA firmware may behave unpredictably.

#### See Also

- **EnumerateItems Method**
- **RemoveItem Method**

#### VB Syntax

```vbnet
CalSet.Item (name) = value
```

#### Variable (Type) - Description

- **CalSet** *(object)* - A **Cal Set** object
- **name** *(String)* - Name of the name-value pair.
- **value** *(Variant)* - Can be an integer, float, double, string, or a single-dimensioned array of integer, float, double, string.

#### Return Type

**Variant**

**Default**

Not Applicable

#### Example

```vbnet
' Create the pna object
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
' Get a handle to the calsets collection
Dim calsets
```
Set calsets = pna.GetCalManager.calsets
' Get a handle to the cal set to be edited
Dim MyCalSet
Set MyCalSet = calsets.Item("CalSet_1")
' Add a name-value pair(item) to MyCalSet
MyCalSet.Item("MyItem")=15
' Save the edited Cal Set to the PNA
MyCalSet.Save
' Loop thru the name-value pairs in the Cal Set
Dim CSetItems
CSetItems = MyCalSet.EnumerateItems
for i=lbound(CSetItems) to Ubound(CSetItems)
    ' List the item names in MyCalSet
    Dim name
    name = CSetItems(i)
    wscript.echo name
    ' List the value for each item name
    Dim value
    value = myCalSet.Item(name)
    wscript.echo value
Next
' Delete the new name-value pair
MyCalSet.RemoveItem("MyItem")

**C++ Syntax**

```cpp
HRESULT get_Item( BSTR name, VARIANT *value);
HRESULT put_Item( BSTR name, VARIANT value);
```

**Interface**

ICalSet6

## Items Property

**Description**
Returns a list of configured external devices in the collection.

**VB Syntax**
```
array = extDevices.Items
```

**Variable (Type) - Description**
- **value**
  - (array) Variable to store the returned values. Each item in the array is in the format (name:driver), where:
    - name = name of the external device
    - driver = [See a list of supported drivers](#).

**extDevices**
An [ExternalDevices](#) (collection)

**Return Type**
Variant Array

**Default**
Not Applicable

**Examples**
```
array = extDevices.Items 'Read
```

**C++ Syntax**
```
HRESULT get_Items( VARIANT* array);
```

**Interface**

Write/Read

IterationNumber Property

**Description**
Sets and returns the maximum leveling sweep iterations to be used in order to achieve the tolerance setting.

**VB Syntax**
RxLevel.IterationNumber(srcPort) = value

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RxLevel</td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td>srcPort</td>
<td>(Long Integer) Source port for which to set the IterationNumber for Receiver Leveling. <strong>Note:</strong> If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see <a href="#">Remotely Specifying a Source Port</a>.</td>
</tr>
<tr>
<td>value</td>
<td>(Long Integer) Max iterations. Choose a value between 1 and 25.</td>
</tr>
</tbody>
</table>

**Return Type**
(Long Integer)

**Default**
5

**Examples**
rxLevel.IterationNumber (1) = 10 ' Write
value = rxLevel.IterationNumber 2' Read

**C++ Syntax**
HRESULT get_IterationNumber(long port, long* pVal);
HRESULT put_IterationNumber(long port, long newVal);

**Interface**
IReceiverLevelingConfiguration

Last Modified:
13-Feb-2009  MX New topic
**IterationsTolerance Property**

**Description**
This command, along with `MaximumIterationsPerPoint Property` deal with adjustments made to the source power.

Sets the maximum desired deviation from the sum of the test port power and the offset value. Power readings will continue to be made, and source power adjusted, until a reading is within this tolerance value or the max number of readings has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power readings:

- `ReadingsPerPoint Property`
- `ReadingsTolerance Property`

**VB Syntax**
```vbnet
pwrCal.IterationsTolerance = value
```

**Variable (Type) - Description**

- `pwrCal` (object) - A `SourcePowerCalibrator` (object)
- `value` (Double) – Tolerance value in dBm. Choose any number between 0 and 5

**Return Type**
Double

**Default**
.05 dB

**Examples**
```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.IterationsTolerance = .1 'Write
ReadTol = powerCalibrator.IterationsTolerance 'Read
```

**C++ Syntax**
```cpp
HRESULT get_IterationsTolerance( double *pVal);
HRESULT put_IterationsTolerance( double newVal);
```

**Interface**
ISourcePowerCalibrator3

**KaiserBeta Property**

**Description**  
Sets or returns the Kaiser Beta of Time Domain transform windows

**VB Syntax**  
`trans.KaiserBeta = value`

**Variable** (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>trans</code></td>
<td>A Transform (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(single) - Kaiser Beta. Choose any number between 0 and 13.</td>
</tr>
</tbody>
</table>

**Return Type**  
Single

**Default**  
0

**Examples**

```vbnet
trans.KaiserBeta = 6 'sets the Kaiser Beta of a transform window
KB = trans.KaiserBeta 'Read
```

**C++ Syntax**  
HRESULT get_KaiserBeta(float *pVal)  
HRESULT put_KaiserBeta(float newVal)

**Interface**  
ITransform
### L0 Property

**Description** Sets and Returns the L0 (L-zero) value (the first inductance value) for the calibration standard.

To set the other inductance values, use L1, L2, L3.

**VB Syntax**  
```vbnet
 calstd.L0 = value
```

**Variable** *(Type)* - Description

- `calstd` A CalStandard *(object)*. Use calKit.GetCalStandard to get a handle to the standard.
- `value` *(single)* - Value for L0 in femtohenries(1E-15)

**Return Type** Single

**Default** Not Applicable

**Examples**

```vbnet
  calstd.L0 = 15 'Write the value of L0 = 15 femtohenries
  Induct0 = calstd.L0 'Read the value of L0
```

**C++ Syntax**

```c++
HRESULT get_L0(float *pVal)
HRESULT put_L0(float newVal)
```

**Interface** ICalStandard
# L1 Property

**Description**
Sets and Returns the L1 value (the second inductance value) for the calibration standard.
To set the other inductance values, use L0, L2, L3.

**VB Syntax**
```
calstd.L1 = value
```

**Variable**

- `calstd` (object) - A CalStandard. Use calKit.GetCalStandard to get a handle to the standard.
- `value` (single) - Value for L1.

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
calstd.L1 = 15 'Write the value of L1
Induct1 = calstd.L1 'Read the value of L1
```

**C++ Syntax**
```
HRESULT get_L1(float *pVal)
HRESULT put_L1(float newVal)
```

**Interface**
ICalStandard
L2 Property

Description
Sets and Returns the L2 value (the third inductance value) for the calibration standard. To set the other inductance values, use L0, L1, L3.

VB Syntax
`calstd.L2 = value`

Variable (Type) - Description
- `value` (single) - Value for L2.

Return Type
Single

Default
Not Applicable

Examples
- `calstd.L2 = 15 'Write the value of L2.`
- `Induct2 = calstd.L2 'Read the value of L2`

C++ Syntax
- `HRESULT get_L2(float *pVal)`
- `HRESULT put_L2(float newVal)`

Interface
ICalStandard
**L3 Property**

**Description**  
Sets and Returns the L3 value (the third inductance value) for the calibration standard.  
To set the other inductance values, use L0, L1, L2.

**VB Syntax**  
`calstd.L3 = value`

**Variable**  
(**Type**) Description  

`value` (single) - Value for L3.

**Return Type**  
Single

**Default**  
Not Applicable

**Examples**  
`calstd.L3 = 15 'Write the value of L3.'`

`Induct3 = calstd.L3 'Read the value of L3`  

**C++ Syntax**  
HRESULT get_L3(float *pVal)
HR EULT put_L3(float newVal)

**Interface**  
ICalStandard
Label Property

**Description**
Sets and Returns the label for the calibration standard. The label is used to prompt the user to connect the specified standard.

**VB Syntax**
```
calstd.Label = value
```

**Variable**
- **calstd** A CalStandard *(object)*. Use calKit.GetCalStandard to get a handle to the standard.
- **value** *(string)* - between 1 and 12 characters long. Cannot begin with a numeric.

**Return Type**
String

**Default**
Not Applicable

**Examples**
```
calstd.Label = "Short" 'Write
stdLabel = calstd.Label 'Read
```

**C++ Syntax**
```
HRESULT get_Label(BSTR *pVal)
HRESULT put_Label(BSTR newVal)
```

**Interface**
ICalStandard
Label Property

**Description**
Sets or gets the display label for a given channel/testset combination. The label appears in a status bar at the bottom of the PNA display when the `ShowProperties` property is set to TRUE.

**VB Syntax**
`tset.Label(chNum) = value`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tset</code></td>
<td>A <code>TestsetControl</code> object. Obtained from the <code>ExternalTestsets</code> collection.</td>
</tr>
<tr>
<td><code>chNum</code></td>
<td>(Integer) Channel number of the measurement.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(String) The text of the label.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
None

**Examples**
'The following sets the label for channel 5 corresponding to a given testset object.'
```
testset1.label(5) = 'High-power output'
```

**C++ Syntax**
```cpp
HRESULT get_Label(long channelNum, BSTR *pLabel);
HRESULT put_Label(long channelNum, BSTR label);
```

**Interface**
`ITestsetControl`
LANConfiguration Property

Description
Returns information about the current status of the PNA’s computer networking configuration. This is the same set of information that is returned in an NA_IPConfiguration data structure by the GetIPConfigurationStruct method.

VB Syntax
value = app.LANConfiguration

Variable (Type) - Description
value (String) Variable to contain the PNA’s LAN configuration string
app An Application (object)

Return Type Comma-delimited string

Default Not Applicable

Examples
networkConfigInfo = app.LANConfiguration

C++ Syntax
HRESULT get_LANConfiguration (BSTR * pStrConfig);

Interface IApplication13

### LastCalPassedTolerance Property

**Description**  
Returns the pass / fail status of the tolerance limits of the target power from the most recent source power cal.

**VB Syntax**  
\[ \text{value} = \text{pwrCal}.\text{LastCalPassedTolerance} \]

**Variable**  
- `pwrCal` (object) – A [SourcePowerCalibrator](#) (object)
- `value` (boolean) -  
  - **False** – Source power cal did NOT achieve the specified tolerance limits.
  - **True** – Source power cal DID achieve the specified tolerance limits.

**Return Type**  
Boolean

**Default**  
Not Applicable

**Examples**  
\[ \text{status} = \text{powerCal}.\text{LastCalPassedTolerance} \]

**C++ Syntax**  
```
HRESULT get_LastCalPassedTolerance(VARIANT_BOOL *bState);
```

**Interface**

About Receiver Leveling

LastLevelingAsSPC Property

Description
Sets and returns the state of **Use Last Result for Source Power Cal**. When Leveling Mode is switched back to Internal, this feature turns Source Power Cal correction ON using the latest receiver leveling correction data.

VB Syntax

\[ RxLevel.LastLevelingAsSPC(srcPort) = value \]

Variable (Type) - Description

**RxLevel**
A **ReceiverLeveling** Object

**srcPort**
(Long Integer) Source port being used for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use **chan.getPortNumber** to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

**value**
(Boolean). Choose from:

**True** - When Leveling Mode is switched back to Internal, Source Power Cal correction is turned ON using the latest receiver leveling correction data.

**False** - When Leveling Mode is switched back to Internal, Source Power Cal correction is NOT turned ON.

Return Type
Variant Boolean

Default
False

Examples

\[ rxLevel.LastLevelingAsSPC(1) = True ' Write \]

\[ value = rxLevel.LastLevelingAsSPC 2' Read \]

C++ Syntax

```cpp
HRESULT get_LastLevelingAsSPC(long port, VARIANT_BOOL* pVal);
HRESULT put_LastLevelingAsSPC(long port, VARIANT_BOOL newVal);
```

Interface
IRxReceiverLevelingConfiguration2

About Cal Sets

LastModified Property

**Description**
Returns the time stamp of the last modification to this Cal Set.

This property always returns a time stamp based on the Greenwich Mean Time (GMT) regardless of the local time zone setting of the PNA.

The Cal Set properties that are viewed on the PNA user interface are converted to the local time of the PNA.

**VB Syntax**
```vbnet
value = Object.LastModified
```

**Variable (Type) - Description**
- **object** Channel (object)
  - or
    - CalSet (object) - Read-only property
- **value** (Variant) – Variable to store the time stamp.

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```vbnet
date = CalSet.LastModified 'Read
```

**C++ Syntax**
```cpp
HRESULT get_LastModified(VARIANT* datetime)
```

**Interface**
ICalSet3

Last Modified:

25-Apr-2007 Added GMT note
About Receiver Leveling

LevelingIFBW Property

**Description**
Sets and returns the IFBW to be used for leveling sweeps. Enable separate IFBW for leveling sweeps using **FastMode Property**.

**VB Syntax**
```vbnet
RxLevel.LevelingIFBW(srcPort) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RxLevel</td>
<td>A <strong>ReceiverLeveling</strong> Object</td>
</tr>
<tr>
<td><strong>srcPort</strong></td>
<td>(Long Integer) Source port for which to set the LevelingIFBW for Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see **Remotely Specifying a Source Port**

| **value**    | (Double) IFBW for leveling sweeps in Hz. The list of valid IF Bandwidths is different depending on the PNA model. See list. If an invalid number is specified, the PNA will round up to the closest valid number. |

**Return Type**
(Double)

**Default**
100 kHz

**Examples**
```vbnet
rxLevel.LevelingIFBW (1) = 1e3 ' Write
value = rxLevel.LevelingIFBW 2' Read
```

**C++ Syntax**
```cpp
HRESULT get_LevelingIFBW(long port, double* pVal);
HRESULT put_LevelingIFBW(long port, double newVal);
```

Limit Property

**Description**
Sets and returns the power limit for the specified port.

**VB Syntax**
\[ gpl.Limit \ (port) = value \]

**Variable**
- **(Type)** - Description
  - **gpl**: A **GlobalPowerLimit** (object)
  - **port**: (Long) Port number for which power limit value is to be set.
  - **value**: (Double) Power limit value. Choose a value between -27 dBm (approximately) and the max settable power for the PNA.

**Return Type**
Double

**Default**
100 dBm for all ports

**Examples**
\[ gpl.Limit(1) = 0 \ 'Write \]
\[ Limit = gpl.Limit(2) \ 'Read \]

**C++ Syntax**
HRESULT get_Limit(long port, double *pVal)
HRESULT put_Limit(long port, double newVal)

**Interface**
IGlobalPowerLimit

## LimitFrequency Property

**Description**
Enable or disable the use of the power meter min and max frequencies.

**VB Syntax**
```
pwrSensor.LimitFrequency = value
```

**Variable (Type) - Description**
- **pwrSensor**: A PowerSensorAsReceiver (Object)
- **value**: (Boolean) - State of min and max frequency use. Choose from:
  - `False`: Min and max frequencies disabled.
  - `True`: Min and max frequencies enabled.

**Return Type**
Boolean

**Default**
False

**Examples**
```
pwrSensor.LimitFrequency = False 'Write

limit = pwrSensor.LimitFrequency 'Read
```

**C++ Syntax**
```
HRESULT put_LimitFrequency(VARIANT_BOOL newVal);
HRESULT get_LimitFrequency(VARIANT_BOOL* pVal);
```

**Interface**
IPowerSensorAsReceiver

### EndStimulus Property

**Description**  
When constructing a limit line, specifies the stimulus value for the end of the segment.

**VB Syntax**  
`limtseg.EndStimulus = value`

**Variable**  
- **Type**: - Description
  - `limtseg`: A LimitSegment *(object)*
  - `value`: *(double)* - End Stimulus X-axis value. No units

**Return Type**  
Double

**Default**  
0

**Examples**

```
Set limtseg = meas.LimitTest(1)
limtseg.EndStimulus = 8e9  'Write

EndStim = limtseg.EndStimulus  'Read
```

**C++ Syntax**

```
HRESULT get_EndStimulus(double *pVal)
HRESULT put_EndStimulus(double newVal)
```

**Interface**  
ILimitSegment
**EndResponse Property**

**Description**
When constructing a limit line, specifies the amplitude value at the end of the limit segment.

**VB Syntax**
`limtseg.EndResponse = value`

**Variable**
- **Type**: Description
  - `limts`  A LimitSegment (**object**)
  - `value` (**double**) - Y-axis value of the End Response limit. No units

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
Set limtseg = meas.LimitTest(1)
limtseg.EndResponse = 10 'Write
EndResp = limtseg.EndResponse 'Read
```

**C++ Syntax**
```cpp
HRESULT get_EndResponse(double *pVal)
HRESULT put_EndResponse(double newVal)
```

**Interface**
ILimitSegment
### Type (limit) Property

**Description**  
Specifies the Limit Line type.

**VB Syntax**  
`limt(index).Type = value`

**Variable**  
- **(Type)** - Description
  - **limt**  
    A LimitSegment (object)
  - **index**  
    (variant) - Limit line number in the LimitTest collection
  - **value**  
    (enum NALimitSegmentType) - Limit Line type. Choose from:
    - 0 - `naLimitSegmentType_OFF` - turns limit line OFF
    - 1 - `naLimitSegmentType_Maximum` - limit line fails with a data point ABOVE the line
    - 2 - `naLimitSegmentType_Minimum` - limit line fails with a data point BELOW the line

**Return Type**  
Long Integer

**Default**  
0 - OFF

**Examples**  
```vba
Set limts = meas.LimitTest
limts.Type = naLimitSegmentType_Maximum 'Write

limitType = limts.Type 'Read
```

**C++ Syntax**  
```cpp
HRESULT put_Type(tagNALimitSegmentType *pVal)
HRESULT get_Type(tagNALimitSegmentType newVal)
```

**Interface**  
ILimitSegment
# LineDisplay Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Turns the display of limit lines ON or OFF. To turn limit TESTING On and OFF, use State Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note</td>
<td>Trace data must be ON to view limit lines</td>
</tr>
</tbody>
</table>

## VB Syntax

```vbnet
limitst.LineDisplay = state
```

## Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>limitst</code></td>
<td>A LimitTest (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean)</td>
</tr>
<tr>
<td><code>False</code></td>
<td>- Turns the display of limit lines OFF</td>
</tr>
<tr>
<td><code>True</code></td>
<td>- Turns the display of limit lines ON</td>
</tr>
</tbody>
</table>

## Return Type

Long Integer

## Default

True

## Examples

```vbnet
Limtttest.LineDisplay = true 'Write
lineDsp = Limtttest.LineDisplay 'Read
```

## C++ Syntax

```cpp
HRESULT get_LineDisplay(VARIANT_BOOL *pVal)
HRESULT put_LineDisplay(VARIANT_BOOL newVal)
```

## Interface

ILimitTest
## LoadCharFromFile Property

**Description**
Sets and returns whether a Mixer characterization file is to be loaded. Specify and load the filename with CharFileName Property.

**VB Syntax**
```vbnet
VMC.LoadCharFromFile = bool
```

**Variable (Type) - Description**
- **VMC VMCType** (object)
- **bool** (Boolean)
  - **True** - Load from file
  - **False** - Perform mixer characterization

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
value = VMC.LoadCharFromFile
```

**C++ Syntax**
```cpp
HRESULT put_LoadCharFromFile(VARIANT_BOOL bLoadCharFromfile);
HRESULT get_LoadCharFromFile(VARIANT_BOOL *bLoadCharFromfile);
```

**Interface**
VMCType
**LoadPort Property**

**Description**
Returns the load port number associated with an S-parameter reflection measurement. If the measurement is not a reflection S-parameter, the number returned by this property will have no meaning.

**VB Syntax**

```
loadPort = meas.LoadPort
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>loadPort</td>
<td>(long integer) - The reflection measurement's load port number.</td>
</tr>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
</tr>
</tbody>
</table>

**Return Type**

Long Integer

**Default**

Not Applicable

**Examples**

```
Set meas = pna.ActiveMeasurement
loadPort = meas.LoadPort
```

**C++ Syntax**

```
HRESULT get_LoadPort(long *pPortNumber);
```

**Interface**

IMeasurement
## LocalLockoutState Property

### Description
Prevents use of the mouse, keyboard, and front panel while your program is running. Use of these controls while this property is set TRUE causes an error message on the PNA display. To prevent these messages, see About Error Messages.

### VB Syntax
```vbnet
app.LocalLockoutState = bool
```

### Variable
**app** - An Application (object)

**bool** - Choose either:
- **False** - User Interface is NOT locked out.
- **True** - User Interface IS locked out.

### Return Type
Boolean

### Default
False

### Examples
```vbnet
app.LocalLockoutState = True 'Write
block = app.LocalLockoutState 'Read
```

### C++ Syntax
```cpp
HRESULT get_LocalLockoutState(VARIANT_BOOL *State);
HRESULT put_LocalLockoutState(VARIANT_BOOL *State);
```

### Interface
IApplication4
Locator Property

**Description**
Specifies the location, address, or ID string of the power meter / sensor that is used during a source power calibration. Use **Interface Property** to specify the type of interface.

**VB Syntax**
```
pwrMtrInterface.Locator = value
```

**Variable (Type) - Description**

- **pwrMtrInterface (object)** - A **PowerMeterInterface** (object)
- **value (string)** Location of the power meter / sensor, depending on the type of **Interface**.
  - For **naGPIB**, address of the power meter. Choose any integer between 0 and 30.
  - For **naUSB**, the ID string of the power sensor. Use **USBPowerMeterCatalog Property** to see a list of ID strings of connected power sensors.
  - For **naLAN**, the hostname or IP address of the power meter.

**Return Type**
String

**Default**
Not applicable

**Examples**
```
pwrMeterInterface.Locator = "13"  'GPIB address
pwrMeterInterface.Locator = "Agilent Technologies,U2000A,MY12345678"  'USB ID string
pwrMeterInterface.Locator = "mymeter.agilent.com"  'LAN
```

**C++ Syntax**
```
HRESULT put_Locator( BSTR pValue );
HRESULT get_Locator(BSTR* pValue );
```

**Locator**
IPowerMeterInterface

## Lock Property

**Description**  
Enables or disables the ability to change the power limit values through the user interface.

**VB Syntax**  
`gpl.Lock = state`

**Variable**  
*(Type)* - Description

- `gpl`  
  A GlobalPowerLimit *(object)*

- `state`  
  *(boolean)*
  - **False** - Disables the ability to change the power limit values from the user interface.
  - **True** - Enables the ability to change the power limit values from the user interface.

**Return Type**  
Boolean

**Default**  
False

**Examples**  
`gpl.Lock = True 'Write`

`UILock = gpl.Lock 'Read`

**C++ Syntax**  
HRESULT get_Lock(BOOL *pVal)
HRESULT put_Lock(BOOL newVal)

**Interface**  
IGlobalPowerLimit

LODeltaFound Property

**Description**
Returns the LO frequency delta from the specified tuning sweep.

**VB Syntax**
```
value = embedLODiag.LODeltaFound (n)
```

**Variable**

- **(Type)**: Description
  - **value**: (Double) Variable to store the returned data.
  - **embedLODiag**: An **EmbeddedLODiagnostic** (object)
    - **n**: (Long) Tuning sweep number. Use **NumberOfSweeps** to find the number of sweeps taken.
  - **Default**: Not Applicable

**Examples**
```
data= embedLO.LODeltaFound 3  'read
```

**C++ Syntax**
```
HRESULT LODeltaFound(long sweep, double* deltaLO);
```

**Interface**
IEmbeddedLODiagnostic

## LODenominator Property

### Description
Sets or returns the denominator value of the LO Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

### VB Syntax

```
obj.LODenominator (n) = value
```

### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A Mixer Interface pointer to the Measurement (object) Or A Converter Object</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>(Long)</td>
<td>LO denominator value</td>
</tr>
<tr>
<td>n</td>
<td>(Long)</td>
<td>LO stage number</td>
</tr>
</tbody>
</table>

Choose from 1 or 2

### Return Type
Long

### Default
1

### Examples

```vbnet
Print mixer.LODenominator(1) 'prints the value of the first LODenominator
```

### C++ Syntax

```cpp
HRESULT get_LODenominator(long *pVal)
HRESULT put_LODenominator(long newVal)
```

### Interface

Write/Read About Mixer Configuration

LOFixedFrequency Property

**Description**
Sets or returns the LO frequency value.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**

```
obj.LOFixedFrequency(n) = value
```

**Variable (Type) - Description**

- **obj**: A **Mixer Interface** pointer to the **Measurement** (object)  
  Or
  A **Converter Object**

- **value**: **(double)** - LO Frequency in Hertz.

- **n**: **(Long)** - LO stage number
  Choose from 1 or 2

**Return Type**
Double

**Default**
0 Hz

**Examples**

Print mixer.LOFixedFrequency(1) 'prints the value of the first LO fixed frequency

**C++ Syntax**

```c++
HRESULT get_LOFixedFrequency(double *pVal)
HRESULT put_LOFixedFrequency(double newVal)
```

Read/Write About Embedded LO

LOFrequencyDelta Property

**Description**
Sets and returns LO Frequency Delta. There is usually no need to set this value. Read this value to determine the difference between the LO Frequency that is stated in the Mixer dialog box and the last measured LO Frequency.

**VB Syntax**

```
obj.LOFrequencyDelta = value
```

**Variable**

*(Type) - Description*

- **obj**
  - An EmbeddedLO (object) or
  - A ConverterEmbeddedLO (object)

- **value**
  - (Double) LO Frequency delta in Hertz.

**Return Type**

(Double)

**Default**

Not Applicable

**Examples**

```vba
embedLO.LOFrequencyDelta = 0 'write

value = embedLO.LOFrequencyDelta 'read
```

**C++ Syntax**

```cpp
HRESULT get_LOFrequencyDelta(double* val);

HRESULT put_LOFrequencyDelta(double val);
```

**Interface**

LogMagnitudeOffset Property  Superseded

Description  Note: This property is replaced by DoReceiverPowerCal Method.

For Receiver Calibration - Sets or returns the value to offset the normalized unratioed power measurement data. The unratioed power measurement is effectively calibrated to the power level specified by the value of LogMagnitudeOffset as soon as the Normalization property is set to ON after calling the DataToDivisor method.

To offset the data trace magnitude a specified value, use MagnitudeOffset Property

VB Syntax  meas.LogMagnitudeOffset = value

Variable  (Type) - Description

meas  (object) - A Measurement object

value  (double) - Offset value in dBm.

Return Type  Double

Default  0

Examples  meas.LogMagnitudeOffset = -10 'Write (-10 dBm)

calpower = meas.LogMagnitudeOffset 'Read
meas.DataToDivisor 'Store meas data as measurement divisor
meas.Normalize = 1 'Measurement is now calibrated to –10 dBm

C++ Syntax  HRESULT put_LogMagnitudeOffset(double newVal);
HRESULT get_LogMagnitudeOffset(double *pVal);

Interface  IMeasurement
# LOName Property

Sets or returns the name of the PNA internal source or external source to use as the LO in an FCA measurement.

**VB Syntax**

```vbnet
obj.LOName (n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| obj  | A Mixer Interface pointer to the Measurement (object)  
 Or  
 A Converter Object  |

| n    | (Long) - LO stage number  
 Choose from 1 or 2 |

| value | (string) - LO Source name. Use SourcePort Property to return a list of valid source ports. An external source must be configured and selected to be valid. Learn more about external source configuration. |

**Note:** If the port is defined by a string name, such as an external source or one of the Source 2 outputs on the 2-port, 2-source PNA-x model, then you must use cap.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**Return Type**

String

**Default**

"Not controlled"

**Examples**

```plaintext
mixer.LOName(1) = "MySource"
```

**C++ Syntax**

```cpp
HRESULT get_LOName(string *pVal)  
HRESULT put_LOName(string newVal)
```

**Interface**

MIXer

- 24-Apr-2008  Added string names note
- 23-Jul-2007  Updated for external source config.
**LONumerator Property**

**Description**
Sets or returns the numerator value of the LO Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**
```
obj.LONumerator (n) = value
```

**Variable (Type) - Description**
- `obj` A [Mixer Interface](#) pointer to the [Measurement](#) (object)
- Or
- A [Converter Object](#)
- `value` (Long) - LO denominator value
- `n` (Long) - LO stage number

Choose from 1 or 2

**Return Type**
Long

**Default**
1

**Examples**
```vbnet
Print mixer.LONumerator(1) 'prints the value of the first LO Numerator
```

**C++ Syntax**
```
HRESULT get_LONumerator(long *pVal)
HRESULT put_LONumerator(long newVal)
```

About Mixer Configuration

LORangeMode Property

Description
Sets or returns the LO sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

Note: There is also a LORangeMode on the Converter Object.

VB Syntax
obj.LORangeMode (n) = value

Variable (Type) - Description

obj A Mixer Interface pointer to the Measurement (object)

n (Long) - LO stage number.
Choose from 1 or 2

value (Enum as MixerRangeMode) - LO sweep mode. Choose from:
0 - mixSwept
1 - mixFixed

Return Type
Enum

Default
0 - mixSwept

Examples
mixer.LORangeMode(1)=mixSwept

C++ Syntax
HRESULT get_LORangeMode(long LO, enum *pVal)
HRESULT put_LORangeMode(long LO, enum newVal)

Interface
IMixer3

Last Modified:

4-Mar-2008   Added note.
### Loss Property

**Description**
Sets and Returns the insertion loss for the calibration standard.

**VB Syntax**
```
calstd.loss = value
```

**Variable** *(Type) - Description*
- `calstd` A CalStandard *(object)*. Use calKit.[GetCalStandard](#) to get a handle to the standard.
- `value` *(single)* - Insertion loss in Gohms / sec. (Giga Ohms per second of electrical delay)

**Return Type**
Single

**Default**
Not Applicable

**Examples**
- `calstd.loss = 3.5 'Write 3.5 Gohms of loss`
- `stdLoss = calstd.loss 'Read the value of Loss`

**C++ Syntax**
- `HRESULT get_Loss(float *pVal)`
- `HRESULT put_Loss(float newVal)`

**Interface**
ICalStandard
Loss (Power Segment) Property

**Description**
Sets or returns the loss value associated with a PowerLossSegment.

**VB Syntax**

`lossSeg.Loss = value`

**Variable (Type) - Description**

- **lossSeg**
  - A `PowerLossSegment` (object)
  - A `PowerLossSegmentPMAR` (object)

- **value**
  - (double) – Loss value in dB. Loss is entered as a POSITIVE number.

**Return Type**
Double

**Default**
0

**Examples**

```
lossSeg.Loss = 0.5 'Write
lossVal = lossSeg.Loss 'Read
```

**C++ Syntax**

```
HRESULT put_Loss(Double newVal);
HRESULT get_Loss(Double *pVal);
```

**Interface**
- `IPowerLossSegment`
- `IPowerLossSegmentPMAR`

---

**Last Modified:**

- 27-Aug-2009 Added PMAR (9.0)
- 2-Jun-2008 Clarified negative value for loss
LOStage Property

**Description**
Sets or returns the number of LO stages present in the mixer.

**VB Syntax**

```vbnet
obj.LOStage = value
```

**Variable (Type) - Description**

- `obj`: A [Mixer Interface](#) pointer to the Measurement (object)
  - Or
  - A [Converter Object](#)

- `value`: (Long) - Number of LO stages. Choose from 1 or 2

**Return Type**
Long

**Default**
1

**Examples**

```vbnet
mixer.LOStage = 1 'sets the LO Stage value to 1
```

**C++ Syntax**

```cpp
HRESULT get_LOStage(long *pVal)
HRESULT put_LOStage(long newVal)
```

**Interface**

## LOStartPower Property

Sets or returns the Start value of a LO Power sweep. Also set `imdx.SweepType` to `nmDLOPowerSweep`.

### Description
Sets or returns the Start value of a LO Power sweep. Also set `imdx.SweepType` to `nmDLOPowerSweep`.

### VB Syntax
```vb
obj.LOStartPower (n) = value
```

### Variable (Type) - Description

- `obj` - A [Converter Object](#)
- `n` - LO stage number. Choose 1
- `value` - LO start power in dBm.

### Return Type
Double

### Default
-20 dBm

### Examples
```vb
convtr.LOStartPower(1) = -5 'Sets the LO Power sweep start value
start = convtr.LOStartPower(1) 'Reads the start value
```

### C++ Syntax
```cpp
HRESULT get_LOStartPower(long LOStage, double *pVal)
HRESULT put_LOStartPower(long LOStage, double newVal)
```

**LXIDeviceIDState Property**

**Description**
Opens and closes the LAN Status dialog with the LAN Status Indicator showing IDENTIFY.

The PNA supports this capability to satisfy a requirement of the LAN eXtensions for Instrumentation (LXI) standard. Changing the value of this property is the same operation that occurs when clicking the Toggle LXI Identification button on the Welcome web page presented by the PNA web server.

**VB Syntax**
```
app.LXIDeviceIDState = bool
```

**Variable**
*app* (An Application object)
*bool* (boolean) Choose from:
- **True** - Displays the LAN Status dialog with the Status Indicator showing IDENTIFY.
- **False** -
  
  - If the dialog had been opened by this property, then the LAN Status dialog is closed.
  
  - If the dialog was opened manually, then it will stay open.

**Return Type**
Boolean

**Default**
False

**Examples**
```
app.LXIDeviceIDState = True 'Write
value = app.LXIDeviceIDState 'Read
```

**C++ Syntax**
```
HRESULT get_LXIDeviceIDState( VARIANT_BOOL* pState);
HRESULT put_LXIDeviceIDState( VARIANT_BOOL  state);
```

**Interface**

**MagnitudeOffset Property**

**Description**
Offsets the data trace magnitude by the specified value.

To offset the data trace magnitude to a slope value that changes with frequency, use **MagnitudeSlopeOffset Property**.

To implement a Receiver Cal offset, use **LogMagnitudeOffset property**.

**VB Syntax**
```
meas.MagnitudeOffset = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas (object)</td>
<td>A Measurement object</td>
</tr>
<tr>
<td>value (double)</td>
<td>Offset value in dB.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**
```
meas.MagnitudeOffset = 4 'Write
offs = meas.MagnitudeOffset 'Read
```

**C++ Syntax**
```
HRESULT put_MagnitudeOffset(double newVal);
HRESULT get_MagnitudeOffset(double *pVal);
```

**Interface**
IMeasurement4
**MagnitudeSlopeOffset Property**

**Description**
Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.
To offset the entire data trace magnitude by a specified value, use `MagnitudeOffset Property`.

**VB Syntax**
```vbnet
meas.MagnitudeSlopeOffset = value
```

**Variable**
- **meas** *(object)* - A `Measurement` object
- **value** *(double)* - Offset slope value in dB / 1GHz.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
meas.MagnitudeSlopeOffset = 4 'Writes a slope offset of 4dB/1GHz.
offs = meas.MagnitudeSlopeOffset 'Read
```

**C++ Syntax**
```cpp
HRESULT put_MagnitudeSlopeOffset(double newVal);
HRESULT get_MagnitudeSlopeOffset(double *pVal);
```

**Interface**
`IMeasurement4`
# MainToneIFBandwidth Property

**Description**
Sets and returns the IF Bandwidth for measurement of the Main tones.

**VB Syntax**
```vbnet
imd.MainToneIFBandwidth = value
```

**Variable (Type) - Description**
- `imd` A SweptIMD Object
- `value` (Double) IF Bandwidth in Hz. Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

- **Learn more about setting IFBW for IMD.**
- If an invalid number is specified, the analyzer will round up to the closest valid number.

**Return Type**
Double

**Default**
1 kHz

**Examples**
```vbnet
imd.MainToneIFBandwidth = 2e3 'Write

value = imd.MainToneIFBandwidth 'Read
```

**C++ Syntax**
```cpp
HRESULT get_MainToneIFBandwidth(double *pVal)
HRESULT put_MainToneIFBandwidth(double newVal)
```

**Interface**
ISweptIMD

## MarkerAnnotation Property

**Description**
Returns the Y-axis marker value from the specified tuning sweep. Use `IsMarkerOn` to confirm if a marker was used for the tuning sweep.

**VB Syntax**
```vbnet
value = embedLODiag.MarkerAnnotation(n)
```

**Variable (Type) - Description**

- **value** (String) Variable to store the returned data.
- **embedLODiag** An `EmbeddedLODiagnostic` (object)
- **n** (Long) Tuning sweep number. Use `NumberOfSweeps` to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**
```vbnet
data = embedLO.MarkerAnnotation 3 'read
```

**C++ Syntax**
```cpp
HRESULT MarkerAnnotation(long sweep, BSTR* annotation);
```

**Interface**
IEmbededLODiagnostic

---

### MarkerFormat Property

**Description**
Sets the format of all the markers in the measurement. To override this setting for an individual marker, use `mark.Format`.

**VB Syntax**
```
meas.MarkerFormat = value
```

**Variable (Type) - Description**
- `meas` A Measurement (object)
- `value` (enum NAMarkerFormat) - Choose from:
  - 0 - naMarkerFormat_LinMag
  - 1 - naMarkerFormat_LogMag
  - 2 - naMarkerFormat_Phase
  - 3 - naMarkerFormat_Delay
  - 4 - naMarkerFormat_Real
  - 5 - naMarkerFormat_Imaginary
  - 6 - naMarkerFormat_SWR
  - 7 - naMarkerFormat_LinMagPhase
  - 8 - naMarkerFormat_LogMagPhase
  - 9 - naMarkerFormat_ReallImaginary
  - 10 - naMarkerFormat_ComplexImpedance
  - 11 - naMarkerFormat_ComplexAdmittance
  - 12 - naMarkerFormat_Kelvin
  - 13 - naMarkerFormat_Fahrenheit
  - 14 - naMarkerFormat_Centigrade

**Return Type**
Not Applicable

**Default**
1 - naMarkerFormat_LogMag

**Examples**
```
meas.MarkerFormat = naMarkerFormat_SWR  'Write
```

**C++ Syntax**
```
HRESULT put_MarkerFormat(tagNAMarkerFormat NewFormat)
```

**Interface**
IMeasurement

1-Oct-2007  Added temperature formats
Write-only

InterpolateMarkers Method

Description
Turns All Marker Interpolation ON and OFF for the measurement. Marker interpolation enables X-axis resolution between the discrete data values. The analyzer will calculate the x and y-axis data values between discrete data points. To override this property for individual markers, use the Interpolated property.

VB Syntax
`meas.Interpolate = value`

Variable
(Type) - Description

`meas` A Measurement (object)

`value` (boolean)
False - Turns interpolation OFF for all markers in the measurement
True - Turns interpolation ON for all markers in the measurement

Return Type
Boolean

Default
True (ON)

Examples
`meas.Interpolate = 1`

C++ Syntax
`HRESULT InterpolateMarkers(VARIANT_BOOL bNewVal)`

Interface
IMeasurement
# Number Property

**Description**
Returns the number of the marker.

**VB Syntax**
```vbnet
marknum = mark.Number
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>marknum</td>
<td>(long)</td>
<td>Variable to store marker number</td>
</tr>
<tr>
<td>mark</td>
<td>A Marker (object)</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
Not applicable

**Examples**
```vbnet
marknum = mark.Number 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Number(long *pVal)
```

**Interface**
IMarker
Read-only

MarkerPosition Property

**Description**
Returns the X-axis marker position from the specified tuning sweep.

**VB Syntax**
```
value = embedLODiag.MarkerPosition(n)
```

**Variable**
*Type* - Description

- **value** (Double) Variable to store the returned data.

- **embedLODiag** An [EmbeddedLODiagnostic](#) (object)

- **n** (Long) Tuning sweep number. Use [NumberOfSweeps](#) to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**
```
data = embedLO.MarkerPosition 3 'read
```

**C++ Syntax**
```
HRESULT MarkerPosition(long sweep, double *position);
```

**Interface**
IE EmbeddedLODiagnostic

**MarkerReadout Property**

**Description**
Enables or disables the readout of markers in the window. To show the marker on the screen use ShowMarkerReadout Method.

**VB Syntax**

```
win.MarkerReadout = state
```

**Variable**

*(Type) - Description*

*win*  
A NAWindow (object)

*state*  
(boolean)

True - enables marker readout  
False - disables marker readout

**Return Type**
Boolean

**Default**
True

**Examples**

```
win.MarkerReadout = True 'Write
State = app.ActiveNAWindow.MarkerReadout 'Read
```

**C++ Syntax**

```
HRESULT get_MarkerReadout(VARIANT_BOOL *pVal)
HRESULT put_MarkerReadout(VARIANT_BOOL newVal)
```

**Interface**
INAWindow
## MarkerReadoutResponsePlaces Property

**Description**  
For the Y-axis (response), sets the number digits to display after the decimal point in marker readouts.

**VB Syntax**  
`win.MarkerReadoutResponsePlaces = value`

**Variable**  
*(Type)* - Description  

<table>
<thead>
<tr>
<th>win</th>
<th>A <code>NAWindow</code> (object)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>value</th>
<th><em>(Long Integer)</em> Number of digits to display. Choose a value between 1 and 4.</th>
</tr>
</thead>
</table>

**Return Type**  
Long Integer

**Default**  
2

**Examples**  
`win.MarkerReadoutResponsePlaces = 3 'Write`

```
value = app.ActiveNAWindow.MarkerReadoutResponsePlaces 'Read
```

**C++ Syntax**  
```c++
HRESULT get_MarkerReadoutResponsePlaces(long *pVal)
HRESULT put_MarkerReadoutResponsePlaces(long newVal)
```

**Interface**  
`INAWindow3`

MarkerReadoutSize Property

Description: Specifies the size of font used when displaying Marker Readout in the selected window.

VB Syntax: `win.MarkerReadoutSize = value`

Variable (Type) - Description:
- `win`: A NAWindow (object)
- `value`: (enum NAFontSize)
  - `0 - naDefault`: marker readout appears in default font size
  - `1 - naLarge`: marker readout appears in large font size

Return Type: Long Integer

Default: `naDefault`

Examples:
- `win.MarkerReadoutSize = naDefault` 'write default size for marker readout'
- `Dim Size As NAFontSize
  Size = app.ActiveNAWindow.MarkerReadoutSize` 'Read'

C++ Syntax:
- `HRESULT get_MarkerReadoutSize(tagNAFontSize *pVal)`
- `HRESULT put_MarkerReadoutSize(tagNAFontSize newVal)`

Interface: INAWindow
MarkerReadoutsPerTrace Property

**Description**
Sets the number of marker readouts to display per trace. Display up to 20 marker readouts per window.

**VB Syntax**

```vbnet
win.MarkerReadoutsPerTrace = value
```

**Variable**
**(Type) - Description**

- **win**: A `NAWindow` (object)
- **value**: (Long Integer) Number of marker readouts to display. Choose a value between 1 and 10.

**Return Type**
Long Integer

**Default**
5

**Examples**

```vbnet
win.MarkerReadoutsPerTrace = 3 'Write
value = app.ActiveNAWindow.MarkerReadoutsPerTrace 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MarkerReadoutsPerTrace(long *pVal)
HRESULT put_MarkerReadoutsPerTrace(long newVal)
```

## MarkerReadoutStimulusPlaces Property

**Description**
For the X-axis (stimulus), sets the number digits to display after the decimal point in marker readouts.

**VB Syntax**
```
win.MarkerReadoutStimulusPlaces = value
```

**Variable (Type) - Description**
- `win` A `NAWindow` (object)
- `value` (Long Integer) Number of digits to display. Choose a value between 2 and 6.

**Return Type**
Long Integer

**Default**
3

**Examples**
```
win.MarkerReadoutStimulusPlaces = 2 'Write
value = app.ActiveNAWindow.MarkerReadoutStimulusPlaces 'Read
```

**C++ Syntax**
- `HRESULT get_MarkerReadoutStimulusPlaces(long *pVal)`
- `HRESULT put_MarkerReadoutStimulusPlaces(long newVal)`

**Interface**

Write/Read

MarkerReadoutXPosition Property

**Description**: Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position.

**VB Syntax**: `win.MarkerReadoutXPosition = value`

**Variable (Type) - Description**

- `win`: A `NAWindow` (object)
- `value`: (Double) X-axis position. Choose a value between 1 (far left) and 10 (far right).

**Return Type**: Double

**Default**: 10

**Examples**: `win.MarkerReadoutXPosition = 3 'Write

value = app.ActiveNAWindow.MarkerReadoutXPosition 'Read`

**C++ Syntax**: HRESULT get_MarkerReadoutXPosition(double *pVal)

HRESULT put_MarkerReadoutXPosition(double newVal)

**Interface**: INAWindow3

## MarkerReadoutYPosition Property

**Description**
Sets the Y-axis position of marker readouts. Readouts are right-justified at the specified position.

**VB Syntax**
\[ win.MarkerReadoutYPosition = value \]

**Variable**
- **(Type)**: Description
  - \( win \) A NAWindow (object)
  - \( value \) (Double) Y-axis position. Choose a value between 1 (bottom) and 10 (top).

**Return Type**
Double

**Default**
10

**Examples**
- \( win.MarkerReadoutYPosition = 3 \) 'Write
- \( value = app.ActiveNAWindow.MarkerReadoutYPosition \) 'Read

**C++ Syntax**
- HRESULT get_MarkerReadoutYPosition(double *pVal)

Markers Property

**Description**  Set and return the color of data trace markers for nth trace in a window.

**VB Syntax**  
```
trace(n).Markers = value
```

**Variable**  
- **Type** - Description
  - `trace(n)`  One of the 8 [ComTraceColors](#) objects
  - `value`  (Long Integer) - RGB color of the Markers pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R + (G*2^8) + (B*2^16)
```

To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

**Return Type**  Long

**Default**  Varies for each trace.

**Examples**

```
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
trace1.Markers = RGB 'Write
color = trace1.Markers 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Markers(long* pVal);
HRESULT put_Markers(long newVal);
```

**Interface**  IComTraceColors

---

Last Modified: 7-Aug-2009  MX New topic
## MarkerState Property

### Description
Sets or returns the ON / OFF state of the specified marker.

### VB Syntax
```
meas.MarkerState (n) = state
```

### Variable (Type) - Description
- **meas**: A Measurement (object)
- **n**: (Long Integer) Marker number to turn on or off.
- **state**: (boolean) -
  - True - turns the specified marker ON
  - False - turns the specified marker OFF

### Return Type
Boolean

### Default
False

### Examples
- `meas.MarkerState(1) = True`
- `reference = meas.MarkerState(2)`

### C++ Syntax
- `HRESULT get_MarkerState(long markerNum, VARIANT_BOOL bState)`
- `HRESULT put_MarkerState(long markerNum, VARIANT_BOOL* bState)`

### Interface
IMeasurement3
**MarkerSymbol Property**

**Description**
Sets the symbol to display for marker position.

**VB Syntax**

```vbnet
win.MarkerSymbol = value
```

**Variable (Type) - Description**

- **win**
  A **NAWindow** (object)

- **value**
  (Enum as **naMarkerSymbol**) Choose from:
  - 0 - **naMarkerSymbolTriangle**
  - 1 - **naMarkerSymbolFlag**
  - 2 - **naMarkerSymbolLine**

  [See pictures of symbols](#)

**Return Type**

Enum

**Default**

0 - **naMarkerSymbolTriangle**

**Examples**

```vbnet
win.MarkerSymbol = naMarkerSymbolLine
'Write

value = app.ActiveNAWindow.MarkerSymbol
'Read
```

**C++ Syntax**

```cpp
HRESULT get_MarkerSymbol(double *pVal)
HRESULT put_MarkerSymbol(double newVal)
```

**Interface**

### Stimulus Property

**Description**
Sets and reads the X-Axis value of the marker. If the marker is a delta marker, the value will be relative to the reference marker.

**VB Syntax**
```vbnet
mark.Stimulus = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mark</td>
<td>A Marker (object)</td>
</tr>
<tr>
<td>value</td>
<td>(double) - X-Axis value. Choose any number within the full span of the channel or User Range (if set).</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
First activated Marker turns ON in the middle of the X-axis range. Subsequent markers turn ON at the position of the most recently active marker.

**Examples**
```
mark.Stimulus = 3e9 'Write
XVal = mark.Stimulus 'Read
```

**C++ Syntax**
```c++
HRESULT get_Stimulus(double *pVal)
HRESULT put_Stimulus(double newVal)
```

**Interface**
IMarker
Description
Reads the Y-axis value of the marker. If the marker is a delta marker, the value will be relative to the reference marker.

You cannot set the Y-axis value of a marker. The marker remains at the position at the time you set `marker.Type`.

**Note:** To accurately read the marker Y-axis value with trace smoothing applied, the requested format must match the displayed format. Otherwise, the returned value is unsmoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

VB Syntax

```
YValue = mark.Value (format)
```

Variable

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th><strong>(Type)</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>YValue</code></td>
<td><strong>A variable to store the Y-axis value</strong></td>

<table>
<thead>
<tr>
<th><strong>format</strong></th>
<th><strong>(enum NAMarkerFormat)</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>naMarkerFormat_LinMag (1)</td>
<td>The format in which to return the marker's Y-axis value. The number in parenthesis following the format is the number of values that are returned in a variant array. Choose from:</td>
</tr>
<tr>
<td>1</td>
<td>naMarkerFormat_LogMag (1)</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>naMarkerFormat_Phase (1)</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>naMarkerFormat_Delay (1)</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>naMarkerFormat_Real (1)</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>naMarkerFormat_Imaginary (1)</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>naMarkerFormat_SWR (1)</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>naMarkerFormat_LinMagPhase (2)</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>naMarkerFormat_LogMagPhase (2)</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>naMarkerFormat_ReallImaginary (2)</td>
<td></td>
</tr>
<tr>

<td>naMarkerFormat_ComplexImpedance (3)</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>naMarkerFormat_ComplexAdmittance (3)</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>naMarkerFormat_Kelvin (1)</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>naMarkerFormat_Fahrenheit (1)</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>naMarkerFormat_Celsius (1)</td>
<td></td>
</tr>
</tbody>
</table>

Return Type

`Variant` - The (parens) in the previous list of formats indicates the number of values that are returned in a variant array.
**Default**  
Not applicable

**Examples**  
`YVal = mark.Value(0)` *Read*

`or`

`YVal = mark.Value(naMarkerFormat_LinMag)`

**C++ Syntax**  
`HRESULT get_Value(tagNAMarkerFormat format, VARIANT *pVal)`

**Interface**  
IMarker

# MaximumFrequency Property

**Description**
Sets and Returns the maximum frequency for the calibration standard.

**VB Syntax**
`calstd.MaximumFrequency = value`

**Variable**
- **calstd** A CalStandard *(object)*. Use calKit.GetCalStandard to get a handle to the standard.
- **value** *(double)* - Maximum frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
- `calstd.MaximumFrequency = 9e9` *(Write)*
- `maxFrequency = calstd.MaximumFrequency` *(Read)*

**C++ Syntax**
- `HRESULT get_MaximumFrequency(double *pVal)`
- `HRESULT put_MaximumFrequency(double newVal)`

**Interface**
ICalStandard
MaximumFrequency Property

**Description**  
Returns the maximum frequency of the remote PNA.

**VB Syntax**  
\[ value = cap.MaximumFrequency \]

**Variable**  
(Type) - Description

\[ value \] (Double) - Variable to store the returned maximum frequency of the PNA.

\[ cap \] A Capabilities (object)

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
\[ value = cap.MaximumFrequency \]

**C++ Syntax**  
HRESULT get_MaximumFrequency(&frequencyMax);

**Interface**  
ICapabilities
### MaximumFrequency Property

**Description**  
Set and returns the maximum usable frequency specified for the power sensor.

**VB Syntax**  
```vbnet
pwrSensor.MaximumFrequency = value
```

**Variable (Type) - Description**

- **pwrSensor**: A `PowerSensor` (Object) or a `PowerSensorAsReceiver` (Object)
- **value**: (double) - Frequency in Hertz.

**Return Type**  
Double

**Default**  
Device dependent

**Examples**

- `pwrSensor.MaximumFrequency = 6e9 'Write`
- `MaxFreq = pwrSensor.MaximumFrequency 'Read`

**C++ Syntax**

```cpp
HRESULT put_MaximumFrequency(double newVal);
HRESULT get_MaximumFrequency(double *pVal);
```

**Interface**

- `IPowerSensor`
- `IPowerSensorPMAR`
MaximumIFFilterSampleCount Property

**Description**
Returns the maximum allowed value for the `IFFilterSampleCount` property for the queried PNA.

**Note:** This setting applies only to the E836X Opt. H11.

**VB Syntax**
```
value = IfConfig.MaximumIFFilterSampleCount
```

**Variable**
- **(Type)** long
- **Description**
The maximum allowed value that can be applied to the `IFFilterSampleCount` property.

**IfConfig**
`IFConfiguration` (object)

**Return Type**
Long Integer

**Default**
PNA Model number dependent

**Examples**
```
variable = App.ActiveChannel.IFConfiguration.MaximumIFFilterSampleCount
```

See an example program

**C++ Syntax**
```
HRESULT get_MaximumIFFilterSampleCount( long * pMaxSampleCount );
```

**Interface**
`IIFConfiguration2`

**MaximumIterationsPerPoint Property**

**Description**  This command, along with **IterationsTolerance Property** deal with adjustments made to the source power.

Sets the maximum number of readings to take at each data point for iterating the source power. Power readings will continue to made, and source power adjusted, until a reading is within the **IterationsTolerance** value or this max number of readings has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power readings.

**ReadingsPerPoint Property**
**ReadingsTolerance Property**

**VB Syntax**

```
pwrCal.MaximumIterationsPerPoint = value
```

**Variable**  *(Type)* - Description

- **pwrCal** *(object)* - A **SourcePowerCalibrator** (object)
- **value** *(Long)* – Maximum number of readings. Choose any number between 1 and 100.

**Return Type**  Long Integer

**Default**  5

**Examples**

```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.MaximumIterationsPerPoint = 5 'Write
MaxReads = powerCalibrator.MaximumIterationsPerPoint 'Read
```

**C++ Syntax**

```
HRESULT get_MaximumIterationsPerPoint( long *pVal);
HRESULT put_MaximumIterationsPerPoint( long newVal);
```

**Interface**  ISourcePowerCalibrator3

### MaximumNumberOfChannels Property

**Description**
Returns the maximum possible number of channels that can be used in the PNA.

**VB Syntax**

```vbnet
value = cap.MaximumNumberOfChannels
```

**Variable**

- **Type**: (Long)
  - **Description**: Variable to store the returned maximum value for number of channels.

- **cap**: A Capabilities (object)

**Return Type**
Long

**Default**
Not Applicable

**Examples**

```vbnet
value = cap.MaximumNumberOfChannels 'Read
```

**C++ Syntax**

```c++
HRESULT get_MaximumNumberOfChannels(long * maximumNumberOfChans);
```

**Interface**
ICapabilities2
MaximumNumberOfTracesPerWindow Property

**Description**
Returns the maximum possible number of traces that can reside in any window.

**VB Syntax**

```vbnet
value = cap.MaximumNumberOfTracesPerWindow
```

**Variable (Type)** - Description

- **value** (Long) - Variable to store the returned maximum value for number of traces.
- **cap** A [Capabilities](object) (object)

**Return Type**
Long

**Default**
Not Applicable

**Examples**

```vbnet
value = cap.MaximumNumberOfTracesPerWindow 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MaximumNumberOfTracesPerWindow(long * maximumNumberOfTraces);
```

**Interface**
ICapabilities2
MaximumNumberOfWindows Property

**Description**
Returns the maximum possible number of windows that can be present on the PNA screen.

**VB Syntax**

```vbnet
value = cap.MaximumNumberOfWindows
```

**Variable**

- **value** *(Long)* - Variable to store the returned maximum value for number of windows.
- **cap** A Capabilities *(object)*

**Return Type**
Long

**Default**
Not Applicable

**Examples**

```vbnet
value = cap.MaximumNumberOfWindows 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MaximumNumberOfWindows(long * maximumNumberOfWindows);
```

**Interface**
ICapabilities2
MaximumNumberOfPoints Property

Description
Returns the maximum possible number of data points.

VB Syntax
\[ value = obj.MaximumNumberOfPoints \]

Variable (Type) - Description
\[ value \text{ (Long)} - \text{Variable to store the returned maximum value for number of points.} \]
\[ cap \text{ A Capabilities (object)} \]
\[ \text{or} \]
\[ \text{A GainCompression (object)} \]

Return Type
Long

Default
Not Applicable

Examples
\[ value = cap.MaximumNumberOfPoints \]

C++ Syntax
\[ \text{HRESULT get\_MaximumNumberOfPoints(long * maximumNumberOfPoints)}; \]

MaximumPowerCompression
MaximumReceiverStepAttenuator Property

**Description**
Returns the maximum amount of receiver attenuation.

**VB Syntax**
```
value = cap.MaximumReceiverStepAttenuator(n)
```

**Variable**

- **value** *(Double)* - Variable to store the returned value of maximum receiver attenuation.
- **cap** A **Capabilities** *(object)*
- **n** *(Long)* - port number to query for step attenuators

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
value = cap.MaximumReceiverStepAttenuator'Read
```

**C++ Syntax**
```
HRESULT get_MaximumReceiverStepAttenuator(long portNumber, double * attenuation);
```

**Interface**

MeasurementClass Property

Description
Returns the measurement class name from the channel. Use CreateCustomMeasurementEx to create a measurement from a class other than standard S-Parameters.

VB Syntax
class = chan.MeasurementClass

Variable
(Type) - Description

class (string) - Variable to store the returned measurement class name.

chan Channel (object)

Return Type
String

Default
Not Applicable

Examples
class = chan.MeasurementClass "Read For a standard S-Parameter channel, returns...
"Standard"

C++ Syntax
HRESULT get_MeasurementClass();

Interface
IChannel15

### Medium Property

**Description**  
Sets and Returns the media type of the calibration standard.

**VB Syntax**  
```vbnet
calstd.Medium = value
```

**Variable**  
**Type** - Description

- `value`: (enum NACalStandardMedium) - Medium of the transmission line of the standard. Choose from:
  - **0 - naCoax**: Coaxial Cable
  - **1 - naWaveGuide**:

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**

```vbnet
  calstd.Medium = naCoax  'Write
  stdMedium = calstd.Medium  'Read
```

**C++ Syntax**

```cpp
HRESULT get_Medium(tagNACalStandardMedium *pVal)
HRESULT put_Medium(tagNACalStandardMedium newVal)
```

**Interface**

ICalStandard
# Memory Property

**Description**  
Set and return the memory trace color for nth trace in a window.

**VB Syntax**  
`trace(n).Memory = value`

**Variable**  
**Type** - Description  
- `trace(n)` One of the 8 `ComTraceColors` objects  
- `value` (Long Integer) - RGB color of the Memory pen.  
  Convert the three RGB colors to an integer as follows:  
  \[
  \text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
  \]
  To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

**Return Type**  
Long

**Default**  
Varies for each trace.

**Examples**  
\[
\begin{align*}
R &= 10 \\
G &= 10 \\
B &= 10 \\
\text{RGB} &= 10 + (10 \times 2^8) + (10 \times 2^{16})
\end{align*}
\]

```vbnet
trace1.Memory = RGB 'Write
color = trace1.Memory 'Read
```

**C++ Syntax**  

```cpp
HRESULT get_Memory(long* pVal);
HRESULT put_Memory(long newVal);
```

**Interface**  
IComTraceColors

MinimumFrequency Property

**Description**
Sets and Returns the minimum frequency for the calibration standard.

**VB Syntax**
`calsd.MinimumFrequency = value`

**Variable (Type) - Description**
- `value` (double): Minimum frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
`calsd.MinimumFrequency = 300e3 'Write`

`minFrequency = calsd.MinimumFrequency 'Read`

**C++ Syntax**
```
HRESULT get_MinimumFrequency(double *pVal)
HRESULT put_MinimumFrequency(double newVal)
```

**Interface**
ICalStandard
## MinimumFrequency Property

**Description**
Returns the minimum frequency of the remote PNA.

**VB Syntax**
`value = cap.MinimumFrequency`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>(Double) - Variable to store the returned minimum frequency of the PNA.</td>
</tr>
<tr>
<td><code>cap</code></td>
<td>A Capabilities (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not Applicable

**Examples**
`value = cap.MinimumFrequency` 'Read

**C++ Syntax**
`HRESULT get_MinimumFrequency(double *pVal)`

**Interface**

MinimumFrequency Property

**Description**
Sets and returns the minimum usable frequency specified for the power sensor.

**VB Syntax**
```
pwrSensor.MinimumFrequency = value
```

**Variable (Type) - Description**

- `pwrSensor`:
  - A `PowerSensor` (Object) or
  - A `PowerSensorAsReceiver` (Object)

- `value`:
  - (double) - Frequency in Hertz.

**Return Type**
Double

**Default**
Device dependent

**Examples**
```
pwrSensor.MinimumFrequency = 300e3 'Write
MinFreq = pwrSensor).MinimumFrequency 'Read
```

**C++ Syntax**
```
HRESULT put_MinimumFrequency(double newVal);
HRESULT get_MinimumFrequency(double *pVal);
```

MinimumIFFilterSampleCount Property

**Description**
Returns the Minimum allowed value for the IFFilterSampleCount property for the queried PNA.

**Note:** This setting applies only to the E836X Opt. H11.

**VB Syntax**

```vbnet
type = IfConfig.MinimumIFFilterSampleCount
```

**Variable**

- **Type:** (long)
- **Description:** The minimum allowed value that can be applied to the IFFilterSampleCount property.

- **IfConfig**
  - **Type:** IFFConfiguration (object)

**Return Type**
Long Integer

**Default**
PNA Model number dependent

**Examples**

```vbnet
variable = App.ActiveChannel.IFConfiguration.MinimumIFFilterSampleCount
```

See an example program

**C++ Syntax**

```cpp
HRESULT get_MinimumIFFilterSampleCount( long * pMinSampleCount );
```

**Interface**
IIFConfiguration2
MinimumIFFrequency Property

**Description**
Returns the minimum allowed value for the IFFrequency Property.

**VB Syntax**
```vbnet
value = IfConfig.MinimumIFFrequency
```

**Variable** *(Type)* - Description

*value* *(double)* Variable to store the returned minimum allowed frequency that can be applied to the IFFrequency Property.

*IfConfig* *(object)* IFConfiguration (object)

**Return Type** Double

**Default** Not Applicable

**Examples**
```vbnet
val = App.ActiveChannel.IFConfiguration.MinimumIFFrequency
```

**C++ Syntax**
```cpp
HRESULT get_MinimumIFFrequency( double * pMinFreq);
```

**Interface** IIFConfiguration3

Mode Property

**Description**
Sets and returns the stimulus mode for balanced measurements.

**VB Syntax**
`balStim.Mode = value`

**Variable (Type) - Description**
- `balStim` A `BalancedStimulus (object)`
- `value` (Enum `NABALSTIMulus`) - Stimulus Mode. True modes are applicable only with Opt 460 - iTMSA. When a True-Mode is selected, the Balanced port powers are automatically uncoupled.

Choose from:
- 0 - `naSEStim`: Single-Ended stimulus
- 1 - `naTMStim`: True-Mode stimulus
- 2 - `naFTMStim`: Forward only True-Mode stimulus
- 3 - `naRTMStim`: Reversed only True-Mode stimulus

**Return Type**
Enum

**Default**
0 - `naSEStim`: Single-Ended stimulus

**Examples**
```vbnet
balStim.Mode = naTMStim 'Write
variable = balStim.Mode 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Mode(tagNABALSTIMulus *eVal );
HRESULT put_Mode(tagNABALSTIMulus eVal );
```

**Interface**

### Name (trace) Property

**Description**
Sets or returns the name of the Trace. Use the trace name to identify the trace and refer to the trace in the collection.

*Note:* This is the same name as meas.Name; when one changes, the other changes.

**VB Syntax**
```
trac.Name = value
```

**Variable**
- **(Type)** - Description
  - *trac*  A Trace *(object)*
  - *value*  *(String)* Trace name

**Return Type**
String

**Default**
“CH1_S11_1” - name of the default measurement

**Examples**
```
trace.Name = "myTrace"  'Write

traceName = Name.Trace  'Read
```

**C++ Syntax**

- HRESULT put_Name(BSTR name)
- HRESULT get_Name(BSTR *name)

**Interface**
ITrace
NetworkFilename Property

Description: Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement.

VB Syntax: object.NetworkFilename(n) = filename

Variable: (Type) - Description

object

SMCType (object) or VMCTYPE (object)

n (Integer) Apply network to input or output of mixer. Choose from:

1 - Input of mixer
2 - Output of mixer

filename (String) Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

Return Type: String

Default: Not Applicable

Examples: VMC.Filename(2) = "C:/Program Files/Agilent/Network Analyzer/Documents/WaveguideAdapt.S2P"

C++ Syntax:

HRESULT put_NetworkFilename(short networkNum, BSTR filename);
HRESULT get_NetworkFilename(short networkNum, BSTR *filename);

Interface: SMCType2

VMCTYPE2

Last Modified:

### NoiseAverageFactor Property

**Description**
Sets and reads the averaging of the noise receiver.

**VB Syntax**

```vbnet
noise.NoiseAverageFactor = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>noise</code></td>
<td>A NoiseFigure (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(long integer) - Averaging value. Choose a number between 1 and 99.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
1

**Examples**

```vbnet
noise.NoiseAverageFactor = 10 'Write
AvgNoise = noise.NoiseAverageFactor 'Read
```

**C++ Syntax**

```cpp
HRESULT get_NoiseAverageFactor(long* pVal)
HRESULT put_NoiseAverageFactor(long newVal)
```

**Interface**
INoiseFigure

## NoiseAverageState Property

**Description**
Turns Noise Averaging ON and OFF.

**VB Syntax**

```vbnet
noise.NoiseAverageState = value
```

**Variable (Type) - Description**

- **noise**
  A [NoiseFigure](#) *(object)*

- **value** *(boolean)* - Averaging state.
  - **False** - Turns Noise Averaging OFF
  - **True** - Turns Noise Averaging ON

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
noise.NoiseAverageState = OFF 'Write
NoiseAvgState = noise.NoiseAverageState 'Read
```

### C++ Syntax

- `HRESULT get_NoiseAverageState(VARIANT_BOOL* on);`
- `HRESULT put_NoiseAverageState(VARIANT_BOOL on);`

**Interface**
INoiseFigure

**NoiseBandwidth Property**

**Description**
Set the bandwidth of the noise receiver.

**VB Syntax**
```
noise.NoiseBandwidth = value
```

**Variable**
(Type) - Description

- **noise**
  A NoiseFigure (object)

- **value**
  (double) Bandwidth value.
  
  For **NoiseReceiver** = naNoiseReceiver (Opt 029) choose from: 800 KHz, 2 MHz, 4 MHz, 8 MHz, or 24 MHz or the numerical equivalent, such as 8e6 and so forth.
  
  For **NoiseReceiver** = naStandardReceiver (Opt 028) choose from: 720 kHz or 1.2 MHz
  
  If the value does not match one of these, it is rounded up to the next valid bandwidth value.

**Return Type**
Double

**Default**
4 MHz for naNoiseReceiver
1.2 MHz for naStandardReceiver

**Examples**
```
noise.NoiseBandwidth = 2E6 'Write

NoiseBW = noise.NoiseBandwidth 'Read
```

**C++ Syntax**
```
HRESULT get_NoiseBandwidth(double *pVal);
HRESULT put_NoiseBandwidth(double newVal);
```

**Interface**
INoiseFigure

NoiseReceiver Property

Description  Sets and returns the receiver to use for noise measurements.

VB Syntax  

\[ \text{noise.NoiseReceiver} = \text{value} \]

Variable  (Type) - Description

- **noise**  (Object) 

- **value**  (Enum as NANOiseReceiverMode) Noise receiver. Choose from:
  - 0 - naStandardReceiver  The standard PNA receiver. (Opt 028)
  - 1 - naNoiseReceiver  The noise receiver. (Opt 029)

Return Type  Enum

Default  1 - naNoiseReceiver

Examples  

- `noise.NoiseReceiver = naNoiseReceiver  'Write`

- `NoiseRec = noise.NoiseReceiver  'Read`

C++ Syntax  

- `HRESULT get_NoiseReceiver(tagNoiseReceiverMode *pVal);`
- `HRESULT put_NoiseReceiver(tagNoiseReceiverMode newVal);`

Interface  INoiseFigure5

Last Modified: 2-Mar-2010  MX New topic
NoiseReceiverSweepTime Property

Description
Returns the APPROXIMATE time the channel will take to make one noise receiver sweep given the current setup. This, along with the sweep time for a standard receiver measurement and the following calculations, can tell you how long a “single” sweep would take so that you can set an appropriate “timeout” in your program.

Use **Sweep Time Property** to perform the standard sweep time query, shown as **SSwpTime** below.

**To calculate the total sweep time:**
Noise Figure on amplifiers (Vector Correction ON):

- \( 2 \times \text{SSwpTime} + X \times \text{NoiseReceiverSweepTime} \)
  
  Where \( X = \) the number of noise receiver impedance state sweeps. (Default is 4).

Noise Figure on converters (NFX) correction on - increased number of sweeps due to extra mixer sweeps and source pulling:

- \( 4 \times \text{SSwpTime} + X \times \text{NoiseReceiverSweepTime} \) (without source pulling)
  
  \( 8 \times \text{SSwpTime} + X \times \text{NoiseReceiverSweepTime} \) (with source pulling)
  
  Where \( X = \) the number of noise receiver impedance state sweeps. (Default is 4).

**Note:** The number of sweeps to perform a noise measurement is annotated at the bottom of the Noise Figure screen.

**VB Syntax**

```
swpTime = NF.NoiseReceiverSweepTime
```

**Variable**

*(Type) - Description*

- **swpTime** Variable to store the returned sweep time value (in seconds).
- **NF** A **NoiseFigure** *(object)*

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```
swpTime = NF.NoiseReceiverSweepTime()
```

**C++ Syntax**

```
HRESULT get_NoiseReceiverSweepTime (Double* SwpTime);
```

**Interface**
INoiseFigure3
Write/Read

NoiseGain Property

Description
Sets and reads the gain state of the noise receiver. This setting is NOT used when NoiseReceiver = naStandardReceiver (Opt 028)

VB Syntax
noise.NoiseGain = value

Variable
Type - Description

noise A NoiseFigure (object)

value (long integer) - Gain value. Choose from:
0 Low Gain  select if the gain of your DUT is relatively high (>35 dB).
15 Medium Gain  select if the gain of your DUT is about average (20 dB to 45 dB).
30 High Gain ..select if the gain of your DUT is relatively low (<30 dB).
If the value does not match one of these, it is rounded up to the next legal value.

Learn more about Noise Receiver Gain setting.

Return Type
Long Integer

Default
30

Examples
noise.NoiseGain = 30 'Write
GainNoise = noise.NoiseGain 'Read

C++ Syntax
HRESULT get_NoiseGain(long* pVal)
HRESULT put_NoiseGain(long newVal)

Interface
INoiseFigure

NoiseSourceCalKitType Property

Description
Set and read the Cal Kit that will be used for the Noise Source adapter.

An adapter is always necessary to connect a 346C Noise Source to the PNA port 2. Select a Cal Kit that is the same type and gender as the noise source connector.

If the Noise Source mates directly to PNA port 2, then set this type to "None".

VB Syntax
noise.NoiseSourceCalKitType = value

Variable (Type) - Description
noise A NoiseCal (object)
value (string) Cal Kit type. To read possible cal kit strings for the adapter:

1. Change the port connector type to that of the noise source using: ConnectorType
2. Then read the possible cal kit strings for that port using: CompatibleCalKits

Return Type
String

Default
Not applicable

Examples
noise.NoiseSourceCalKitType = "N4691-60004 ECAL" 'Write
calkit = noise.NoiseSourceCalKitType 'Read

C++ Syntax
HRESULT get_NoiseSourceCalKitType(BSTR* pValue)
HRESULT put_NoiseSourceCalKitType(BSTR pNewValue)

Interface
INoiseCal

### NoiseSourceCold Property

**Description**
Sets and returns the temperature of the noise source connector.

**VB Syntax**
`noise.NoiseSourceCold = value`

**Variable**
- **Type** - Description
- `noise` (A NoiseCal object)
- `value` (double) Noise source temperature in Kelvin.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
noise.NoiseSourceCold = 295 'Write

temp = noise.NoiseSourceCold 'Read
```

**C++ Syntax**
- `HRESULT get_NoiseSourceCold(double* pTemp)`
- `HRESULT put_NoiseSourceCold(double pNewTemp)`

**Interface**
INoiseCal

---

Last Modified:
- 21-Jun-2007   MX New topic
**NoiseSourceConnectorType Property**

**Description**  Set and read the Noise Source connector type and gender.

The Agilent 346C has an "APC 3.5 male" connector.

**VB Syntax**  

```vbnet
noise.NoiseSourceConnectorType = value
```

**Variable (Type) - Description**

- `noise`  A `NoiseCal` (object)

- `value`  (string) Connector type. Use `ValidConnectorType` to return a list of valid connector types.

**Return Type**  String

**Default**  Not applicable

**Examples**

```vbnet
noise.NoiseSourceConnectorType = "APC 3.5 male"  'Write

connector = noise.NoiseSourceConnectorType  'Read
```

**C++ Syntax**

```cpp
HRESULT get_NoiseSourceConnectorType(BSTR* pConnectorType)
HRESULT put_NoiseSourceConnectorType(BSTR pConnectorType)
```

About Noise Figure

NoiseSourceState Property

**Description**
Sets and reads the noise source (28V) ON and OFF.

**VB Syntax**
```
app.NoiseSourceState = state
```

**Variable**
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>state</td>
<td>(boolean)</td>
</tr>
<tr>
<td></td>
<td>False (0) - Turns Noise Source OFF</td>
</tr>
<tr>
<td></td>
<td>True (1) - Turns Noise Source ON</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
For PNA models with a Noise Figure option (028/029/H29), the 28V line is ON at application start and after a preset. The ON/OFF state is also available from a PNA softkey menu.

For PNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF at application start and it’s state is not affected by a preset. The ON/OFF state is NOT available from a PNA softkey menu.

**Examples**
```
app.NoiseSourceState = True 'Write

coupl = app.NoiseSourceState 'Read
```

**C++ Syntax**
```
HRESULT put_NoiseSourceState(VARIANT_BOOL bState)
HRESULT get_NoiseSourceState(VARIANT_BOOL *bState)
```

<tr>
<td><code>meas</code></td>
<td><code>A Measurement (object)</code></td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
"1" - number of the default measurement

**Examples**
`measNum = meas.Number`

**C++ Syntax**
`HRESULT get_Number(long *MeasurementNumber)`

**Interface**
`IMeasurement`
**Number Property**

**Description**
Returns the number of the Auxiliary Trigger connector pair currently being used with the instance of the AuxTrigger object. Set the trigger pair with the AuxTrig object.

**VB Syntax**
```
value = auxTrig.Number
```

**Variable (Type) - Description**
- **auxTrig** An AuxTrigger (object)
- **value** (Long Integer) - Connector pair. PNA-X returns 1 or 2. All other models that do not have the Aux trigger connector returns 1.

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
value = auxTrig.Number 'Read the value
```

**C++ Syntax**
```
HRESULT get_Number(long *auxID);
```

**NumberOfPoints Property**

**Description**
Sets or returns the Number of Points of the channel.
Sets or returns the Number of Points of the segment.

**See Also**
- [Measurement2 Interface](#) to learn how this method differs from `meas.NumberofPoints`
- [Gain Compression Number of Points](#)
- [Swept IMD limitations](#)

**VB Syntax**
```
object.NumberOfPoints = value
```

**Variable**
- `(Type)`: Description
  - `object` Channel *(object)*
  - or
  - CalSet *(object)* - Read-only property

- `value` *(long)*: Number of Points.
  - For channel, choose any number from 1 to the [PNA max number of points](#).
  - For segment, the total number of points in all segments cannot exceed the PNA maximum. A segment can have as few as 1 point.

**Return Type**
Long Integer

**Default**
- 201 for channel
- 21 for segment

**Examples**
```
chan.NumberOfPoints = 201 'sets the number of points for all measurements in the channel. -Write
```
```

### NumberOfPorts Property

**Description**
Returns the number of ports on the specified testset. Returns 0 if no test set is connected.

**VB Syntax**
```
value = tset.NumberOfPorts
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Long) variable to store the returned information.</td>
</tr>
</tbody>
</table>

| tset | A `TestsetControl` object. |
| OR   | An `E5091Testset` object. |

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
value = testset1.NumberOfPorts
```

See E5091A Example Program

See External Testset Program

**C++ Syntax**
```
HRESULT get_NumberOfPorts(long *numberOfPorts);
```

**Interface**
- `ITestsetControl`
- `IE5091Testset`
### NumberOfPowerPoints Property

**Description**
Set and read the number of data points in each power sweep. Applies ONLY to 2D acquisition modes.

**VB Syntax**
```
gca.NumberOfPowerPoints = value
```

**Variable**
- **Type**: GainCompression (object)
- **value**: integer - Power points. Do not exceed the max number of points.
  - For 2D sweeps, total = frequency x power. Max = 20,001
  - For Smart sweep, total = frequency. Max = 10,000.

**Return Type**
Integer

**Default**
26

**Examples**
```
gca.NumberOfPowerPoints = 31 'Write
pwrPts = gca.NumberOfPowerPoints 'Read
```

**C++ Syntax**
```
HRESULT get_NumberOfPowerPoints(int* pVal)
HRESULT put_NumberOfPowerPoints(int newVal)
```

**Interface**
IGainCompression

Offset Property

Description
Sets and returns the offset value to be used when coupling this range to the primary range.
This setting is valid only if the specified range is coupled to the primary range.

VB Syntax
FOMRange.Offset = value

Variable (Type) - Description
object An FOMRange (object)
value (Double) - Offset value.-(Unitless)

Return Type Double

Default 0

Examples
fomRange.Offset = 1e9 'Write
Offs = fomRange.Offset 'Read

C++ Syntax
HRESULT get_Offset(double *pVal)
HRESULT put_Offset(double pVal)

Interface IFOMRange

Last Modified: 8-Mar-2007 Modified links.
OffsetReceiverAttenuator Property

**Description**
Set and return whether to offset the reference receiver by the amount of receiver attenuation.

Learn more.

This setting remains until changed or until the hard drive is changed or reformatted.

**VB Syntax**
```vbnet
pref.OffsetReceiverAttenuator = value
```

**Variable**
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pref</td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Boolean) - Choose from:</td>
</tr>
<tr>
<td></td>
<td>False Do NOT offset the test port receivers.</td>
</tr>
<tr>
<td></td>
<td>True Offset the test port receivers.</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
True PNA-X models
False E836xB and PNA-L models

**Examples**
```vbnet
pref.OffsetReceiverAttenuator = 1 'Write
Rcvroffset = pref.OffsetReceiverAttenuator 'Read
```

**C++ Syntax**
```c++
HRESULT get_OffsetReceiverAttenuator(VARIANT_BOOL * val);
HRESULT put_OffsetReceiverAttenuator(VARIANT_BOOL val);
```

OmitIsolation Property - Superseded

Description
This command is replaced with SetIsolationPaths and GetIsolationPaths. Sets and returns whether Isolation portion of the calibration will be performed or not.

VB Syntax

obj.OmitIsolation = bool

Variable

(obj) - Description

obj - SMCType (object)
   or
   VMCType (object)

bool - (Boolean)
   True - Isolation is NOT performed
   False - Isolation is performed

Return Type
Boolean

Default
True

Examples
value = SMC.OmitIsolation

C++ Syntax

HRESULT put_OmitIsolation (VARIANT_BOOL bState)
HRESULT get_OmitIsolation (VARIANT_BOOL *bState)

Interface
SMCType
VMCType
OneMarkerReadoutPerTrace Property - Superseded

**Description**
Either show marker readout of only the active trace or all of the traces simultaneously.

**Note:** This method is replaced by MarkerReadoutsPerTrace Property

**VB Syntax**
```
win.OneReadoutPerTrace = state
```

**Variable (Type) - Description**

*win*  
A *NAWindow* (object)

*value* (boolean)
*True* - Shows the readout of only the active marker for each trace.
*False* - Shows up to 5 marker readouts per trace, up to 20 total readouts.

**Return Type**
Boolean

**Default**
False

**Examples**
```
win.OneMarkerReadoutPerTrace = True 'Write
State = app.ActiveNAWindow.OneMarkerReadoutPerTrace 'Read
```

**C++ Syntax**
```
HRESULT get_OneMarkerReadoutPerTrace(VARIANT_BOOL *pVal)
HRESULT put_OneMarkerReadoutPerTrace(VARIANT_BOOL newVal)
```

**Interface**
INAWindow

Write/Read

OrientECALModule Property

Description
Specifies if the PNA should perform orientation of the ECal module during calibration. Orientation is a technique by which the PNA automatically determines which ports of the module are connected to which ports of the PNA. Orientation begins to fail at very low power levels or if there is much attenuation in the path between the PNA and the ECal module.

Note: For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the PNA determines the orientation. The PNA does not verify that you made the connection properly.

This setting remains until the PNA is restarted or this command is sent again.

This command, and ECALPortMapEx, can be used to perform ECal using the Guided Calibration interface.

VB Syntax

cal.OrientECALModule = value

Variable (Type) - Description

cal A Calibrator (object)
value (boolean)

False - DoECAL1PortEx and DoECAL2PortEx methods will use the value of the ECALPortMapEx property to determine the port connections.

True - DoECAL1PortEx and DoECAL2PortEx methods will use auto Orientation technique to determine port connections.

Return Type
Boolean

Default
True

Examples
Dim cal As Calibrator
Dim bOrient As Boolean
Set cal = PNAapp.ActiveChannel.Calibrator
cal.OrientECALModule = False 'Write
bOrient = cal.OrientECALModule 'Read

C++ Syntax

HRESULT put_OrientECALModule(VARIANT_BOOL bOrient);
HRESULT get_OrientECALModule(VARIANT_BOOL *bOrient);

Interface
ICalibrator3

Last Modified:
7-May-2007  Added note about Guided Cal.
OutputFixedFrequency Property

Description
Sets or returns the mixer output fixed frequency value.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

\[ \text{obj.OutputFixedFrequency} = \text{value} \]

Variable (Type) - Description

obj A Mixer Interface pointer to the Measurement (object)
Or
A Converter Object

value (double) - Output Fixed Frequency in Hertz.

Return Type
Double

Default
Not Applicable

Examples

Print mixer.OutputFixedFrequency 'prints the output fixed frequency value of the mixer.

C++ Syntax

HRESULT get_OutputFixedFrequency(double *pVal)
HRESULT put_OutputFixedFrequency(double newVal)

Interface
IMixer3
IConverter

Last Modified:

2-Feb-2009  Added Converter
4-Mar-2008  Added note.
OutputPort Property

Description
Switches an input to one of the valid outputs on the specified E5091A. The following are valid input/output combinations. If a combination other than these are sent, an “invalid argument” error will occur.

<table>
<thead>
<tr>
<th>Input</th>
<th>Valid Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
</tr>
<tr>
<td></td>
<td>T1 - If Port 2 already is connected to T1, then Port 2 will be switched to T2.)</td>
</tr>
<tr>
<td>2</td>
<td>T1 - If Port 1 already is connected to T1, then Port 1 will be switched to A.</td>
</tr>
<tr>
<td></td>
<td>T2</td>
</tr>
<tr>
<td>3</td>
<td>R1+</td>
</tr>
<tr>
<td></td>
<td>R2+</td>
</tr>
<tr>
<td></td>
<td>R3+ If option 007 (7port), R2 is selected.</td>
</tr>
<tr>
<td>4</td>
<td>R1-</td>
</tr>
<tr>
<td></td>
<td>R2-</td>
</tr>
<tr>
<td></td>
<td>R3- If option 007 (7port), R2 is selected.</td>
</tr>
</tbody>
</table>

Note: Do not confuse the similar Testset. OutputPorts Property, which sets or gets the port mapping for ALL ports.

VB Syntax
\[ \text{testsets}(1).\text{OutputPort} \ (\text{chNum},\text{input}) \ = \ \text{output} \]

Variable (Type) - Description

testsets(1) An item from Testsets (collection)
Learn how to identify a testset in the collection.

chNum (Long) Channel number of the measurement.

input (Long) Testset Input port. Choose from 1|2|3|4.

output (Enum as NAE5091OutputPort) Output port to switch to specified Input. Choose from:
0 or naE5091PortA - Port A
1 or naE5091PortT1 - Port T1
2 or naE5091PortT2 - Port T2
3 or **naE5091PortR1** - Port R1
4 or **naE5091PortR2** - Port R2
5 or **naE5091PortR3** - Port R3

**Return Type**  Enum

**Default**  Not Applicable

**Examples**  See Example Program

**C++ Syntax**

```cpp
HRESULT get_OutputPort(long channelNum, long inputPort, E5091OutputPort *outPort);
HRESULT put_OutputPort(long channelNum, long inputPort, E5091OutputPort outPort);
```

**Interface**  IE5091Testsets
**OutputPorts (Cal Set) Property**

**Description**
Returns the port mapping for the Cal Set.

**VB Syntax**

```vbnet
portMap = calset.OutputPorts
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>portMap</code></td>
<td>(String) Variable to store the returned string. The returned values are the physical ports. The POSITION of the returned values corresponds to the logical ports. For example, with an N44xx test set, if the returned string is &quot;PNA 1,TS 2,PNA 2, TS 4&quot; this means:</td>
</tr>
<tr>
<td><code>calset</code></td>
<td>A <code>Cal Set</code> object.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Depends on the test set.

**Example**

```vbnet
portMap = calset.OutputPorts
```

**C++ Syntax**

```cpp
HRESULT get_OutputPorts(BSTR *mapping);
```

**Interface**
ICalset5

Last modified:
9/18/06 MQ Added for multiport
### OutputPorts Property

**Description**
Sets or gets the port mappings for ALL ports. An “invalid argument” error will occur if you attempt to set an illegal port combination. 
Refer to your testset documentation for valid port combinations.  
**Note:** Do not confuse the similar E5091. **OutputPort Property**, which sets or gets the port mapping for a single port.

**VB Syntax**
```
tset.OutputPorts(chNum) = portList
```

**Variable (Type) - Description**
- **tset** A TestsetControl object.
- **chNum** (Long) Channel number of the measurement.
- **portList** (String) A comma-separated list of port mappings. Spaces are ignored at the beginning and end of this text, and before or after commas. Space characters in other locations are not ignored.

**Return Type** String

**Default** Not Applicable

**Examples**
See External Testset Program

**C++ Syntax**
```
HRESULT get_OutputPorts(long channelNum, BSTR *outPorts);
HRESULT put_OutputPorts(long channelNum, BSTR outPorts);
```

**Interface** ITestsetControl
OutputRangeMode Property

Description
Sets or returns the Output sweep mode.
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

Note: There is also a OutputRangeMode Property on the Converter Object.

VB Syntax

obj.OutputRangeMode = value

Variable (Type) - Description

obj A Mixer Interface pointer to the Measurement (object)

value (Enum as MixerRangeMode) - Output sweep mode. Choose from:
0 - mixSwept
1 - mixFixed

Return Type Enum

Default 0 - mixSwept

Examples mixer.OutputRangeMode = mixSwept

C++ Syntax

HRESULT get_OutputRangeMode(long *pVal)
HRESULT put_OutputRangeMode(long newVal)

Interface IMixer6

Last Modified:
4-Mar-2008  Added note.
OutputSideband Property

Description
Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input (+ or -) LO1 = Output frequency.
- When two LO’s are used: IF (+ or -) LO2 = Output frequency. See Also: IFSideband Property

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

```vbnet
obj.OutputSideband = value
```

Variable (Type) - Description

- **obj**: A Converter Object
- **value** (enum as ConverterSideBand) - Choose from:
  - 0 - or **naLowSide**: Minus (-) on the Mixer setup dialog
  - 1 - or **naHighSide**: Plus (+) on the Mixer setup dialog

Return Type
Enum as ConverterSideBand

Default
naLowSide

Examples

- `Print converter.OutputSideband 'prints the value of the OutputSideband`

C++ Syntax

```cpp
HRESULT get_OutputSideband(ConverterSideBand *pVal)
HRESULT put_OutputSideband(ConverterSideBand newVal)
```

Interface
IConverter

OutputSideband Property

**Description**
Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input + or - LO1 = Output frequency
- When two LOs are used: IF1 + or - LO2 = Output frequency

Use **IFSideband_Property** when two LOs are used to determine the IF1 frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**Note:** There is also an **OutputSideband_Property** on the Converter Object.

**VB Syntax**

```vbnet
mixer.OutputSideband = value
```

**Variable** *(Type) - Description*

- **mixer** A **Mixer (object)**
- **value** *(FCASideBand)* - Choose from:
  - 0 - **LOW** Minus (-) on the Mixer setup dialog
  - 1 - **HIGH** Plus (+) on the Mixer setup dialog

**Return Type**
Enum as FCASideBand

**Default**
LOW

**Examples**

```
Print mixer.OutputSideband 'prints the value of the OutputSideband
```

**C++ Syntax**

```
HRESULT get_OutputSideband(FCASideBand *pVal)
HRESULT put_OutputSideband(FCASideBand newVal)
```

## Parameter Property

**Description**
Returns the measurement Parameter. To change the parameter, use `meas.ChangeParameter`.

**VB Syntax**
`measPar = meas.Parameter`

**Variable**
- **measPar** *(string)* - Variable to store Parameter string
- **meas** A Measurement *(object)*

**Return Type**
String

**Default**
Not applicable

**Examples**
`measPar = meas.Parameter` *Read*

**C++ Syntax**
`HRESULT get_Parameter(BSTR *pVal)`

**Interface**
IMeasurement
Parameter (Embedded LO) Property

**Description**
Returns the name of the parameter of the specified tuning sweep.

**VB Syntax**
```
value = embedLODiag.Parameter (n)
```

**Variable**
**Type** - Description
- **value** *(String)* Variable to store the returned data.
- **embedLODiag** *(EmbeddedLODiagnostic (object))*
- **n** *(Long)* Tuning sweep number. Use **NumberOfSweeps** to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**
```
data = embedLO.Parameter 3 ' read
```

**C++ Syntax**
```
HRESULT Parameter(long sweep, BSTR * param);
```

**Interface**
IEmbededLODiagnostic

**Read-only**

**Parent Property**

**Description**
Returns a handle to the parent object of the collection object being referred to in the statement. The parent property allows the user to traverse from an object back up the object hierarchy.

**VB Syntax**
`collection.Parent`

**Variable**
- **(Type)** - Description
  - `collection` - Description
    - `CalFactorSegments collection`
    - `CalFactorSegmentsPMAR Collection`
    - `Channels collection`
    - `E5091Testset Collection`
    - `ECalModules Collection`
    - `ExternalDevices Collection`
    - `ExternalTestsets Collection`
    - `Measurements collection`
    - `NaWindows collection`
    - `PowerLossSegments collection`
    - `PowerLossSegmentsPMAR Collection`
    - `PowerSensors collection`
    - `Segments collection`
    - `Traces collection`
    - `PathConfigurationManager`
    - `PowerMeterInterfaces Collection`

**Return Type**
Object

**Default**
Not Applicable

**Examples**
parentobj = chans.Parent 'returns a handle to the parent object (Application) of the chans collection. -Read

**C++ Syntax**
HRESULT get_Parent(IApplication* *pApplication); //IChannels, IChannel, IMeasurements, INAWindows, and IExternalDevices
HRESULT get_Parent(IChannel* *pChannel); //ITraces
HRESULT get_Parent(INAWindow* *pWindow); //ISegments
HRESULT get_Parent(IPowerSensor* *pSensor); //ICalFactorSegments(PMAR)
HRESULT get_Parent(ISourcePowerCalibrator* *pCalibrator); //IPowerSensors, IPowerLossSegments, and IPowerMeterInterfaces
<table>

*PassFailLogic Property*

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Sets and reads the logic of the PassFail line on the <strong>HANDLER IO connector</strong> (pin 33) and <strong>AUX IO connector</strong> (pin 12). Learn more about Global Pass/Fail. Note: This line is connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.</th>
</tr>
</thead>
</table>

**VB Syntax**  
`object.PassFailLogic = value`

**Variable**  
*(Type) - Description*

- `object` *(object)* - An Aux I/O or Handler I/O object
- `value` *(enum as NARearPanelIOLogic)* Choose from:
  - `0 - naPositiveLogic` - Causes the PassFail line to have positive logic (high = pass, low = fail).
  - `1 - naNegativeLogic` - Causes the PassFail line to have negative logic (high = fail, low = pass).

**Return Type**  
Long Integer

**Default**  
naPositiveLogic

**Examples**

```
aux.PassFailLogic = naNegativeLogic 'Write  
Text1.Text = aux.PassFailLogic 'Read
```

**C++ Syntax**

```
HRESULT put_PassFailLogic ( tagNARearPanelIOLogic Mode );
HRESULT get_PassFailLogic ( tagNARearPanelIOLogic* Mode );
```

**Interface**

- IHWAuxIO
- IHWMaterialHandlerIO
PassFailMode Property

Description
Sets and reads the mode of the PassFail line on the HANDLER IO connector (pin 33) and AUX IO connector (pin 12). Learn more about Global Pass/Fail.

Note: This line is connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

VB Syntax

\[
\text{object.PassFailMode} = \text{value}
\]

Variable (Type) - Description

\text{object} (object) - An Aux I/O or Handler I/O object

\text{value} (enum as NAPassFailMode) - Choose from:

0 - \text{naDefaultPassNoWaitMode} - the line stays in PASS state. When a device fails, then the line goes to fail IMMEDIATELY.

1 - \text{naDefaultPassWaitMode} - the line stays in PASS state. When a device fails, then the line goes to fail after the Sweep End line is asserted.

2 - \text{naDefaultFailWaitMode} - the line stays in FAIL state. When a device passes, then the line goes to PASS state after the Sweep End line is asserted.

Return Type
Long Integer

Default
0 - \text{naDefaultPassNoWaitMode}

Examples

\text{HWAuxIO.PassFailMode} = \text{naDefaultPassNoWaitMode} \ 'Write

\text{mode} = \text{HWAuxIO.PassFailMode} \ 'Read

C++ Syntax

\[
\text{HRESULT put_PassFailMode ( tagNAPassFailMode Mode );}
\text{HRESULT get_PassFailMode ( tagNAPassFailMode* Mode );}
\]

Interface
IHWAuxIO
IHWMaterialHandlerIO
PassFailPolicy Property

**Description**
Sets the policy used to determine how global pass/fail is computed. [Learn more about Global Pass/Fail](#).

**VB Syntax**

```vbnet
object.PassFailPolicy = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>An Aux I/O or Handler I/O object</td>
</tr>
</tbody>
</table>

**value**

(enumer as NAPassFailPolicy) Choose from:

- 0 - `naPolicyAllTests` - Pass/Fail Status returns PASS if all tests on all measurements pass.
- 1 - `naPolicyAllMeas` - Pass/Fail Status returns PASS if all measurements have associated tests, and all tests pass. FAIL is returned if even one measurement has no associated limit test.

Only those measurements which are not in HOLD mode contribute to the pass/fail result.

**Return Type**

Long Integer

**Default**

`naPolicyAllTests`

**Examples**

```vbnet
matHndler.PassFailPolicy = naPolicyAllTests 'Write
policy = aux.PassFailPolicy 'Read
```

**C++ Syntax**

```cpp
HRESULT put_PassFailPolicy ( tagNAPassFailPolicy Policy);
HRESULT get_PassFailPolicy ( tagNARearPanelIOLogic* Policy);
```

**Interface**

IHWAuxI04

IHWMaterialHandlerI02
Read/Write

PassFailScope Property

Description
Sets and reads the Scope of the PassFail line on the HANDLER IO connector (pin 33) and AUX IO connector (pin 12). Learn more about Global Pass/Fail.

Note: The PassFail line is connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

VB Syntax

```
object.PassFailScope = value
```

Variable (Type) - Description

- **object** (object) - An Aux I/O or Handler IO object
- **value** (enum NAPassFailScope) Choose from:
  - 0 - naChannelScope - The PassFail line returns to its default state before sweeps on the next channel start. (A channel measurement may require several sweeps.)
  - 1 - naGlobalScope - The PassFail line returns to its default state before the sweeps for the next triggerable channel start.

The default state of the PassFail line before a measurement occurs and after a failure occurs is set by the PassFailMode property.

Return Type
enum NAPassFailScope

Default
1 - naGlobalScope

Examples

```
HWAuxIO.PassFailScope = naGlobalScope 'Write

scope = HWAuxIO.PassFailScope 'Read
```

C++ Syntax

```
HRESULT put_PassFailScope ( tagNAPassFailScope Scope );
HRESULT get_PassFailScope ( tagNAPassFailScope* Scope );
```

Interface
IHWAuxIO
IHWMaterialHandlerIO
**Read-Only**

**PassFailStatus Property**

**Description** Returns the most recent pass/fail status value. Use this command as follows:

1. Set the PNA **trigger scope** to GLOBAL
2. Set the PNA **trigger source** to MANUAL or EXTERNAL.
3. Configure and enable **Limit Testing**
4. Trigger the PNA.
5. Use the **OPC?** (with **SCPIStringParser object**) to determine when the sweep is complete.
6. Use the **PassFailStatus** property to obtain the global pass/fail result.

Learn more about **Global Pass/Fail**.

**VB Syntax**

```
var = object.PassFailStatus
```

**Variable** *(Type) - Description*

<table>
<thead>
<tr>
<th>var</th>
<th>(enum as NAPassFailStatus) Variable to store returned status. One of the following will be returned:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td><strong>naStatusFail</strong> - all measurements not in HOLD mode have been swept, and one or more limit tests failed according to the specified Pass/Fail policy.</td>
</tr>
<tr>
<td>1</td>
<td><strong>naStatusPass</strong> - all measurements not in HOLD mode have been swept, and all associated limit tests have passed.</td>
</tr>
<tr>
<td>2</td>
<td><strong>naStatusNone</strong> - status cannot be determined because measurements are in progress.</td>
</tr>
</tbody>
</table>

| object | (object) - An **Aux I/O** or **Handler I/O** object |

**Return Type** Long Integer

**Default** Not Applicable

**Examples**

```
status = aux.PassFailStatus 'Read
```

**C++ Syntax**

```
HRESULT get_PassFailPolicy ( tagNAPassFailStatus* status);
```

**Interface**

- IHWAuxIO4
- IHWMaterialHandlerIO2

PathCalMethod Property

Description

Note: This command replaces ThruCalMethod. (Read-Write) Specifies the calibration method for each port pair.

Note: Do NOT send this command to rely on SmartCal to determine the most accurate cal method for your connector settings and Cal Kits. You can send the query form of this command to learn the cal method determined by SmartCal.

Before using this command, first do the following:

- Set the connector types: ConnectorType
- Set cal kit: CalKitType
- Set or query the thru path pairs: ThruPortList

After sending or querying this command, send the Thru method: PathThruMethod

See an example of a 4-port guided calibration using COM.

VB Syntax

guidedCal.PathCalMethod (port1, port2) = "caltype1[,caltype2]"

Variable (Type) - Description

guidedCal GuidedCalibration (object)

port1 First port of the pair to be calibrated.

port2 Second port of the pair to be calibrated.

"caltype1[,caltype2]" (String) Cal types for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

caltype1 Cal type for the pair if caltype2 is not specified. Otherwise, Cal type for port 1. Choose from:

- “TRL”
- “SOLT”
- “QSOLTN”
- “EnhRespN”

For the last two arguments, replace N with the port to be used as the source port, which MUST be one of the port pair.

[caltype2] Optional argument. Use only when performing an adapter removal cal on the pair. This argument specifies the Cal Type on the second port; caltype1 then specifies the Cal Type of the first port.
Choose from the same arguments as `caltype1`.

**Return Type**  
**String** - Returns comma-separated cal types.

**Default**  
The most accurate cal method for the current cal.

**Example**  
```cpp
guidedCal.PathCalMethod(2,3) = "TRL"  'Write trl for port pair

guidedCal.PathCalMethod(1,4) = "TRL,SOLT"  'Write adapter removal cal, consisting of trl on port 1 and solt on port 4

calmethod = guided.PathCalMethod(1,4)  'Read previous example, returns: "TRL,SOLT"
```

**C++ Syntax**  
```cpp
HRESULT get_PathCalMethod(long firstport, long secondport, BSTR *calMethod);
HRESULT put_PathCalMethod(long firstport, long secondport, BSTR calMethod);
```

**Interface**  
`IGuidedCalibration3`

PathThruMethod Property

Description  

Note: This command replaces ThruCalMethod.  

(Read-Write) Specifies the calibration THRU method for each port pair.  

Note: Do NOT send this command to rely on SmartCal to determine the most accurate THRU method for your connector settings and Cal Kits. You can send the query form of this command to learn the THRU method determined by SmartCal.

Before sending this command, first do the following:

- Set the connector types: ConnectorType
- Set cal kit: CalKitType
- Set or query the thru path pairs: ThruPortList
- Set or query the Cal Type: PathCalMethod

To determine the default Thru method:

- Set the connector types: ConnectorType
- Set cal kit: CalKitType
- Send GenerateSteps
- Read the proposed port pairs: ThruPortList
- Read this command: (calmethod = guided.PathThruMethod(p1, p2)

See an example of a [4-port guided calibration using COM](https://example.com).

VB Syntax  

guidedCal.PathThruMethod (port1, port2) = "ThruType1[,ThruType2]"

Variable  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GuidedCal</td>
<td>GuidedCalibration (object)</td>
</tr>
<tr>
<td>port1</td>
<td>First port of the pair to be calibrated.</td>
</tr>
<tr>
<td>port2</td>
<td>Second port of the pair to be calibrated.</td>
</tr>
</tbody>
</table>

"ThruType1[,ThruType2]"  

(String) Thru methods for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

thruType1  

Calibration thru method for the pair if thruType2 is not specified. Otherwise, thru method for port 1.

Choose from:

- “Defined Thru” A thru type for which there is a stored definition in the Cal Kit.
- “Zero Thru” Zero length thru, also known as flush-thru.
• “Undefined Thru” A thru type for which there is NOT a stored definition in the Cal Kit. Also known as Unknown Thru. Valid ONLY for SOLT cal type.

• “Undefined Thru using a Defined Thru” Using an ECal module, measure the internal thru using the “Undefined Thru” method.

**ThruType2** (String) Optional argument. Use only when performing an adapter removal cal on the pair as determined by **PathCalMethod**. The only valid arguments for ThruType1&2 (when specified) is “Defined Thru, Defined Thru”.

**Return Type**  **String** - Returns comma-separated ThruTypes.

**Default** The most accurate THRU method for the current cal.

**Example**
```
guidedCal.PathThruMethod(2,3) = "Zero Thru" 'Write for port pair

guidedCal.PathThruMethod(1,4) = "Defined Thru, Defined Thru" 'Write for adapter removal cal.

calmethod = guided.PathThruMethod(1,4) 'Read previous example,
return: "Defined Thru, Defined Thru"
```

**C++ Syntax**
```
HRESULT get_PathThruMethod(long firstport, long secondport, BSTR *thruMethod);
HRESULT put_PathThruMethod(long firstport, long secondport, BSTR thruMethod);
```

**Interface** IGuidedCalibration3

## PeakExcursion Property

**Description**
Sets and reads the peak excursion value for the specified marker. The Excursion value determines what is considered a "peak".

**VB Syntax**

```vbnet
mark.PeakExcursion = value
```

**Variable**

- **mark**
  
  A Marker (object)

- **value**
  
  (single) - Peak Excursion. Choose any number between -500 and 500

**Return Type**

Single

**Default**

3

**Examples**

```vbnet
mark.PeakExcursion = 1 'Write

PkExcur = mark.PeakExcursion 'Read
```

**C++ Syntax**

```csharp
HRESULT get_PeakExcursion(float *pVal)
HRESULT put_PeakExcursion(float newVal)
```

**Interface**

IMarker
**PeakThreshold Property**

**Description**
Sets peak threshold for the specified marker. If a peak (using the criteria set with PeakExcursion) is below this reference value, it will not be considered when searching for peaks.

**VB Syntax**

```
mark.PeakThreshold = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mark</td>
<td>A Marker (object)</td>
</tr>
<tr>
<td>value</td>
<td>(single) - Peak Threshold. Choose any number between: -500 and 500</td>
</tr>
</tbody>
</table>

**Return Type**
Single

**Default**
-100db

**Examples**

```
mark.PeakThreshold = 1 'Write
PkThresh = mark.PeakThreshold 'Read
```

**C++ Syntax**

```
HRESULT get_PeakThreshold(float *pVal)
HRESULT put_PeakThreshold(float newVal)
```

**Interface**
IMarker
### PeakToPeak Property

</table>
**Percent Property**

**Description**
Sets group delay aperture using a percent of the channel frequency span.

**VB Syntax**
`gdAperture.Percent = value`

**Variable (Type) - Description**

- **gdAperture**
  - Type: `GroupDelayAperture` (object)

- **value**
  - Type: `Double`
  - Description: Percent of frequency span to use for the aperture setting. Choose between the equivalent of 2 points and 100 percent of the channel frequency span.

**Return Type**
Double

**Default**
Percent range that equates to 11 points.

This can be changed to two points with a preference setting.

**Examples**
```
gdAperture.Percent = 25 'Write
aperture = gdAperture.Percent 'Read
```

**C++ Syntax**
```
HRESULT get_Percent(double Percent *pVal)
HRESULT put_Percent(double Percent newVal)
```

PerformPowerCalibration Property

**Description**  
Enables Guided Power Cal and sets the source port to be calibrated.

**VB Syntax**  
guidedCal.**PerformPowerCalibration** (port) = value

**Variable**  
*(Type) - Description*

- **guidedCal**  
  GuidedCalibration (object)

- **port**  
  *(Long integer)*  
  Source port to be calibrated. ONLY one port may be calibrated with a Guided Power Cal.

- **value**  
  *(Boolean)*

  - **True**  
    Perform a Guided Power Calibration.

  - **False**  
    Do NOT perform a Guided Power Calibration

**Return Type**  
Boolean

**Default**  
False

**Example**  
guided.PerformPowerCalibration(1) = True

See example program

**C++ Syntax**  
HRESULT get_PerformPowerCalibration(long port,VARIANT_BOOL* val);
HRESULT put_PerformPowerCalibration(long port,VARIANT_BOOL newVal);

**Interface**  
IGuidedCalibration7

**Period Property**

**Description**
Sets the pulse-period (1/PRF) for ALL PNA-X internal pulse generators. The resolution of the period is 16.667nS.

**VB Syntax**
`pulse.Period = value`

**Variable**
- **Type** - Description
  - `pulse` A [PulseGenerator](#) (object)
  - `value` (Double) Pulse period in seconds. Choose a value from about 33ns to about 70 seconds.

**Return Type**
Double

**Default**
1e-3 sec

**Examples**
- `pulse.Period = 1ms 'Write`
- `value = pulse.Period 'Read`

**C++ Syntax**
```cpp
HRESULT get_Period(double* period);
HRESULT put_Period(double period);
```

PhaseOffset Property

Description
Sets the Phase Offset for the active channel.

VB Syntax
meas.PhaseOffset = value

Variable
(meas - Description

(meas - A Measurement (object)

(value - (double) - PhaseOffset in degrees. Choose any number between:
-360 and +360

Return Type
Double

Default
0

Examples
meas.PhaseOffset = 25 'Write
poffset = meas.PhaseOffset 'Read

C++ Syntax
HRESULT get_PhaseOffset(double *pVal)
HRESULT put_PhaseOffset(double newVal)

Interface
IMeasurement
Write/Read

PhaseAsFixture Property

**Description**
Sets and reads the state of phase offset as a fixture with True Mode balanced measurements. Learn more about iTMSA phase and power offset.

**VB Syntax**
```vbnet
balStim.PhaseAsFixture = value
```

**Variable**
- **Type** - Description
  - `balStim` A `BalancedStimulus` (object)
  - `value` (Boolean) State of phase offset as a fixture.
    - **False** Offset is applied but is NOT included as a fixture in the output calculations.
    - **True** Offset is applied and included as a fixture in the output calculations.

**Return Type**
Boolean

**Default**
False

**Examples**
```
balStim.PhaseAsFixture = False 'Write
var = balStim.PhaseAsFixture 'Read
```

**C++ Syntax**
```cpp
HRESULT get_PhaseAsFixture (VARIANT_BOOL *bVal)
HRESULT put_PhaseAsFixture (VARIANT_BOOL bVal)
```

**Interface**
`IBalancedStimulus`

PhaseControlMode Property

**Description**  
Write and read the Phase Control mode for the specified port.

**VB Syntax**  
`phase.PhaseControlMode(srcPort) = value`

**Variable**  
**(Type)** - Description

- **phase**: A `PhaseControl` Object
- **srcPort**: (Long Integer) Source port for which to make phase control settings.
  
  **Note**: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**: (Enum as NAPhaseControlMode) Choose from:
  
  0 - `naPhaseControlOff`  
  Do NOT control the phase of <port>.

  1 - `naPhaseControlParameter`  
  Control the phase of <port>.

  2 - `naPhaseControlPaired`  
  (READ-only) - reference port for a 'controlled' (parameter) Port.

  3 - `naPhaseControlOpenLoop`  
  Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.

**Return Type**  
Enum

**Default**  
0 - `naPhaseControlOff`

**Examples**  
```vbnet
phase.PhaseControlMode 1 = naPhaseControlParameter ' Write

value = phase.PhaseControlMode 2' Read
```

**C++ Syntax**  
```cpp
HRESULT get_PhaseControlMode(long port, enum NAPhaseControlMode* pVal);
HRESULT put_PhaseControlMode(long port, enum NAPhaseControlMode newVal);
```

**PhaseCorrectionData Property**

**Description**
Write and read an array of phase offsets. Each phase offset is summed with each phase point to get new target value. The PNA attempts to set phase for each target value. The number of phase offset values must be the same as the number of data points.

**VB Syntax**
```
phase.PhaseCorrectionData(srcPort) = value
```

**Variable**
(Description)

- **phase**
  A PhaseControl Object

- **srcPort**
  (Long Integer) Source port for which to make phase control settings.

  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**
  (Long values) Phase offset data array.

**Return Type**
Long data array

**Default**
Not Applicable

**Examples**
```
phase.PhaseCorrectionData 1 = 10,11,12 ' Write 3 phase offset values
value = phase.PhaseCorrectionData 2 ' Read
```

**C++ Syntax**
```
HRESULT get_PhaseCorrectionData(long port, long* pVals);
HRESULT put_PhaseCorrectionData(long port, long newVals);
```

Write/Read

PhaseCorrectionEnabled Property

**Description**
Write and read whether to use the phase correction offset array. Use `PhaseCorrectionData` to write or read the offset data.

**VB Syntax**
```
phase.PhaseCorrectionEnabled(srcPort) = value
```

**Variable**
(Length) - Description

- `phase` (A `PhaseControl` Object)
- `srcPort` (Long Integer) Source port for which to make phase control settings.
  
  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- `value` (Boolean) Phase correction array state.
  - `True` – Apply phase correction offset array.
  - `False` – Do NOT apply phase correction offset array.

**Return Type**
Boolean

**Default**
False

**Examples**
```
phase.PhaseCorrectionEnabled 1 = True ' Write
value = phase.PhaseCorrectionEnabled 2 ' Read
```

**C++ Syntax**
```
HRESULT get_PhaseCorrectionEnabled(long port, VARIANT_BOOL* pVal);
HRESULT put_PhaseCorrectionEnabled(long port, VARIANT_BOOL newVal);
```

**Interface**
`IPhaseControl`

# PhaseParameterModes Property

**Description**  
Returns the available phase control modes for the specified port. Use `PhaseControlMode` to set the Phase Control mode.

**VB Syntax**  
```vbnet
phase.PhaseParameterModes(srcPort) = value
```

**Variable**  
**Type** - Description

- `phase`  
  A `PhaseControl` Object

- `srcPort`  
  (Long Integer) Source port for which to make phase control settings.
  
  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- `value`  
  (String) Choose from:
  
  - "Off" - Turn phase control OFF
  - "Openloop" - Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.
  - "Parameter" - Sets and controls the phase of the signal at <port>.
  - "Reference" - Reference port for a controlled (parameter) port. Use `PhaseReferencePort` to set the reference port.

**Return Type**  
String

**Default**  
"Off"

**Example**  
```vbnet
value = phase.PhaseParameterModes 2' Read
```

**C++ Syntax**  
```c++
HRESULT get_PhaseParameterModes(long port, BSTR* pVal);
```

PhaseReferencePort Property

Description
Sets and returns the reference port for the Phase Control measurement.

VB Syntax
`phase.PhaseReferencePort(srcPort) = value`

Variable (Type) - Description

`phase` A PhaseControl Object

`srcPort` (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

`value` (Long Integer) Reference port number. ONLY specific ports are available to be a reference for each source port. Learn more.

Return Type
Long Integer

Default
Depends on the controlled port.

Examples
```
phase.PhaseReferencePort 1 = 3 ' Write
```

```
value = phase.PhaseReferencePort 2 ' Read
```

C++ Syntax
```
HRESULT get_PhaseReferencePort(long port, long* pVal);

HRESULT put_PhaseReferencePort(long port, long newVal);
```

Interface
IPhaseControl

PhaseSwpState Property

Description  Sets and reads the state of phase sweep. Sweep type must be set to CWTime.

VB Syntax  

```
balStim.PhaseSwpState  = value
```

Variable  

- **balStim**  
  A BalancedStimulus (object)
- **value**  
  (Boolean) State of phase sweep.  
  - **False**  
    Phase sweep disabled.  
  - **True**  
    Phase sweep enabled.

Return Type  Boolean

Default  False

Examples  

```
balStim.PhaseSwpState = False  'Write
var = balStim.PhaseSwpState  'Read
```

C++ Syntax  

```
HRESULT get_PhaseSwpState (VARIANT_BOOL *bVal)
HRESULT put_PhaseSwpState (VARIANT_BOOL bVal)
```

Interface  IBalancedStimulus2

PhaseTolerance Property

**Description**  Write and read the tolerance value to be used for background phase sweeps.

**VB Syntax**  
```
phase.PhaseTolerance(srcPort) = value
```

**Variable**  
- **(Type)** - Description
  - **phase**  A `PhaseControl` Object
  - **srcPort**  (Long Integer) Source port for which to make phase control settings.
    - **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).
  - **value**  (Double) Tolerance for background sweeps in degrees. Choose a value between 1 and 5.

**Return Type**  Double

**Default**  5 degrees

**Examples**  
```
phase.PhaseTolerance 1 = 3 ' Write
value = phase.PhaseTolerance 2' Read
```

**C++ Syntax**  
```
HRESULT get_PhaseTolerance(long port, double* pVal);
HRESULT put_PhaseTolerance(long port, double newVal);
```

# Pin Property

**Description**
Returns the Pin result of a PNOP or PSAT marker search.

- PNOP In = Marker 4 X-axis value
- PSAT In = Marker 2 X-axis value

**VB Syntax**
```vbnet
pln = pMark.Pin
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pln</code></td>
<td>(double) Variable to store returned value</td>
</tr>
<tr>
<td><code>pMark</code></td>
<td>A <a href="#">PNOP</a> (object) or <a href="#">PSaturation</a> (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not applicable

**Examples**
```vbnet
pln = pMark.Pin 'Read
```

See example program

**C++ Syntax**
```cpp
HRESULT get_Pin(double * pNewVal)
```

**Interface**
IPNOP or IPSaturation

PinOffset Property

Description
Sets and returns the PinOffset value used to calculate various PNOP parameters. Also set BackOff Property.

A sweep must be executed (single or continuous) and SearchPowerNormalOperatingPoint Method must be sent before reading marker results.

To turn off the PNOP markers, either turn them off individually or DeleteAllMarkers.

To search a User Range with the PNOP search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

VB Syntax
```vbnet
pnop.PinOffset = value
```

Variable
(Type) - Description

- **pnop** (A PNOP (object))
- **value** (double) - PinOffset value in dB. Choose any number between: -500 and 500

Return Type
Double

Default
0 dB

Examples
```vbnet
pinOffs = pnop.PinOffset 'Read
```

See example program

C++ Syntax
```cpp
HRESULT put_PinOffset(double newVal);
HRESULT get_PinOffset(double* pNewVal)
```

Interface
IPNOP
PMaxBackOff Property

**Description**
Sets and returns the backoff value used to calculate various PSAT parameters. A sweep must be executed (single or continuous) and SearchPowerSaturation Method must be sent before reading marker results.

To turn off the PSAT markers, either turn them off individually or DeleteAllMarkers.

To search a User Range with the PSAT search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**VB Syntax**

```
pSat.PMaxBackOff = value
```  

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSat</td>
<td>A PSaturation (object)</td>
</tr>
<tr>
<td>value</td>
<td>(double) - Backoff value in dB. Choose any number between: -500 and 500</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

0 dB

**Examples**

```
backoff = pSat.PMaxBackOff 'Read
```

**C++ Syntax**

```
HRESULT put_PMaxBackOff(double newVal);
HRESULT get_PMaxBackOff(double* pNewVal)
```

**Interface**

IPSaturation

---

Last Modified:

22-Feb-2010  MX New topic
**Description**

Returns the PMaxIn result of a PNOP and PSAT marker search.

\[ \text{PMax In} = \text{Marker 3 X-axis value} \]

**VB Syntax**

\[ p\text{MaxIn} = p\text{Mark}.\text{PMaxIn} \]

**Variable (Type) - Description**

- \( p\text{MaxIn} \) (double) - Variable to store returned value
- \( p\text{Mark} \) A PNOP (object) or PSaturation (object)

**Return Type**

Double

**Default**

Not applicable

**Examples**

\[ p\text{MaxIn} = p\text{Mark}.\text{PMaxIn} \]

### Points Property

**Description**  
Sets group delay aperture using a fixed number of data points.

**VB Syntax**  
`gdAperture.Points = value`

**Variable**  
**Type** - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gdAperture</code></td>
<td>A <code>GroupDelayAperture</code> (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
Points range that equates to 11 points.  
This can be changed to two points with a preference setting.

**Examples**  
```
gdAperture.Points = 25 'Write
aperture = gdAperture.Points 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_Points(double Points *pVal)
HRESULT put_Points(double Points newVal)
```

**PointSweepState Property**

**Description**
Turns point sweep ON or OFF for all measurements on the channel. Point sweep measures both the forward and reverse parameters at each frequency point before stepping to the next frequency. The display trace is updated after the forward and reverse parameters are measured at that frequency point.

**VB Syntax**

```
chan.PointSweepState = state
```

**Variable**

- **chan**  
  A Channel (object)

- **state**  
  boolean

  - **False** - Turns point sweep OFF
  - **True** - Turns point sweep ON

**Return Type**
Boolean

**Default**
False

**Examples**

```
chan.PointSweepState = True 'Write
averg = chan.PointSweepState 'Read
```

**C++ Syntax**

```
HRESULT get_PointSweepState(VARIANT_BOOL *pVal)
HRESULT put_PointSweepState(VARIANT_BOOL newVal)
```

```

### Variable  **(Type)** - Description

- **portExt**: A Port Extension **(object)**
- **value**: **(double)** - Port Extension value in seconds. Choose any number between **-10** and **10**

### Return Type

Double

### Default

0

### Examples

```vbnet
    portExt.Port2 = 10e-6  'Write
    prt2 = portExt.Port2     'Read
```

### C++ Syntax

```cpp
    HRESULT get_Port2(double *pVal)
    HRESULT put_Port2(double newVal)
```

### Interface

IPortExtension
Port3 Property  Superseded

Description  This command is replaced by PortDelay property.
Sets a Port Extension value for Port 3

VB Syntax  
\[ \text{portExt.Port3} = \text{value} \]

Variable  
\- \textbf{(Type)} - \textbf{Description}

portExt  A Port Extension (\textbf{object})

value  (\textbf{double}) - Port Extension value in seconds. Choose any number between \textbf{-10} and \textbf{10}

Return Type  Double

Default  0

Examples  
\text{portExt.Port3} = 10e-6  \textbf{'Write}

\text{prt3} = \text{portExt.Port3}  \textbf{'Read}

C++ Syntax  
\text{HRESULT get\_Port3(double *pVal)}
\text{HRESULT put\_Port3(double new\_Val)}

Interface  IPortExtension
Port1NoiseTunerSwitchPresetsToExternal Property

Description
Sets the default setting for the Noise Tuner switch. Learn more.

VB Syntax
pref.Port1NoiseTunerSwitchPresetsToExternal = bool

Variable
(Type) - Description
pref (Preference (object))
bool (Boolean) - Choose from:
False - Sets the default (preset) to INTERNAL
True - Sets the default (preset) to EXTERNAL

Return Type
Boolean

Default
True

Examples
pref.Port1NoiseTunerSwitchPresetsToExternal = False 'Write
prefer = pref.Port1NoiseTunerSwitchPresetsToExternal 'Read

C++ Syntax
HRESULT put_Port1NoiseTunerSwitchPresetsToExternal(VARIANT_BOOL bValue)
HRESULT get_Port1NoiseTunerSwitchPresetsToExternal(VARIANT_BOOL *bValue)

Interface
IPreferences8

### Port2PdeembedCktModel Property

**Description**  Select whether or not to load a 2-port De-embedding circuit model for the specified port number. Circuit model is applied when both "USER" is selected and the filename is specified. To set the filename, use strPort2Pdeembed_S2PFile Property.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**  
```vb
fixture.Port2PdeembedCktModel(port) = value
```

**Variable**  
- **fixture** *(Type)*: A Fixturing (object)
- **port** *(Integer)*: Port number to receive circuit model.
- **value** *(Enum as NAFixturing2PdeembedCkt)*:  
  0 naFix2PD_USER: load a 2-port De-embedding circuit model  
  1 naFix2PD_NONE: no model

**Return Type**  Long Integer

**Default**  naFix2PD_NONE

**Examples**  
```vb
fixture.Port2PdeembedCktModel(2) = naFix2PD_USER 'Write
value = fixture.Port2PdeembedCktModel(1) 'Read
```

**C++ Syntax**  
```c++
HRESULT get_Port2PdeembedCktModel(short port tagNAFixturing2PdeembedCkt *pVal)
HRESULT put_Port2PdeembedCktModel(short port tagNAFixturing2PdeembedCkt newVal)
```

**Interface**  IFixturing
### Port2PdeembedState Property

**Description**
Turns de-embedding ON or OFF for all ports on the channel.

**VB Syntax**

```vbnet
fixture.Port2PdeembedState = value
```

**Variable**

- **Type** - Description
- **fixture** - A Fixturing (object)
- **value** - (Boolean)
  - **False** - Turns De-embedding OFF
  - **True** - Turns De-embedding ON

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
fixture.Port2PdeembedState = False 'Write
value = fixture.Port2PdeembedState 'Read
```

**C++ Syntax**

```csharp
HRESULT get_Port2PdeembedState(VARIANT_BOOL *pVal)
HRESULT put_Port2PdeembedState(VARIANT_BOOL newVal)
```

**Interface**
IFixturing
### PortArbzImag Property

**Description**
Sets and returns the Imaginary portion of the impedance value for the specified single-ended port. Use `PortArbzReal` to set the real value. Or use `PortArbzZ0` to set both values together.

**VB Syntax**
```
fixture.PortArbzImag(portNum) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td>A Fixturing object</td>
<td></td>
</tr>
<tr>
<td>portNum</td>
<td>Integer</td>
<td>Single-ended port number to receive impedance value.</td>
</tr>
<tr>
<td>value</td>
<td>Double</td>
<td>Real Impedance value. Choose a value between -1E18 and 1E18</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**
```
fixture.PortArbzImag(2) = 75 'Write
value = fixture.PortArbzImag(1) 'Read
```

**C++ Syntax**
```
HRESULT get_PortArbzImag( short portNum, double *pVal)
HRESULT put_PortArbzImag( short portNum, double newVal)
```

**Interface**
IFixturing3
# PortArbzReal Property

**Description** Sets and returns the Real portion of the impedance value for the specified single-ended port. Use `PortArbzImag` to set the imaginary value. Or use `PortArbzZ0` to set both values together.

**VB Syntax**

```vb
fixture.PortArbzReal(portNum) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>A <code>Fixturing</code> (object)</td>
</tr>
<tr>
<td><code>portNum</code></td>
<td>(Integer) Single-ended port number to receive impedance value.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Real Impedance value. Choose a value between 0 to 1E7</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

50

**Examples**

```vb
fixture.PortArbzReal(2) = 75 'Write
value = fixture.PortArbzReal(1) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PortArbzReal( short portNum, double *pVal)
HRESULT put_PortArbzReal( short portNum, double newVal)
```

**Interface**

`IFixturing3`
### PortArbzState Property

**Description**  
Turns Port Impedance ON or OFF for all ports on the channel.

**VB Syntax**  
```
fixture.PortArbzState = value
```

**Variable**  
(Type) - Description

- **fixture**  
  A [Fixturing](#) (object)

- **value**  
  (Boolean)
  - **False** - Turns Port Impedance OFF
  - **True** - Turns Port Impedance ON

**Return Type**  
Boolean

**Default**  
False

**Examples**  
```
fixture.PortArbzState = False 'Write

value = fixture.PortArbzState 'Read
```

**C++ Syntax**  
```
HRESULT get_PortArbzState(VARIANT_BOOL *pVal)
HRESULT put_PortArbzState(VARIANT_BOOL newVal)
```

**Interface**  
IFixturing
**Write/Read**

**PortArbzZ0 Property**

**Description**
Sets and returns the Real portion of the impedance value for the specified single-ended port. The imaginary portion is automatically set to 0.0.

To set both values separately, use `PortArbzReal` and `PortArbzImag`.

**VB Syntax**

```vb
fixture.PortArbzZ0(portNum) = value
```

**Variable**

- `fixture` *(Type)* - Description
  - A `Fixturing` *(object)*

- `portNum` *(Integer)* - Single-ended port number to receive impedance value.

- `value` *(Double)* - Impedance value. Choose a value between 0 to 1E7

**Return Type**

- `Double`

**Default**

- `50`

**Examples**

```vb
fixture.PortArbzZ0(2) = 75 'Write
value = fixture.PortArbzZ0(1) 'Read
```

**C++ Syntax**

```c++
HRESULT get_PortArbzZ0( short portNum, double *pVal)
HRESULT put_PortArbzZ0( short portNum, double newVal)
```

**Interface**

- `IFixturing3`
### PortCatalog Property

**Description**
Returns a comma-separated list of the Output port selections that are available for a given logical input port.

Read the number of input ports for the test set using `NumberOfPorts` Property.

**VB Syntax**
```vbnet
value = tset.PortCatalog(logPort)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>(String) Variable to store the returned information.</td>
</tr>
<tr>
<td><code>tset</code></td>
<td>A <code>TestsetControl</code> object.</td>
</tr>
<tr>
<td><code>logPort</code></td>
<td>(Long) Logical Input port number for which to return valid output ports.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Not Applicable

**Examples**

```vbnet
value = testset1.PortCatalog 2
```

**C++ Syntax**

```cpp
HRESULT get_PortCatalog(long inputPort, BSTR *outPort);
```

**Interface**
`ITestsetControl`

---

**Last Modified:**

18-Jan-2007  Fixed argument
### PortCLogic Property

**Description**
Sets and reads the logic mode of Port C on the AUX IO connector and the Handler IO connector.

*Note:* Port C lines are connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**
```
AuxIO.PortCLogic = value
```

**Variable**

- **AuxIO** *(object)* - A Hardware Aux I/O object

- **value** *(Enum as NaRearPanelIOLogic)* - Choose from:
  - **0 - naPositiveLogic** - The associated data line goes **HIGH** when writing a 1 to a PortC bit.
  - **1 - naNegativeLogic** - The associated data line goes **LOW** when writing a 1 to a PortC bit.

When Port C is in Output/Write mode, a change in logic causes the output lines to change state immediately. For example, Low levels change to High levels.

When Port C is in Input/Read mode, a change in logic will not cause the lines to change, but data read from Port C will reflect the change in logic.

**Return Type**
Enum

**Default**
1 - naNegativeLogic

**Examples**
```
auxIO.PortCLogic = value  'Write
value = auxIo.PortCLogic  'Read
```

**C++ Syntax**
```
HRESULT put_PortCLogic ( tagNARearPanelIOLogic Mode );
HRESULT get_PortCLogic ( tagNARearPanelIOLogic* Mode );
```

**Interface**
IHWAuxIO
PortCMode Property

**Description**
Sets and reads whether Port C is setup for writing or reading data on the AUX IO connector and the Handler IO connector.

**Note:** Port C lines are connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**

```
AuxIO.PortCMode = value
```

**Variable**

* AuxIO *(object) - A Hardware Aux I/O object
* value *(enum as NaPortMode) - Choose from:
  0 - naInput - set the port for reading
  1 - naOutput - set the port for writing

**Return Type**

Enum as NaPortMode

**Default**

1 - naInput

**Examples**

```vbnet
auxIo.get_PortCMode = naInput 'Write
value = auxIo.get_PortCMode 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PordCMode( tagNAPortMode* pMode );
HRESULT put_PordCMode( tagNAPortMode pMode );
```

**Interface**

IHWAuxIO
## PortCoupleToSystemMedia Property

**Description**  
Sets and returns the state of coupling with the system Media type.

**VB Syntax**  
`fixture.PortCoupleToSystemMedia(port)= value`

**Variable** (Type) - Description

- **fixture**  
  A `Fixture` Object

- **port**  
  (Integer) Port Number that will receive the coupling change.

- **value**  
  (Boolean) Coupling state. Choose from:
  - **True** - Media type is coupled with the system setting.
  - **False** - Media type is NOT coupled with the system setting.

**Return Type**  
Boolean

**Default**  
True

**Examples**

- `fixture.PortCoupleToSystemMedia(2)= True`

- `bool = fixture.PortCoupleToSystemMedia(1)`

**C++ Syntax**

- `HRESULT get_PortCoupleToSystemMedia(short portNum, VARIANT_BOOL *pVal);`
- `HRESULT put_PortCoupleToSystemMedia(short portNum, VARIANT_BOOL newVal);`

**Interface**  
`IFixturing4`

PortCoupleToSystemVelocity Property

**Description**
Sets and returns the state of coupling with the system Velocity Factor.

**VB Syntax**
```
fixture.PortCoupleToSystemVelocity (port) = value
```

**Variable** *(Type) - Description*
- **fixture** A Fixturing Object
- **port** (Integer) Port Number that will receive the coupling change.
- **value** (Boolean) Coupling state. Choose from:
  - **True** - Velocity Factor is coupled with the system setting.
  - **False** - Velocity Factor is NOT coupled with the system setting.

**Return Type**
Boolean

**Default**
True

**Examples**
```
fixture.PortCoupleToSystemVelocity(2) = True

bool = fixture.PortCoupleToSystemVelocity(1)
```

**C++ Syntax**
```
HRESULT get_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL *pVal);
HRESULT put_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL newVal);
```

**Interface**

## PortDelay Property

**Description**
Sets and returns the Port Extensions Delay value for the specified port number.

*Note:* This command affects ALL measurements on the channel. This command replaces Port 1, Port 2, Port 3 Properties.

**VB Syntax**
```
fixture.PortDelay(port) = value
```

**Variable (Type) - Description**
- `fixture` A Fixturing (object)
- `port` (Integer) Port number to receive delay value.
- `value` (Double) Delay value in seconds. Choose a value between -1E18 and 1E18.

**Return Type**
Double

**Default**
0

**Examples**
```
fixture.PortDelay(2) = .002 'Write
value = fixture.PortDelay(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_PortDelay(short port double *pVal)
HRESULT put_PortDelay(short port double newVal)
```

**Interface**
IFixturing
PortDescription Property

Description  For each port of the ECal module that is going to be characterized, sets and reads the description of the adapters, cable, or fixture to be included in the user characterization. This description is stored with the characterization in the ECal module.

Set this description before sending Initialize or the default (empty string) will be used.

VB Syntax  
userChar.PortDescription (port)= value

Variable  (Type) - Description

userChar  An ECalUserCharacterizer Object

port  (Enum) ECal port for which description is to be set. Choose from:

1 or naECalPort_A
2 or naECalPort_B
3 or naECalPort_C
4 or naECalPort_D

value  (String) Descriptive text, limited to 24 characters maximum.

Return Type  String

Default  "" (Empty String)

Examples  
userChar.PortDescription (naECalPort_C)= "3.5 mm adapter, SN 00001"

C++ Syntax  
HRESULT get_PortDescription(NAECalPort port, *BSTR description);
HRESULT put_PortDescription(NAECalPort port, BSTR description);

Interface  IECalUserCharacterizer
PortDistance Property

**Description**  Sets and returns the port extension delay in physical length (distance).

**VB Syntax**  
```
fixture.PortDistance (port) = value
```

**Variable (Type) - Description**
- **fixture**  A Fixturing Object
- **port**  (Integer) Port Number that will receive the delay setting.
- **value**  (Double) Physical length in distance. First specify units with `PortDistanceUnit`.

**Return Type**  Double

**Default**  0

**Examples**
```
fixture.PortDistance(2) = .01 'Write
value = fixture.PortDistance(2) 'Read
```

**C++ Syntax**
```
HRESULT get_PortDistance(short portNum, double *pVal);
HRESULT put_PortDistance(short portNum, double newVal);
```

**Interface**  IFixturing4

---

**PortDistanceUnit Property**

**Description**
Sets and returns the units for specifying port extension delay in physical length (distance).

**VB Syntax**
`fixture.PortDistanceUnit = value`

**Variable**
(Type) - Description

- **fixture**
  A Fixturing Object

- **value**
  (enum naDistanceUnit) Choose from:
  - 0 – naDistanceUnit_Meter
  - 1 – naDistanceUnit_Feet
  - 2 – naDistanceUnit_Inch

**Return Type**
Enum

**Default**
naDistanceUnit_Meter

**Examples**

```vbnet
fixture.PortDistanceUnit(2) = naDistanceUnit_Meter 'Write
value = fixture.PortDistanceUnit(2) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PortDistanceUnit(short portNum, tagNADistanceUnit* pVal);
HRESULT put_PortDistanceUnit(short portNum, tagNADistanceUnit newVal);
```

**Interface**
IFixturing4

## PortExtState Property

### Description
Turns Port Extension ON or OFF for all ports on the channel.

### VB Syntax
```
fixture.PortExtState = value
```

### Variable
- **Type:** Description

  - `fixture` A [Fixturing](#) object
  
  - `value` (Boolean)
    
    - **False** - Turns Port Extensions OFF
    - **True** - Turns Port Extensions ON

### Return Type
Boolean

### Default
False

### Examples
```
fixture.PortExtState = 0 'Write

value = fixture.PortExtState 'Read
```

### C++ Syntax
```
HRESULT get_PortExtState(VARIANT_BOOL *pVal)
HRESULT put_PortExtState(VARIANT_BOOL newVal)
```

### Interface
IFixturing
## PortExtUse1 Property

**Description**
Sets and returns the Use1 ON/OFF state for the use of the PortLoss1 and PortFreq1 values for the specified port number.

*Note:* This command affects ALL measurements on the channel.

**VB Syntax**
```
fixture.PortExtUse1(port) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>A <em>Fixturing</em> object</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Port number to receive Use1 ON / OFF state. (Integer)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Boolean) False - Turns Use1 OFF True - Turns Use1 ON</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```
fixture.PortExtUse1(2) = False 'Write
```
```
value = fixture.PortExtUse1(1) 'Read
```

**C++ Syntax**
```
HRESULT get_PortExtUse1(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse1(short port VARIANT_BOOL newVal)
```

**Interface**
`IFixturing`
PortExtUse2 Property

**Description**
Sets and returns the Use2 ON/OFF state for the use of the PortLoss2 and PortFreq2 values for the specified port number.

*Note:* This command affects ALL measurements on the channel.

**VB Syntax**
```
fixture.PortExtUse2(port) = value
```

**Variable - Description**

- **fixture**  A **Fixturing** (object)
- **port** (Integer) Port number to receive Use2 ON / OFF state.
- **value** (Boolean)
  - False - Turns Use1 OFF
  - True - Turns Use1 ON

**Return Type**
Boolean

**Default**
False

**Examples**
```
fixture.PortExtUse2(2) = False 'Write
value = fixture.PortExtUse2(1) 'Read
```

**C++ Syntax**
```
HRESULT get_PortExtUse2(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse2(short port VARIANT_BOOL newVal)
```

**Interface**
IFixturing
**PortFreq1 Property**

**Description**
Sets and returns Frequency1 value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```vbnet
fixture.PortFreq1(port) = value
```

**Variable**
- **(Type) - Description**
  - `fixture` A **Fixturing** (object)
  - `port` (Integer) Port number to receive extrapolated loss.
  - `value` (Double) Frequency1 value. Choose a frequency within the frequency span of the PNA.

**Return Type**
Double

**Default**
1 GHz

**Examples**
```vbnet
fixture.PortFreq1(2) = naFix2PD_USER 'Write
value = fixture.PortFreq1(1) 'Read
```

**C++ Syntax**
```c++
HRESULT get_PortFreq1(short port double *pVal)
HRESULT put_PortFreq1(short port double newVal)
```

**Interface**
IFixturing
## PortFreq2 Property

**Description**
Sets and returns Frequency2 value for the specified port number.

*Note: This command affects ALL measurements on the channel.*

**VB Syntax**

```vbnet
fixture.PortFreq2(port) = value
```

**Variable**

- **fixture** (*Fixturing* object)
- **port** (*Integer*) Port number to receive extrapolated loss.
- **value** (*Double*) Frequency2 value. Choose a frequency within the frequency span of the PNA.

**Return Type**
Double

**Default**
1 GHz

**Examples**

```vbnet
fixture.PortFreq2(2) = 10E9 'Write
value = fixture.PortFreq2(1) 'Read
```

### C++ Syntax

- HRESULT get_PortFreq2(short port double *pVal)
- HRESULT put_PortFreq2(short port double newVal)

**Interface**
IFixturing
### PortLabel Property

**Description**
Sets and returns the label on the calibration kit Port for the calibration wizard.

**VB Syntax**

```vbnet
calKit.PortLabel (portNum) = value
```

**Variable**

- **Type** - Description
  - **calKit** - A CalKit (object)
  - **portNum** - (long integer) - number of the port to be labeled. Choose either 1 or 2
  - **value** - (string) - Label that is visible in the calibration wizard.

**Return Type**
String

**Default**
Depends on the Cal Kit.

**Examples**

```vbnet
calKit.PortLabel = "MyCalKit" 'Write
kitLabel = calKit.PortLabel 'Read
```

**C++ Syntax**

```
HRESULT get_PortLabel(long port, BSTR *pVal)
HRESULT put_PortLabel(long port, BSTR newVal)
```

**Interface**
ICalKit
# PortLogic Property

**Description**
Sets and returns the logic mode of data ports A-H on the Handler I/O connector. Port C of the Handler I/O is connected internally to the Port C of the Aux I/O connector. Therefore, it will have the same logic mode.

**VB Syntax**
```
handler.PortLogic = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>(object) - A Handler I/O object</td>
</tr>
<tr>
<td>value</td>
<td>(enum as NaRearPanelIOLogic) - Choose from:</td>
</tr>
<tr>
<td>0</td>
<td>naPositiveLogic - When a value of one is written, the associated line goes High</td>
</tr>
<tr>
<td>1</td>
<td>naNegativeLogic - When a value of one is written, the associated line goes Low</td>
</tr>
</tbody>
</table>

For ports that are in output (write) mode, a change in logic causes the output lines to change state immediately. For example, Low levels change immediately to High levels.

For ports that are in input (read) mode (C,D,E only), a change in logic will be reflected when data is read from that port. For example, if a line read 0, the next read after a logic change will read 1.

**Return Type**
Long Integer

**Default**
1 - naNegativeLogic

**Examples**
```
handler.PortLogic = value 'Write
value = handler.PortLogic 'Read
```

**C++ Syntax**
```
HRESULT put_PortLogic( tagNARearPanelIOLogic Mode );
HRESULT get_PortLogic( tagNARearPanelIOLogic* Mode );
```

**Interface**
IHWMaterialHandlerIO
**PortLoss1 Property**

**Description**
Sets and returns the Loss1 value for the specified port number.

*Note:* This command affects ALL measurements on the channel.

**VB Syntax**
`fixture.PortLoss1(port) = value`

**Variable**
- **(fixture)** - A Fixturing (object)
- **(port)** - Port number to receive Loss value
- **(value)** - Loss1 value in dB. Choose a value between -90 and 90.

**Return Type**
Double

**Default**
0

**Examples**
`fixture.PortLoss1(2) = .002 'Write`

`value = fixture.PortLoss1(1) 'Read`

**C++ Syntax**

- `HRESULT get_PortLoss1(short port double *pVal)`
- `HRESULT put_PortLoss1(short port double newVal)`

**Interface**
IFxturing
## PortLoss2 Property

**Description**  
Sets and returns the Loss2 value for the specified port number.  

*Note:* This command affects ALL measurements on the channel.

**VB Syntax**  
```vbnet  
fixture.PortLoss2(port) = value  
```

**Variable**  
*Type* - Description  

- `fixture`  
  - **Type:** A `Fixturing` object  
- `port`  
  - **Type:** Integer  
  - Port number to receive Loss value  
- `value`  
  - **Type:** Double  
  - Loss2 value in dB. Choose a value between -90 and 90.

**Return Type**  
Double

**Default**  
0

**Examples**  
```vbnet  
fixture.PortLoss2(2) = .002 'Write  
value = fixture.PortLoss2(1) 'Read  
```

**C++ Syntax**  
```c++  
HRESULT get_PortLoss2(short port double *pVal)  
HRESULT put_PortLoss2(short port double newVal)  
```

**Interface**  
IFixturing
PortLossDC Property

Description
Sets and returns the Loss value at DC for the specified port number.

Learn about Loss compensation values.

Note: This command affects ALL measurements on the channel.

VB Syntax
```
fixture.PortLossDC(port) = value
```

Variable (Type) - Description

| fixture  | A Fixturing (object) |
| port     | (Integer) Port number to receive Loss value at DC. |
| value    | (Double) Loss value in ohms. Choose a value between -90 and 90 |

Return Type
Double

Default
0

Examples
```
fixture.PortLossDC(2) = .002 'Write

value = fixture.PortLossDC(1) 'Read
```

C++ Syntax
```
HRESULT get_PortLossDC(short port double *pVal)
HRESULT put_PortLossDC(short port double newVal)
```

Interface
IFixturing
Write/Read

PortMatching_C Property

Description
Sets and returns the Capacitance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax

`fixture.PortMatching_C(port) = value`

Variable

(Type) - Description

*fixture* A Fixturing (object)

*port* (Integer) Port number to receive capacitance value

*value* (Double) Capacitance value in farads. Choose a value between -1E18 to 1E18.

Return Type
Double

Default
0

Examples

`fixture.PortMatching_C(2) = .00002 'Write`

`value = fixture.PortMatching_C(1) 'Read`

C++ Syntax

HRESULT get_PortMatching_C(short port double *pVal)

HRESULT put_PortMatching_C(short port double newVal)

Interface
IFixturing
PortMatching_G Property

Description
Sets and returns the Conductance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax
   fixture.PortMatching_G(port) = value

Variable (Type) - Description

   fixture (A Fixturing (object))
   port (an Integer) Port number to receive conductance value.
   value (a Double) Conductance value in siemens. Choose a value between -1E18 and 1E18.

Return Type
Double

Default
0

Examples
   fixture.PortMatching_G = .002 'Write
   value = fixture.PortMatching_G 'Read

C++ Syntax
   HRESULT get_PortMatching_G(short port double *pVal)
   HRESULT put_PortMatching_G(short port double newVal)

Interface
IFixturing
PortMatching_L Property

Description
Sets and returns the Inductance value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax
fixture.PortMatching_L(port) = value

Variable (Type) - Description
fixture A Fixturing (object)
port (Integer) Port number to receive inductance value
value (Double) Inductance value in henries. Choose a value between -1E18 and 1E18.

Return Type
Double

Default
0

Examples
fixture.PortMatching_L = .002 'Write
value = fixture.PortMatching_L 'Read

C++ Syntax
HRESULT get_PortMatching_L(short port double *pVal)
HRESULT put_PortMatching_L(short port double newVal)

Interface
IFixturing
## PortMatching_R Property

### Description
Sets and returns the Resistance value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

### VB Syntax
`fixture.PortMatching_R(port) = value`

### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>Fixturing (object)</td>
<td></td>
</tr>
<tr>
<td><code>port</code></td>
<td>Integer</td>
<td>Port number to receive resistance value.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Double</td>
<td>Resistance value in ohms. Choose a value between -1E18 and 1E18.</td>
</tr>
</tbody>
</table>

### Return Type
Double

### Default
0

### Examples
```vbnet
fixture.PortMatching_R = .1 'Write
value = fixture.PortMatching_R 'Read
```

### C++ Syntax

```cpp
HRESULT get_PortMatching_R(short port double *pVal)
HRESULT put_PortMatching_R(short port double newVal)
```

### Interface
`IFixturing`
**PortMatchingCktModel Property**

**Description**
Sets and returns the Port Matching circuit model for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```vbnet
fixture.PortMatchingCktModel(port) = value
```

**Variable**
- **Type** - Description
  - `fixture` A **Fixturing** (object)
  - `port` (Integer) Port number to receive circuit model.
  - `value` (Enum as **NAFixturingPortMatchCkt**) Circuit model. Choose from
    - 0 `naFixPMC_SLPC` Series L - Parallel C
    - 1 `naFixPMC_PCSL` Parallel C - Series L
    - 2 `naFixPMC_PLSC` Parallel L - Series C
    - 3 `naFixPMC_SCPL` Series C - Parallel L
    - 4 `naFixPMC_PLPC` Parallel L - Parallel C
    - 5 `naFixPMC_USER` Load S2P file - also set filename to load with **strPortMatch_S2PFile Property**
    - 6 `naFixPMC_NONE` No circuit model

**Return Type**
Long Integer

**Default**
`naFixPMC_NONE`

**Examples**
```vbnet
fixture.PortMatchingCktModel(2) = naFixPMC_PLSC 'Write
value = fixture.PortMatchingCktModel(1) 'Read
```

**C++ Syntax**
```c
HRESULT get_PortMatchingCktModel(short port tagNAFixturingPortMatchCkt *pVal)
HRESULT put_PortMatchingCktModel(short port  tagNAFixturingPortMatchCkt newVal)
```

**Interface**
IFixturing
PortMatchingState Property

Description
Sets and returns the Port Matching State on the channel.

VB Syntax
```
fixture.PortMatchingState = value
```

Variable (Type) - Description

- `fixture` A Fixturing (object)
- `value` (boolean)
  - `True` - Turns Port Matching ON
  - `False` - Turns Port Matching OFF

Return Type
Boolean

Default
False

Examples
```
fixture.PortMatchingState = True 'Write
value = fixture.PortMatchingState 'Read
```

C++ Syntax
```
HRESULT get_PortMatchingState(VARIANT_BOOL *pVal)
HRESULT put_PortMatchingState(VARIANT_BOOL newVal)
```

Interface
IFixturing
PortMedium Property

**Description**  Sets and returns the media type of the added fixture or transmission line.

**VB Syntax**  

```vbnet
fixture.PortMedium (port)= value
```

**Variable**  

- **Type**  - Description

  - **fixture**  - A Fixturing Object
  - **port**  - (Integer) Port Number for which media type is being set.
  - **value**  - (enum NACalStandardMedium) - Medium of the transmission line of the standard. Choose from:
    - 0 - naCoax - Coaxial Cable
    - 1 - naWaveGuide - Waveguide

**Return Type**  Enum

**Default**  0 - naCoax

**Examples**  

```vbnet
fixture.PortMedium(2)= naCoax 'Write
value = fixture.PortMedium(2) 'Read
```

**C++ Syntax**  

```cpp
HRESULT get_PortMedium(short portNum, tagNACalStandardMedium* pVal);
HRESULT put_PortMedium(short portNum, tagNACalStandardMedium newVal);
```

**Interface**  IFixturing4

PortMode Property

Description
Sets and returns whether Port C or Port D is used for writing or reading data on the Handler IO connector. The Handler IO Port C is connected internally to the Port C of the Aux IO connector. Therefore, the Aux IO connector will have the same input/output mode.

VB Syntax
`handler.PortMode (port) = value`

Variable (Type) - Description
- `handler` (object) - A Handler I/O object
- `port` (enum as NAMatHandlerPort) Port to be changed. Choose from:
  - 2 - naPortC
  - 3- naPortD
- `value` (enum as NaPortMode) - Choose from:
  - 0 - naInput - set the port for reading
  - 1 - naOutput - set the port for writing

Return Type
Long Integer

Default
1 - naInput

Examples
```vbnet
handler.PortMode(naPortC) = naInput 'Write
value = handler.PortMode(naPortD) 'Read
```

C++ Syntax
```cpp
HRESULT put_PortMode ( tagNAMatHandlerPort Port, tagNAPortMode Mode );
HRESULT get_PortMode ( tagNAMatHandlerPort Port, tagNAPortMode* Mode );
```

Interface
IHWMaterialHandlerIO
PortsNeedingDeltaMatch Property

Description
Returns the port numbers for which delta match correction is required. 0 (zero) is returned if the Cal does NOT require Delta Match correction for one of the following reasons:

- The Cal does NOT involve Unknown Thru or TRL. You specify this using ThruCalMethod Property.
- The Cal DOES involve Unknown Thru or TRL, but the delta match data can be calculated by the Unknown Thru or TRL Cal. Learn how this is possible. However, you can force the Cal to use the Delta Match data from a Cal Set.

VB Syntax
value = guided.PortsNeedingDeltaMatch

Variable (Type) - Description
value (Variant) Variable to store the returned list of port numbers.

guided GuidedCalibration (object)

Return Type Variant

Default Not Applicable

Examples
Dim ports As Variant
ports = guided.PortsNeedingDeltaMatch

C++ Syntax
HRESULT get_PortsNeedingDeltaMatch (VARIANT* portList);

Interface IGuidedCalibration2
## PortVelocityFactor Property

**Description** Sets and returns the Port Extensions Velocity Factor value for the specified port number.  

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**

```
fixture.PortVelocityFactor(port) = value
```

**Variable**

- **(Type) - Description**
  - `fixture` A Fixturing (object)
  - `port` (Integer) Port number to receive velocity factor value.
  - `value` (Double) Velocity Factor value. Choose a number between: 0 and 10  
  
  - (.66 polyethylene dielectric; .7 PTFE dielectric)

**Return Type** Double

**Default** 1

**Examples**

```
fixture.PortVelocityFactor(2) = .6 'Write
value = fixture.PortVelocityFactor(1) 'Read
```

**C++ Syntax**

```
HRESULT get_PorVelocityFactor(short port double *pVal)
HRESULT put_PorVelocityFactor(short port double newVal)
```

**Interface** IFixturing4

About Port Extensions

PortWGCT cutoffFreqProperty

Description
Sets and returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

VB Syntax

`fixture.PortWGCT cutoffFreq(port) = value`

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td>A Fixturing Object</td>
<td></td>
</tr>
<tr>
<td>port</td>
<td>(Integer) Port Number for which media type is being set.</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>(Double) Cutoff frequency in Hz.</td>
<td></td>
</tr>
</tbody>
</table>

This value is ignored when PortMedium Property is set to COAX for the same port.

Return Type
Double

Default
System Media Cutoff Frequency

Examples

`fixture.PortWGCT cutoffFreq(2) = 1e9`  'Write

`value = fixture.PortWGCT cutoffFreq(2)`  'Read

C++ Syntax

`HRESULT get_PortWGCT cutoffFreq(short portNum, double *pVal);`
`HRESULT put_PortWGCT cutoffFreq(short portNum, double newVal);`

Interface IFixturing4

### POut Property

**Description**
Returns the POut result of the PNOP or PSAT marker search.

- PSAT Out = Marker 2 Y-axis value
- PNOPOut = Marker 4 Y-axis value

**VB Syntax**

```vb
pOut = pMark.POut
```

**Variable**

- **Type**
- **Description**
  - `pOut` (double) - Variable to store returned value
  - `pMark` - A PNOP (Object) or PSaturation (Object)

**Return Type**
Double

**Default**
Not applicable

**Examples**

```
'Read
pOut = pMark.POut

See example program
```

**C++ Syntax**

```cpp
HRESULT get_POut(double* pNewVal)
```

**Interface**
IPNOP or IPSaturation

## PowerSlope Property

**Description**
Sets or returns the Power Slope value. Power Slope function increases or decreases the output power over frequency. Units are db/GHz. For example: PowerSlope = 2 will increase the power 2db/1GHz.

**VB Syntax**

```
object.PowerSlope = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object</code></td>
<td>Channel (object)</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>CalSet (object) - Read-only property</td>
</tr>
</tbody>
</table>

**Value**

(double) - Power Slope. Choose any number between -2 and 2. 
No slope = 0

**Return Type**

Double

**Default**

0

**Examples**

```
chan.PowerSlope = 2  'Write
pwrslp = chan.PowerSlope  'Read
```

**C++ Syntax**

```
HRESULT get_PowerSlope(double *pVal)
HRESULT put_PowerSlope(double newVal)
```

**Interface**

IChannel
CalSet3
PowerAcquisitionDevice Property

**Description**
Returns the power sensor channel (A or B) that is currently selected for use at a specific frequency.

If **UsePowerSensorFrequencyLimits** is set to False, this property will return the sensor channel last used for a source power calibration. This setting corresponds to the **Use this sensor only** checkbox in the **Power Sensor Settings** dialog.

When performing an SMC calibration, use **SetPowerAcquisitionDevice Method** to set the power sensor channel.

**VB Syntax**
```
sensor = pwrCal.PowerAcquisitionDevice(dFreq)
```

**Variable** *(Type)* - Description

**sensor** *(enum NAPowerAcquisitionDevice)* The currently selected sensor channel for the specified frequency. Choose from:
- 0 – naPowerSensor_A
- 1 – naPowerSensor_B

**pwrCal** A SourcePowerCalibrator (object)

**dFreq** (double) Frequency (Hz) for the power reading of interest.

**Return Type** enum NAPowerAcquisitionDevice

**Default** Not Applicable

**Examples**
```
selectedSensor = pwrCal.PowerAcquisitionDevice(1.E9) 'Write
```

**C++ Syntax**
```
HRESULT get_PowerAcquisitionDevice(double dFreq, tagNAPowerAcquisitionDevice* enumAcqDevice);
```

**Interface** ISourcePowerCalibrator2
**PowerAsFixture Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and reads the state of power offset as a fixture with True Mode balanced measurements. <a href="#">Learn more about iTMSA power and power offset.</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>balStim.PowerAsFixture = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>
</tr>
<tr>
<td><code>balStim</code></td>
<td>A <code>BalancedStimulus</code> (object)</td>
</tr>
</tbody>
</table>
| `value`     | **(Boolean)** State of power offset as a fixture.  
**False** Offset is applied but is NOT included as a fixture in the output calculations.  
**True** Offset is applied and included as a fixture in the output calculations. |
| Return Type | Boolean                                                                                                                         |
| Default     | False                                                                                                                          |
| Examples    | `balStim.PowerAsFixture = False` **Write**                                                                                      |
|             | `var = balStim.PowerAsFixture` **Read**                                                                                         |
| C++ Syntax  | HRESULT `get_PowerAsFixture (VARIANT_BOOL *bVal)`  
HRESULT `put_PowerAsFixture (VARIANT_BOOL bVal)`                                                                 |
| Interface   | IBalancedStimulus                                                                                                               |

**PowerCalibrationLevel Property**

**Description**  
Set and read the power level at which to perform the source cal during an Enhanced Power Cal or during the power cal portion of some Noise Figure Cals.

**VB Syntax**  
`object.PowerCalibrationLevel (port) = value`

**Variable (Type) - Description**

*object A GuidedCalibration (Object)*

*port (Long) PNA Port number to connect the power sensor.*

*value (Double) - Power level in dB. Choose a value from +30 to (-30).*

**Return Type**  
Double

**Default**  
0

**Examples**

```vbnet
cal.PowerCalibrationLevel(1) = -5 'Write
pLevel = nfx.PowerCalibrationLevel(1) 'Read
```

See enhanced power cal example

**C++ Syntax**

```c++
HRESULT get_PowerCalibrationLevel(long port, double* pVal)
HRESULT put_PowerCalibrationLevel(long port, double* pVal)
```

**Interface**

IGuidedCalibration6

PowerMax Property

**Description**
Sets and returns the maximum power level for Safe Mode.

**VB Syntax**
```
RxLevel.PowerMax(srcPort) = value
```

**Variable**
- **RxLevel**: A `ReceiverLeveling` Object
- **srcPort**: (Long Integer) Source port for which to set the max power for Receiver Leveling.
- **value**: (Double) Maximum power level in dB.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Return Type**
(Double)

**Default**
+ 30

**Examples**
```
rxLevel.PowerMax (1) = 25 ' Write

value = rxLevel.PowerMax 2' Read
```

**C++ Syntax**
```
HRESULT get_PowerMax(long port, double* pVal);
HRESULT put_PowerMax(long port, double newVal);
```

PowerMaxIn
PowerMaxOut
PowerMeterChannel Property

Description  Identifies which channel of the power meter the power sensor is connected to.

VB Syntax  

\[
\text{chan} = \text{powerSensor}.\text{PowerMeterChannel}
\]

Variable  (Type) - Description

\[
\text{chan} \quad \text{(enum NAPowerAcquisitionDevice)}
\]

– Power meter channel identifier for sensor.

Choose from:

\[
\begin{align*}
0 & \quad \text{naPowerSensor}_A \\
1 & \quad \text{naPowerSensor}_B
\end{align*}
\]

\[
\text{pwrSensor} \quad \text{A PowerSensor (Object) or A PowerSensorAsReceiver (Object)}
\]

Return Type  NAPowerAcquisitionDevice

Default  Not Applicable

Examples  

\[
\text{meterChannel} = \text{pwrSensor}.\text{PowerMeterChannel}
\]

C++ Syntax  

\[
\text{HRESULT PowerMeterChannel(tagNAPowerAcquisitionDevice *pSensor)};
\]

Interface  

IPowerSensor

IPowerSensorAsReceiver

Last Modified:

25-Aug-2009  Added PMAR
PowerMeterGPIBAddress Property  Superseded

Description  This command is replaced with PowerMeterInterface Object. Specifies the GPIB address of the power meter that will be referenced by the SourcePowerCalibrator object.

When performing a source power cal, the PNA will search VISA interfaces that are configured in the Agilent IO Libraries on the PNA.

VB Syntax

`powerCalibrator.PowerMeterGPIBAddress = value`

Variable (Type) - Description

`powerCalibrator (object) - A SourcePowerCalibrator (object)`

`value (long integer) – Power meter GPIB address. Choose any number between 0 and 30.`

Return Type  Long integer

Default  13

Examples

Set `powerCalibrator = pna.SourcePowerCalibrator`
`powerCalibrator.PowerMeterGPIBAddress = 13` 'Write

`pwrMtrAddress = powerCalibrator.PowerMeterGPIBAddress` 'Read

C++ Syntax

HRESULT put_PowerMeterGPIBAddress(long newVal);
HRESULT get_PowerMeterGPIBAddress(long *pVal);

Interface  ISourcePowerCalibrator

Last Modified:

9-Jul-2007  Superseded
PowerMin Property

**Description**
Sets and returns the minimum power level for Safe Mode.

**VB Syntax**
```
RxLevel.PowerMin(srcPort) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RxLevel</td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td>srcPort</td>
<td>(Long Integer) Source port for which to set the min power for Receiver Leveling.</td>
</tr>
</tbody>

### PowerOffset Property

**Description**
Sets and returns the power level offset value.

**VB Syntax**
```
RxLevel.PowerOffset(srcPort) = value
```

**Variable (Type) - Description**

- **RxLevel**: A `ReceiverLeveling` Object
- **srcPort**: (Long Integer) Source port for which to set the offset power for Receiver Leveling.
  - **Note**: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).
- **value**: (Double) Power level Offset in dB.

**Return Type**
(Double)

**Default**
0 dB

**Examples**
```
rxLevel.PowerOffset (1) = 10 ' Write
value = rxLevel.PowerOffset 2' Read
```

**C++ Syntax**
```
HRESULT get_PowerOffset(long port, double* pVal);
HRESULT put_PowerOffset(long port, double newVal);
```

# PowerOnDuringRetraceMode Property

## Description
For single-band frequency or segment sweeps ONLY, specify whether to turn RF power ON or OFF during a retrace.

This setting remains until changed using this command, or until the hard drive is changed or reformatted.

## VB Syntax
```
pref.PowerOnDuringRetraceMode = value
```

## Variable
- **Type**: A Preferences (object)
- **Description**:

## Value
- **Type**: Enum
- **Choose from**:
  - **0 - naRetracePowerMode_Auto**: Power is left ON during retrace of single-band frequency or segment sweeps ONLY.
  - **1 - naRetracePowerMode_OFF**: Power is turned OFF during retrace of single-band frequency or segment sweeps ONLY.

## Return Type
- **Type**: Enum
- **Default**: 0 - naRetracePowerMode_Auto

## Examples
```
pref.PowerOnDuringRetraceMode = naPowerSweepRetraceMode_Start 'Write
psMode = pref.naPowerOnDuringRetraceMode_Start 'Read
```

## C++ Syntax
```
HRESULT get_PowerOnDuringRetraceMode (tagNARetracePowerMode* preference);
HRESULT put_PowerOnDuringRetraceMode (tagNARetracePowerMode val)
```

## Interface

### PowerSensorCalKitType Property

**Description**
Set and read the cal kit to be used for calibrating at the reference plane when the power sensor connector is different from the DUT port.

When used with Guided Power Cal, first enable a power cal using `PerformPowerCalibration` Property.

**VB Syntax**

```vbnet
object.PowerSensorCalKitType (n) = value
```

**Variable**

- **(Type)** - Description

  - **object**
    - A GuidedCalibration (object)
  - **n** (Long) PNA port number for which cal kit is specified.
  - **value** (String) - Cal Kit. Use `CompatibleCalKits Property` to return a list of valid cal kits.

**Return Type**

String

**Default**

Not Applicable

**Examples**

```vbnet
gguided.PowerSensorCalKitType(1) = "85052B"  'Write
cType = guided.PowerSensorCalKitType(1)  'Read
```

**C++ Syntax**

```cpp
HRESULT get_PowerSensorCalkitType(long port, BSTR* Val)
HRESULT put_PowerSensorCalkitType(long port, BSTR  newVal)
```

**PowerStep Property**

**Description**
Sets and returns the safe mode power step value.

**VB Syntax**
\[ RxLevel.PowerStep(srcPort) = value \]

**Variable**
*(Type)* - Description

- **RxLevel**
  A ReceiverLeveling Object

- **srcPort**
  (Long Integer) Source port for which to set the power step for Receiver Leveling.

  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**
  (Double) Power step in dB.

**Return Type**
(Double)

**Default**
1 dB

**Examples**

```
rxLevel.PowerStep (1) = 2 ' Write

value = rxLevel.PowerStep 2 ' Read
```

**C++ Syntax**

```cpp
HRESULT get_PowerStep(long port, double* pVal);
HRESULT put_PowerStep(long port, double newVal);

### PreciseTuningTolerance Property

**Description**
Sets and returns the tuning tolerance for precise tuning.

**VB Syntax**
```
obj.PreciseTuningTolerance = value
```

**Variable**
- **(Type)** - Description
  - `obj` An [EmbeddedLO](#) (object) or a [ConverterEmbeddedLO](#) (object)
  - `value` (Double) Tuning tolerance in Hz.

**Return Type**
(Double)

**Default**
1 Hz

**Examples**
- `embedLO.PreciseTuningTolerance = .5` 'write
- `value = embedLO.PreciseTuningTolerance` 'read

**C++ Syntax**
```
HRESULT get_PreciseTuningTolerance(double* tolerance);
HRESULT put_PreciseTuningTolerance(double tolerance);
```

**Interface**
IEembeddedLO

---

**Last Modified:**
- 12-Aug-2009  Added ConvEmbedLO object
- 18-Apr-2007  MX New topic
**PreferInternalTriggerOnChannelSingle Property**

**Description**
Set and read the preference for the `chan.Single` trigger behavior. This setting persists until changed.

These preferences are important when performing a Guided calibration, as the PNA uses the `chan.Single` trigger command to measure standards.

- set `PreferInternalTriggerOnChannelSingle = False` to use an External trigger sweep to measure a cal standard.
- set `PreferInternalTriggerOnChannelSingle = True` to use an External sweep for the measurement, but rely on the PNA to send Internal trigger signals for calibrating.

To set this preference for an **Unguided** Calibration, use `PreferInternalTriggerOnUnguidedCal Property`.

The `chan.Single` trigger command NEVER respects the Trigger Source = Manual setting. It always switches to Internal for one trigger, then back to Manual, regardless of this preference command.

**VB Syntax**

```
pref.PreferInternalTriggerOnChannelSingle = bool
```

**Variable (Type) - Description**

- **pref**
  A Preferences (object)

- **bool** (Boolean) - Choose from:
  
  - 0 - False - the Single trigger property does respect the Trigger Source = External setting. For example, if Trigger source = External, the single trigger method will wait for the External trigger signal and then allow only one sweep.

  - 1 - True - the Single trigger command does NOT respect the Trigger Source = External setting. For example, when the Single method is sent, the PNA immediately switches to Internal sweep, responds to one trigger signal, then switches back to External.

**Return Type**
Boolean

**Default**
0 - False

**Examples**

```
pref.PreferInternalTriggerOnChannelSingle = False 'Write
prefer = pref.PreferInternalTriggerOnChannelSingle 'Read
```

**C++ Syntax**

```
HRESULT put_PreferInternalTriggerOnChannelSingle( VARIANT_BOOL bprefSingle)
HRESULT get_PreferInternalTriggerOnChannelSingle( VARIANT_BOOL *bprefSingle)
```

**Interface**
IPreferences2
### PreferInternalTriggerOnUnguidedCal Property

**Description**  
Set and read the preference for the trigger behavior when performing an Unguided calibration.

**VB Syntax**  
`pref.PreferInternalTriggerOnUnguidedCal = bool`

**Variable (Type) - Description**

- **pref**  
  A `Preferences` (object)

- **bool**  
  (Boolean) - Choose from:

  **0 - False** - The trigger behavior during an Unguided calibration DOES respect the setting of the `Trigger source` command. For example, during an Unguided Cal, when Trigger source = External, the PNA will wait for the External trigger signal and then allow only one sweep.

  **1 - True** - The trigger behavior during an Unguided calibration does NOT respect the `Trigger Source = External` setting. For example, during an Unguided Cal, when Trigger source = External, the PNA immediately switches to Internal sweep, measures the standard with one trigger signal, then switches back to External trigger.

**Note:** When Trigger Source = Manual during a calibration, the PNA ALWAYS switches to Internal for one trigger to measure a standard, then back to Manual, regardless of this preference command.

**Return Type**  
Boolean

**Default**  
0 - False

**Examples**

- `pref.PreferInternalTriggerOnUnguidedCal = False` 'Write

- `prefer = pref.PreferInternalTriggerOnUnguidedCal` 'Read

**C++ Syntax**

- `HRESULT put_PreferInternalTriggerOnUnguidedCal( VARIANT_BOOL bprefUnguided)`
- `HRESULT get_PreferInternalTriggerOnUnguidedCal( VARIANT_BOOL *bprefUnguided)`

**Interface**  
`IPreferences2`
PresetPowerState Property

Description  Set and return the Preset Power ON/OFF state.

VB Syntax  \texttt{pref.PresetPowerState = value}

Variable  
\begin{itemize}
  \item \texttt{pref} A Preferences (object)
  \item \texttt{value} (Enum as NAPowerStates) - Choose from:
    \begin{itemize}
      \item \texttt{naPowerON (0)} - Instrument Preset always turns RF power ON.
      \item \texttt{naPowerAUTO (1)}: \hspace{1cm}
        \begin{itemize}
          \item When the current power setting is OFF, leave power OFF at Preset.
          \item When the current power setting is ON, turn power ON at Preset.
        \end{itemize}
    \end{itemize}
\end{itemize}

Return Type  enum

Default  naPowerON (0)

Examples  \texttt{pref.PresetPowerState = naPowerON } \texttt{ 'Write}
\texttt{pwrState = pref.PresetPowerState } \texttt{ 'Read}

C++ Syntax  HRESULT get_PresetPowerState(tagNAPowerStates* pVal);
HRESULT put_PresetPowerState(tagNAPowerStates pVal);

Interface  IPreferences11

rangeNumber Property

Description
Returns the index number of the range within the FOM collection.

VB Syntax
value = FOMRange.rangeNumber

Variable (Type) - Description
value (Long) - Variable to store the returned range number.

object An FOMRange (object)

Return Type
Long

Default
Not Applicable

Examples
num = fomRange.rangeNumber 'Read

C++ Syntax
HRESULT get_rangeNumber(long *pVal)

Interface
IFOMRange
RatioedPowerCorrectionData Property

**Description**  
Write and read an array of ratioed power offsets. This allows the setting of arbitrary impedance, which is used for active load applications. The number of offset values must be the same as the number of data points. Use [RatioedPowerCorrectionEnabled](#) to use the offset values.

**VB Syntax**  
`phase.RatioedPowerCorrectionData(srcPort) = value`

**Variable**  
- **(Type)** - Description
  - `phase`  
    A [PhaseControl](#) Object
  - `srcPort`  
    (Long Integer) Source port for which to make phase control settings.
    **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)
  - `value`  
    (Long values) Ratioed amplitude offset data array.

**Return Type**  
Long data array

**Default**  
Not Applicable

**Examples**  
```
phase.RatioedPowerCorrectionData 1 = .1,.2,.3 ' Write 3 power offset values
value = phase.RatioedPowerCorrectionData 2' Read
```

**C++ Syntax**  
```c++
HRESULT get_RatioedPowerCorrectionData(long port, long* pVals);
HRESULT put_RatioedPowerCorrectionData(long port, long newVals);
```

**Interface**  
IPhaseControl

Write/Read

RatioedPowerCorrectionEnabled Property

Description
Write and read whether to use the ratioed power offset array. Use RatioedPowerCorrectionData Property to write or read the offset data.

VB Syntax
\[ \text{phase.RatioedPowerCorrectionEnabled}(\text{srcPort}) = \text{value} \]

Variable (Type) - Description

\textit{phase} \hspace{1cm} \text{A PhaseControl Object}

\textit{srcPort} \hspace{1cm} \text{(Long Integer) Source port for which to make phase control settings.}

\textbf{Note:} If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use \textit{chan.getPortNumber} to translate the string into a port number. To learn more see \text{Remotely Specifying a Source Port}

\textit{value} \hspace{1cm} \text{(Boolean) Ratioed power offset array state.}

\textbf{True} – Apply offset array.

\textbf{False} – Do NOT apply offset array.

Return Type
Boolean

Default
False

Examples
\textit{phase.RatioedPowerCorrectionEnabled 1 = True} ' Write

\textit{value = phase.RatioedPowerCorrectionEnabled 2} ' Read

C++ Syntax
\begin{verbatim}
HRESULT get_RatioedPowerCorrectionEnabled(long port, VARIANT_BOOL* pVal);
HRESULT put_RatioedPowerCorrectionEnabled(long port, VARIANT_BOOL newVal);
\end{verbatim}

Interface
IPhaseControl

R1InputPath Property

**Description**

PNA models with option 081, and all PNA-X models, have a switch in the test set that allows access to the port 1 reference receiver through the front panel Reference 1 connectors. This command throws that switch between the internal path to the receiver, or through the external connectors.

See other Frequency Offset properties.

**VB Syntax**

```vbnet
chan.R1InputPath = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>A Channel (object)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Enum as naInputPath) - Choose from:naPathInternal - (0) - internal path to the reference receiver naPathExternal (1) - path through external connectors</td>
</tr>
</tbody>
</table>

**Return Type**

Enum

**Default**

naPathInternal - (0)

**Examples**

```vbnet
chan.R1InputPath = naPathInternal 'Write
```

```vbnet
Inpath = chan.R1InputPath 'Read
```

**C++ Syntax**

```cpp
HRESULT get_R1InputPath (tag NAInputPath *pPath);
HRESULT put_R1InputPath (tag NAInputPath newPath);
```

**Interface**

IChannel2

ReadingsPerPoint Property

This command, along with ReadingsTolerance, allows for settling of the power sensor READINGS. Specifies the maximum number of power readings that are taken at each stimulus point to allow for power meter settling. Each reading is averaged with the previous readings at that stimulus point. When this average meets the ReadingsTolerance value or this number of readings has been made, the average is returned as the valid reading.

**VB Syntax**

\[ \text{pwrSensor.ReadingsPerPoint} = \text{value} \]

**Variable**

* (Type) - Description

- \( pwrCal \) A SourcePowerCalibrator (Object) or A PowerSensorAsReceiver (Object)
- \( \text{value} \) (long integer) – Number of power readings. Choose any number between 3 and 100.

**Return Type**

Long Integer

**Default**

3

**Examples**

\[ \text{pwrSensor.ReadingsPerPoint} = 3 \] 'Write
\[ \text{numReadings} = \text{pwrSensor.ReadingsPerPoint} \] 'Read

**C++ Syntax**

HRESULT put_ReadingsPerPoint(long newVal);
HRESULT get_ReadingsPerPoint(long *pVal);

**Interface**

ReadingsTolerance Property

**Description**  
This command, along with ReadingsPerPoint Property allows for settling of the power sensor READINGS. Each power reading is averaged with the previous readings at each stimulus point. When the average meets this tolerance value or the maximum ReadingsPerPoint has been made, the average is returned as the valid reading.

**VB Syntax**  
pwrSens.ReadingsTolerance = value

**Variable**  
**Type** - Description

- **pwrCal**  
  A SourcePowerCalibrator (Object) or A PowerSensorAsReceiver (Object)

- **value**  
  **(Double)** – Power meter settling tolerance value in dB. Choose any number between 0 and 5.

**Return Type**  
Double

**Default**  
.05 dB

**Examples**  
pwrSens.ReadingsTolerance = .1 'Write
ReadTol = pwrSensor.ReadingsTolerance 'Read

**C++ Syntax**  
HRESULT get_ReadingsTolerance( double *pVal);
HRESULT put_ReadingsTolerance( double newVal);

## ReadyForTriggerPolarity Property

**Description**
Specifies the polarity of Ready for Trigger output.

All existing Ready for Trigger outputs for PNA-X and PNA-L models are configured simultaneously with this command. [See Capabilities Summary.](#)

The Ready for Trigger polarity can NOT be configured for E836x models.

**VB Syntax**

```vbnet
trigsetup.ReadyForTriggerPolarity = value
```

**Variable**

- **Type**: Description

  - `trigsetup` A [TriggerSetup](object) (object)
  - `value` [Enum as NALevel](#)

  Choose from:

  - **0 - naLow**: Outputs a TTL low when the PNA is ready for trigger.
  - **1 - naHigh**: Outputs a TTL high when the PNA is ready for trigger.

**Return Type**
Enum

**Default**

- **0 - naLow**

**Examples**

```vbnet
trigsetup.ReadyForTriggerPolarity = naLow  'Write
pol = trigsetup.ReadyForTriggerPolarity  'Read
```

**C++ Syntax**

```cpp
HRESULT get_ReadyForTriggerPolarity(tagNALevel *pVal);
HRESULT put_ReadyForTriggerPolarity(tagNALevel newVal);
```

**Interface**

About the Handler I/O Connector

ReadyForTriggerState Property

Description: Determines the control of Material Handler connector Pin 21.

VB Syntax: `handler.ReadyForTriggerState = value`

Variable: (Type) - Description

`handler` (object) - A Handler I/O object

`value` (boolean)
False - Pin 21 is controlled by Output Port B7
True - Pin 21 is controlled by the Ready for Trigger signal

Return Type: Boolean

Default: False

Examples: `handler.ReadyForTriggerState = False` 'Write
`bState = handler.ReadyForTriggerState` 'Read

C++ Syntax: `HRESULT put_ReadyForTriggerState (BOOL *pVal);`
`HRESULT get_ReadyForTriggerState (BOOL newVal);`

Interface: IHWMaterialHandlerIO2
## ReceiverAttenuator Property

**Description**
Sets or returns the value of the specified receiver attenuator control.

**VB Syntax**

```vbnet
object.ReceiverAttenuator(rec) = value
```

**Variable**

- **object**
  - Channel *(object)*
  - or
  - CalSet *(object)* - Read-only property

- **rec** *(long integer)* - Receiver with attenuator control to be changed. Choose from any of the available receivers in your PNA
  1 - Receiver A
  2 - Receiver B

Receiver attenuation can not be set using *logical receiver notation*.

- **value** *(double)* - Attenuator value in dB. Choose any Long Integer between 0 and 35 in 5dB steps:
  If an invalid value is entered, the analyzer will select the next lower valid value. For example, if 19.9 is entered the analyzer will select 15 dB attenuation.

**Return Type**

Double

**Default**

0 db

**Examples**

```vbnet
chan.ReceiverAttenuator(1) = 5 'Write

attn = chan.ReceiverAttenuator(2) 'Read
```

**C++ Syntax**

```c++
HRESULT get_ReceiverAttenuator(long lport, double *pVal)
HRESULT put_ReceiverAttenuator(long lport, double newVal)
```

**Interface**

IChannel
|CalSet3
Description
Returns the number of receivers in the remote PNA. The returned number includes both test port receivers and reference receivers. See the number of reference receivers in your PNA.

VB Syntax
value = cap.ReceiverCount

Variable (Type) - Description
value (Long) - Variable to store the returned number of receivers.
cap A Capabilities (object)

Return Type
Long

Default
Not Applicable

Examples
value = cap.ReceiverCount 'Read

C++ Syntax
HRESULT get_ReceiverCount(long * receiverCount);

Interface ICapabilities
About Receiver Leveling

ReceiverRatio Property

**Description**
Sets and returns the receiver ratio pair to be used with Receiver Leveling.
To perform receiver leveling with a ratioed receiver, use `ReceiverRatio Property`.

**VB Syntax**
```
RxLevel.ReceiverRatio(srcPort) = value
```

**Variable**
- **RxLevel** (Type) - Description
  A `ReceiverLeveling` Object

- **srcPort** (Long Integer) Source port for which to set the receiver for Receiver Leveling.
  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see `Remotely Specifying a Source Port`.

- **value** (String) Receiver to use for the leveling sweeps. (Not case sensitive). Choose any receiver in your PNA. See the block diagram of your PNA, located at the bottom of all `Specs documents`.
  Receivers can also be referred to using logical receiver notation. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more.

**Return Type**
String

**Default**
Not applicable

**Examples**
```
rxLevel.ReceiverRatio (1) = "R1"  ' Write
rxLevel.ReceiverRatio (1) = "b2"  ' Write
value = rxLevel.ReceiverRatio 2  ' Read
```

**C++ Syntax**
```
HRESULT get_ReceiverRatio( long port, BSTR* pVal);
HRESULT put_ReceiverRatio( long port, BSTR newVal);
```

**Interface**
`IReceiverLevelingConfiguration`

## ReceiverStepAttenuatorStepSize Property

**Description**
Returns a value indicating the step size of the attenuator.

**VB Syntax**
value = cap.ReceiverStepAttenuatorStepSize(n)

**Variable**
- **value** (Double) - Variable to store the returned value of the attenuator step size.
- **cap** A Capabilities (object)
- **n** (Long) - port number to query for the value of the attenuator step size.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
value = cap.ReceiverStepAttenuatorStepSize(1) 'Read

**C++ Syntax**
HRESULT get_ReceiverStepAttenuatorStepSize(long portNumber, double * stepSize);

**Interface**
ICapabilities
Read-only

ReceivePort Property

Description
Returns the receiver (response) port number of measurement. To understand how this property is useful, see IMeasurement2 Interface.

Note: Returning a receiver port is only supported for S-Parameter measurements. If the measurement is not an S-Parameter, then E_NA_BAD_PARAMETER is returned.

VB Syntax
value = meas.ReceivePort

Variable (Type) - Description
value (Long) - Variable to store the returned value
meas A Measurement (object)

Return Type
Long Integer

Default
Not Applicable

Examples
rp = meas.ReceivePort

C++ Syntax
HRESULT ReceivePort(Long* rcvPort);

Interface
IMeasurement2
## RedTraceOnFail Property

**Description**
Set and return whether to display limit line failures as red trace segments or red data points (dots).

**VB Syntax**
```
pref.RedTraceOnFail = bool
```

### Variable (Type) - Description
- **pref**: A `Preferences` (object)
- **bool** (Boolean) - Choose from:
  - **False**: Display failures as red data points (dots).
  - **True**: Display failures as red trace segments. (Red Trace On Fail).

**Return Type**
Boolean

**Default**
False

**Examples**
```
pref.RedTraceOnFail = False 'Write
prefer = pref.RedTraceOnFail 'Read
```

### C++ Syntax
```
HRESULT put_RedTraceOnFail( VARIANT_BOOL bValue)
HRESULT get_RedTraceOnFail( VARIANT_BOOL *bValue)
```

**ReduceIFBandwidth Property**

**Description**
Sets or returns the state of the Reduced IF Bandwidth at Low Frequencies setting.

**VB Syntax**
```
chan.ReduceIFBandwidth = state
```

**Variable**
(Type) - Description
- **chan** A Channel (object)
- **state** (boolean)
  - False - Turns Reduce IFBW OFF
  - True - Turns Reduce IFBW ON

**Return Type**
Boolean

**Default**
True

**Examples**
- `chan.ReduceIFBandwidth = False 'Write`
- `reduce = chan.ReduceIFBandwidth 'Read`

**C++ Syntax**
- `HRESULT get_ReduceIFBandwidth(BOOL *pVal)`
- `HRESULT put_ReduceIFBandwidth(BOOL newVal)`

<td>(double) - Reference position on the screen measured in horizontal graticules from the bottom of the screen. Choose from any number between: 0 and 10.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**

```
meas.ReferencePosition = 5 'Middle of the screen -Write
rpos = meas.ReferencePosition -Read
```

**C++ Syntax**

```
HRESULT get_ReferencePosition(double *pVal)
HRESULT put_ReferencePosition(double newVal)
```

**Interface**
ITrace
RemoteCalStoragePreference Property

Description
Specifies the default manner in which calibrations performed using COM or SCPI are to be stored. Cal data is always stored to the channel’s Cal Register regardless of this setting. This setting survives instrument preset and reboot. It remains until changed by another invocation of this property.

VB Syntax
`pref.RemoteCalStoragePreference = value`

Variable (Type) - Description
- `cal` (A Preferences (object))
- `value` (Enum) - Choose from:
  - 0 - `naPreferCalRegister` - Cal is saved ONLY to the channel’s Cal Register.
  - 1 - `naPreferNewUserCalSet` - Cal is automatically saved to a new User Cal Set file when performing a calibration using COM. The Cal Set name is automatically generated. This corresponds to pre-6.0 behavior. Use the `Name` property to change the name after the cal is complete.
  - 2 - `naPreferReuseCurrentCalSet` - The cal is saved to the Cal Set that is currently selected on the specific channel. This could be the channel’s Cal Register. If the channel does not yet have a selected Cal Set, the cal will be saved to a new User Cal Set with an automatically-generated name.

Return Type
Enum

Default
0 - `naPreferCalRegister`

Examples
`pref.RemoteCalStoragePreference = naPreferNewUserCalSet`  `'Write`
`calStorageMode = pref.RemoteCalStoragePreference`  `'Read`

C++ Syntax
`HRESULT get_RemoteCalStoragePreference(enum NARemoteCalStoragePreference* preference);`
`HRESULT put_RemoteCalStoragePreference(enum NARemoteCalStoragePreference val);`

Interface
IPreferences7

# ReportReceiverOverload Property

**Description**  
Set and return whether to display receiver overload warnings.

**VB Syntax**  
`pref.ReportReceiverOverload = value`

**Variable**  
*pref* A [Preferences](object) (object)

*value* (Boolean) - Choose from:
- **True**  Display overload warnings.
- **False**  Do NOT display overload warnings.

**Return Type**  
Boolean

**Default**  
True

**Examples**  
```vba  
pref.ReportReceiverOverload = True 'Write  
value = pref.ReportReceiverOverload 'Read  
```

**C++ Syntax**  
```cpp  
HRESULT get_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode* preference);  
HRESULT put_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode val)  
```

### ResolutionBW Property

**Description**  
Sets and returns the Resolution Bandwidth for the IM Spectrum measurement.

**VB Syntax**  
```vbnet
ims.ResolutionBW = value
```

**Variable**  
*ims* - An `IMSpectrum` Object

*value* - (Double) Resolution BW in Hz. Choose from:
- 60k  | 100k  | 150k  | 300k  | 600k  | 1.0M  | 3.0M

If an invalid number is specified, the PNA will round up to the closest valid number.

**Return Type**  
Double

**Default**  
600 kHz

**Examples**  
```vbnet
ims.ResolutionBW = 150e3 'Write
```

```vbnet
value = ims.ResolutionBW 'Read
```

**C++ Syntax**  
```c++
HRESULT get_ResolutionBW(double *pVal)
HRESULT put_ResolutionBW(double newVal)
```

SafeMode Property

Description  Sets and returns the state of Safe Mode.

VB Syntax  

\[
RxLevel.SafeMode(srcPort) = value
\]

Variable  

\( RxLevel \)  A \( ReceiverLeveling \) Object

\( value \)  (Boolean) Choose from:

- \( True \) - Safe mode ON
- \( False \) - Safe mode OFF

\( srcPort \)  (Long Integer) Source port for which to set the Safe Mode state for Receiver Leveling.

Note: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use \( chan.getPortNumber \) to translate the string into a port number. To learn more see Remotely Specifying a Source Port

Return Type  Variant Boolean

Default  False

Examples  

\[
rxLevel.SafeMode (1) = True ' Write
\]

\[
value = rxLevel.SafeMode 2' Read
\]

C++ Syntax  

\[
HRESULT get_SafeMode(long port, VARIANT_BOOL* pLevelingSafeMode);
\]

\[
HRESULT put_SafeMode(long port, VARIANT_BOOL LevelingSafeMode);
\]

Interface  \( IReceiverLevelingConfiguration \)

### SafeSweepCoarsePowerAdjustment Property

**Description**  Set and read the Safe Sweep COARSE power adjustment.

**VB Syntax**  

```vbnet
gca.SafeSweepCoarsePowerAdjustment = value
```

**Variable**  

- **Type**
  - `gca`  A `GainCompression` object
  - `value`  (Double) Coarse power adjustment setting in dBm. Choose a value from +30 to (-30).

**Return Type**  Double

**Default**  3.0

**Examples**  

```vbnet
gca.SafeSweepCoarsePowerAdjustment = 2.0 'Write

SSCourse = gca.SafeSweepCoarsePowerAdjustment 'Read
```

**C++ Syntax**  

- `HRESULT get_SafeSweepCoarsePowerAdjustment(double* value)`
- `HRESULT put_SafeSweepCoarsePowerAdjustment(double value)`

**Interface**  `IGainCompression`

---

**Last Modified:**  1-Dec-2007  MX New topic
**SafeSweepEnable Property**

**Description**  
Set and read the (ON | OFF) state of Safe Sweep mode.

**VB Syntax**  
gca.SafeSweepEnable = value

**Variable**  
*Type* - Description

- **gca** A **GainCompression** (object)
- **value** (Boolean) Safe Sweep state. Choose from:
  - **False** - Disable Safe Sweep
  - **True** - Enable Safe Sweep

**Return Type**  
Boolean

**Default**  
False

**Examples**  
gca.SafeSweepEnable = True 'Write
SSEnable = gca.SafeSweepEnable 'Read

**C++ Syntax**  
HRESULT get_SafeSweepEnable(VARIANT_BOOL* value)
HRESULT put_SafeSweepEnable(VARIANT_BOOL value)

**Interface**  
IGainCompression

---

### SafeSweepFinePowerAdjustment Property

**Description**  
Set and read the Safe Sweep FINE power adjustment.

**VB Syntax**  
gca.SafeSweepFinePowerAdjustment = value

**Variable**  
- **Type**  
  - `gca` A `GainCompression` (object)
  
- **value** (Double) Fine power adjustment setting in dBm. Choose a value from +30 to (-30).

**Return Type**  
Double

**Default**  
1.0

**Examples**  
gca.SafeSweepFinePowerAdjustment = 0.1 'Write

SSfine = gca.SafeSweepFinePowerAdjustment 'Read

**C++ Syntax**  
HRESULT get_SafeSweepFinePowerAdjustment(double* value)  
HRESULT put_SafeSweepFinePowerAdjustment(double value)

**Interface**  
IGainCompression

---

Write/Read

SafeSweepFineThreshold Property

Description
Set and read the compression level at which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment.

VB Syntax
`gca.SafeSweepFineThreshold = value`

Variable (Type) - Description
- `gca` A `GainCompression` (object)
- `value` (Double) Threshold setting in dBm. Choose a value from +30 to (-30).

Return Type
Double

Default
0.5 dBm

Examples
`gca.SafeSweepFineThreshold = 0.1` 'Write
`SSThresh = gca.SafeSweepFineThreshold` 'Read

C++ Syntax
HRESULT get_SafeSweepFineThreshold(double* value)
HRESULT put_SafeSweepFineThreshold(double value)

Interface
IGainCompression

### SafeSweepMaximumLimit Property

**Description**  
When the PNA port that is connected to the DUT Output measures the specified value, the input power to the DUT is no longer incremented at that frequency.

**VB Syntax**  
`gca.SafeSweepMaximumLimit = value`

**Variable**  
*Type* - Description  
- **gca** A [GainCompression](#) (object)
- **value** (Double) Maximum power level in dBm. Choose a value from -100 to +100.

**Return Type**  
Double

**Default**  
100

**Examples**  
```vbnet  
gca.SafeSweepMaximumLimit = 23 'Write
maxPwr = gca.SafeSweepMaximumLimit 'Read
```

**C++ Syntax**  
```cpp  
HRESULT get_SafeSweepMaximumLimit(double* value)  
HRESULT put_SafeSweepMaximumLimit(double value)

### SaturationLevel Property

**Description**
Set and read the deviation dB from the maximum Pout. This is the point of saturation. This value is used for Compression Method: Compression from Saturation.

**VB Syntax**
```
gca.SaturationLevel = value
```

**Variable**
- **(Type)** - Description
  - `gca` A [GainCompression](#) (object)
  - `value` (Double) - Saturation level in dB. Choose a value greater than 0.01 dB.

**Return Type**
Double

**Default**
.1 dB

**Examples**
```
gca.SaturationLevel = .5 'Write
satLevel = gca.SaturationLevel 'Read
```

**C++ Syntax**
```
HRESULT get_SaturationLevel(double* pVal)
HRESULT put_SaturationLevel(double newVal)
```

Read-only

SB_BalPortNegative Property

Description
With a Single-ended - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's Balanced Port.
Use SetSBPorts Method to set the port mapping for a Single-Ended - Balanced topology.

VB Syntax
var = balTopology.SB_BalPortNegative

Variable
(Type) - Description
var (Long Integer) Variable to store the returned value.

balTopology A BalancedTopology (object)

Return Type
Long Integer

Default
Not Applicable

Examples
variable = balTop.SB_BalPortNegative 'Read

C++ Syntax
HRESULT get_SB_BalPortNegative(long *bVal)

Interface
IBalancedTopology
### SB_BalPortPositive Property

**Description**  
With a Single-ended - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's Balanced Port. Use [SetSBPorts Method](#) to set the port mapping for a Single-Ended - Balanced topology.

**VB Syntax**  
```
var = balTopology.SB_BalPortPositive
```

**Variable** *(Type) - Description*
- **var** *(Long Integer)* Variable to store the returned value.

**balTopology**  
A [BalancedTopology](#) *(object)*

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```
variable = balTop.SB_BalPortPositive  'Read
```

**C++ Syntax**  
```
HRESULT get_SB_BalPortPositive(long *bVal)
```

**Interface**  
IBalancedTopology
### SB_SEPort Property

**Description**
With a Single-ended - Balanced topology, returns the PNA port number that is connected to the DUT's Single-ended port.

Use [SetSBPorts Method](#) to set the port mapping for a Single-Ended - Balanced topology.

**VB Syntax**

```vbnet
var = balTopology.SB_SEPort
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>var</td>
<td>(Long Integer) Variable to store the returned value.</td>
</tr>
</tbody>
</table>

**balTopology**
A [BalancedTopology](#) (object)

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**

```
variable = balTopology.SB_SEPort  'Read
```

**C++ Syntax**

```c++
HRESULT get_SB_SEPort(long *bVal)
```

**Interface**
IBalancedTopology
### SBalMeasurement Property

**Description**
Sets and returns the measurement for the Single-Ended - Balanced topology.

**VB Syntax**

```vbnet
balMeas.SBalMeasurement = value
```

**Variable (Type) - Description**

- **balMeas**
  - A `BalancedMeasurement` (object)

- **value**
  - (String) - Single-ended - Balanced Measurement parameter. Not case-sensitive. Choose from:

<table>
<thead>
<tr>
<th>Sss11</th>
<th>Ssd12</th>
<th>Ssc12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sds21</td>
<td>Sdd22</td>
<td>Sdc22</td>

<tr>
<td>Imb</td>
<td>CMRR1</td>
<td>CMRR2</td>
</tr>
<tr>
<td></td>
<td>(Sds21/Scs21)</td>
<td>(Ssd12/Scs12)</td>
</tr>
</tbody>
</table>

**Return Type**

Sss11

**Default**
Not Applicable

**Examples**

```
balMeas.SBalMeasurement = "Ssd12"  'Write
variable = balMeas.SBalMeasurement  'Read
```

**C++ Syntax**

```c++
HRESULT get_SBalMeasurement(BSTR *pVal)
HRESULT put_SBalMeasurement(BSTR newVal)
```

**Interface**

`IBalancedMeasurement`
## ScaleCouplingMethod Property

## Scope Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the scope of a trigger signal. This determines whether a trigger signal affects a single channel or all channels in the PNA.</th>
</tr>
</thead>
</table>

**Note:** Trigger Modes Point and EverySweep require that Trigger.Scope be set to `naChannelTrigger`.

### VB Syntax

```vbnet
trigsetup.Scope = value
```

### Variable (Type) - Description

- **trigsetup** A `TriggerSetup (object)`
- **value** (enum `NATriggerType`) - Trigger type. Choose from:
  - 0 - `naGlobalTrigger` - a trigger signal is applied to all triggerable channels
  - 1 - `naChannelTrigger` - a trigger signal is applied to the current channel. The next trigger signal will be applied to the next channel; not necessarily the next channel in numeric sequence (1-2-3-4 and so forth).

### Return Type

Long Integer

### Default

`naGlobalTrigger`

### Examples

```vbnet
trigsetup.Scope = naGlobalTrigger 'Write
trigtyp = trigsetup.Scope 'Read
```

### C++ Syntax

```cpp
HRESULT get_Scope(tagNATriggerType *pTrigger)
HRESULT put_Scope(tagNATriggerType trigger)
```

### Interface

`ITriggerSetup`

About Marker Search

SearchFunction Property

Description
Emulates the Tracking function in the marker search dialog box. The value you choose for SearchFunction will determine the type of search that takes place when the Tracking property is set true.

The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as executing one of the "Search..." methods (such as SearchMin, SearchMax) for every sweep.

VB Syntax
(mark.SearchFunction = value)

Variable
(Type) - Description

mark A Marker (object)
value (enum NAMarkerFunction) - search function. Choose from:
0 - naMarkerFunction_None
1 - naMarkerFunction_Min
2 - naMarkerFunction_Max
3 - naMarkerFunction_Target
4 - naMarkerFunction_NextPeak
5 - naMarkerFunction_PeakRight
6 - naMarkerFunction_PeakLeft
7 - naMarkerFunction_Compression

Return Type
Long Integer

Default
0 - naMarkerFunction_None

Examples
mark.SearchFunction = naMarkerFunction_Target 'When this marker is set to track, it will track the Target value.

searchfunction = mark.SearchFunction 'Read

C++ Syntax
HRESULT get_SearchFunction(tagNAMarkerFunction *pVal)
HRESULT put_SearchFunction(tagNAMarkerFunction newVal)

Interface IMarker

1441
**SearchFailures Property**

**Description**
Returns a comma-separated list of the frequency indexes that were out of tolerance for SMART Sweep mode, or at the power limit for 2D Sweep mode. Zero (0) is the first frequency data point.

Must be Single triggered. Invalid results occur if the GCA channel is continuously sweeping.

**VB Syntax**
```vbnet
value = gca.SearchFailures
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Double</td>
<td>Variable to store the returned data.</td>
</tr>
<tr>
<td>gca</td>
<td>GainCompression</td>
<td>A GainCompression (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Returns a comma-separated list of frequency indexes.

**Default**
Not applicable

**Examples**
```vbnet
SFA = gca.SearchFailures 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SearchFailures(VARIANT* value)
```

**Interface**
IGainCompression

---

Last Modified:

11-Dec-2007    MX New topic
SearchSummary Property

**Description**
Returns the status of a compression search.
This command can be used to indicate when a GCA search is complete.

**Note:** The returned value reflects the current state of the GCA compression search which can vary when in continuous sweep. This command is intended to be used with `chan.Single` (trigger).

**VB Syntax**

```vb
value = gca.SearchSummary
```

**Variable** *(Type) - Description*

`value` *(Enum)* Variable to store the returned value.

- **0** - `naSearchNotDone` - Acquisition is still in process.
- **1** - `naSearchSucceeded` - Acquisition is complete and compression value found for all frequency points.
- **2** - `naSearchFailed` - Acquisition is complete and unable to find the compression value at one or more frequency points.

**gca** A `GainCompression` *(object)*

**Return Type**
Enum

**Default**
Not Applicable

**Examples**

```vb
sum = gca.SearchSummary
```

**C++ Syntax**

```c++
HRESULT get_SearchSummary(enum naGCASearchSummary* value)
```

**Interface**
`IGainCompression`

---

10-Jun-2009   MX New topic
SecurityLevel Property

Description
Controls the display of frequency information on the PNA screen and printouts.

VB Syntax
```
app.SecurityLevel value
```

Variable (Type) - Description

*app*  An *Application* (object)

*value* (enum NASecurityLevel) - Choose from:

0 - *naNoSecurity*  ALL frequency information is displayed.

1 - *naLowSecurity*  NO frequency information is displayed. Frequency information can be redisplayed using the Security Setting dialog box or this command.

2 - *naHighSecurity*  LOW setting plus GPIB console is disabled. Frequency information can be redisplayed ONLY by performing a Preset, recalling an instrument state with None or Low security settings, or using this command.

3 - *naExtraSecurity*  HIGH setting plus:

- **ASCII data saving** is disabled. Same method to redisplay frequency information as HIGH setting.
- **Mixer setup files** (*.mxr) can NOT be saved.

Return Type
Long Integer

Default
0 - None

Examples
```
app.SecurityLevel = naLowSecurity  'Write

level = app.SecurityLevel  'Read
```

C++ Syntax
```
HRESULT get_NASecurityLevel(tagNASecurityLevel *level);
HRESULT put_NASecurityLevel(tagNASecurityLevel level);
```

Interface

17-Jul-2007  Add Extra level
SegmentNumber Property

**Description**
Returns the number of the current segment, PowerSensorCalFactorSegment or PowerLossSegment object.

**VB Syntax**
```
seg.SegmentNumber
```

**Variable**
(Type) - Description

- `seg` Any of the following objects:
  - A `Segment` (Object)
  - A `PowerSensorCalFactorSegment` (Object)
  - A `PowerSensorCalFactorSegmentPMAR` Object (Object)
  - A `PowerLossSegment` (Object)
  - A `PowerLossSegmentPMAR` (Object)

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
segNum = seg.SegmentNumber 'returns the segment number -Read
```

**C++ Syntax**
```
HRESULT get_SegmentNumber(long *pVal)
```

**Interface**
ISegment
- IPowerSensorCalFactorSegment
- IPowerSensorCalFactorSegmentPMAR
- IPowerLossSegment
- IPowerLossSegmentPMAR

**Last Modified:**

## SegmentCount Property

**Description**
Returns the number of segments on the Applied mixer.

**VB Syntax**

```vbnet
value = conv.SegmentCount
```

**Variable**

- **value** (Long integer) Variable in which to store the returned segment count.
- **conv** A [Converter Object](#)

**Return Type**
Long integer

**Default**
1 Segment is created on new converter objects.

**Examples**

```vbnet
count = mxr.SegmentCount
```

[See example program](#)

**C++ Syntax**

```c
HRESULT get_SegmentCount(long *value);
```

**Interface**

SegmentFixedFrequency Property

**Description**  
Set and read the CW Frequency for mixer segments. The specified SegmentRangeMode must be set to Fixed. Send Apply before sending a query (read). Learn more.

**VB Syntax**  
`conv.SegmentFixedFrequency(index, range) = value`

**Variable (Type) - Description**

- **conv**  
  A Converter Object

- **index**  
  (Long integer) Segment for which fixed frequency is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.

- **range**  
  (Enum as ConverterFrequencyRange) Range for which fixed frequency is being set. Choose from:
  - 0 - naInputFrequencies - set input frequency
  - 1 - naOutputFrequencies - set output frequency
  - 2 - naLO1Frequencies - set LO1 frequency
  - 3 - naLO2Frequencies - set LO2 frequency
  - 4 - naIFFrequencies - set IF frequency

- **value**  
  (Double) CW Frequency. Choose a value within the frequency range of the PNA.

**Return Type**  
Double

**Default**  
Center frequency of the PNA

**Examples**

```vbnet
mxr.SegmentFixedFrequency(1, 0) = 1e9 'sets the input frequency to 1 GHz
```

See example program

**C++ Syntax**

```csharp
HRESULT get_SegmentFixedFrequency(long index, tagConverterFrequencyRange range, double *value);
HRESULT put_SegmentFixedFrequency(long index, tagConverterFrequencyRange value, double value);
```

SegmentIFBandwidth Property

**Description**
Sets and returns the IF Bandwidth for the sweep segment. Send **Apply** before sending a query (read). Learn more.

**VB Syntax**
```vbnet
conv.SegmentIFBandwidth(index, value)
```

**Variable** *(Type) - Description*

- `conv` A **Converter Object**
- `index` (Long integer) Segment for which IF Bandwidth is to be set. Choose a segment between 1 and the current segment count. Use **SegmentCount Property** to read the current count in the **Applied Mixer**.
- `value` (Long integer) IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. See the lists. If an invalid number is specified, the analyzer will round up to the closest valid number.

**Return Type** Long integer

**Default** 100 kHz

**Examples**
```vba
mxr.SegmentIFBandwidth(1,3)=10e3 'Sets IFBW to 10 kHz
```

**C++ Syntax**
```
HRESULT get_SegmentIFBandwidth(long index, long * val);
HRESULT put_SegmentIFBandwidth(long index, long val);
```

**SegmentIsInputGreaterThanLO Property**

**Description**  
Set and read whether to use the Input frequency that is greater than the LO or less than the LO.

Send **Apply** before sending a query (read). [Learn more](#).

**VB Syntax**  
`conv.SegmentIsInputGreaterThanLO(index, range) = value`

**Variable**  
**Variable (Type) - Description**

- **conv**  
  A **Converter Object**

- **index**  
  (Long integer) Segment which is being set. Choose a segment between 1 and the current segment count. Use **SegmentCount Property** to read the current count in the Applied Mixer.

- **range**  
  (Enum as `ConverterFrequencyRange`) Range for which value is being set. Choose from:
  - 0 - `naInputFrequencies` - set input power
  - 1 - `naOutputFrequencies` - set output power
  - 2 - `naLO1Frequencies` - set LO1 power
  - 3 - `naLO2Frequencies` - set LO2 power
  - 4 - `naIFrequencies` - set IF power

- **value**  
  (Boolean) - Choose from the following:
  - **True** - Use the Input that is Greater than the specified LO.
  - **False** - Use the Input that is Less than the specified LO.

**Return Type**  
Boolean

**Default**  
True

**Examples**  
```vbnet
mxr.SegmentIsInputGreaterThanLO(1, 2=1 'sets segment 1, LO1 to Input greater
```

See example program

**C++ Syntax**  
```c++
HRESULT get_SegmentIsInputGreaterThanLO(long index,  
tagConverterFrequencyRange range, VARIANT_BOOL *value);

HRESULT put_SegmentIsInputGreaterThanLO(long index,  
tagConverterFrequencyRange value, VARIANT_BOOL value);
```

* `conv`  
  A [Converter Object](#)

* `index`  
  (Long integer) Segment for which points is to be set. Choose a segment between 1 and the current segment count. Use [SegmentCount Property](#) to read the current count in the [Applied Mixer](#).

* `value`  
  (Long integer) - Choose a value between 1 and the [maximum number of data points allowed in the PNA](#). This is also the total number of points allowed for ALL segments.

**Return Type**  
Long integer

**Default**  
21

**Examples**  
```vbnet
mxr.SegmentPoints(1)=3 'Sets 3 points for segment 1.
```

See example program

**C++ Syntax**  
```cpp
HRESULT get_SegmentPoints(long index, long * val);
HRESULT put_SegmentPoints(long index, long val);
```

26-Oct-2010  New command (A.09.33)
SelectPort Property

**Description**
Sets and returns a port mapping for a single port. If this command creates a conflict with an existing port, the PNA will resolve the conflict.

**Note:** This command is currently not supported for the Z5623AK44.

**VB Syntax**
```vbnet
tset.SelectPort(chNum, portNum) = portValue
```

**Variable**
- **Type** - Description
  - `tset` A `TestsetControl` object.
  - `chNum` *(Long)* Channel number of the measurement.
  - `portNum` *(Long)* Physical port number to map.
  - `portValue` *(Long)* Logical port value to assign

**Return Type**
Long

**Default**
Not Applicable

**Examples**
See External Testset Program

**C++ Syntax**
```c++
HRESULT get_SelectPort(long channelNum, long PortNum long *outPort);
HRESULT put_SelectPort(long channelNum, long PortNum long outPort);
```

**Interface**
`ITestsetControl`
SensorIndex Property

**Description**
For dual sensor power meters, sets and returns the power sensor channel (1 or 2) to be used.

**VB Syntax**
```vbnet
pwrSensor.SensorIndex = value
```

**Variable**

- **pwrSensor** (Type): PowerSensorAsReceiver (Object)
- **value** (Long) - Power Meter channel. Choose from:
  1 - Sensor A
  2 - Sensor B

**Return Type**
Long

**Default**
1

**Examples**
```vbnet
pwrSensor.SensorIndex = False 'Write
sensor = pwrSensor.SensorIndex 'Read
```

**C++ Syntax**
```c++
HRESULT put_SensorIndex(long newVal);
HRESULT get_SensorIndex(long* pVal);
```

**Interface**
IPowerSensorAsReceiver

Write/Read

SeparatePowerCal Property

**Description**
Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration. [Learn more.](#)

This command must be sent immediately after the Initialize command, but before all other calibration properties.

**VB Syntax**
```
smc.SeparatePowerCal = bool
```

**Variable**
(Type) - Description

smc An SMCType (object)

bool (Boolean)

**True** - Do NOT use a Thru, but instead perform separate power cals on Input and Output reference planes.

**False** - Perform Cal with Thru standard.

**Return Type**
Boolean

**Default**
False

**Example**
```
FCAppLib.ISMCType4 SMC =
  (FCAppLib.ISMCType4)CalMgr.CreateCustomCal("SMC");
SMC.Initialize(chan, true);
if (separatePowerCalIsDesired)
  SMC.SeparatePowerCal = true;
```

**C++ Syntax**
```
HRESULT put_SeparatePowerCal(VARIANT_BOOL bValue);
HRESULT get_SeparatePowerCal(VARIANT_BOOL *bValue);
```

**ShowStatistics Property**

**Description**
Displays and hides the measurement (Trace) statistics (peak-to-peak, mean, standard deviation) on the screen. To display measurement statistics for a narrower band of the X-axis, use `StatisticsRange`.

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

**VB Syntax**

```
meas.ShowStatistics = value
```

**Variable**

- **meas**
  - Type: A Measurement *(object)*
- **value**
  - Type: Boolean value:
    - True - Show statistics
    - False - Hide statistics

**Return Type**

Boolean

**Default**

False

**Examples**

```
meas.ShowStatistics = True 'Write
showstats = meas.ShowStatistics 'Read
```

**C++ Syntax**

```
HRESULT put_ShowStatistics(VARIANT_BOOL bState)
```

**Interface**

IMeasurement
### ShowProperties Property

**Description**  
Turns ON and OFF the display of the test set control status bar. This status bar indicates the test set that is being controlled and the current port mappings. This setting is turned ON and OFF automatically when the test set is enabled or disabled.

**VB Syntax**  
`tset.ShowProperties = value`

**Variable**  
(***Type***) - Description

- `tset`  
  A `TestsetControl` object.  
  OR  
  An `E5091Testset` object.

- `value`  
  (***Boolean***)
  
  - **True** - Turns display of testset properties ON.  
  - **False** - Turns display of testset properties OFF.

**Return Type**  
Boolean

**Default**  
**False** (True when test set control is enabled.)

**Examples**  
See E5091A Example Program
See External Testset Program

**C++ Syntax**  
`HRESULT get_ShowProperties(VARIANT_BOOL *state);`
`HRESULT put_ShowProperties(VARIANT_BOOL state);`

**Interface**  
IE5091Testsets  
ITestsetControl
## SICL Property

### Description
Allows you to control the PNA via SICL (standard instrument control library). In this mode, the analyzer can receive SCPI commands from the LAN interface or from a program residing on the PNA itself. This command performs the same function as the SICL / GPIB dialog box - SICL Enabled checkbox. See Configuring the analyzer for SICL/VISA.

With this method you can augment a test program written using SICL that resides on the PNA so that it will run unattended. An automation script can be written to start the PNA, enable SICL (using the SICL property), and then start the SICL based program.

### VB Syntax

```
app.SICL value
```

### Variable (Type) - Description

- **app**: An Application (object)
- **value**: (Boolean) Choose from:
  - True - enable SICL
  - False - disable SICL

### Return Type
Boolean

### Default
False

### Examples

```vbnet
Dim Pna as AgilentPNA835x.Application
Dim siclState as Boolean
Set Pna = CreateObject("AgilentPNA835x.Application")
Pna.SICL = true 'write

siclState = Pna.SICL 'Read
```

### C++ Syntax

```cpp
HRESULT get_SICL(VARIANT_BOOL *pVal)
HRESULT put_SICL(VARIANT_BOOL newVal)
```

### Interface
IAgilentPNA835x.Application5
**SICLAddress Property**

**Description**
Sets and returns the PNA SICL address. This is the address used for SICL over LAN.

**VB Syntax**

```vbnet
app.SICLAddress = value
```

**Variable (Type) - Description**

- **app**
  - An Application (object)

- **value**
  - (Integer) SICL Address of the PNA. Choose a value between 0 and 30.

**Return Type**
Short Integer

**Default**
16

**Examples**

```vbnet
address=app.SICLAddress 'Read

app.SICLAddress=16 'Write
```

**C++ Syntax**

```cpp
HRESULT get_SICLAddress(short busIndex, short* address);
HRESULT put_SICLAddress(short busIndex,short address);
```

**Interface**
IApplication8
Simultaneous2PortAcquisition Property

**Description**
Specifies whether a 2-port calibration will be done with a single set of standards (one port at a time) or with two sets of standards (simultaneously).

The AcquireCalStandard2 command uses the same standard index for each calibration class. To specify the calibration standard gender for each port, you must first ensure that the order of calibration class accurately reflects the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

**VB Syntax**
```
cal.Simultaneous2PortAcquisition = state
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>state</td>
<td>(boolean) - Choose from:</td>
</tr>
<tr>
<td></td>
<td>True - measures 2 ports simultaneously</td>
</tr>
<tr>
<td></td>
<td>False - measures 1 port at a time</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
True

**Examples**
```
cal.Simultaneous2PortAcquisition = True
```

**C++ Syntax**
```
HRESULT put_Simultaneous2PortAcquisition( VARIANT_BOOL bTwoSetsOfStandards)
HRESULT Simultaneous2PortAcquisition( VARIANT_BOOL *bTwoSetsOfStandards)
```

**Interface**
ICalibrator

SmartSweepMaximumIterations Property

### Description
Set and read the maximum permitted number of iterations which SMART Sweep may utilize to find the desired compression level, to within the specified tolerance.

### VB Syntax
\[
gca\text{.SmartSweepMaximumIterations} = value
\]

### Variable (Type) - Description
- **gca** A GainCompression (object)
- **value** (integer) - Maximum number of iterations. Choose a value between 1 and 50.

### Return Type
Integer

### Default
20

### Examples
\[
\text{gca.SmartSweepMaximumIterations} = 10 \quad \text{Write}
\]
\[
\text{iters} = \text{gca.SmartSweepMaximumIterations} \quad \text{Read}
\]

### C++ Syntax
- HRESULT get_SmartSweepMaximumIterations(int* pVal)
- HRESULT put_SmartSweepMaximumIterations(int newVal)

### Interface
IGainCompression

**SmoothingAperture Property**

**Description**
Specifies or returns the amount of smoothing as a ratio of the number of data points in the measurement trace.

There is no COM command for specifying smoothing by number of aperture points.

**VB Syntax**
`meas.SmoothingAperture = value`

**Variable**

- **meas** (Type) *A Measurement* (object)
- **value** (double) - Smoothing Aperture. A ratio of (aperture points / trace points). Choose any number between .01 and .25.

**Return Type**
Double

**Default**
.25

**Examples**

```vbnet
meas.SmoothingAperture = .10 'Write
saperture = meas.SmoothingAperture 'Read
```

**C++ Syntax**

```csharp
HRESULT get_SmoothingAperture(double *pVal)
HRESULT put_SmoothingAperture(double newVal)
```

Smoothing Property

Description: Turns ON and OFF data smoothing.

VB Syntax: `meas.Smoothing = state`

Variable (Type) - Description:
- `meas`: A Measurement (object)
- `state`: (boolean)
  - `True`: Turns smoothing ON
  - `False`: Turns smoothing OFF

Return Type: Boolean

Default: False

Examples:
- `meas.Smoothing = False` 'Write
- `smooth = meas.Smoothing` 'Read

C++ Syntax:
- `HRESULT get_Smoothing(VARIANT_BOOL *pVal)`
- `HRESULT put_Smoothing(VARIANT_BOOL newVal)`

Interface: IMeasurement
SnPFormat Property

**Description**
Specifies the format of .SnP files.

Use either app. `Save` (saves data to file) or meas. `Get_SnpDataWithSpecifiedPorts` (reads data into variant array).

**VB Syntax**
```vbnet
pref.SnPFormat = value
```

**Variable (Type) - Description**

`pref` A `Preferences` (object)

`value` (string) - Format of the .S1P, .S2P, .S3P, .S4P data. Choose from:

- "MA" - Linear Magnitude / degrees
- "DB" - Log Mag / degrees
- "RI" - Real / Imaginary
- "Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.

**Return Type**
String

**Default**
"Auto"

**Examples**
```vbnet
pref.SnPFormat = "MA" 'Write
format = pref.SnPFormat 'Read
```

**C++ Syntax**

- HRESULT get_SnPFormat(BSTR *Format)
- HRESULT put_SnPFormat(BSTR Format)

SourcePortMode Property

**Description**
Sets the state of the PNA source for the specified port.

**VB Syntax**
`chan.SourcePortMode(sourcePort) = value`

**Variable**
- **(Type)** - **Description**
  - `chan` (object) - A `Channel` object
  - `sourcePort` (long integer) - The source port for which to make this setting.
  
  **Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- `value` (enum) - State of the source. Choose from:
  - 0 - `naSourcePortAuto` Port power is turned on when required for a measurement.
  - 1 - `naSourcePortOn` Port power is always ON, regardless of the measurement.
  - 2 - `naSourcePortOff` Port power is always OFF, regardless of the measurement.

**Return Type**
Enum

**Default**
0 - `naSourcePortAuto`

**Examples**
- `chan.SourcePortMode(1) = naSourcePortOn`  
  - "Write"
- `state = chan.SourcePortMode(4)`  
  - "Read"

**C++ Syntax**

```
HRESULT get_SourcePortMode(long sourcePort, enum NASourcePortMode*);
HRESULT put_SourcePortMode(long sourcePort, enum NASourcePortMode);
```

**Interface**
IChannel9

SourcePortNames Property

Description
Returns the string names of ports that can output a signal.
The following is a list of string names for the PNA-X. Your PNA will NOT have all of these ports. Use GetPortNumber Method to return the correct port number for the specified port name.

- "Port 1"
- "Port 2"
- "Port 3"
- "Port 4"
- "Src2 Out1"
- "Src2 Out2"
- "Port 1 Src2"

For iTMSA (Opt 460)

- "Bal Port 1"
- "Bal Port 2"
- "SE Port1"
- "SE Port 2"

This command also lists the External Sources that are currently configured and selected.
To learn more, see Remotely Specifying a Source Port.

VB Syntax
`value = object.SourcePortNames`

Variable (Type) - Description

`value` (Variant array) - Variable to store the returned integer value of the number of source ports.

`object` A Channel (object) - always more complete than capabilities object.
A Capabilities (object) - use when a channel is not available, or to find the common ports across all channels.

Return Type
Variant array of string names.

Default
Not Applicable

Examples
`value = chan.SourcePortNames` 'Read
**C++ Syntax**

HRESULT get_SourcePortNames(VARIANT *names);

**Interface**

SourcePowerCalPowerOffset Property

Description
Sets or returns a power level offset from the PNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT.

Cal power is the sum of the test port power setting and this offset value. Following the calibration, the PNA power readouts are adjusted to the cal power.

This property performs the same function as the power offset argument on SetCallInfoEx Method, except that this property can read the offset value.

VB Syntax

`chan.SourcePowerCalPowerOffset(sourcePort) = value`

Variable (Type) - Description

`chan` (object) - A Channel object

`sourcePort` (long integer) - The source port for which to set this power offset value.

`value` (double) - Gain or loss value in dB. Choose a value between -200 and 200.

Return Type
Double

Default
0 dB

Examples

`chan.SourcePowerCalPowerOffset(1) = 10 'Write`

`offset = chan.SourcePowerCalPowerOffset(2) 'Read`

C++ Syntax

```cpp
HRESULT get_SourcePowerCalPowerOffset(long sourcePort, double *pVal);
HRESULT put_SourcePowerCalPowerOffset(long sourcePort, double newVal);
```

Interface
IChannel4

Last Modified:

1-May-2007 Modified link to EX method.
SourcePowerCorrection Property

Description
Sets source power correction ON or OFF for a specific source port on this channel, or returns the current ON or OFF state of correction for that source port.

VB Syntax
`chan.SourcePowerCorrection (srcPort) = value`

Variable (Type) - Description
- `chan` (object) – A Channel object
- `srcPort` (long integer) – Source port for which to set or return the ON or OFF state of source power correction.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- `value` (boolean)
  - False – Turns source power correction OFF for the source port.
  - True – Turns source power correction ON for the source port.

Return Type
Boolean

Default
False - Source power correction will turn correction ON

Examples
```
chan.SourcePowerCorrection(1) = False 'Write
calOnPort2 = chan.SourcePowerCorrection(2) 'Read
```

C++ Syntax
```
HRESULT put_SourcePowerCorrection(VARIANT_BOOL bState);
HRESULT get_SourcePowerCorrection(VARIANT_BOOL *bState);
```

Interface
IChannel

Last Modified:
- 24-Apr-2008  Added note for string names
- 30-Apr-2007  Modified for src strings
SourcePowerOption Property

**Description**
Enables the source power to be set on individual sweep segments. This property must be set True before `seg.TestPortPower = value` is sent. Otherwise, the test port power command will be ignored.

**VB Syntax**
```
segs.SourcePowerOption = state
```

**Variable**
- **Type** - Description

- `segs` A Segments collection *(object)*
- `state` *(boolean)*
  - **True** - Enables variable TestPortPower to be set segment sweep
  - **False** - Disables variable TestPortPower to be set segment sweep

**Return Type**
Boolean

**Default**
False

**Examples**
```
segs.SourcePowerOption = True  'Write
powerOption = SourcePowerOption  'Read
```

**C++ Syntax**
```
HRESULT get_SourcePowerOption(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerOption(VARIANT_BOOL newVal)

# SourcePowerState Property

**Description**

Turns Source Power ON and OFF.  
See note about source power state with instrument state save and recall.

**VB Syntax**

```
app.SourcePowerState = state
```

**Variable** *(Type) - Description*

- `app` An Application *(object)*
- `state` *(boolean)*
  - `False` - Turns Source Power OFF
  - `True` - Turns Source Power ON

**Return Type**

Boolean

**Default**

True

**Examples**

```
app.SourcePowerState = True 'Write
pwr = app.SourcePowerState 'Read
```

**C++ Syntax**

```
HRESULT get_SourcePowerState(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerState(VARIANT_BOOL newVal)
```

SourcePullForSParameters Property

Description
Enables and disables the use of source pull technique to compute S22 on Noise Figure on Converters. Learn more.

VB Syntax
nfx.SourcePullForSParameters = value

Variable (Type) - Description
nfx A NoiseFigure (object)
value (Boolean) Source pull technique state. Choose from:
    False - Disable use of source pull technique.
    True - Enable use of source pull technique.

Return Type
Boolean

Default
False

Examples
nfx.SourcePullForSParameters = true 'Write
sourcePull = nfx.SourcePullForSParameters 'Read

C++ Syntax
HRESULT get_SourcePullForSParameters (VARIANT_BOOL * Val)
HRESULT put_SourcePullForSParameters (VARIANT_BOOL newVal)

### SpectrumCenterFrequency Property

**Description**
Sets and returns the receiver Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when **Sweep Type** = Linear. Otherwise, this setting is ignored.

**VB Syntax**
```vbnet
ims.SpectrumCenterFrequency = value
```

**Variable**
**Type** - Description

- **ims**:
  - An **IMSpectrum** Object

- **value**:
  - (Double) Center frequency in Hz. Choose a frequency within the range of the PNA.

**Return Type**
Double

**Default**
1.0 GHz

**Examples**
```vbnet
ims.SpectrumCenterFrequency = 10e9 'Write

value = ims.SpectrumCenterFrequency 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SpectrumCenterFrequency(double *pVal)
HRESULT put_SpectrumCenterFrequency(double newVal)
```

**Interface**
IMSpectrum

**SpectrumStopFrequency Property**

**Description**
Sets and returns the receiver Stop frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**VB Syntax**
```vbnet
ims.SpectrumStopFrequency = value
```

**Variable (Type) - Description**
- `ims`: An `IMSpectrum` Object
- `value`: (Double) Stop frequency in Hz. Choose a frequency within the range of the PNA.

**Return Type**
Double

**Default**
950 MHz

**Examples**
```vbnet
ims.SpectrumStopFrequency = 10e9 'Write
value = ims.SpectrumStopFrequency 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SpectrumStopFrequency(double *pVal)
HRESULT put_SpectrumStopFrequency(double newVal)
```

### SSB_BalPortNegative Property

**Description**  
With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the Negative side of the DUT's Balanced Port.

**VB Syntax**  
```vbnet
var = balTopology.SSB_BalPortNegative
```

**Variable**  
*(Type)* - Description

```vbnet
var (Long Integer) Variable to store the returned value.
```

**balTopology**  
A [BalancedTopology](#) object

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```vbnet
variable = balTopology.SSB_BalPortNegative 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_SSB_BalPortNegative(long *bVal)
```

**Interface**  
IBalancedTopology
SSB_BalPortPositive Property

**Description**
With a Single-ended - Single-ended - Balanced topology, returns the PNA port number that is connected to the Positive side of the DUT's Balanced Port.

**VB Syntax**
```vbnet
var = balTopology.SSB_BalPortPositive
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>

### Stage1Coefficients Property

**Description**
Sets and returns the digital filter coefficients of stage1.

**VB Syntax**
```vba
spm4.Stage1Coefficients = value
```

**Variable**  
**Type** — Description

- `spm4`: A `SignalProcessingModuleFour (object)`
- `value`: (Variant Array) Coefficients. An array of real values.

**Return Type**
Variant

**Default**
Stage dependent.

**Examples**
```vba
spm4.Stage1Coefficients = 0,0.1,0.7,0.7,0.1 'Write
mode = spm4.Stage1Coefficients 'Read
```

**C++ Syntax**
```cpp

Returns a list of strings for the currently supported filter types that can be used for the stage 3 filter. This command is only used when FilterMode is set to False (Manual). See Stage3FilterType for a list of currently supported filter types.

**VB Syntax**
values = spm4.Stage3FilterTypes

**Variable**
- **value** (Variant) Variable to store the returned filter types.
- **spm4** A SignalProcessingModuleFour (object)

**Return Type**
Variant Array

**Default**
Not Applicable

**Examples**
mode = spm4.Stage3FilterTypes 'Read

**C++ Syntax**
HRESULT get_Stage3FilterTypes(VARIANT* pTypes);

**Interface**
ISignalProcessingModuleFour
Stage3Parameter Property

Description
Sets and returns the Stage 3 filter parameters.
Must first select the filter type using Stage3FilterType before setting these parameters.
Use Stage3Parameters to return a list of the available parameters for the currently selected filter type.

VB Syntax

```
spm4.Stage3Parameter(param) = value
```

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spm4 SignalProcessingModuleFour (object)</td>
<td></td>
</tr>
<tr>
<td>param (String)</td>
<td>Filter parameter. Choose from:</td>
</tr>
<tr>
<td>&quot;C&quot; - Tap count (Tukey, RECT, PWIN)</td>
<td></td>
</tr>
<tr>
<td>&quot;P&quot; - Period (PWIN ONLY)</td>
<td></td>
</tr>
<tr>
<td>&quot;D&quot; - Delay (PWIN ONLY)</td>
<td></td>
</tr>
<tr>
<td>&quot;W&quot; - Width (PWIN ONLY)</td>
<td></td>
</tr>
<tr>
<td>&quot;R&quot; - Ramp Count (PWIN ONLY)</td>
<td></td>
</tr>
</tbody>
</table>

value (String) Parameter Value for the specified stage 3 parameter. Use Stage3ParameterMaximum and Stage3ParameterMinimum to return a range of values for the specified parameter.

Default

RECT: C = 1
PWIN: C=1E6, P=10ms, D=50us, W=50us, R=7
TUKEY: C=1

Examples

```
spm4.Stage3Parameter("C") = 2
```

```
mode = spm4.Stage3Parameter("pwin") 'Read
```

C++ Syntax

```cpp
HRESULT get_Stage3Parameter(BSTR pName, double* pVal);
HRESULT put_Stage3Parameter(BSTR pName, double pVal);
```

Stage3ParameterMaximum Property

Description  Returns maximum parameter value for the current filter type.

VB Syntax  \( \text{values} = \text{spm4}.\text{Stage3ParameterMaximum}(\text{parameter}) \)

Variable  (Type) - Description

value  (Variant) Variable to store the maximum parameter value.

spm4  A SignalProcessingModuleFour (object)

parameter  (String) Parameter name. See Stage3Parameter Property for a list of parameters.

Return Type  Double

Default  Not Applicable

Examples  \( \text{mode} = \text{spm4}.\text{Stage3ParameterMaximum}("c") \) 'Read

C++ Syntax  HRESULT get_Stage3ParameterMaximum(BSTR pName, double* pVal);

Interface  ISignalProcessingModuleFour

Last Modified:  1-Jan-2007  MX New topic
# Stage3ParameterMinimum Property

**Description**
Returns minimum parameter value for the current filter type.

**VB Syntax**
```vbnet
values = spm4.Stage3ParameterMinimum (parameter)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Variant) Variable to store the minimum parameter value.</td>
</tr>
<tr>
<td>spm4</td>
<td>A SignalProcessingModuleFour (object)</td>
</tr>
</tbody>
</table>

**parameter**
(String) Parameter name. See [Stage3Parameter Property](#) for a list of parameters.

**Return Type**
Double

**Default**
Not applicable

**Examples**
```vbnet
mode = spm4.Stage3ParameterMinimum ("c")  'Read
```

**C++ Syntax**
```cpp
HRESULT get_Stage3ParameterMinimum(BSTR pName, double* pVal);
```

**Interface**
ISignalProcessingModuleFour

### Stage3Parameters Property

**Description**
Returns the names of parameters for the current filter type. Use `Stage3FilterType Property` to set the filter type.

**VB Syntax**
```
values = spm4.Stage3Parameters
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>(Variant) Variable to store the returned parameter names.</td>
</tr>
<tr>
<td><code>spm4</code></td>
<td>A <code>SignalProcessingModuleFour</code> (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```
mode = spm4.Stage3Parameters 'Read
```

**C++ Syntax**
```
HRESULT get_Stage3Parameters(VARIANT* pNames);
```

**Interface**
`ISignalProcessingModuleFour`

StandardDeviation Property

**Description**

Returns the standard deviation of the measurement. To retrieve all 3 statistics value at the same time, use `meas.GetTraceStatistics`.

**VB Syntax**

```vbnet
stdev = meas.StandardDeviation
```

**Variable**

- **Type**
  - `stdev` (single) - Variable to store standard deviation value
- **meas** A Measurement (object)

**Return Type**

Single

**Default**

Not applicable

**Examples**

```vbnet
stdev = meas.StandardDeviation 'Read
```

**C++ Syntax**

```cpp
HRESULT get_StandardDeviation(float* stdDeviation)
```

**Interface**

IMeasurement
StandardForClass Property - Superseded

**Description**  
Superseded  This command sets a single standard to a calibration class. Does NOT set or dictate the order for measuring the standards. Use GetStandardForClass and SetStandardForClass. These commands allow up to seven standards to be assigned to a cal class.

**VB Syntax**  
\`calKit.StandardForClass(class, portNum) = value\`

**Variable (Type) - Description**

- `calKit`  
  A CalKit (object). Use calKit.GetCalStandard to get a handle to the standard.

- `class`  
  (enum NACalClass) Standard. Choose from:

  1 - naClassA  
  2 - naClassB  
  3 - naClassC  
  4 - naClassD  
  5 - naClassE  
  6 - naReferenceRatioLine  
  7 - naReferenceRatioThru

**SOLT Standards**

  1 - naSOLT_Open  
  2 - naSOLT_Short  
  3 - naSOLT_Load  
  4 - naSOLT_Thru  
  5 - naSOLT_Isolation

**TRL Standards**

  1 - naTRL_Reflection  
  2 - naTRL_Line_Reflection  
  3 - naTRL_Line_Tracking  
  4 - naTRL_Thru  
  5 - naTRL_Isolation
**portNum** *(long)* - The port number the standard will be connected to. For example, you may have a 3.5mm connector designated for port 1, and Type N designated for port 2.

**value** *(long)* - Calibration class number. Choose a number between 1 and 8. The `<value>` numbers are associated with the following calibration classes:

<table>
<thead>
<tr>
<th><code>&lt;value&gt;</code></th>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>S11A</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>2</td>
<td>S11B</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>3</td>
<td>S11C</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>4</td>
<td>S21T</td>
<td>Thru standard</td>
</tr>
<tr>
<td>5</td>
<td>S22A</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>6</td>
<td>S22B</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>7</td>
<td>S22C</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>8</td>
<td>S21T</td>
<td>Thru standard</td>
</tr>
</tbody>
</table>

**Return Type** Long Integer

**Default** Not Applicable

**Examples**

```c
calKit.StandardForClass(naSOLT_Short, 1) = 1
Kclass = calKit.StandardForClass(naSOLT_Short, 1)
```

**C++ Syntax**

```c
HRESULT put_StandardForClass (NACalClass item, long pNum);
HRESULT get_StandardForClass (NACalClass* item, long *pNum);
```

**Interface** ICalKit
# StartFrequency (Cal Set) Property

**Description**
Returns the start frequency that is stored in the Cal Set.

**VB Syntax**
```vbnet
value = CalSet.StartFrequency(range)
```

**Variable**
- **(Type)** - **Description**
  - `value` *(double)* - returned Start frequency in Hertz.
  - `CalSet` *(object)*
  - `range` *(Long)* - Choose: 0 (Source and receiver frequency)

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vbnet
start = calset.StartFrequency(0) 'Reads the start frequency stored in the cal set.
```

**C++ Syntax**
```c++
HRESULT get_StartFrequency(long range, *pVal)
```

**Interface**
`ICalSet3`

### StartFrequency Property

**Description**
Sets or returns the start frequency of the channel. (Channel Object)
Sets or returns the start frequency of the segment. (Segment Object)
Sets or returns the start frequency of the FOM Range. (FOMRange Object)
Sets or returns the start frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

See also [Measurement2](#) interface

**VB Syntax**
```
object.StartFrequency = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>Channel (object)</td>
</tr>
<tr>
<td></td>
<td>Segment (object)</td>
</tr>
<tr>
<td></td>
<td>FOMRange (object)</td>
</tr>
<tr>
<td></td>
<td>GuidedCalibrationPowerSensor (object)</td>
</tr>
</tbody>
</table>

| value     | (double) - Start frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer. |

**Default**
Channel - Minimum frequency of the analyzer
Segment - 0
FOMRange - Minimum frequency of the analyzer
PowerSensor - Minimum frequency of the analyzer

**Examples**

```
chan.StartFrequency = 4.5e9 'sets the start frequency of a linear sweep for the channel object -Write
```

```
startfreq = Chan.StartFrequency 'Read
```

Last modified:

8-Feb-2011  Added Power Sensor
8-Mar-2007  Added FOMRange
1-Nov-2006  Removed Cal Set object. There is now a new cs.StartFreq
StartPower Property

Description
Sets the start power of the analyzer when sweep type is set to Power Sweep. Frequency of the measurement is set with chan.CWFrequency.

VB Syntax
object.StartPower = value

Variable (Type) - Description
object One of the following:

- Channel (object)
- CalSet (object) - Read-only property

value (double) - Start Power in dBm.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use cap.MaximumSourceALCPower and cap.MinimumSourceALCPower

Auto attenuation is not allowed in Power Sweep.

Return Type
Double

Default
0

Examples
Chan.StartPower = -10  'Write
strtpwr = Chan.StartPower 'Read

C++ Syntax
HRESULT get_StartPower(double *pVal)
HRESULT put_StartPower(double newVal)

Interface

Write/Read

About Phase Control

StartPhase Property

**Description**
Write and read the start value of phase sweep. Must also send [Sweep Type Property](#) to put the analyzer into phase sweep mode.

**VB Syntax**

```vbnet
phase.StartPhase(srcPort) = value
```

**Variable** *(Type) - Description*

- **phase**
  A [PhaseControl](#) Object

- **srcPort**
  (Long Integer) Source port for which to make phase control settings.

  **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#)

- **value**
  (Double) Start phase value in degrees. Choose a value between -360 and 360.

**Return Type**
Double

**Default**
0 degrees

**Examples**

```vbnet
phase.StartPhase 1 = 60 ' Write

value = phase.StartPhase 2' Read
```

**C++ Syntax**

```cpp
HRESULT get_StartPhase(long port, double* pVal);
HRESULT put_StartPhase(long port, double newVal);
```

**Interface**
IPhaseControl

**StartPowerEx Property**

**Description**
Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set **SweepType** = naPowerSweep, **Coupled** = False (Off), and **StopPowerEx**.

**VB Syntax**

```vbnet
chan.StartPowerEx (srcPort) = value
```

**Variable**

- **(Type)** - **Description**
  - **chan** - A **Channel** (object)
  - **srcPort** - (long integer) – Source port for which to set the Start power value.
    - **Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see **Remotely Specifying a Source Port**.

- **value** - (double) - Start Power in dBm.
  - **Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use `cap.MaximumSourceALCPower` and `cap.MinimumSourceALCPower`.
  - Auto attenuation is not allowed in Power Sweep.

**Return Type**

- Double

**Default**

- -10 dBm

**Examples**

```vbnet
Chan.StartPowerEx 1 = -10 'Write
strtpwr = Chan.StartPowerEx 2 'Read
```

**C++ Syntax**

- `HRESULT get_StartPowerEx(long port, double *pVal)`
- `HRESULT put_StartPowerEx(long port, double newVal)`

**Interface**

- `IChannel13`

---

**Last Modified:**

**StartRatioedPower Property**

**Description**
Write and read the start power ratioed value. Must also set **SweepType** to **Power**.

**VB Syntax**
```
phase.StartRatioedPower(srcPort) = value
```

**Variable**
(Type) - Description
- **phase**: A **PhaseControl** Object
- **srcPort**: (Long Integer) Source port for which to make phase control settings.

**Note**: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use **chan.getPortNumber** to translate the string into a port number. To learn more see **Remotely Specifying a Source Port**

- **value**: (Double) Start power ratio value in dBc. Must be within the allowable range of the PNA.

**Return Type**
Double

**Default**
0 dBc

**Examples**
```
phase.StartRatioedPower 1 = -1 ' Write
value = phase.StartRatioedPower 2' Read
```

**C++ Syntax**
```
HRESULT get_StartRatioedPower(long port, double* pVal);
HRESULT put_StartRatioedPower(long port, double newVal);

# State (Rx Leveling) Property

**Description**
Sets and reads the state of Receiver Leveling for a specific source port.

**VB Syntax**

```vbnet
RxLevel.State(srcPort) = value
```

**Variable**

- **RxLevel**
  A `ReceiverLeveling` Object

- **value**
  (Boolean) Choose from:
  - `True` - Receiver leveling ON
  - `False` - Receiver leveling OFF

- **srcPort**
  (Long Integer) Source port for which to set the state of Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Return Type**

Variant Boolean

**Default**

False

**Examples**

```
rxLevel.State (1) = True ' Write
```

```
value = rxLevel.State 2' Read
```

**C++ Syntax**

```
HRESULT get_State(long port, VARIANT_BOOL* pLevelingState);

StimulusValues Property

Description  Returns the specified X-axis FOM frequency range. The array contains one frequency value for each data point.

VB Syntax  value = calSet.StimulusValues (range)

Variable  (Type) - Description

calSet  CalSet (object) - Read-only property

range  (Long) FOM frequency range to read.
0  - returns source frequencies.
1  - returns response frequencies.
2  - returns primary frequencies.

Return Type  1-dimensional variant array

Default  Not Applicable

Examples  array = CalSet.StimulusValues 'Read

C++ Syntax  HRESULT get_StimulusValues (long range, VARIANT* vals)

Interface  ICalSet3

Last Modified:

16-Sep-2009  Added 2 - primary

19-Oct-2007  Fixed title and syntax
StopFrequency Property

Description
Sets or returns the stop frequency of the channel. (Channel Object)
Sets or returns the stop frequency of the segment. (Segment Object)
Sets or returns the stop frequency of the FOM Range. (FOMRange Object)
Sets or returns the stop frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

See also Measurement2 interface.

VB Syntax
object.StopFrequency = value

Variable (Type) - Description

object Any of the following:
Channel (object)
Segment (object)
FOMRange (object)
GuidedCalibrationPowerSensor (object)

value (double) - Stop frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer.

Return Type
Double

Default
Channel - Maximum frequency of the analyzer.
Segment - 0
FOMRange - Maximum frequency of the analyzer.
GuidedCalibrationPowerSensor - Maximum frequency of the analyzer.

Examples
chan.StopFrequency = 4.5e9 'sets the stop frequency for the channel
object -Write

stopfreq = Chan.StopFrequency 'Read

C++ Syntax
HRESULT get_StopFrequency(double *pVal)
HRESULT put_StopFrequency(double newVal)

Interface
IChannel
ISegment
IFOMRange
IGuidedCalibrationPowerSensor
Last modified:

8-Feb-2011  Added GuidedCalibrationPowerSensor
8-Mar-2007  Added FOMRange
1-Nov-2006  Removed Cal Set object - created cs.stopfreq
StopFrequency (Cal Set) Property

Description
Returns the stop frequency that is stored in the Cal Set.

VB Syntax
value = CalSet.StopFrequency (range)

Variable (Type) - Description
value (double) - returned Stop frequency in Hertz.

CalSet (object)

range (Long) Choose: 0 (Source and receiver frequency)

Return Type
Double

Default
Not Applicable

Examples
stop = calset.StopFrequency(0) 'Reads the stop frequency stored in the cal set.

C++ Syntax
HRESULT get_StopFrequency(long range, double *pVal)

Interface |CalSet3

Last modified:
25-Jan-2011 Fixed range argument
Nov. 1, 2006 New command - split from ch.StopFreq
StopPower Property

Description
Sets the Stop Power of the analyzer when sweep type is set to Power Sweep. Frequency of the measurement is set with chan.CWFrequency.

VB Syntax
object.StopPower = value

Variable (Type) - Description

object One of the following:
  • Channel (object)
  • CalSet (object) - Read-only property

value (double) - Stop Power in dB.

Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use cap.MaximumSourceALCPower and cap.MinimumSourceALCPower.

Auto attenuation is not allowed in Power Sweep.

Return Type
Double

Default
0

Examples
Chan.StopPower = -10 'Write
stppwr = Chan.StopPower 'Read

C++ Syntax
HRESULT get_StopPower(double *pVal)
HRESULT put_StopPower(double newVal)

Interface
IChannel
|CalSet3

Last Modified:

7-Jan-2008 Removed FOMRange
8-Mar-2007 Added FOMRange

**Read-only**

## Stop Property

**Description**  Returns the stimulus value of the last data point for the measurement. To understand how this property is useful, see [IMeasurement2 Interface](#).

**VB Syntax**  

```
value = meas.Stop
```

**Variable**  

- **(Type) - Description**
  - **value**  (Double) Variable to store the returned value
  - **meas**  A Measurement (object)

**Return Type**  Double

**Default**  Not Applicable

**Examples**  

```vbnet
Print meas.Stop 'prints the stimulus value of the last data point
```

**C++ Syntax**  

```cpp
HRESULT get_Stop(double * Val);
```

**Interface**  IMeasurement2
**StopPhase Property**

**Description**
Write and read the stop value of phase sweep. Must also send Sweep Type Property to put the analyzer into phase sweep mode.

**VB Syntax**
```
phase.StopPhase(srcPort) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>phase</code></td>
<td>A <code>PhaseControl</code> Object</td>

To learn more see <a href="#">Remotely Specifying a Source Port</a></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Stop phase value in degrees. Choose a value between -360 and 360.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0 degrees

**Examples**
```
phase.StopPhase 1 = 60 ' Write
value = phase.StopPhase 2 ' Read
```

**C++ Syntax**
```
HRESULT get_StopPhase(long port, double* pVal);
HRESULT put_StopPhase(long port, double newVal);
```

**Interface**
IPhaseControl

---

Last Modified:
8-Dec-2010    MX New topic
StopPowerEx Property

Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set `SweepType` = naPowerSweep, `Coupled` = False (Off), and `StartPowerEx`.

**VB Syntax**

```
chan.StopPowerEx (srcPort) = value
```

**Variable**

(*Type*) - Description

- **chan** - A Channel (object)
- **srcPort** - (long integer) – Source port for which to set the Stop power value.
  
  **Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- **value** - (double) - Stop Power in dBm.
  
  **Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use `cap.MaximumSourceALCPower` and `cap.MinimumSourceALCPower`

Auto attenuation is not allowed in Power Sweep.

**Return Type**

Double

**Default**

0 dBm

**Examples**

- `Chan.StopPowerEx 1 = -10` 'Write
- `stopPwr = Chan.StopPowerEx 2` 'Read

**C++ Syntax**

```
HRESULT get_StopPowerEx(long port, double *pVal)
HRESULT put_StopPowerEx(long port, double newVal)
```

**Interface**

IChannel13
StopRatioedPower Property

**Description**  Write and read the stop power ratioed value. Must also set SweepType to Power.

**VB Syntax**  

\[
\text{phase.StopRatioedPower}(\text{srcPort}) = \text{value}
\]

**Variable**  

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>phase</td>
</tr>
</tbody>
</table>

A PhaseControl Object

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcPort</td>
</tr>
</tbody>
</table>

(Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
</tr>
</tbody>
</table>

(Double) Stop power ratio value in dBc. Must be within the allowable range of the PNA.

**Return Type**  Double

**Default**  0 dBc

**Examples**  

phase.StopRatioedPower 1 = -1 'Write

value = phase.StopRatioedPower 2' Read

**C++ Syntax**  

HRESULT get_StopRatioedPower(long port, double* pVal);

HRESULT put_StopRatioedPower(long port, double newVal);

**Interface**  IPhaseControl

Write/Read

strPort2Pdeembed_S2PFile Property

Description
Sets and returns the 2 port De-embedding .S2P file name for the specified port number. Model is applied when both the file name is specified and User is specified using Port2PdeembedCktModel Property.

Learn more about S2P files.

Note: This command affects ALL measurements on the channel.

VB Syntax
fixture.strPort2Pdeembed_S2PFile(port) = value

Variable (Type) - Description

fixture
A Fixturing (object)

port
(Integer) Port number to receive circuit model.

value
(String) Full path, file name, and extension (.s2P) of the de-embedding circuit.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

Return Type
String

Default
Not Applicable

Examples
fixture.strPort2Pdeembed_S2PFile(2) = "C:/Program Files/Agilent/Network Analyzer/Documents/myFile.s2p" 'Write

value = fixture.strPort2Pdeembed_S2PFile(1) 'Read

C++ Syntax
HRESULT get_strPort2Pdeembed_S2PFile(short port BSTR *bstrFile)
HRESULT put_strPort2Pdeembed_S2PFile(short port BSTR bstrFile)

Interface
IFixturing
strPortMatch_S2PFile Property

**Description**
Sets and returns the Port Matching 'S2P' file name for the specified port number. Model is applied when both the file name is specified and User is specified using PortMatchingCktModel Property. Learn more about S2P files.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```
fixture.strPort2PMatch_S2PFile(port) = value
```

**Variable**
- **(Type)** - Description

  - `fixture`  A Fixturing (object)
  - `port`  (Integer) Port number to receive circuit model.
  - `value`  (String) Full path, file name, and extension (.s2P) of the matching circuit. Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents".

**Return Type**
String

**Default**
Not Applicable

**Examples**
```
fixture.strPort2PMatch_S2PFile(2) = "C:/Program Files/Agilent/Network Analyzer/Documents/myFile.s2p" 'Write

value = fixture.strPort2PMatch_S2PFile(1) 'Read
```

**C++ Syntax**
- HRESULT get_strPort2PMatch_S2PFile(short port BSTR *bstrFile)
- HRESULT put_strPort2PMatch_S2PFile(short port BSTR bstrFile)

**Interface**
IFixturing
# SubPointTrigger Property

## Description
Enables / Disables subpoint triggering. When enabled and performing [Point Averaging](#), each rising edge of P0 triggers a subpoint (one of N acquisitions in an N point average). Must also enable the P0 generator using `pulse.State(n)`.

## VB Syntax

```vbnet
pulse.SubPointTrigger(n) = value
```

## Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pulse</td>
<td>PulseGenerator (object)</td>
<td>A PulseGenerator (object)</td>
</tr>
<tr>
<td>n</td>
<td>Integer</td>
<td>Pulse generator number. <strong>Must be 0</strong> as this is the generator that triggers the ADC.</td>
</tr>
<tr>
<td>value</td>
<td>Boolean</td>
<td>Enable or disable SubPointTrigger</td>
</tr>
</tbody>
</table>

- **True** - turns subpoint triggering ON.
- **False** - turns subpoint triggering OFF.

## Return Type
Boolean

## Default
False

## Examples

```vbnet
pulse.SubPointTrigger(0) = True 'Write

bool = pulse.SubPointTrigger(0) 'Read
```

## C++ Syntax

```c++
HRESULT get_SubPointTrigger (integer pulse, VARIANT_BOOL* on_off);
HRESULT put_SubPointTrigger (integer pulse, VARIANT_BOOL on_off);
```

## Interface
IPulseGenerator2

## Sweep Delay Property

**Description**
Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to **Dwell Time** and **External Trigger** delay if enabled.

**VB Syntax**

```
chan.SweepDelay = value
```

**Variable (Type) - Description**

- **chan**  
  *Channel (object)*

- **value**  
  *double* - Sweep delay in seconds.

**Return Type**
Double

**Default**
0

**Examples**

```
chan.SweepDelay = 3e-3 'Write

swpdelay = chan.SweepDelay 'Read
```

**C++ Syntax**

```
HRESULT get_SweepDelay(double *pVal)
HRESULT put_SweepDelay(double newVal)
```

**Interface**
IChannel

**Read/Write**

**SweepEndMode Property**

**Description**
Sets and reads the event that will cause the Sweep End line to go to a low state. The line will return to a high state after the appropriate calculations are complete.

*Note:* This line is connected to the following pins on the HANDLER IO connector and AUX IO connector in the PNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**

```vbnet
object.SweepEndMode = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A HandlerIO or AuxIO object</td>
</tr>
</tbody>
</table>

**value**

(enumerator as NASweepEndMode) Choose from:

0 - naSweep - the line goes low when each sweep is complete

1 - naChannelSweep - the line goes low when all the sweeps for each channel is complete.

2 - naGlobalSweep - the line goes low when all sweeps for all triggerable channels are complete.

**Return Type**
Long Integer

**Default**
0 - naSweep

**Examples**

```vbnet
HWAuxIO.PassFailMode = naSweep 'Write
value = HWAuxIO.PassFailMode 'Read
```

**C++ Syntax**

```c++
HRESULT put_SweepEndMode ( tagNASweepEndMode Mode );
HRESULT get_SweepEndMode ( tagNASweepEndMode* Mode );
```

**Interface**

IHWAuxIO

IHWMaterialHandlerIO
**SweepHoldOff Property**

**Description**
Returns a boolean that represents the state of SweepHoldoff line (pin2) of the External Test Set connector.

**VB Syntax**
```vbnet
value = ExtIO.SweepHoldOff
```

**Variable**
- **value** *(boolean)* - Variable to store the returned data
- **ExtIO** *(object)* - An External IO object

**Return Type**
Boolean
- **False** - indicates the line is being held at a TTL Low
- **True** - indicates the line is being held at a TTL High

**Default**
Not Applicable

**Examples**
```vbnet
value = ExtIO.SweepHoldOff
```

**C++ Syntax**
```cpp
HRESULT get_SweepHoldOff( VARIANT_BOOL* bValue);
```

**Interface**
IHWExternaTestSetIO
# SweepOrder Property

**Description**
Sets and returns the order number of IM products to view when `SweepType = NTH` is specified. This actually sets the frequency span to `DeltaF * N` (this command value).

**VB Syntax**
```vbnet
ims.SweepOrder = value
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ims</td>
<td>An IMSpectrum Object</td>
</tr>
<tr>
<td>value</td>
<td>(Integer) Order number of IM product.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
9

**Examples**
```vbnet
ims.SweepOrder = 5 'Write
value = ims.SweepOrder 'Read
```

**C++ Syntax**
```c++
HRESULT get_SweepOrder(long *pVal)
HRESULT put_SweepOrder(long newVal)
```

### SweepSpeedMode Property

**Description**
Sets and returns the sweep speed mode: FastSweep or Normal.

**VB Syntax**
```vbnet
chan.SweepSpeedMode = value
```

**Variable**
- **Type**: Channel (object)
- **Description**

**Value**
- (enum as NASweepSpeedMode) - Choose from:
  - 0 - naSweepSpeedModeNormal - Standard PNA sweep mode
  - 1 - naSweepSpeedModeFast - Fast sweep mode

**Return Type**
Enum

**Default**
0 - naSweepSpeedModeNormal

**Examples**
```vbnet
chan.SweepSpeedMode = naSweepSpeedModeNormal 'Write
swpSpeed = chan.SweepSpeedMode 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SweepSpeedMode(tagNASweepSpeedModes* pVal)
HRESULT put_SweepSpeedMode(tagNASweepSpeedModes newVal)
```

**Interface**
IChannel14

---

Last Modified:

26-Aug-2008  MX New topic
### SweepGenerationMode Property

**Description**
Sets the method used to generate a sweep: continuous ramp (analog) or discrete steps (stepped).

**VB Syntax**
```
object.SweepGenerationMode = value
```

**Variable**

*object*  
Channel *(object)*  

*or*

CalSet *(object)* - Read-only property

**value** *(enum NASweepGenerationModes)* - Choose either:

- **0 - naSteppedSweep** - source frequency is CONSTANT during measurement of each displayed point. More accurate than Analog. Dwell time can be set in this mode.
- **1 - naAnalogSweep** - source frequency is continuously RAMPING during measurement of each displayed point. Faster than Stepped. Sweep time (not dwell time) can be set in this mode.

**Return Type**
Long Integer

**Default**
Analog

**Examples**
```
Chan.SweepGenerationMode = naAnalogSweep 'Write

swpgen = Chan.SweepGenerationMode 'Read
```

**C++ Syntax**
```
HRESULT get_SweepGenerationMode(tagNASweepGenerationModes* pVal)
HRESULT put_SweepGenerationMode(tagNASweepGenerationModes newVal)
```

**Interface**
IChannel
|CalSet3
## SweepTime Property

### Description
Sets the Sweep time of the analyzer. If sweep time accuracy is critical, use ONLY the values that are attained using the up and down arrows next to the sweep time entry box. See Sweep Time.

### VB Syntax
```
object.SweepTime = value
```

### Variable
- **object (Type)** - Description
  - **object**: Channel (object)
    - or
      - **Segment (object)** first set SweepTimeOption to true.
    - or
      - **CalSet (object)** - Read-only property
- **value (double)** - Sweep time in seconds. The maximum sweep time of the PNA is 86400 seconds (1 day).
  - To set the fastest sweep speed possible, set this value to 0.

### Return Type
**Double**

### Default
0

### Examples
```
chan.SweepTime = 3e-3 'Write
swptme = chan.SweepTime 'Read
```

### C++ Syntax
```
HRESULT get_SweepTime(double *pVal)
HRESULT put_SweepTime(double newVal)
```

### Interface
- IChannel
- CalSet3
- ISegment2
SweepTimeOption Property

**Description**
Enables the Sweep time or Dwell time to be set on individual sweep segments. This property must be set True before the sweep or dwell time commands are sent. Otherwise, those commands will be ignored.

**VB Syntax**
```
segs.SweepTimeOption = state
```

**Variable**
- **Type** - Description
  - **segs** A Segments collection (object)
  - **state** (boolean)
    - **True** - Enables Sweep or Dwell time to be set independently.
    - **False** - Disables Sweep or Dwell time from being set independently.

**Return Type**
Boolean

**Default**
False

**Examples**
```
segs.SweepTimeOption = True 'Write
timeOption = SweepTimeOption 'Read
```

**C++ Syntax**
```
HRESULT get_SweepTimeOption(VARIANT_BOOL *pVal)
HRESULT put_SweepTimeOption(VARIANT_BOOL newVal)
```

**Interface**
ISegments3

Write/Read About Swept IMD Sweep types

SweepType Property (IMD Opt 087)

Description
Sets and returns the type of sweep for a Swept IMD measurement.
See a list of commands that are relevant for each sweep type.

VB Syntax

```vbnet
imd.SweepType = value
```

Variable (Type) - Description

 IMD A SweptIMD Object

\n
value (Enum as naSweepTypes) - Choose from:

- **0 - naIMDToneCWSweep** The main tone frequencies (F1 and F2) and power levels (P1 and P2) are held constant. Measurements are taken for the specified number of points.

- **1 - naIMDTonePowerSweep** The main tone frequencies are specified as either F1 and F2, or as FC and DeltaF. These frequencies are held constant while the power of each tone is varied from the Start Power to Stop Power.

- **2 - naIMDToneCenterFreqSweep** Maintaining a constant tone spacing (DeltaF) and tone powers (P1 and P2), the center frequency (FC) is swept from Start to Stop, or can also be specified as Center and Span.

- **3 - naIMDDeltaFrequencySweep** The center frequency (FC) is held constant. The tone spacing is increased from Start DeltaF to Stop DeltaF.

- **4 - naIMDToneSegmentSweep** Same as FCenter sweep, except that the center frequencies for the sweep are constructed using the standard segment sweep commands. (NOT valid for IMDx)

- **5 - naLOPowerSweep** All frequencies are fixed while the LO power is swept. (IMDx ONLY)

Return Type

Enum

Default

2 - naIMDToneCenterFreqSweep

Examples

```vbnet
imd.SweepType = naIMDToneCWSweep  'Write

swptyp = imd.SweepType  'Read
```

C++ Syntax

```c++
HRESULT get_SweepType(tagNASweepTypes* pVal)
HRESULT put_SweepType(tagNASweepTypes newVal)
```

Interface

ISweptIMD

Last Modified: 1564
**SweepType Property** (IMSpectrum Opt 087)

**Description**
Sets and returns the type of sweep for an IMSpectrum measurement.

**VB Syntax**

```vbnet
ims.SweepType = value
```

**Variable** *(Type)* - Description

- **ims** An IMSpectrum Object

- **value** (Enum as NAIMSSweepType) - Choose from:
  
  - **0 - naIMSLinearSpan** When Tracking is enabled, allows tuning the Response Settings (receiver) to any values within the frequency range of the PNA. When Tracking is NOT enabled also allows setting the Stimulus (sources) to any values within the frequency range or the PNA.
  
  - **1 - naIMSSecondOrderSpan** The receiver is tuned to view the 2nd order products \((f_2-f_1\) and \(f_1+f_2\)) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
  
  - **2 - naIMSThirdOrderSpan** The receiver is tuned to view the 3rd order products \((2f_1 - f_2\) and \(2f_2-f_1\)) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
  
  - **3 - naIMSNthOrderSpan** The frequency range is set to \(N \times \Delta F\). This algorithm will NOT tune the receivers to see the EVEN order products.

**Return Type**

- **Enum**

**Default**

- **3 - naIMSNthOrderSpan**

**Examples**

```vbnet
ims.SweepType = naIMSNthOrderSpan 'Write
swptyp = ims.SweepType 'Read
```

**C++ Syntax**

- HRESULT get_SweepType(tagNAIMSSweepType* pVal)
- HRESULT put_SweepType(tagNAIMSSweepType newVal)

**Interface**

- IMSpectrum

### SweepType Property

**Description**
Sets and returns the type of sweep. First set SweepType, then set sweep parameters such as frequency or power settings.

**VB Syntax**
```vbnet
object.SweepType = value
```

**Variable**
- **(Type)** - Description
  - `object` One of the following:
    - `Channel` (object)
    - `FOMRange` (object) Must be an `UNCOUPLER` range.
    - `CalSet` (object) - Read-only property
  - `value` - Choose from:
    - 0 - naLinearSweep
    - 1 - naLogSweep
    - 2 - naPowerSweep
    - 3 - naCWT ImSweep
    - 4 - naSegmentSweep
    - 5 - naPhaseSweep

**Note**: Sweep type cannot be set to Segment sweep if there are no segments turned ON. A segment is automatically turned ON when a application is created.

**Return Type**
Long Integer

**Default**
naLinearSweep

**Examples**
```vbnet
chan.SweepType = naPowerSweep 'Write
swptyp = chan.SweepType 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SweepType(tagNASweepTypes* pVal)
HRESULT put_SweepType(tagNASweepTypes newVal)
```

**Interface**
- IChannel
- ICaliSet3
- IFOMRange

---

Last Modified: 1567
3-Dec-2010  Added phase sweep
6-May-2010  Added sweep type note.
8-Mar-2007  Added FOMRange
### SystemImpedanceZ0 Property

**Description**
Sets and returns the impedance for the analyzer.

**VB Syntax**
```vbnet
app.SystemImpedanceZ0 = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An <a href="#object">Application</a></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) Analyzer Impedance. Choose any number between 0 and 1000 ohms.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
50

**Examples**
```vbnet
app.SystemImpedanceZ0 = 75 'Write
z0 = app.SystemImpedanceZ0 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SystemImpedanceZ0(double dSystemZ0)
HRESULT put_SystemImpedanceZ0(double *pdSystemZ0)
```

**Interface**

About Marker Search

TargetValue Property

**Description**  Sets the target value for the marker when doing Target Searches (SearchTargetLeft, SearchTarget, SearchTargetRight).

**VB Syntax**  

```
mark.TargetValue = value
```

**Variable**  (Type) - Description

- **mark**  A Marker (object)

- **value**  (single) - Target value. Choose any number between: -500 and 500

**Return Type**  Single

**Default**  0

**Examples**  

```
mark.TargetValue = 10.5 'Write
```

```
target = mark.TargetValue 'Read
```

**C++ Syntax**  

```
HRESULT get_TargetValue(float *pVal)
HRESULT put_TargetValue(float newVal)
```

**Interface**  IMarker
Write/Read

TestPortPower Property

Description
Sets or returns the RF power level for the channel
or
Sets or returns the RF power level of the segment.

VB Syntax
\[ \text{object}.\text{TestPortPower}(\text{srcPort}) = \text{value} \]

Variable (Type) - Description

- **object**
  - A Channel (object) - to set coupled power, use chan.CouplePorts. If CouplePorts = False, then each port power can be set independently. Otherwise, chanTestPortPower (1) = value sets power level at both ports.
  - or
  - A CalSet (object)
  - or
  - A Segment (object)

- **srcPort**
  - (long integer) - Source Port number.
  - Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- **value**
  - (double) - RF Power in dBm.
  - Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, use cap.MaximumSourceALCPower and cap.MinimumSourceALCPower.
  - Actual achievable leveled power depends on frequency.

Return Type
Double

Default
0

Examples
\[ \text{chan.TestPortPower}(1) = 5 \ 'sets the port 1 RF power level for the channel} \]
\[ \text{object} \ 'Write} \]

\[ \text{powerlev} = \text{Chan.TestPortPower}(1) 'Read} \]

C++ Syntax
HRESULT get_TestPortPower(long port, double *pVal)
HRESULT put_TestPortPower(long port, double newVal)

Interface
IChannel
ICalSet3
ISegment

Last Modified:
## TestSetType Property

**Description**  Returns the Test Set Type (model) that was used for the Cal Set.

**VB Syntax**  

```vbnet
TSType = calset.TestSetType
```

**Variable**  

- **Type** - Description
- **TSType**  (String) Variable to store the returned test set model.
- **calset**  A **Cal Set** object.

**Return Type**  String

**Default**  Depends on the test set.

**Example**  

```vbnet
TSType = calset.TestSetType
```

**C++ Syntax**  

```cpp
HRESULT get_OutputPorts(BSTR *mapping);
```

**Interface**  ICalset5

---

**Last modified:**  
9/18/06  MQ Added for multiport

ThruCalMethod Property - Superseded

Description
This command is replaced by PathThruMethod Property. Sets and returns the method for performing the thru portion of the calibration.

VB Syntax
```
obj.ThruCalMethod = value
```

Variable (Type) - Description

- **obj**
  - SMCType (object)
  - or
  - VMCType (object)

- **value**
  - (String) Specifies the Thru method. Case insensitive - include spaces. Choose from:
    - "Default"
    - "Flush Thru" or "FLUSH"
    - "Unknown Thru" or "UNKN"
    - "Adapter Removal" or "ADAP"

Return Type
String

Default
Default

Examples
```
SMC.ThruCalMethod = "UNKN"
```

C++ Syntax
```
HRESULT put_ThruCalMethod(enum NAThruCalMethod thruMethod);
HRESULT get_ThruCalMethod(enum NAThruCalMethod *thruMethod);
```

Interface
SMCType
VMCType
Read/Write

**ThruCalMethod Property  Superseded**

- **Description**: This command is replaced by PathThruMethod Property.
  Sets and returns the method for performing the Cal Method and the THRU portion of the calibration.

- **VB Syntax**: `guidedCal`.ThruCalMethod = value

- **Variable** (Type) - Description
  - `guidedCal` - GuidedCalibration (object)
  - `value` - (Enum as NATruCalMethod) Choose from:
    - **0 - naDefaultCalMethod** - allow the PNA to choose the best possible method (from the following) depending on whether the device or ECal module is insertable or non-insertable and given the model number of the PNA. (default selection if omitted.)
    - **1 - naAdapterRemoval** - Perform Adapter removal calibration.
    - **2 - naFlushThru** - Perform Flush Thru calibration.
    - **3 - naDefinedThru** - Perform Defined Thru calibration. If performing an ECal, this is the Thru standard in the ECal module.
    - **4 - naUnknownThru** - Perform Unknown Thru calibration.
    - **5 - naSOLT** - Perform SOLT calibration
    - **6 - naTRL** - Perform TRL calibration
    - **7 - naQSOLT** - Perform QSOLT calibration.

- **Return Type**: Enum
- **Default**: 0 - naDefaultCalMethod

- **Examples**: `guided.ThruCalMethod = naDefinedThru`

- **C++ Syntax**:
  - `HRESULT get_ThruCalMethod(enum NATruCalMethod *thruMethod);`
  - `HRESULT put_ThruCalMethod(enum NATruCalMethod thruMethod);`

- **Interface**: IGuidedCalibration

---

Last Modified: 30-Apr-2007  MX Superseded
Read/Write
ThruPortList Property

Description

**Note:** Available only on PNA releases 5.0 and greater.

**Note:** Do NOT send this command to rely on SmartCal to determine the most accurate Thru port pairs for the cal. You can send the query form of this command to learn the port pairs determined by SmartCal.

Sets and returns the thru connection port pairs for the calibration.

- For 3-port cals, specify at least two pairs.
- For 4-port cals, specify at least three pairs.
- For highest accuracy, specify more than the minimum pairs.
- For a 2-port cal, there is only one port pair. It is the only pair in the list and it is required.

Learn more about [Thru method and port pairings](#).
See an example of a [4-port guided calibration using COM](#).

<table>
<thead>
<tr>
<th>VB Syntax</th>
<th>Variable (Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>guidedCal.ThruPortList = t1a, t1b, t2a, t2b, t3a, t3b</code></td>
<td><code>guidedCal</code> GuidedCalibration (object)</td>
</tr>
</tbody>
</table>

- `t1a, t1b...` (Variant) Port numbers in pairs - a one-dimensional array of Long integers.
  - `t1a, t1b` (Thru1 - port A and port B)
  - `t2a, t2b` (Thru2 - port A and port B)
  - `t3a, t3b` (Thru3 - port A and port B)

**Return Type** Variant - a one-dimensional array of Long integers.

**Default** The most accurate port pairs for the cal.

**Example**

```vbnet
thruList = Array(1,2,1,3,1,4)
guided.ThruPortList = thruList
'Sets the following three thru connections for a 4-port calibration:
Thru 1 - ports 1 and 2
Thru 2 - ports 1 and 3
Thru 3 - ports 1 and 4
```
C++ Syntax

HRESULT get_ThruPortList(VARIANT* portList);
HRESULT put_ThruPortList(VARIANT portList);

Interface

IGuidedCalibration
TimeOut Property

Description
Sets and returns the Time out value for communication with the external device. An error is returned if communication with the device is not successful within this period of time.

VB Syntax
extDevices.TimeOut = value

Variable (Type) - Description
extDevices An ExternalDevice (object)
value (Double) Time out in milliseconds.

Return Type
Double

Default
20000 milliseconds (20 seconds)

Examples
extDevices.TimeOut = 1000 Write
value = extDevices.TimeOut 'Read

C++ Syntax
HRESULT get_TimeOut(Double* value);
HRESULT put_TimeOut(Double newVal);

Interface
IExternalDevices

## Title Property

### Description
Writes or reads a custom title for the window. Newer entries replace (not append) older entries. Turn the title ON and OFF with `TitleState`.

### VB Syntax
```vb
win.Title = string
```

### Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win</code></td>
<td>NaWindow</td>
<td>A NaWindow (object)</td>
</tr>
<tr>
<td><code>string</code></td>
<td>long</td>
<td>Title limited to 50 characters.</td>
</tr>
</tbody>
</table>

### Return Type
String

### Default
Null

### Examples
```vb
win.Title = "Hello World" 'Write

titl = win.Title 'Read
```

### C++ Syntax
```cpp
HRESULT get_Title(BSTR *title)
HRESULT put_Title(BSTR title)
```

### Interface
INAWindow
### TitleState Property

**Description**
Turns ON and OFF the window title. Write a window title with `Title`.

**VB Syntax**

```vbnet
win.TitleState = state
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win</code></td>
<td>A NaWindow (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean)</td>
</tr>
<tr>
<td></td>
<td>True - Title ON</td>
</tr>
<tr>
<td></td>
<td>False - Title OFF</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
win.TitleState = True 'Write
```

```vbnet
titlestate = win.TitleState 'Read
```

**C++ Syntax**

```c++
HRESULT get_TitleState(VARIANT_BOOL* bState)
HRESULT put_TitleState(VARIANT_BOOL bState)
```

**Interface**
INAWindow

**TonePower Property**

**Description**
Sets and returns the power level of the Main Tones. Use with IMD sweep types:

- naIMDToneCWSweep
- naIMDToneCenterFreqSweep
- naIMDDeltaFrequencySweep

When tone power is coupled, setting either F1 or F2 power sets both.

**VB Syntax**

```vbnet
object.TonePower (tone) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>object</strong></td>
</tr>
<tr>
<td><strong>tone</strong></td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td><strong>value</strong></td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```vbnet
imd.TonePower(naIMDF1Power) = 0 'Write
value = imd.TonePower(naIMDF2Power) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_TonePower(tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePower(tagNAIMDTonePowerID naIMDF1, double newVal);
```

**Write/Read**

**About Swept IMD**

**TonePowerStart Property**

**Description**
Sets and returns the start power level of the Main tones. Use with IMD sweep type=naIMDTonePowerSweep.
When tone power is coupled, setting either F1 or F2 power sets both.

**VB Syntax**
object.TonePowerStart (tone) = value

**Variable**
**Type** - Description

*object* A SweptIMD or IMSpectrum Object

*tone* (Enum as NAIMDTonePowerID) Choose from:

- 0 - naIMDF1Power - F1 tone
- 1 - naIMDF2Power - F2 tone

*value* (Double) Start power in dBm. Choose a value between +30 dBm and -30 dBm.

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```vbnet
imd.TonePowerStart(naIMDF1Power) = 0 'Write
value = imd.TonePowerStart(naIMDF2Power) 'Read
```

**C++ Syntax**

```csharp
HRESULT get_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double newVal);

TotalIterations Property

**Description**
Returns the total number of iterations required by the last SMART sweep. Returns number of power points for a 2D sweep.

**VB Syntax**
iter = gca.TotalIterations

**Variable (Type) - Description**
- **iter** (Integer) Variable to store the returned number of iterations.
- **gca** A GainCompression (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**
data = gca.TotalIterations

**C++ Syntax**
HRESULT get_TotalIterations();

**Interface**
IGainCompression2

Last Modified:
9-May-2008   MX New topic
TotalNumberOfPoints Property

**Description**
Read the total number of points a complete GCA measurement will generate.

- For 2D modes, this is Frequency * Power points
- For SMART Sweep, this is Frequency points.

The total can NOT exceed the PNA maximum. See Frequency and Power points.

**VB Syntax**
```
value = gca.TotalNumberOfPoints
```

**Variable** *(Type) - Description*
- **value** *(integer)* Variable to store the returned total number of points
- **gca** A GainCompression *(object)*

**Return Type** Integer

**Default** 5226 (201 * 26)

**Example**
```
totPoints = gca.TotalNumberOfPoints 'Read
```

**C++ Syntax**
```
HRESULT get_TotalNumberOfPoints(int* pVal)
```

**Interface** IGainCompression

## Touchscreen Property

**Description**
Sets and reads the state of the PNA-X Touchscreen (ON and OFF).
This setting remains until changed again from the front-panel or remote command.

**VB Syntax**
```vbnet
app.Touchscreen = state
```

**Variable**
**Type** - Description

- `app` An Application (object)
- `state` (boolean)
  - **False (0)** - Disables use of Touchscreen
  - **True (1)** - Enables use of Touchscreen

**Return Type**
Boolean

<table>
<thead>
<tr>
<th>False</th>
<th>OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>ON</td>
</tr>
</tbody>
</table>

**Default**
TRUE when shipped from factory.

**Examples**
```vbnet
app.Touchscreen = True 'Write

coupl = app.Touchscreen 'Read
```

**C++ Syntax**
```cpp
HRESULT put_Touchscreen(VARIANT_BOOL bState)
HRESULT get_Touchscreen(VARIANT_BOOL *bState)
```

**TraceMath Property**

**Description**
Performs math operations on the measurement object and the trace stored in memory. (There MUST be a trace stored in Memory to perform math. See [Meas.DataToMemory](#) method.)

**VB Syntax**
```
meas.TraceMath = value
```

**Variable**
- **Type** - Description
  - `meas` A [Measurement](#) (object)
  - `value` (enum NAMathOperation) - Choose from:
    - 0 - naDataNormal
    - 1 - naDataMinusMemory
    - 2 - naDataPlusMemory
    - 3 - naDataDivMemory
    - 4 - naDataTimesMemory

**Return Type**
NAMathOperation

**Default**
Normal (0)

**Examples**
```
meas.TraceMath = naDataMinusMemory 'Write
mathOperation = meas.TraceMath 'Read
```

**C++ Syntax**
```
HRESULT get_TraceMath(tagNAMathOperation* pMathOp)
HRESULT put_TraceMath(tagNAMathOperation mathOp)
```

**Interface**
IMeasurement
## TraceMax Property

**Description**
Maximizes (isolates) or restores the active trace in the active window. When TraceMax is ON, the active trace is the ONLY trace on the display. All other traces are hidden.

**VB Syntax**
```vbnet
meas.TraceMax = state
```

**Variable (Type) - Description**

- **meas**: A Measurement (object)
- **state**: (boolean) - Choose from:
  - **True**: Maximizes / isolates the active trace in the window.
  - **False**: Restores other traces to be viewed in the window.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
meas.TraceMax = True
state = meas.TraceMax
```

### C++ Syntax

## TraceTitle Property

**Description**  
Writes and reads data for the trace title area.  
The trace title is embedded in the [trace status field](#).  
The title is turned ON and OFF using [TraceTitleState](#).

**VB Syntax**  
`meas.TraceTitle = value`

**Variable (Type) - Description**

- `meas` A [Measurement](#) (object)
- `value` (string) - Title to be displayed. Any characters (no spaces), enclosed with quotes.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
`meas.TraceTitle = "My new s11 measurement"`

`title = TraceTitle`  
`'Read`

**C++ Syntax**  
`HRESULT get_TraceTitle(BSTR *title );`
`HRESULT put_TraceTitle(BSTR title );`

About Marker Search

Tracking Property

Description: This property, when on, executes the search function `marker/SearchFunction` every sweep. In effect, turning Tracking ON is the same as executing one of the immediate, one-time, “Search...” methods (such as `SearchMin`, `SearchMax`) for every sweep.

VB Syntax: `mark.Tracking = state`

Variable: (Type) - Description

mark A Marker (object)
state (boolean) - Tracking state. Choose from:
False - Tracking OFF
True - Tracking ON

Return Type: Boolean

Default: False

Examples: `mark.Tracking = False` 'Write
`markTracking = mark.Type` 'Read

C++ Syntax: HRESULT put_Tracking(VARIANT_BOOL bOn)
HRESULT get_Tracking(VARIANT_BOOL * pbOn)

Interface: IMarker
Write/Read

About IM Spectrum

TrackingChannel Property

Description
Sets and returns the IMD channel number to which the IM Spectrum channel is coupled. Use TrackingEnable to enable tracking.

VB Syntax
ims.TrackingChannel = value

Variable (Type) - Description

ims An IMSpectrum Object

value (Integer) Existing IMD channel number to which frequency and power settings are coupled.

Return Type
Long Integer

Default
First existing IMD channel

Examples
ims.TrackingChannel = 1 'Write
value = ims.TrackingChannel 'Read

C++ Syntax
HRESULT get_TrackingChannel(long *pVal)
HRESULT put_TrackingChannel(long newVal)

Interface
IIMSpectrum

Last Modified:
19-Aug-2008 MX New topic
Write/Read

About IM Spectrum

TrackingEnable Property

**Description**  
When an IMD channel exists, allows the IM Spectrum frequency and power setting to track (couple with) the IMD channel settings. Use TrackingChannel to set the channel number to track.

**VB Syntax**  
ims.TrackingEnable = value

**Variable**  
*ims* (Type) - Description

- **ims** An IMSpectrum Object

- **value** (Boolean) Tracking state. Choose from:
  - **True** - IM Spectrum frequency and power settings track the IMD channel settings.
  - **False** - IM Spectrum frequency and power settings are specified in the IMS channel.

**Return Type**  
Boolean

**Default**  
False

**Examples**  
ims.TrackingEnable = True  'Write

value = ims.TrackingEnable  'Read

**C++ Syntax**  
HRESULT get_TrackingEnable(VARIANT_BOOL* bValue)

HRESULT put_TrackingEnable(VARIANT_BOOL newVal)

**Interface**

<td></td>
<td><strong>False</strong> - Automatic Step</td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> - Manual Step</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False - Automatic Step

**Examples**

```vbnet
ims.TrackingManualStepEnable = True 'Write
value = ims.TrackingManualStepEnable 'Read
```

**C++ Syntax**

```c
HRESULT get_TrackingManualStepEnable(VARIANT_BOOL *bVal)
HRESULT put_TrackingManualStepEnable(VARIANT_BOOL newVal)
```

**Interface**
`IIM Spectrum`

Last Modified:
19-Aug-2008    MX New topic
TrackingStepIndex Property

Description
When TrackingManualStepEnable = True (Manual step), sets and returns the data point number at which the IM spectrum measurement occurs.

VB Syntax
ims.TrackingStepIndex = value

Variable (Type) - Description
ims An IMSpectrum Object

value (Integer) Existing IMD channel number to which frequency and power settings are coupled.

Return Type
Long Integer

Default
1

Examples
ims.TrackingStepIndex = 50 'Write
value = ims.TrackingStepIndex 'Read

C++ Syntax
HRESULT get_TrackingStepIndex(long *pVal)
HRESULT put_TrackingStepIndex(long newVal)

Interface
IIMSpectrum

### TriggerDelay Property

**Description**  
Sets and reads the trigger delay for all measurements (GLOBAL). This delay is only applied while in `app.Source = naTriggerSourceExternal` and `trigsetup.Scope = naGlobalTrigger`. After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for a channel only, use `ExternalTriggerDelay Property`.

**VB Syntax**  
```
app.TriggerDelay = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>Double</td>
<td>Trigger delay value in seconds. Range is from 0 to 107</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
0

**Examples**

```
app.TriggerDelay = .003  'Write

delay = app.TriggerDelay 'Read
```

**C++ Syntax**  
```
HRESULT get_TriggerDelay(double *delay);
HRESULT put_TriggerDelay(double delay)
```

**Interface**  
IApplication
**TriggerInPolarity Property**

**Description**
Specifies the polarity of the trigger IN signal.

- **AuxTrigger Object** - Sets the polarity to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the polarity of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: 4.0 FPGA:34 or higher. Learn more.

**Note:** Used on PNA-X ONLY.

**VB Syntax**

```vbnet
object.TriggerInPolarity = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>An AuxTrigger (object) or A PulseGenerator (object)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>value</th>
<th>(enum NATriggerPolarity) - Choose from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>naTriggerPositive</td>
<td>PNA responds to rising edge or HIGH level</td>
</tr>
<tr>
<td>naTriggerNegative</td>
<td>PNA responds to falling edge or LOW level.</td>
</tr>
</tbody>
</table>

Set Edge or Level triggering using **TriggerInType Property**

**Return Type**
Enum

**Default**

AuxTriggerIn Object - naTriggerNegative
PulseGenerator Object - naTriggerPositive. Also the polarity used when the PNA-X does not have the required DSP hardware

**Exaamples**

```vbnet
obj.TriggerInPolarity = naTriggerPositive 'Write
value = obj.TriggerInPolarity 'Read the value
```

**C++ Syntax**

```c++
HRESULT get_TriggerInPolarity(enum NATriggerPolarity *val);
HRESULT put_TriggerInPolarity(enum NATriggerPolarity val);
```

**Interface**

IAuxTrigger
IPulseGenerator3
9-Dec-2009  Added PulseGenerator Object

**TriggerInType Property**

**Description**
Specifies the type of trigger input being supplied to the PNA.

- **AuxTrigger Object** - Sets the type to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the type of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: 4.0 FPGA:34 or higher. Learn more.

**Note:** Use on PNA-X ONLY.

**VB Syntax**

```vbnet
obj.TriggerInType = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>An AuxTrigger (object) or PulseGenerator (object)</td>
</tr>
<tr>
<td>value</td>
<td>(enum NATriggerSignalType) Choose from: naTriggerEdge PNA responds to the edge (rising or falling) of a signal naTriggerLevel PNA responds to the level (HIGH or LOW) of a signal Use TriggerInPolarity to set Positive or Negative polarity.</td>
</tr>
</tbody>
</table>

**Return Type**
Enum

**Default**
naTriggerLevel - Also the type used for the PulseGenerator Object when the PNA-X does not have the required DSP hardware

**Examples**

```vbnet
obj.TriggerInType = naTriggerEdge 'Write
value = obj.TriggerInType 'Read the value
```

**C++ Syntax**

```c++
HRESULT get_TriggerInType(enum NATriggerSignalType *val);
HRESULT put_TriggerInType(enum NATriggerSignalType val);
```

**TriggerMode (ExtendedProperties) Property**

**Description**
Sets and returns the trigger mode for an external source.

**VB Syntax**
```vbnet
extSource.TriggerMode = value
```

**Variable**
- **Type** - Description
  - `extSource` An [ExternalSource Object](#) (object)
  - `value` (enum NAExtDevTriggerMode) - Choose from:
    - 0 - `naExtDevTriggerModeCW`
    - 1 - `naExtDevTriggerModeHW`

**Return Type**
Enum

**Default**
0 - `naExtDevTriggerModeCW`

**Examples**
- `extSource.TriggerMode = naExtDevTriggerModeCW`  
  `'Write`
- `tm = extSource.TriggerMode`  
  `'Read`

**C++ Syntax**
```
HRESULT get_TriggerMode (tagNAExtDevTriggerMode *pMode)
HRESULT put_TriggerMode (tagNAExtDevTriggerMode newMode)
```

## About Auxiliary Triggering

### TriggerOutDuration Property

**Description**
Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

**VB Syntax**
```vbnet
auxTrig.TriggerOutDuration = value
```

**Variable**
- **Type**: Description
- **auxTrig**: An `AuxTrigger` (object)
- **value**: (single) - Duration value in seconds. Choose a value between 1E-6 and 1.

**Return Type**
Double

**Default**
1E-6 sec

**Examples**
```vbnet
auxTrig.TriggerOutDuration = 1e-3 'Write
value = auxTrig.TriggerOutDuration 'Read the value
```

**C++ Syntax**
```c++
HRESULT get_TriggerOutDuration(double *val);
HRESULT put_TriggerOutDuration(double val);
```

**Interface**
`IAuxTrigger`

---

**Last Modified:**
14-Dec-2006  MX New topic
# TriggerOutInterval Property

**Description**
Specifies how often a trigger output signal is sent.

**VB Syntax**

```vb
auxTrig.TriggerOutInterval = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auxTrig</td>
<td>An <code>AuxTrigger</code> (object)</td>
</tr>
<tr>
<td>value</td>
<td>(single) - Choose from:</td>
</tr>
</tbody>
</table>

- **0** - `naTriggerModePoint`: a single data point is measured with each trigger signal the channel receives. Subsequent trigger signals continue to go to the channel in Point mode until the channel measurements are complete. This is effectively the same as trigger point mode.

- **1** - `naTriggerModeMeasurement`: entire traces are swept with a trigger signal, which and how many traces depends on the Scope setting.

**Return Type**
Enum

**Default**

1 - `naTriggerModeMeasurement`

**Examples**

```vb
auxTrig.TriggerOutInterval = naTriggerModeMeasurement 'Write

value = auxTrig.TriggerOutInterval 'Read the value
```

**C++ Syntax**

```c++
HRESULT get_TriggerOutInterval(enum NATriggerMode *val);
HRESULT put_TriggerOutInterval(enum NATriggerMode val);
```

**Interface**
IAuxTrigger

**Write/Read**

**About Auxiliary Triggering**

**TriggerOutPosition Property**

**Description**
Specifies whether the Aux trigger out signal is sent Before or After the acquisition.

**VB Syntax**

```vbnet
auxTrig.TriggerOutPosition = value
```

**Variable**

- **(Type)**: Description
- **auxTrig**: An `AuxTrigger (object)`
- **value**: (enum NATriggerPosition) Choose from:
  - **naTriggerOutBeforeAcquire**: Use if the external device needs to be triggered before the data is acquired, such as a power meter.
  - **naTriggerOutAfterAcquire**: Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the PNA.

**Return Type**
Enum

**Default**
`naTriggerOutAfterAcquire`

**Examples**

```vbnet
auxTrig.TriggerOutPosition = naTriggerOutAfterAcquire 'Write
```

```vbnet
value = auxTrig.TriggerOutPosition 'Read the value
```

**C++ Syntax**

```cpp
HRESULT get_TriggerOutPosition(enum NATriggerPosition *val);
HRESULT put_TriggerOutPosition(NATriggerPosition val);
```

**Interface**
IAuxTrigger

TriggerOutputEnabled Property

Description: Enables the PNA to send trigger signals out the rear-panel TRIGGER OUT connector. For more information, see External triggering.

VB Syntax: `trigsetup.TriggerOutputEnabled = boolean`

Variable: `(Type) - Description`

`trigsetup` A `TriggerSetup2 (object)`

`boolean` Choose from:
- **False** - PNA does NOT send output trigger signals.
- **True** - PNA sends output trigger signals.

Return Type: Boolean

Default: False

Examples:
- `trigsetup.TriggerOutputEnabled = True 'Write`
- `atba = trigsetup.TriggerOutputEnabled 'Read`

C++ Syntax:
- `HRESULT get_TriggerOutputEnabled( BOOL *pVal);`
- `HRESULT put_TriggerOutputEnabled( BOOL newVal);`

Interface: ITriggerSetup2
**TriggerPort Property**

**Description**  
Sets and returns the PNA port through which an external source is to be triggered.

**VB Syntax**  
`extSource.TriggerPort = value`

**Variable**  
**(Type) - Description**

- `extSource`  
  An [ExternalSource Object](object)

- `value`  
  *(enum NAExtDevTriggerPort)*  
  - Choose from:
    - 0 - `naExtDevTriggerPortBNC1` (PNA 'C' models)
    - 1 - `naExtDevTriggerPortAux1` (PNA-X models)
    - 2 - `naExtDevTriggerPortAux2` (PNA-X models)

**Return Type**  
Enum

**Default**  
For PNA 'C' models - BNC1  
For PNA-X models - Aux1

**Examples**  
```
extSource.TriggerPort = 1 'Write
trigpt = extSource.TriggerPort 'Read
```

**C++ Syntax**  
```c++
HRESULT get_TriggerPort (tagNAExtDevTriggerPort *pValue)
HRESULT put_TriggerPort (tagNAExtDevTriggerPort newVal)
```

**Interface**

### TuningIFBW Property

**Description**  
Set the IF Bandwidth for Broadband and Precise tuning sweeps.

**VB Syntax**  
`obj.TuningIFBW = value`

**Variable (Type) - Description**
- **obj**: An [EmbeddedLO](#) (object) or a [ConverterEmbeddedLO](#) (object)
- **value**: (Double) IF Bandwidth

**Return Type**  
(Double)

**Default**  
30 kHz

**Examples**

```vbnet
embedLO.TuningIFBW = 10e3 'write

value = embedLO.TuningIFBW 'read
```

**C++ Syntax**

```c++
HRESULT get_TuningIFBW(double* ifbw);
HRESULT put_TuningIFBW(double ifbw);
```

**TuningMode Property**

**Description**
Sets and returns the method used to determine the embedded LO Frequency.

**VB Syntax**
```
obj.TuningMode = value
```

**Variable (Type) - Description**

obj  
An EmbeddedLO (object) or  
A ConverterEmbeddedLO (object)

value  
(Enum as NAEmbeddedLOTuningMode)
Tuning mode. Choose from:

0 - naEmbeddedLOTuningMode_Broadband_And_Precise
1 - naEmbeddedLOTuningMode_Precise_Only
2 - naEmbeddedLOTuningMode_None

**Return Type**
(Enum)

**Default**
0 - naEmbeddedLOTuningMode_Broadband_And_Precise

**Examples**
```
embedLO.TuningMode = naEmbeddedLOTuningMode_None 'write

value = embedLO.TuningMode 'read
```

**C++ Syntax**
```
HRESULT get_TuningMode(enum NAEmbeddedLOTuningMode* mode);
HRESULT put_TuningMode(enum NAEmbeddedLOTuningMode mode);
```

Read/Write

TuningSweepInterval Property

**Description**  Set how often a tuning sweep is performed.

**VB Syntax**

```vbnet
obj.TuningSweepInterval = value
```

**Variable**  **(Type)** - **Description**

- `obj`  An `EmbeddedLO (object)` or an `ConverterEmbeddedLO (object)`
- `value`  **(Long)** Tuning sweep interval.

**Return Type**  **(Long)**

**Default**  1

**Examples**

```vbnet
embedLO.TuningSweepInterval = 3 'write .. tuning is performed every third measurement sweep
```

```vbnet
value = embedLO.TuningSweepInterval 'read
```

**C++ Syntax**

```cpp
HRESULT get_TuningSweepInterval(long* interval);
HRESULT put_TuningSweepInterval(long interval);
```

**Interface**  IEmbededLO

Write/Read

TwoPointGroupDelayAperture Property

Description
Sets the default group delay aperture setting.

VB Syntax
`pref.TwoPointGroupDelayAperture = value`

Variable (Type) - Description
- `pref` A `Preferences` (object)
- `value` (Boolean) - Choose from:
  - True - Set the default group delay aperture setting to two points.
  - False - Set the default group delay aperture setting to 11 points.

Return Type
Boolean

Default
False

Examples
`pref.TwoPointGroupDelayAperture = True` 'Write
`gda = pref.TwoPointGroupDelayAperture` 'Read

C++ Syntax
`HRESULT get_TwoPointGroupDelayAperture(VARIANT_BOOL* pVal);`
`HRESULT put_TwoPointGroupDelayAperture(VARIANT_BOOL pVal);`

Interface
IPreferences11

**TriggerMode Property**

**Description**
These settings determine what EACH signal will trigger.

**Note:** Setting Point and EverySweep mode forces `Trigger.Scope = naChannelTrigger`.

**VB Syntax**

`chan.TriggerMode = value`

**Variable (Type) - Description**

- **chan** A `Channel` (object)
- **value** (enum `NATriggerMode`) - Choose from:
  - 0 - `naTriggerModePoint` - Each Manual or External trigger signal causes one data point to be measured.
  - 1 - `naTriggerModeMeasurement` (superseded - still works but replaced with a more descriptive enum)
  - 1 - `naTriggerModeChannel` - Each trigger signal causes ALL traces in that channel to be swept.
  - 2 - `naTriggerModeEverySweep` - Each Manual or External trigger signal causes ALL traces that share a source port to be swept.
  - 3 - `naTriggerModeTrace` - Allowed ONLY when `PointSweepState` is enabled. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.

**Return Type**
Long Integer

**Default**
1 - `naTriggerModeChannel`

**Examples**

- `chan.TriggerMode = naTriggerModePoint` 'Write
- `trigtyp = chan.TriggerMode` 'Read

**C++ Syntax**

- `HRESULT get_TriggerMode (tagNATriggerMode *pMode)`
- `HRESULT put_TriggerMode (tagNATriggerMode newMode)`

**Interface**
IChannel

---

**Last Modified:**
6-Nov-2007   Added new sweep mode
**TriggerSignal Property - Superseded**

<table>
<thead>
<tr>
<th>Description</th>
<th><strong>Note:</strong> This command has been replaced by <strong>Source</strong> Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets or returns the trigger source.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
app.TriggerSignal = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>app</strong> An Application <em>(object)</em></td>
</tr>
</tbody>
</table>

**value** *(enum NATriggerSignal)* - Choose from:

- **0** - `naTriggerInternal` - free run
- **1** - `naTriggerExternalPositive` - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector
- **2** - `naTriggerExternalNegative` - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector.
- **4** - `naTriggerExternalHigh` - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector
- **5** - `naTriggerExternalLow` - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector.

**Return Type**

Long Integer

**Default**

`naTriggerInternal`

**Examples**

```vbnet
app.TriggerSignal = naTriggerExternalPositive 'Write
trigsign = app.TriggerSignal 'Read
```

**C++ Syntax**

```cpp
HRESULT get_TriggerSignal(tagNATriggerSignal *pSignal)
HRESULT put_TriggerSignal(tagNATriggerSignal signal)
```

**Interface**

`IApplication`
**TriggerType Property - Superseded**

**Description**  
*Note: This property has been replaced with Scope Property.*

Sets or returns the trigger type which determines the scope of a trigger signal.

**VB Syntax**  
```
app.TriggerType = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>app</th>
<th>An Application (object)</th>
</tr>
</thead>

## TZImag Property

### Description
Sets and Returns the TZImag value (the Imaginary Terminal Impedance value) for the calibration standard. Only applicable when "Type" is set to `naArbitraryImpedance`.

To set the other resistance values, use `TZReal`.

### VB Syntax
`calstd.TZImag = value`

### Variable (Type) - Description

- **calstd**: A CalStandard `(object)`. Use `calKit.GetCalStandard` to get a handle to the standard.

- **value**: `(single)` - Value for TZImag in Ohms

### Return Type
Single

### Default
Not Applicable

### Examples
```vbnet
  calstd.TZImag = 15 'Write the value of TZImag to 15 Ohms

  imp0 = calstd.TZImag 'Read the value of TZImag
```

### C++ Syntax
```csharp
HRESULT get_TZImag(float *pVal);
HRESULT put_TZImag(float newVal);
```

### Interface
ICalStandard2
### TZReal Property

**Description**
Sets and Returns the TZReal value (the real Terminal Impedance value) for the calibration standard. Only applicable when "**Type**" is set to **naArbitraryImpedance**.

To set the other resistance values, use **TZImag**

**VB Syntax**
```vbnet
calstd.TZReal = value
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calstd</td>
<td>(object)</td>
<td>A CalStandard. Use calKit.GetCalStandard to get a handle to the standard.</td>
</tr>
<tr>
<td>value</td>
<td>(single)</td>
<td>Value for TZReal in Ohms</td>
</tr>
</tbody>
</table>

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
calstd.TZReal = 15 'Write the value of TZReal to 15 Ohms
imp0 = calstd.TZReal 'Read the value of TZReal
```

**C++ Syntax**

```
HRESULT get_TZReal(float *pVal);
HRESULT put_TZReal(float newVal);
```

**Interface**
ICalStandard2
### UnusedChannelNumbers Property

**Description**
Returns an array of channel numbers that are NOT in use. An unused channel has NO measurements subscribed to it.

**VB Syntax**
```
chanNumbers = chans.UnusedChannelNumbers (NumberOfChannels)
```

**Variable**

- **chanNumbers** Variable array to store the returned channel numbers
- **chans** A Channel collection (object)

- **NumberOfChannels** (Long Integer) Number of channels that you are requesting.

**Return Type**
One-dimensional array of long integers. The size of the array is specified by the `NumberOfChannels` parameter.

- **Default** Not Applicable

**Examples**
```
chanNumbers = chans.UnusedChannelNumbers(5)
```

**C++ Syntax**
```
HRESULT get_UnusedChannelNumbers(long numberRequested,VARIANT* channelNumbers);
```

**Interface**
IChannels2
**USBPowerMeterCatalog Property**

**Description**
Returns the ID string of power meters / sensors that are connected to the PNA USB. Use the list to select a power sensor for a source power cal.

**VB Syntax**

```vbnet
list = pwrCal.USBPowerMeterCatalog
```

**Variable**

(Type) - Description

- **list** (String) Variable to store the returned list of USB power meters.
- **pwrCal** (object) – A SourcePowerCalibrator (object)

**Return Type**
Comma-delimited strings. Two sensor strings are separated by a semicolon.

**Default**
Not Applicable

**Examples**

```vbnet
Set pwrCal = pna.SourcePowerCalibrator
list = pwrCal.USBPowerMeterCatalog
```

**C++ Syntax**

```cpp
HRESULT get_USBPowerMeterCatalog(BSTR *pUSBList);
```

**Interface**
ISourcePowerCalibrator6

UseCalWindow Property

**Description**
Turns Calibration window ON or OFF during a calibration. [Learn more.]

**VB Syntax**
`guidedCal.UseCalWindow = value`

**Variable (Type) - Description**
- `guidedCal` GuidedCalibration (object)
- `value` (Boolean)
  - **True**  Show calibration window
  - **False**  Hide calibration window

**Return Type**
Boolean

**Default**
True

**Example**
`guided.UseCalWindow = True`

**C++ Syntax**
HRESULT get_UseCalWindow(VARIANT_BOOL* val);
HRESULT put_UseCalWindow(VARIANT_BOOL newVal);

**Interface**
IGuidedCalibration

UseMultipleSensors Property

**Description**
Enable and disable the use of multiple power sensors during a guided calibration.

**VB Syntax**
```
guidPwrSensors.UseMultipleSensors = value
```

**Variable** *(Type) - Description*

- `guidPwrSensors` *(GuidedCalibrationPowerSensors Collection)*
- `value` *(Boolean)*
  - True  Use multiple power sensors
  - False  Do NOT use multiple power sensors

**Return Type**  Boolean

**Default**  False

**Examples**
```
guidedPwrSensors.UseMultipleSensors = True
value = guidedPwrSensors.UseMultipleSensors
```

**C++ Syntax**
```
HRESULT get_UseMultipleSensors(VARIANT_BOOL* val);
HRESULT put_UseMultipleSensors(VARIANT_BOOL newVal);
```

**Interface**  IGuidedCalibrationPowerSensors

# UsePowerLossSegments Property

**Description**
Specifies if subsequent power readings will use of the loss table. (PowerLossSegments).

**VB Syntax**
```vbnet
pwrCal.UsePowerLossSegments = value
```

**Variable**
- **(Type)** - Description
- **pwrCal**
  - A [SourcePowerCalibrator](#) (object)
  - A [PowerSensorAsReceiver](#) (Object)
- **value**
  - **(boolean)**
  - **False** – Do not use loss table
  - **True** – Use loss table

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
pwrSens.UsePowerLossSegments = True 'Write
lossTableState = pwrSens.UsePowerLossSegments 'Read
```

**C++ Syntax**
```c++
HRESULT put_UsePowerLossSegments(VARIANT_BOOL bState);
HRESULT get_UsePowerLossSegments(VARIANT_BOOL *bState);
```

**Interface**
- ISourcePowerCalibrator
- IPowerSensorAsReceiver

---

**Last Modified:**

UsePowerSensorFrequencyLimits Property

Description
Specifies if subsequent calls to the AcquirePowerReadings method will observe frequency values of the MinimumFrequency and MaximumFrequency properties.

VB Syntax
`pwrCal.UsePowerSensorFrequencyLimits = value`

Variable (Type) - Description
- `pwrCal (object)` – A SourcePowerCalibrator (object)
- `value (boolean)` -
  - **False** – Do not use power sensor frequency limits. An acquisition will use just one power sensor for the entire sweep, regardless of frequency.
  - **True** – Use power sensor frequency limits. A requested acquisition will only succeed for those frequency points which fall between the MinimumFrequency and MaximumFrequency values of that PowerSensor. An acquisition will pause in mid-sweep if the frequency is about to exceed the MaximumFrequency value. When the sweep is paused in this manner, a sensor connected to the other channel input of the power meter can be connected to the measurement port in place of the previous sensor, and then the sweep completed by another call to AcquirePowerReadings. However, the MaximumFrequency specified for the second sensor would need to be sufficient for the sweep to complete.

Return Type
Boolean

Default
False

Examples
```vbnet
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.UsePowerSensorFrequencyLimits = True 'Write
FreqCheck = powerCalibrator.UsePowerSensorFrequencyLimits 'Read
```

C++ Syntax
HRESULT put_UsePowerSensorFrequencyLimits(VARIANT_BOOL bState);
HRESULT get_UsePowerSensorFrequencyLimits(VARIANT_BOOL *bState);

Interface
ISourcePowerCalibrator
Write/Read

**UserRange Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Assigns the marker to the specified User Range. This restricts the marker’s x-axis travel to the User Range span, specified with <strong>Start</strong> and <strong>Stop</strong> values.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Each channel has 16 user ranges.</td>
</tr>
<tr>
<td></td>
<td>- Markers and trace statistics can be restricted to any user range.</td>
</tr>
<tr>
<td></td>
<td>- More than one marker can occupy a user range.</td>
</tr>
<tr>
<td></td>
<td>- User ranges can overlap. For example:</td>
</tr>
<tr>
<td></td>
<td>- User range 1: 3 GHz to 5 GHz</td>
</tr>
<tr>
<td></td>
<td>- User range 2: 4 GHz to 6 GHz</td>
</tr>
</tbody>
</table>

**Note:** User ranges are especially useful in restricting marker searches to specific areas of the measurement.

**VB Syntax**

```vbnet
mark.UserRange = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mark</strong></td>
</tr>
<tr>
<td><strong>value</strong></td>
</tr>
</tbody>
</table>

**Return Type**

Long Integer

**Default**

0 - Full Span

**Examples**

```vbnet
mark.UserRange = 1 'Write
UserRange = mark.UserRange 'Read
```

**C++ Syntax**

```cpp
HRESULT get_UserRange(long *pRangeNumber)
HRESULT put_UserRange(long lRangeNumber)
```

**Interface**

IMarker
UserRangeMax Property

### Description

**Note:** This property on the Channel Object is superseded by the same property on the Measurement Object.

Sets the stimulus stop value for the specified User Range.

### VB Syntax

```vbnet
chan.UserRangeMax(domainType, Rnum) = value - Superseded
meas(UserRangeMax(Rnum) = value
mark.UserRangeMax(Rnum) = value
```

### Variable (Type) - Description

- **chan** A Channel (object) - Superseded
- **meas** A Measurement (object)
- **mark** A Marker (object)

To assign a marker to a User Range, use the UserRange Property.

- **domainType** (enum NADomainType) - Choose from:
  0 - naDomainFrequency
  1 - naDomainTime
  2 - naDomainPower

- **Rnum** (long integer) - User Range number. Choose any number between 1 and 16 (0=Full Span)

- **value** (double) - Stop value. Choose any number within the full span of the channel.

### Return Type

Double

### Default

The current stimulus setting for the channel

### Examples

```plaintext
mark.UserRangeMax(1) = 3e9 'Write
meas.UserRangeMax(1) = 3e9 'Write
UserRangeMax = mark.UserRangeMax(1) 'Read
UserRangeMax = meas.UserRangeMax(2) 'Read
```

### C++ Syntax

```c
HRESULT put_UserRangeMax(long rangeNumber, double maxValue)
HRESULT get_UserRangeMax(long rangeNumber, double *maxValue)
```

1631
Interface
  IMeasurement
  IMarker

Last Modified:

  3-May-2011  Updated for measurement object
## UserRangeMin Property

### Description
Sets the stimulus start value for the specified User Range. This property uses different arguments for the channel and marker objects.

### VB Syntax
```
chan.UserRangeMin(domainType, range) = value
or
mark.UserRangeMin(range) = value
```

### Variables
- `chan` A Channel (object)
- `mark` A Marker (object)

To assign a marker to a User Range, use the UserRange Property.

- `domainType` (enum NADomainType) Type of sweep currently implemented on the channel - Choose from:
  - 0 - naDomainFrequency
  - 1 - naDomainTime
  - 2 - naDomainPower
  - 3 - naDomainPhase

- `range` (long) - User Range number. Choose any number between 1 and 16 (0=Full Span)

- `value` (double) - Start value. Choose any number within the full span of the analyzer

### Return Type
Double

### Default
The current stimulus setting for the channel

### Examples
```
mark.UserRangeMin(1) = 3e9 'Write
chan.UserRangeMin(naDomainFrequency, 1) = 3e9 'Write

UserRngeMin = mark.UserRangeMin 'Read
UserRngeMin = chan.UserRangeMin 'Read
```

### C++ Syntax
- HHRESULT put_UserRangeMin(tagNADomainType domain, long rangeNumber, double minValue)
- HHRESULT get_UserRangeMin(tagNADomainType domain, long rangeNumber, double *minValue)

Interface
- IChannel

Last Modified:
- 3-May-2011 Updated for phase
**UserDescriptionOfPNA Property**

**Description**
Sets and reads a description of the PNA used to perform the User Characterization. This description is stored with the characterization in the ECal module. Set this description before sending [Initialize](#) or the default (empty string) will be used.

**VB Syntax**
```
userChar.UserDescriptionOfPNA = value
```

**Variable**
*userChar* (Type) - Description

- **userChar**: An ECalUserCharacterizer Object
- **value**: (String) Descriptive text, limited to 14 characters maximum.

**Return Type**
String

**Default**
"" (Empty String)

**Examples**
```
userChar.UserDescriptionOfPNA = "My PNA"
```

**C++ Syntax**
```
HRESULT get_UserDescriptionOfPNA(BSTR *info);
HRESULT put_UserDescriptionOfPNA(BSTR info);
```

**Interface**
IECalUserCharacterizer

---

Last Modified:

2-Nov-2008 New topic (8.33)
UserName Property

**Description**
Sets and reads the description of the person and/or company who is producing the ECaI user characterization. This description is stored with the characterization in the ECaI module.

Set this description before sending Initialize or the default (empty string) will be used.

**VB Syntax**
```
userChar.UserName = value
```

**Variable**
*Type* - Description

*userChar* An ECaIUserCharacterizer Object

*value* (String) Descriptive text, limited to 19 characters maximum.

**Return Type**
String

**Default**
"" (Empty String)

**Examples**
```
userChar.UserName = "John Doe, Acme Inc."
```

**C++ Syntax**
```
HRESULT get_UserName(BSTR *name);
HRESULT put_UserName(BSTR name);
```

**Interface**
IECalUserCharacterizer
**UserPresetEnable Property**

**Description**
'Checks' and 'clears' the enable box on the User Preset dialog box. This only affects subsequent Presets from the front panel user interface.

Regardless of the state of the User Preset Enable checkbox, the `app.Preset` command will always preset the PNA to the factory preset settings, and `app.UserPreset` will always perform a User Preset.

**VB Syntax**

```vbnet
app.UserPresetEnable = state
```

**Variable (Type) - Description**

- `app` An `Application` (object)
- `state` (boolean) Front Panel User Preset State. Choose from:
  - False – User Preset OFF
  - True – User Preset ON

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
app.UserPresetEnable = True 'Write
upreset = app.UserPresetEnable 'Read
```

**C++ Syntax**

```cpp
HRESULT get_UserPresetEnable(VARIANT_BOOL *pVal)
HRESULT put_UserPresetEnable(VARIANT_BOOL newVal)
```

**Interface**
IApplication6
### Valid Property

**Description**
Returns a boolean value to indicate if the current equation on the measurement is valid. For equation processing to occur, the equation must be valid and ON.

**VB Syntax**
```vbnet
IsValid = eq.Valid
```

**Variable**
- **(Type) - Description**
  - `good` *(Boolean)* Variable to store the returned value.
    - **True** (1) - equation is valid
    - **False** (0) - equation is NOT valid
  
  - `eq` *(Equation (object))*

**Return Type**
Boolean

**Default**
Not Applicable

**Examples**
```vbnet
IsValid = eq.Valid 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Valid(Boolean *equation)
```

**Interface**
IEquation

---

New topic
ValidConnectorTypes Property

Description

Returns a list of all connector types for which there are calibration kits. Looks for connector types in mechanical cal kits, within PNA disk memory, and within the attached ECal Module memory.

Here are the more common connector types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>W-band waveguide</td>
<td>Type B</td>
<td>1.00 mm female</td>
</tr>
<tr>
<td>V-band waveguide</td>
<td>Type A (50) female</td>
<td>1.00 mm male</td>
</tr>
<tr>
<td>U-band waveguide</td>
<td>Type A (50) male</td>
<td>1.85 mm male</td>
</tr>
<tr>
<td>R-band waveguide</td>
<td>Type F (75) female</td>
<td>1.85 mm female</td>
</tr>
<tr>
<td>Q-band waveguide</td>
<td>Type F (75) male</td>
<td>2.92 mm female</td>
</tr>
<tr>
<td>K-band waveguide</td>
<td>Type N (75) female</td>
<td>2.92 mm male</td>
</tr>
<tr>
<td>P-band waveguide</td>
<td>Type N (75) male</td>
<td>APC 2.4 female</td>
</tr>
<tr>
<td>X-band waveguide</td>
<td>Type N (50) female</td>
<td>APC 2.4 male</td>
</tr>
<tr>
<td>7-16 female</td>
<td>Type N (50) male</td>
<td>APC 3.5 female</td>
</tr>
<tr>
<td>7-16 male</td>
<td>APC 3.5 male</td>
<td>APC 7</td>
</tr>
</tbody>
</table>

VB Syntax

value = obj.ValidConnectorTypes

Variable (Type) - Description

value (Variant) List of connector types

obj Any of the following:

- ECalUserCharacterizer (object)
- GuidedCalibration (object)
- SMCType (object)
- VMCType (object)

Return Type Variant

Default Not Applicable

Examples

value = SMC.ValidConnectorTypes

C++ Syntax

HRESULT get_ValidConnectorTypes(VARIANT* connectorTypes);
Interface: IGuidedCalibration
   SMCType
   VMCType

Last Modified:

23-Feb-2011   Added list

1-Sep-2009    Added ECal User and within disk memory (A.09.00)
## Value Property

**Description**  
Write or read a value (setting) for the current element.  
See a [list of configurable elements and settings](#) for various PNA models.

**VB Syntax**  
`pathElement.Value = value`

**Variable**  
*Type* - Description

- `pathElement`  
  A [PathElement](#) (object)

- `value`  
  *(String)* Value for the element. Use `pathElement.Values` to return a list of valid settings for this element.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
Set the "Combiner" element to value "Reversed"

```vbnet
chan.PathConfiguration.Element("Combiner").Value = "Reversed"
setting=pathElement.Value
```

**C++ Syntax**  
```cpp
HRESULT get_Value( BSTR* pValue );
HRESULT put_Value( BSTR value );
```

**Interface**  
IPathElement

---

Values Property

Description
Returns an array of valid settings that can be used with the element object.
See a list of configurable elements and settings for various PNA models.

VB Syntax
values = pathElement.Values

Variable (Type) - Description
values (Variant array) Variable to store the array of valid settings for the element.

pathElement A PathElement (object)

Return Type Variant array

Default Not Applicable

Examples settings=pathElement.Values

C++ Syntax
HRESULT Values( VARIANT* pValues );

Interface IPathElement

### VelocityFactor Property

**Description**
Sets the velocity factor to be used with Electrical Delay, Port Extensions, and Time Domain marker distance calculations.

**VB Syntax**
```vbnet
app.VelocityFactor = value
```

**Variable**

- **app** (An Application (object))
- **value** (double) - Velocity factor. Choose a number between: 0 and 10 (.66 polyethylene dielectric; .7 PTFE dielectric)

**Return Type**
Double

**Default**
1

**Examples**
```vbnet
app.VelocityFactor = .66 'Write
RelVel = app.VelocityFactor 'Read
```

**C++ Syntax**
```cpp
HRESULT get_VelocityFactor(double *pVal)
HRESULT put_VelocityFactor(double newVal)
```

**Interface**
IApplication

### WGCutoffFreq Property

**Description**
Sets or returns the value of the waveguide cut off frequency.

**VB Syntax**
`meas.WGCutoffFreq = value`

**Variable**
- **(Type)** - Description
  - *meas* A Measurement *(object)*
  - *value* *(double)* - Frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
`Print meas.WGCutoffFreq` 'prints the value of the waveguide cut off frequency'

**C++ Syntax**
- `HRESULT get_WGCutoffFreq(double *pVal);`
- `HRESULT put_WGCutoffFreq(double newVal);`

**Interface**
`IMeasurement2`
WideBandDectionState Property

Description: Set and read the pulse mode detection method.

VB Syntax: `pulseMeas.WideBandDectionState = bool`

Variable (Type) - Description:
- `pulseMeas` A PulseMeasurementControl (object)

- `bool` False - Narrowband mode.
  True - Wideband mode

Return Type: Boolean

Default: Based on pulse width.

Examples:
- `pulse.WideBandDectionState = True` Write
- `value = pulse.WideBandDectionState` Read

C++ Syntax:
- `HRESULT get_WideBandDectionState(VARIANT_BOOL *pVal);`
- `HRESULT put_WideBandDectionState(VARIANT_BOOL newVal);`

Interface: IPulseMeasurementControl

Last Modified:
- 11-Mar-2010 New topic
Write/Read

About PNA-X Pulsed Capabilities

Width Property

Description
Sets the pulse width - the amount of time that the pulse is ON.

VB Syntax
pulse.Width (n) = value

Variable (Type) - Description

pulse A PulseGenerator (object)

n (Integer) Pulse generator number. Choose from 0 to 4.
0 is the generator that pulses the ADC.

value (Double) Pulse width in seconds. Choose a value from about 33ns to about 70 seconds.

Return Type Double

Default 1e-4 sec

Examples
pulse.Width = 1ms 'Write
value = pulse.Width 'Read

C++ Syntax
HRESULT get_Width (integer pulse, double* width);
HRESULT put_Width (integer pulse, double width);

Interface IPulseGenerator

Last Modified: 2-Jan-2007  MX New topic
**Read-only**

**WindowNumber Property**

**Description**
Returns the window number. You might use this property to identify a particular window so that you can create a new Measurement in that window.

**VB Syntax**
`value = win.WindowNumber`

**Variable**
(Type) - Description

- `win`  A NAWindow (object)

- `value`  (long integer) - Variable to store the returned window number

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
`value = app.ActiveNAWindow.WindowNumber`

**C++ Syntax**
`HRESULT (long* windowNumber);`

**Interface**
INAWindow
WindowState Property

Description Sets or returns the window setting of Maximized, Minimized, or Normal. To arrange all of the windows, use app.ArrangeWindows.

VB Syntax object.WindowState = value

Variable (Type) - Description

object An Application (object) - main window
or
A NaWindow (object) - data windows

value (enum NAWindowStates) - The window state. Choose from:
0 - naMinimized - Minimizes the window to an Icon on the lower toolbar
1 - naMaximized - Maximizes the window
2 - naNormal - changes the window size to the user defined setting (between Max and Min).

Return Type Long Integer

Default naMaximized

Examples appWindowState = naMinimized 'changes the Network Analyzer application window to an icon. -Write
winWindowState = naNormal 'changes the window defined by the win object variable to user defined settings. -Write

Winstate = appWindowState 'Read

C++ Syntax HRESULT get_WindowState(tagNAWindowStates *pVal)
HRESULT put_WindowState(tagNAWindowStates newVal)

Interface INAWindow
IApplication
## XAxisAnnotation Property

**Description**
Returns the X-Axis annotation of the specified tuning sweep.

**VB Syntax**
```
value = embedLODiag.XAxisAnnotation (n)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(String) Variable to store the returned data.</td>
</tr>
</tbody>
</table>

**embedLODiag**
An **EmbeddedLODiagnostic** (object)

<table>
<thead>
<tr>
<th>n</th>
<th>(Long) Tuning sweep number. Use NumberOfSweeps to find the number of sweeps taken.</th>
</tr>
</thead>
</table>

**Default**
Not Applicable

**Examples**
```
data= embedLO.XAxisAnnotation 3 'read
```

**C++ Syntax**
```
HRESULT XAxisAnnotation (long sweep, BSTR* annotation);
```

**Interface**
IEembedLODiagnostic

XAxisPointSpacing Property

**Description**
Sets X-axis Point Spacing for the display traces measured with segment sweeps on the active channel.

**VB Syntax**
`chan.XAxisPointSpacing = value`

**Variable**  
**Type** - Description
- `chan` A Channel (object)
- `value` (Enum as `naStates`) - Choose from:
  - 0 - `naOFF` - Turns X-axis Point Spacing OFF
  - 1 - `naON` - Turns X-axis Point Spacing ON

**Return Type**
Enum

**Default**
0 - `naOFF`

**Examples**
- `chan.XAxisPointSpacing = naOFF`  'Write
- `xspac = chan.XAxisPointSpacing`  'Read

**C++ Syntax**
```cpp
HRESULT get_XAxisPointSpacing (tagNAStates *pState);
HRESULT put_XAxisPointSpacing (tagNAStates newState);
```

**Interface**
IChannel2
**XAxisStart Property**

**Description**
Returns the X-Axis start value of the specified tuning sweep.

**VB Syntax**

```vbnet
value = embedLODiag.XAxisStart(n)
```

**Variable**

- **value** (Double) Variable to store the returned data.
- **embedLODiag** An EmbeddedLODiagnostic (object)
- **n** (Long) Tuning sweep number. Use NumberOfSweeps to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**

```vbnet
data= embedLO.XAxisStart 3   'read
```

**C++ Syntax**

```c++
HRESULT XAxisStart(long sweep, double* start);
```

**Interface**
IEembedLODiagnostic

---

Last Modified:

13-Apr-2007  MX New topic
### XAxisStop Property

**Description**

Returns the X-Axis stop value of the specified tuning sweep.

**VB Syntax**

```
value = embedLODiag.XAxisStop (n)
```

**Variable (Type) - Description**

- **value** (Double) Variable to store the returned data.
- **embedLODiag** An `EmbeddedLODiagnostic` (object)
- **n** (Long) Tuning sweep number. Use `NumberOfSweeps` to find the number of sweeps taken.
- **Default** Not Applicable

**Examples**

```
data= embedLO.XAxisStop 3 'read
```

**C++ Syntax**

```
HRESULT XAxisStop (long sweep, double* start);
```

**Interface**

`IEmbededLODiagnostic`

---

Last Modified:

13-Apr-2007   MX New topic
### YAxisAnnotation Property

**Description**
Returns the Y-Axis annotation of the specified tuning sweep.

**VB Syntax**
```vbnet
value = embedLODiag.YAxisAnnotation(n)
```

**Variable (Type) - Description**

- **value (String)** Variable to store the returned data.
- **embedLODiag (An EmbeddedLODiagnostic (object))**
  
  - **n (Long)** Tuning sweep number. Use `NumberOfSweeps` to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**
```vbnet
data= embedLO.YAxisAnnotation 3 'read
```

**C++ Syntax**
```cpp
HRESULT YAxisAnnotation (long sweep, BSTR* annotation);
```

**Interface**
IEembedLODiagnostic

---

Last Modified: 13-Apr-2007  MX New topic
YScale Property

Description
Sets or returns the Y-axis Per-Division value of the active trace.

VB Syntax
```
trace.YScale = value
```

Variable
- **trace** - A Trace (object)
- **value** - (double) - Scale /division number. Units and range depend on the current data format.

Return Type
Double

Default
10 (db)

Examples
```
trac.YScale = 5 'Write
yscl = trac.YScale 'Read
```

C++ Syntax
```
HRESULT get_YScale(double *pVal)
HRESULT put_YScale(double newVal)
```

Interface
ITrace
# Z0 Property

**Description**  
Sets and Returns the characteristic impedance for the calibration standard.

**VB Syntax**  
```
calstd.Z0 = value
```

**Variable**  
- **calstd**: A CalStandard object. Use calKit.GetCalStandard to get a handle to the standard.
- **value**: (single) - Impedance in Ohms

**Return Type**  
Single

**Default**  
Not Applicable

**Examples**  
```
calstd.Z0 = 50 'Write
impedance = calstd.Z0 'Read
```

**C++ Syntax**  
- HRESULT get_Z0(float *pVal)
- HRESULT put_Z0(float newVal)

**Interface**  
ICalStandard
Abort Method

Description
Ends the current measurement sweep on the channel.

VB Syntax
chan.Abort [sync]

Variable (Type) - Description

chan (object) - A Channel object
sync (boolean) - wait (or not) for the analyzer to stop before processing subsequent commands. Optional argument; if unspecified, value is set to False. Choose from: True - synchronize - the analyzer will not process subsequent commands until the current measurement is aborted. False - continue processing commands immediately

Return Type
None

Default
None

Examples
chan.abort True
chan.abort

C++ Syntax
HRESULT Abort(VARIANT_BOOL bSynchronize);

Interface IChannel
AbortPowerAcquisition Method

**Description**
Aborts a source power cal acquisition sweep that is currently in progress.

**VB Syntax**
`powerCalibrator.AbortPowerAcquisition`

**Variable**
`powerCalibrator` *(object)* - A `SourcePowerCalibrator` object

**Return Type**
None

**Default**
Not Applicable

**Examples**
`powerCalibrator.AbortPowerAcquisition`

**C++ Syntax**
`HRESULT AbortPowerAcquisition();`

**Interface**
`ISourcePowerCalibrator`
Write-only

AcquireCalStandard Method - Superseded

About Calibration Standards

Description  
Note: This command has been replaced by AcquireCalStandard2 Method, which provides for acquisition of sliding load standards. All other functionality is identical.

VB Syntax  
`cal.AcquireCalStandard std[,index]`

Variable  
(Type) - Description

cal  
A Calibrator (object)

std  
(enum NACalClass) Standard to be measured. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

index  
(long integer) number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1.
**Note** The behavior has changed with PNA revisions as follows:

- Before 6.01: Accepted 0 and changed it to 1
- 6.01 to 6.04: Did NOT accept 0
- 6.04.11 and higher: Accepts 0 and changes it to 1

**Return Type** None

**Default** Not Applicable

**Examples**
```
Cal.AcquireCalStandard naSOLT_Thru 'Write
```

**C++ Syntax**
```
HRESULT AcquireCalStandard(tagNACalClass enumClass, short standardNumber)
```

**Interface** ICaliibrator

Last modified:

10/05/06 Modified Index argument.
AcquireCalStandard2 Method

**Description**
Measures the specified standard from the selected calibration kit. The calibration kit is selected using `app.CalKitType`.

For 2-port calibration, it is also necessary to specify direction with `AcquisitionDirection`.

To omit Isolation from a 2-port calibration, do not Acquire a cal standard for `naSOLT_Isolation`.

For using two sets of standards, see `Simultaneous2PortAcquisition Property`.

**Note:** This command replaces `AcquireCalStandard`. This command provides for the acquisition of a sliding load cal. All other functionality is identical.

**VB Syntax**
```
cal.AcquireCalStandard2 std[,index][,slide]
```

**Variable (Type) - Description**

- `cal` A `Calibrator (object)`
- `std` (enum `NACalClass`) Standard to be measured. Choose from:
  1. `naClassA`
  2. `naClassB`
  3. `naClassC`
  4. `naClassD`
  5. `naClassE`
  6. `naReferenceRatioLine`
  7. `naReferenceRatioThru`

**SOLT Standards**

- 1. `naSOLT_Open`
- 2. `naSOLT_Short`
- 3. `naSOLT_Load`
- 4. `naSOLT_Thru`
- 5. `naSOLT_Isolation`

**TRL Standards**

- 1. `naTRL_Reflection`
- 2. `naTRL_Line_Reflection`
- 3. `naTRL_Line_Tracking`
4 - naTRL_Thru

5 - naTRL_Isolation

[index] (long  integer) Number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1.

**Note** The behavior has changed with PNA revisions as follows:

- Before 6.01: Accepted 0 and changed it to 1
- 6.01 to 6.04: Did NOT accept 0
- 6.04.11 and higher: Accepts 0 and changes it to 1

[slide] (enum as NACalStandardSlidingState) Optional argument. State of the sliding load. The slide should be set a minimum of five times. Seven is the maximum that can be stored. Choose from:

0 - naNotSlidingStd - not using a sliding load - Default if not specified.
1 - naSlidelsSet - slide is set for acquisition
2 - naSlidelsDone - this next acquisition will be the last. Calculations will then be performed.

**Return Type** None

**Default** Not Applicable

**Examples**

Cal.AcquireCalStandard2 naSOLT_Thru
Cal.AcquireCalStandard2 naSOLT_Thru,2,naNotSlidingStd

'measures the second standard listed in the class of naSOLT_Thru'

**C++ Syntax**

HRESULT AcquireCalStandard2(NACalClass enumClass, long standardPosition, NACalStandardSlidingState slidingStandardState)

**Interface** ICalibrator

---

Last modified:

10/05/06 Modified Index argument.
AcquireCalConfidenceCheckECALEx Method

Description
This method replaces AcquireCalConfidenceCheckECAL. Transfers confidence data from the specified ECal module into the measurement's memory trace. The data is transferred to the specified S-parameter on the same channel as this Calibrator object.

The characterization within the ECal module that the confidence data will be read from is specified by ECALCharacterizationEx. The default value is 0.

Note: A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

VB Syntax
`cal.AcquireCalConfidenceCheckECALEx Sparam [,ecalModule]`

Variable (Type) - Description
- **cal** (object) A Calibrator
- **Sparam** (String) S-parameter to transfer confidence data to. This parameter must be present on the same channel as the calibrator object.
- **ecalModule** (Integer) – Optional argument. ECal module. Choose from modules 1 through 8. Use IsECALModuleFoundEx to determine the number of modules connected to the PNA. Use GetECALModuleInfoEx to return the model and serial number of each module.

Return Type None

Default Not applicable

Examples
`Cal.AcquireCalConfidenceCheckECALEx "S11", 2`

C++ Syntax
`HRESULT AcquireCalConfidenceCheckECALEx(BSTR strParameter, long moduleNumber = 1);`

Interface ICalibrator4

Last modified:

- 10-Feb-2011  Added PMAR
- 9/12/06  MQ New command to accommodate receiver only SPC
AcquireStep Method

**Description**
Acquire the measurement data for the specified step in the calibration process. For an ECal User characterization this measures the ECal module.

*Note:* Guided Cal allows you to measure standards in any order. See an example.

**VB Syntax**

```vbnet
obj.AcquireStep (n)
```

**Variable (Type) - Description**

- **obj**
  Any of the following:
  - `GuidedCalibration` (object)
  - `SMCType` (object)
  - `VMCType` (object)
  - `ECalUserCharacterizer` (object) - Currently, only ONE step is required to measure the ECal module.

- **n**
  Step number in the calibration process.
  Use `GenerateSteps` to determine the total number of steps.
  Use `GetStepDescription` to read the description of each step.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
VMC.AcquireStep (3)
```

**C++ Syntax**

```cpp
HRESULT put_AcquireStep(long step);
```

**Interface**

- `SMCType`
- `VMCType`
- `IGuidedCalibration`
- `IECalUserCharacterizer`

---

**Last Modified:**

- 4-Nov-2008  Added ECalUserChar object
- 20-Jan-2007  Added any order note.
Write-only

Activate Method

**Description**
Makes an object the Active Object. When making a measurement active, the channel and window the measurement is contained in becomes the active channel and active window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the **Set** command. For more information, See [Getting a Handle to an Object](#).

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

**VB Syntax**
```
object.Activate
```

**Variable**

**Type** - **Description**

- `object` **Measurement** *(object)*
- or
- `Marker` *(object)*

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
meas.Activate
mark.Activate
```

**C++ Syntax**
```
HRESULT Activate()
```

**Interface**
IMeasurement
IMarker
Write-only

ActivateMarker Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Makes a marker the Active Marker. Use <code>meas.ActiveMarker</code> to read the number of the active marker.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>

</tr>
<tr>
<td>Remarks</td>
<td>Use <code>ReferenceMarkerState</code> to control the Reference marker.</td>
</tr>
</tbody>
</table>
ActivateWindow Method

Description  Makes a window object the Active Window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the Set command. For more information, See Programming the Analyzer Object Model.

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

VB Syntax  

`app.ActivateWindow n`

Variable  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An <strong>Application</strong> (object)</td>
</tr>
<tr>
<td><code>n</code></td>
<td>(long) Number of the window to make active</td>
</tr>
</tbody>
</table>

Return Type  Window Object

Default  Not Applicable

Examples  

`app.ActivateWindow 4`

C++ Syntax  

`HRESULT ActivateWindow(long WindowNumber)`

Interface  IApplication

See the PNA Object Model
### Add (channels) Method

**Description**  
Creates a channel and returns a handle to it. If the channel already exists, it returns the handle to the existing channel.

**VB Syntax**  
`chans.Add (item)`

**Variable** (Type) - Description

- `chans` A Channel collection (object)
- `item` (variant) - Channel number.

**Return Type**  
Channel

**Default**  
Not Applicable

**Examples**  
`chans.Add 3 'Creates channel 3`

**C++ Syntax**  
`HRESULT Add(VARIANT numVal, IChannel** pChannel)`

**Interface**  
IChannels
Write-only

Add (measurement) Method

**Description**  Adds a Measurement to the collection.

**VB Syntax**  `meas.Add channel,param,source[,window]`

- `meas`  A **Measurements** collection **(object)**
- `channel`  **(long)** - Channel number of the new measurement.

**For S-parameters:**

- **Any S-parameter that can be measured by your PNA.**
  - Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"
  - Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

**For Ratioed measurements:**

- Any two receivers in your PNA separated by "/". For example: "A/R1"
  - See the [block diagram](#) showing the receivers in YOUR PNA.

**For Unratioed (absolute power) measurements:**

- Any receiver in the PNA. For example: "A"
  - See the [block diagram](#) showing the receivers in YOUR PNA

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an **external test set** connected to the PNA. You do not need to know which physical receiver is used for each test port. [Learn more](#).

**For ADC measurements**

- Any ADC receiver in the PNA followed by a comma, then the source port.
  - For example: "AI1_2" indicates the Analog Input1 with source port of 2.
  - [Learn more about ADC receiver measurements](#).

**For Balanced S-parameter measurements:**

- "*topology:Sabxy*"
  - `topology` - Choose from:
  - `sbal` - single-ended to balanced
  - `ssb` - single-ended / single-ended to balanced
  - `bbal` - balanced to balanced
Sabxy -

Where

a - device output (receive) mode
b - device input (source) mode

(choose from the following for both a and b):

- d - differential
- c - common
- s - single ended

x - device output (receive) logical port number
y - device input (source) logical port number

For example: "sbal:sdd42"

See an example program

For Imbalance and Common Mode Rejection measurements:

"topology:parameter" Choose from:

<table>
<thead>
<tr>
<th>Choose this:</th>
<th>To get this:</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SBAL:IMBSB&quot;</td>
<td>single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB1&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Sds21/Scs21)</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB2&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Ssd12/Ssc12)</td>
</tr>
<tr>
<td>&quot;SSB:IMB1SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 1</td>
</tr>
<tr>
<td>&quot;SSB:IMB2SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 2</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB1&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Sds31/Scs31)</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB2&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Sds32/Scs32)</td>
</tr>
<tr>
<td>&quot;BBAL:IMB1BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance 1</td>
</tr>
<tr>
<td>&quot;BBAL:IMB2BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance 2</td>
</tr>
<tr>
<td>&quot;BBAL:CMRRBB&quot;</td>
<td>balanced to balanced</td>
<td>common mode rejection (Sdd21/Scc21)</td>
</tr>
</tbody>
</table>

source (long integer) - Source port number; if unspecified, value is set to 1. Only used for non-s-parameter measurements; ignored if s-parameter.

window (long integer) - Optional argument. Window number of the new measurement. If unspecified, the S-Parameter will be created in the Active Window. Choose between 1 and the maximum number of windows allowed on the PNA. If unspecified, the measurement will be created in the Active Window.

See also Traces, Channels, and Windows on the PNA

Return Type None

Default None

Examples meass.Add 3,"A/R1",1,1 ' Adds A/R1 measurement to channel 3 in window 1

C++ Syntax HRESULT Add(long ChannelNum, BSTR strParameter, long srcPort, VARIANT_BOOL bNewWindow)

Interface IMeasurements

Last modified:

9/12/06 MQ Added logical receiver notation and number of windows.
Add (NAWindows) Method

**Description**
Add a window to the display. Does not add a measurement. The window number must not already exist.

**VB Syntax**
```
wins.Add [item]
```

**Variable (Type) - Description**
- `wins` A NAWindow collection (object)
- `item` (variant) - Window number. Choose between 1 and the maximum number of windows allowed on the PNA.

See also Traces, Channels, and Windows on the PNA.

**Return Type**
Object

**Default**
Not Applicable

**Examples**
```
wins.Add 3 'Creates a window number 3
```

**C++ Syntax**
```
HRESULT Add(long windowNumber )
```

**Interface**
INAWindows

Last Modified:

25-Aug-2009  Added PMAR
Add (segment) Method

Description
Adds segments to the Segments collection, but does not turn the segments ON.

VB Syntax
`segs.Add (item, [size])`

*segs* A segments collection *(object)*

*item* *(variant)* Number of the new segment. If it already exists, a new segment is inserted at the requested position.

*size* *(long integer)* Optional argument. The number of segments to add, starting with *item*. If unspecified, value is set to 1.

Return Type
None

Default
None

Examples
```vbnet
Segs.Add 1, 4 'Adds segments 1,2,3,and 4. (does NOT automatically turn segments ON)
```

C++ Syntax
`HRESULT Add(VARIANT index, long size);`

Interface
ISegments

Remarks
To ensure predictable results, it is best to remove all segments before defining a segment list. For each segment in the collection, do a seg.Remove.
**Add (External Device) Method**

**Description**

Adds an external device to the system. This is the same as clicking the **New** button and editing the name on the Configure an External Device dialog.

Upon creation, all settings on the new device are set to the defaults. The device is not active until set using `Ext.Dev.Active`.

**VB Syntax**

```
extDevices.Add name
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extDevices</code></td>
<td>An <code>ExternalDevices</code> (collection)</td>
</tr>
<tr>
<td><code>name</code></td>
<td>(String) - Name of the new external device.</td>
</tr>
</tbody>
</table>

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```
extDevices.Add 'MySource' 'Creates a new external device'
```

**C++ Syntax**

```
HRESULT Add (BSTR name)
```

**Interface**

`IExternalDevices`

Add (GuidedPowerSensors) Method

**Description**
Adds a power sensor name and item number to be used during a source power calibration. Use when multiple power sensors are to be used to calibrate the entire frequency span. The Name is used to recognize the sensor in the User Interface.

Item numbers in the **GuidedCalibrationPowerSensors** collection are used to refer to the power sensor remotely. Use the **Count Property** to return the number of power sensor items that are configured for use on the channel.

The port number to be calibrated is set using the **PerformPowerCalibration Property**.

[Learn about using multiple power sensors](#)

**VB Syntax**
sensors.Add(name)

**Variable**
- **(Type) - Description**
  
  *sensors* - A **GuidedCalibrationPowerSensors** (collection)

  *name* - (String) - Name of the power sensor to add. The power sensor must be already configured as a PMAR device using this name. [Learn how to remotely configure a PMAR device](#).

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
sensors.Add "pmar2"

[See Example program](#)

**C++ Syntax**
HRESULT Add(BSTR name);

**Interface**

Add (Testset) Method

**Description**
Adds a testset to the ExternalTestsets Collection and loads the configuration file.

**VB Syntax**
```vbnet
testsets.Add (model,address)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testsets</td>
<td>An ExternalTestsets (collection)</td>
</tr>
<tr>
<td>model</td>
<td>(String) Model of the testset to be added, NOT case-sensitive. There is no COM command to read a list of currently-supported test sets. However, the following SCPI command can be used with the following format:</td>
</tr>
<tr>
<td>address</td>
<td>(Integer) Address of the testset to be added.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
testsets.Add("Z5623AK66",12) ' add Z5623AK66 test at address 12 to testsets collection
```

See an example program

**C++ Syntax**
```cpp
HRESULT Add(BSTR typename, long address)
```

**Interface**
IExternalTestsets
## AddSegment Method

**Description**  Adds the specified number of segments to the scratch mixer at the index position. All segments are added with default settings.

**VB Syntax**  

```vbnet
conv.AddSegment index,count
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>conv</code></td>
<td>A Converter Object</td>
</tr>
<tr>
<td><code>index</code></td>
<td>(Long integer) Position at which to add segments. Valid index range is between 1 and the current segment count +1. Using count +1 adds segments to the end of the segment table. Use SegmentCount Property to read the current count in the Applied Mixer.</td>
</tr>
<tr>
<td><code>count</code></td>
<td>(Long integer) Optional argument. Number of segments to add. If unspecified, 1 segment is added.</td>
</tr>
</tbody>
</table>

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  

```vbnet
mxr.AddSegment 1,5 'Adds 5 segments beginning at the first position.
```

**See example program**

**C++ Syntax**  

```cpp
HRESULT AddSegment(long index, long count);
```

**Interface**  IConverter5

---

AllowChannelToSweepDuringCalAcquisition Method

Description
Specifies the channel to sweep during a Calibration.

When this command is sent, the SwpChan channel is ‘flagged’ to be swept during calibration. The flag is cleared when the channel is deleted, if the Measurement Class is changed, or if all measurements are deleted from the channel. If the same channel number is recreated, this command must be sent again to sweep the channel during a calibration. The flag is NOT saved with an instrument state.

A Preset or Instrument State Recall deletes the channel.

VB Syntax
```
calMgr.AllowChannelToSweepDuringCalAcquisition (CalChan, SwpChan, State)
```

Variable
( Type ) - Description

- **calMgr** (object) - A CalManager object
- **CalChan** (long) - Channel to be calibrated.
- **SwpChan** (long) - The channel to sweep when waiting to measure a standard.
  
  This channel must already exist with at least one measurement in the channel. If this channel is in continuous sweep mode, it must have the same attenuator settings and path configuration (PNA-X only).

- **state** (Boolean) - Channel sweep state. Choose from:
  - **True** - Sweep the channel during calibration.
  - **False** - Do NOT sweep the channel during calibration.

Return Type
Not Applicable

Default
Not Applicable

Example
```
calMgr.AllowChannelToSweepDuringCalAcquisition 2,1,True
```

See example using this command

C++ Syntax
```
HRESULT AllowChannelToSweepDuringCalAcquisition ( long CalChannel, long SwpChannel, VARIANT_BOOL bVal);
```

Interface
ICalManager5

Last Modified:

- 23-Jan-2009  Added ‘if measurements are deleted’.

AllowEventSeverity Method

Description
Sets event filtering to monitor levels of severity.

VB Syntax
`app.AllowEventSeverity severity, state`

Variable (Type) - Description
- `app` An Application (object)
- `severity` (enum `naEventSeverity`) Choose from: `naEventSeverityERROR` `naEventSeverityINFORMATIONAL` `naEventSeveritySUCCESS` `naEventSeverityWARNING`
- `state` (boolean)
  - `True` - monitor
  - `False` - do not monitor

Return Type
Not Applicable

Default
Not Applicable

Examples
`app.AllowEventSeverity`

Write-only

ApplyDeltaMatchFromCalSet Method

Description
Specifies a Cal Set as a source of delta match correction.

If ‘GUID’ is not supplied then the Global Delta Match Cal Set is assumed. An error is returned if the specified Cal Set does not meet the following Delta Match criteria. The Global Delta Match Cal can ALWAYS be applied.

- Must have been performed using ECal or as a guided mechanical cal (not Unguided).
- Must have the same start freq, stop freq, and number of points as the channel being calibrated.
- Must calibrate the ports that are required by the TRL or Unknown Thru Cal as indicated by PortsNeedingDeltaMatch Property.

Learn more about Delta match calibration.
See example of a complete Delta Match calibration.

VB Syntax

```
guided.ApplyDeltaMatchFromCalSet [GUID]
```

Variable (Type) - Description

- **guided** GuidedCalibration (object)
- **GUID** Optional Argument. GUID of the Cal Set to use. If unspecified, the Global Delta Match Cal Set is used.

Return Type
Not Applicable

Default
Not Applicable

Examples

```
guided.ApplyDeltaMatchFromCalSet "{2B893E7A-971A-11d5-8D6C-00108334AE96}"
```

C++ Syntax

```
HRESULT ApplyDeltaMatchFromCalSet(BSTR calsetGUID);
```

Interface
IGuidedCalibration2
## ApplyPowerCorrectionValuesEx Method

**Description**
This command replaces `ApplyPowerCorrectionValues Method`. Applies the array of power correction values to the channel memory and turns correction ON. Perform after completing a source power cal acquisition sweep.

This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.

Optionally, as part of the source power calibration, perform calibration of the reference receiver used in the power calibration. Learn more.

**VB Syntax**
```
powerCalibrator.ApplyPowerCorrectionValuesEX [rRec]
```

**Variable**
- `powerCalibrator` *(object)* - A `SourcePowerCalibrator` object
- `rRec` *(Enum as NASourcePowerApplyCorrectionOption)* Optional argument. Choose from:
  - 0 - `naSourcePowerApplyCorrectionDefault` Do NOT perform and save a calibration of the reference receiver. (Default if not specified).
  - 1 - `naIncludeReferenceReceiverPowerCal` Perform and save a calibration of the reference receiver. The Cal Set, which includes only the reference receiver cal, is saved to the destination specified by `RemoteCalStoragePreference`.

**Return Type**
None

**Default**
Not Applicable

**Examples**
```
powerCalibrator.ApplyPowerCorrectionValuesEX
powerCalibrator.ApplyPowerCorrectionValuesEX (naIncludeReferenceReceiverPowerCal)
```

**C++ Syntax**
```
HRESULT ApplyPowerCorrectionValuesEx(enum NASourcePowerApplyCorrectionOption option);
```

**Interface**
`ISourcePowerCalibrator5`

ApplySourcePowerCorrectionTo Method

Description
Copies and applies an existing Source Power Calibration to another channel.

VB Syntax
`chan.ApplySourcePowerCorrectionTo (fromPortNum, targetChan, targetPortNum);`

Variable (Type) - Description

- **chan** A Channel (object)
- **fromPortNum** (Long) Port number of the existing source power correction.
- **targetChan** (Long) Channel number to which the source power correction will be copied.
- **targetPortNum** (Long) Port number to which the source power correction will be applied.

Return Type
Not Applicable

Default
Not Applicable

Examples
`chan.ApplySourcePowerCorrectionTo 1,2,1`

C++ Syntax
`HRESULT ApplySourcePowerCalibrationTo (long fromPortNumber, long otherChannelNumber, long portNumber);`

Interface
IChannel11

Last Modified:
20-Jul-2007   MX New topic
AssignSourceToRole Method - Superseded

Description
This command is replaced by: `chan.RoleDevice`
Assigns a configured source to the specified role.

VB Syntax
`conv.AssignSourceToRole role, source`

Variable (Type) - Description
- `conv` A `Converter Object`
- `role` (String) Role to which the external source is assigned. Choose from:
  - For IMDX and IMSX, choose from:
    - "RF2"
    - "LO1"
    - "LO2"
  - For all other converter applications, choose from:
    - "LO1"
    - "LO2"
- `source` (String) Source name from `Source Configuration dialog`.

Return Type
Not Applicable

Default
Not Applicable

Examples
`conv.AssignSourceToRole "LO1", "LO1Name"`

C++ Syntax
`HRESULT AssignSourceToRole(BSTR roleID, BSTR deviceName);`

Interface
IConverter

# AutoOrient Method

**Description**
Returns the ECal port that is connected to the specified PNA port. A calibration does not have to be in process.

**VB Syntax**
```vba
ecalPortNumber = ecal.AutoOrient(chanNum, pnaPort, ecalCharNum)
```

**Variable**
<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ecalPortNumber</td>
<td>Long</td>
<td>Variable to store the returned ECal port number that is connected to the specified PNA port number. The returned ECal port number is a 1-based number: 1 = Port A, 2 = Port B, 3 = Port C, 4 = Port D. Zero (0) is returned when the auto-orientation routine is unable to resolve the orientation.</td>
</tr>
<tr>
<td>ecal</td>
<td>ECalModule Object (object)</td>
<td>A ECalModule Object (object)</td>
</tr>
<tr>
<td>chanNum</td>
<td>Long</td>
<td>Channel number that contains the frequency range that will be calibrated.</td>
</tr>
<tr>
<td>pnaPort</td>
<td>Long</td>
<td>PNA port number.</td>
</tr>
<tr>
<td>ecalCharNum</td>
<td>Long</td>
<td>User Characterization number that matches the physical adapters/fixtures that are on the ECal module. This aids in determining the orientation of the ECal module. Choose from: 0 Factory characterization (no adapters - data that was stored in the ECal module by Agilent) 1 User characterization #1 2 User characterization #2 ...and so forth up to: 12 User characterization #12</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pna
pna.Preset
Const chanNum = 1
pna.Channels(chanNum).StopFrequency = 20E9 ' for a 20 GHz ECal mod
```
Const pnaPortNumber = 1
Const ecalCharacterizationNum = 0
Dim calMgr
Set calMgr = pna.GetCalManager
Dim ecalPortNumber ' The returned ECal port number is a 1-based number
' (1 = Port A, 2 = Port B, etc)
ecalPortNumber = calMgr.ECalModules(1).AutoOrient(chanNum, pnaPortNumber, ecalCharacterizationNum)
MsgBox "ECal port number attached to PNA port 1 = " & ecalPortNumber

**C++ Syntax**

```cpp
HRESULT AutoOrient(long channel, long pnaPortNumber, long characterization, long *pECalPortNumber);
```

fixture.AutoPortExtReset
```

**C++ Syntax**

```cpp
HRESULT AutoPortExtReset();
```

**Interface**

IFxturing2
# Autoscale Method

**Description**

**Trace Object** - Autoscales only the ONE trace on which Autoscale is being called.

**NAWindow Object** - Scales ALL of the traces to fit in the same window. This is equivalent to "Autoscale All" from the front panel.

Autoscale (both trace and window) behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. [Learn more.](#)

**VB Syntax**

`object.Autoscale`

**Variable**

*(Type) - Description*

- `object Trace (object)`
- `object NAWindow (object)`

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

- `Trac.Autoscale 'Autoscales the trace`
- `Win.Autoscale 'Autoscales all the traces in the window -Write`

**C++ Syntax**

`HRESULT AutoScale()`

**Interface**

INAWindow

ITrace

---

**Last Modified:**

15-Sep-2010  Added links to scale coupling
### AveragingRestart Method

**Description**
Clears and restarts averaging of the measurement data.

**VB Syntax**
```
chan.AveragingRestart
```

**Variable**

<table>
<thead>

ChangeParameter Method

Description
Changes the parameter of the measurement.

VB Syntax
`meas.ChangeParameter(param,src)`

Variable (Type) - Description
- `meas` A Measurement (object)
- `param` (string) - New parameter. Case insensitive.

For S-parameters and Applications parameters:
Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"
Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For Ratioed receiver measurements:
Any two receivers in your PNA separated by "/". For example: "A/R1"
See the block diagram showing the receivers in YOUR PNA.

For Unratioed (absolute power) measurements:
Any receiver in the PNA. For example: "A"
See the block diagram showing the receivers in YOUR PNA

With PNA Rev 6.2, Ratioed and Unratioed measurements can also use logical receiver notation to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more.

For ADC measurements
Any ADC receiver in the PNA.
For example: "AI1" indicates the Analog Input1.
Learn more about ADC receiver measurements.

For Balanced S-parameter measurements:
"topology: Sabxy"

- `topology` - Choose from:
  - `sbal` - single-ended to balanced
  - `ssb` - single-ended / single-ended to balanced
  - `bbal` - balanced to balanced
*Sabxy*

Where

- **a** - device output (receive) mode
- **b** - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output (receive) logical port number
- **y** - device input (source) logical port number

For example: "**sbal:sdd42**"

See an example program

For **Imbalance** and **Common Mode Rejection** measurements:

"**topology:parameter**" Choose from:

<table>
<thead>
<tr>
<th>Choose this:</th>
<th>To get this:</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SBAL:IMBSB&quot;</td>

<td>● Source port if param is a ratioed or unratioed receiver measurement (including ADC measurements).</td>
</tr>
</tbody>
</table>

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```cpp
meas.ChangeParameter "S11",2 '2 is ignored
meas.ChangeParameter "VC21",1 '1 is ignored
meas.ChangeParameter "A/R1",2 '2 is the source port
meas.ChangeParameter "a1/b1",1 '1 is the source port
meas.ChangeParameter "R1",2 '2 is the source port

'to change to a parameter with a string name
dim app
set app = CreateObject("Agilentpna835x.application")
dim capabilities
set capabilities = app.Capabilities
dim portnum
portnum = Capabilities.GetPortNumber("Src2 Out1")
app.activemasurement.ChangeParameter "A",portnum
```

**C++ Syntax** HRESULT ChangeParameter(BSTR parameter, long lPort)

**Interface** IMeasurement

CheckPower Method

Description
Measures power at a specified frequency. Use this method to test power level before and/or after applying a source power calibration.

VB Syntax
```vbnet
pow = pwrCal.CheckPower (device, freq [,unit])
```

Variable (Type) - Description
- `pow` (double) Variable to store power value returned by this method.
- `pwrCal` A `SourcePowerCalibrator` (object)
- `device` (enum `NAPowerAcquisitionDevice`) The specific sensor on the power meter to be used for the acquisition. Choose from:
  - 0 – `naPowerSensor_A`
  - 1 – `naPowerSensor_B`
  To use the sensor that currently corresponds to the frequency of interest, use the value from the `PowerAcquisitionDevice` property.
- `freq` (double) Frequency (Hz) at which the sensor is to read the power.
- `unit` (enum `NAPowerUnit`) Optional argument. Choose from:
  - `naDBM` – Returns the power in dBm. (default)
  - `naWATT` – Returns the power in Watts.

Return Type
Double

Default
Not Applicable

Examples
```csharp
watt = powerCalibrator.CheckPower(naPowerSensor_A, 1E9, naWATT)
```

C++ Syntax
```cpp
HRESULT put_CheckPower(tagNAPowerAcquisitionDevice enumAcqDevice, double dFreq, tagNAPowerUnit enumPowerUnit, double *pdPower);
```

Interface
`ISourcePowerCalibrator2`

Write-only

CloseCalSet Method  Superseded

Description
This command is no longer necessary. The CalSet.get... and put... commands that
required this command have been replaced,
Closes read/write access to the Cal Set.
See OpenCalSet for an explanation of gaining access to the Cal Set.
When you are finished reading and writing data from or to the Cal Set, close the Cal
Set. Subsequent read/writes will require a new OpenCal Set call.
Reading and writing Cal Set data is performed with the PutStandard, GetStandard,
PutErrorTerm, GetErrorTerm method calls. These methods are provided by the ICal Set
and ICalData2 interfaces.

VB Syntax

CalSet.CloseCalSet

Variable  (Type) - Description
CalSet  (object) - A Cal Set object

Return Type  Not Applicable

Default  Not Applicable

Examples

CSet.CloseCalSet

C++ Syntax  HRESULT CloseCalSet

Interface  ICalSet
ComputeErrorTerms Method

**Description**  Computes error terms for the caltype specified by a preceding OpenCal Set call.

The Cal Set must first be opened using OpenCalSet. If this call has not been made, the following error is issued:

E_NA_Cal Set_ACCESS_DENIED

The standards data required for the CalType must be available in the Cal Set or this error will be returned: E_NA_STANDARD_NOT_FOUND.

**Note:** Error term computation requires data for the actual calibration kit standards from the current kit definition. ComputeErrorTerms assumes that the standards were acquired using only one standard per class.

**VB Syntax**  
`CalSet.ComputeErrorTerms`

**Variable**  
<table>
<thead>
<tr>

**Examples**  
`CalSet.ComputeErrorTerms`

**C++ Syntax**  
`HRESULT ComputeErrorTerms()`

**Interface**  ICalSet
ConfigEnhancedNB2 Method

Description  
**Note:** This command replaces ConfigEnhancedNB Method.

This subroutine determines, then returns, the proper configuration for pulsed measurements on the **PNA-X ONLY** using the spectral nulling technique. The configuration returned needs to be sent to the PNA and any other related external equipment.

The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the PNA.

**VB Syntax**

```
Pulsed.ConfigEnhancedNB2 (PRF, BW, PhysicalIF, NCO, ClockFreq, Stage1TapArray, Stage2TapArray, Stage3TapArray, FixedPRF, GateDelay, GateWidth, SWGateDelay, SWGateWidth, SWGateRamp)
```

**Variable (Type) - Description**

**Pulsed** (interface) An interface to the agilentpnapulsed.dll application interface.

**PRF** (Double) The Pulse Repetition Frequency.

[out] The pulse repetition frequency that has been optimized for use with the PNA. NOTE: This value may be different from the value requested.

[in] The desired pulse repetition frequency.

**BW** (Long) The PNA IF Bandwidth.

[out] The PNA IF bandwidth that has been optimized for use with the PNA. NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified **PRF** and **BW**.

[in] The desired PNA IF bandwidth.

**PhysicalIF** (Double)

[out] Returns physical intermediate frequency.

**NCO** (Double)

[out] Returns numeric controlled oscillator frequency.

**ClockFreq** (Double)

[out] Returns the clock frequency (in Hz) of the PNA-X.

**Stage1TapArray** (Long array)

[out] Returns the stage 1 filter coefficients

**Stage2TapArray** (Long array)

[out] Returns the stage 2 filter coefficients
Stage3TapArray (Long array)
[ out ] Returns the stage 3 filter coefficients

FixedPRF (Boolean)
[in]

- 1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.
- 0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

GateDelay (Double)
[in] Highest delay value in seconds used in any of the receiver gates.

GateWidth (Double)
[in] Widest pulse width value in seconds used in any of the receiver gates.

SWGateDelay (Double)
[ out ] Returns the SW gate delay in seconds.

SWGateWidth (Double)
[ out ] Returns the SW Gate width in seconds.

SWGateRamp (Long)
[ out ] Returns the SW Gate ramp

Return Type Not Applicable
Default Not Applicable
Example See an example using this command.

C++ Syntax HRESULT ConfigEnhancedNB2(double *pPRF, long *pBW, double *pIF, double *pNCO, double *clock, double *pStg1, double *pStg2, double *pStg3, VARIANT_BOOL fixPRF, double gateDelay, double gateWidth, double *SWGateDelay, double *SWGateWidth, long *SWGateRamp)

Interface AgilentPNAPulsed.Application
ConfigEnhancedNBIFAtten Method

Description
Sets PNA-X receivers to auto gain setting.

VB Syntax
Pulsed.ConfigEnhancedNBIFAtten (PRF, RxWidth, IFAtten)

Variable (Type) - Description

Pulsed (interface) An interface to the agilentpnapulsed.dll application interface.

PRF (Double)

RxWidth (Double)

IFAtten (Long Integer)
[out] IF attenuation value.

Return Type Not Applicable

Default Not Applicable

Example See an example using this command.

C++ Syntax
HRESULT ConfigEnhancedNBIFAtten(double *pPRF, double *pWidth, long *pIF)

Interface AgilentPNAPulsed.Application
**Description**

Note: This method replaces ConfigNarrowBand2 Method. The BW argument now returns 0 if no solution is found for the specified PRF and BW. In addition, adjustments were made to the filter finder algorithm.

This subroutine determines, then returns, the proper configuration for pulsed measurements on the PNA using the spectral nulling technique. The configuration returned needs to be sent to the PNA and any other related external equipment such as pulse generators. The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the PNA. The routine will also return the Sample Rate, Number of Taps, and Offset that must be sent to the PNA to configure it in pulsed mode using the spectral nulling technique.

Although the example below uses COM programming to communicate with the PNA, these commands can be replaced with SCPI equivalents.

Note: The pulsed application may set the offset frequency (option 080) of the PNA to some value other than zero (the default value). If the stop frequency is set to the maximum of the PNA model, then an error message may appear on the PNA stating that the response frequency has exceeded the maximum allowed frequency. To fix this, set the stop frequency to a value that is at least 2 KHz less than the maximum allowed. For example, if you have a 20 GHz PNA, and the stop frequency is set to 20 GHz, and the error message appears, then set the stop frequency to 19.999998 GHz.

**VB Syntax**

```
Pulsed.ConfigNarrowBand (PRF, NumTaps, BW, OffSet, SampleRate, Precision, FixedPRF, PG81110)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulsed</td>
<td>(interface) An interface to the agilentpnanpuled.dll application interface.</td>
</tr>
<tr>
<td>PRF</td>
<td>(Double) The Pulse Repetition Frequency.</td>
</tr>
<tr>
<td>[out]</td>
<td>The pulse repetition frequency that has been optimized for use with the PNA. NOTE: This value may be different from the value requested.</td>
</tr>
<tr>
<td>[in]</td>
<td>The desired pulse repetition frequency.</td>
</tr>
<tr>
<td>NumTaps</td>
<td>(Long) The number of taps to send to the PNA for pulsed operation.</td>
</tr>
<tr>
<td>BW</td>
<td>(Long) The PNA IF Bandwidth.</td>
</tr>
<tr>
<td>[out]</td>
<td>The PNA IF bandwidth that has been optimized for use with the PNA. NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified PRF and BW.</td>
</tr>
<tr>
<td>[in]</td>
<td>The desired PNA IF bandwidth.</td>
</tr>
<tr>
<td>OffSet</td>
<td>(Double) The offset value to send to the PNA for pulsed operation. The offset value is used to adjust the PNA for the two different possible sample rates that may be returned.</td>
</tr>
</tbody>
</table>
SampleRate (Double)
[**out**] The sample rate to send to the PNA for pulsed operation.

[**in**] Passing a value of 6.2 us will make sure that the offset frequency is not shifted and therefore could be used with converter measurements. Otherwise enter 0.

Precision (Double)  The precision variables sets the precision that will be used to decrement the PRF when running the configuration routines. This variable can be set to the precision required by the external pulse generators so that the configuration routine will not return a PRF that is not within the precision limits of the pulse generators.

FixedPRF (Boolean)
1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.

0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

PG81110 (Boolean)
1 (True) You are using an Agilent 81110 as the pulse generator. This allows increased accuracy in adjustments for offset and PRF.

0 (False) Not using an Agilent 8110.

Return Type Not Applicable

Default Not Applicable

Example See an example using this command.

### ConfigurationFile Method

**Description**
Recalls an Interface Control file from the hard drive into the analyzer.

**VB Syntax**

```vbnet
IntControl.ConfigurationFile (filename)
```

**Variable**

- **Type**
  - Description

  - **IntControl**
    - An `InterfaceControl` (object)

  - **filename**
    - Full path, file name, and extension (.xml) of the file to recall.
    - Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
IntControl.ConfigurationFile ("C:/Program Files/Agilent/Network Analyzer/Documents/MySettings.xml")
```

**C++ Syntax**

```cpp
HRESULT ConfigurationFile(BSTR bstrFile)
```

**Interface**
`IInterfaceControl`
### Configurations Property

**Description**
Returns an array of stored configuration names that can be used with `DeleteConfiguration Method` and `LoadConfiguration Method`.

**VB Syntax**
```vb
names = pathMgr.Configurations
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>names</code></td>
<td>(Variant array) Variable to store the returned configuration names.</td>
</tr>
</tbody>
</table>

**pathMgr**

`PathConfigurationManager` (object)

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```vb
names = path.Configurations
```

**C++ Syntax**
`HRESULT get_Configurations (VARIANT* configurations );`

**Interface**
`IPathConfigurationManager`

Configure Method

**Description**
Restarts as an "N-port" PNA using the specified multiport test set.

*See other commands to configure multiport test sets.*

**VB Syntax**
`app.Configure(model, address)`

**Variable (Type) - Description**

- `app` An Application (object)
- `model` String - Model of the test set with which to restart.
  Use "Native" to restart without a test set.
  To see a list of supported test sets, use
- `address` Integer - GPIB Address of the test set. Use 0 for native restart.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
*See an example using this command.*

```plaintext
app.Configure("N44xx",18)
```

**C++ Syntax**
`HRESULT Configure(BSTR model, long address);`

**Interface**
IAppliation9
Continuous Method

Description  The channel continuously responds to trigger signals.

Note: This command does NOT change TriggerSignal to Continuous.

VB Syntax  chan.Continuous

Variable  (Type) - Description

chan  A Channel (object)

Return Type  Not Applicable

Default  Not Applicable

Examples  chan.Continuous

C++ Syntax  HRESULT Continuous()

Interface  IChannel
**Description**  
Creates a new Cal Set and copies the current Cal Set data into it. Therefore, you now have a clone Cal Set with a different ID. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

**VB Syntax**  
`CalSet.Copy`

**Variable**  
`(Type) - Description`

`CalSet (object) - A Cal Set object`

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**

```vbscript
Dim mgr As CalManager  
Dim ocalset As CalSet  
Dim newcalset As CalSet  
Set mgr = pna.GetCalManager  
'Create a new (empty) Cal Set.  
Set ocalset = mgr.CreateCalSet(1)  
ocalset.Description = "original calset"  
pna.Channel(1).SelectCalSet ocalset.GetGUID, True

'Launch the cal wizard and allow the user to perform the calibration.  
If pna.LaunchCalWizard(False) Then  
'If the Launch returns true then the calibration finished.  
ocalset.Save

'Copy the Cal Set to the new one.  
Set newcalset = ocalset.Copy  
nnewcalset.Description = "copy of original calset"

Else  
'If the cal doesn't finish, delete the old Cal Set  
'so it isn't taking up unnecessary memory.  
mgr.DeleteCalSet ocalset.GetGUID
End If
```

As a result, the programmer can manipulate the data in the new Cal Set and always revert back to the old Cal Set as needed.

**C++ Syntax**  
`HRESULT Copy( ICalSet** pCalSet);`

**Interface**  
ICalSet
### CopyToChannel Method

**Description**  
Copies ALL settings from this channel to the specified channel.  
Use **CopyFrom** to copy ONLY the mechanical switch and attenuator settings.

**VB Syntax**  
*chan*.CopyToChannel(*IChanNum*)

**Variable**  
**(Type) - Description**

- **chan**  
  A **Channel** (object)

- **IChanNum**  
  (long integer) – Number of the channel to become a copy of <chan>.

**Return Type**  
None

**Default**  
Not Applicable

**Examples**

```vbnet
Dim chan
Set chan = PNAapp.ActiveChannel
chan.CopyToChannel 2
```

**C++ Syntax**  
HRESULT CopyToChannel(long IChanNum);

**Interface**  
IChannel2

---

CreateS-Parameter Method

### Description
This method creates a new S-Parameter measurement in an existing or new window.

### VB Syntax
```vbnet
app.CreateSParameter chan, recvr, source, [window]
```

### Variable (Type) - Description
- **app** [Application](#) (object)
- **chan** (long integer) - Channel number of the new measurement
- **recvr** (long integer) - Port number of the receiver (1 or 2)
- **source** (long integer) - Port number of the source (1 or 2)
- **window** (long integer) - Optional argument. Window number of the new measurement. Choose 1 to 4. If unspecified, the S-Parameter will be created in the Active Window.

### Return Type
Not Applicable

### Default
Not Applicable

### Examples
```vbnet
app.CreateSParameter 1, 2, 1, 1 'Creates a new S21 measurement in channel 1 and New window(1) app.CreateSParameter 1, 2, 1 'Creates a new S21 measurement in channel 1 and in the active window
```

### C++ Syntax
```c++
HRESULT CreateSParameter(long ChannelNum, long RcvPort, long SrcPort, long windowNumber)
```

### Interface
IAplication

Write-only

CreateCalSet Method

**Description**

Creates a new Cal Set.

The new cal set is initialized with the stimulus settings from the channel whose number is passed as the argument to this method. Stimulus settings include frequency, bandwidth, number of points, and so forth.

Use this method when you want to manually upload data to the Cal Set using the returned ICal Set interface handle.

The channel number does not restrict the usage of this Cal Set on any other channel. It simply provides a link to the originating channel so that the stimulus values can be stored in the Cal Set.

*Note:* Be sure to SAVE the CalSet you are creating. Use `ICalSet::Save`.

**VB Syntax**

```vbnet
calMgr.CreateCalSet (chan)
```

**Variable (Type) - Description**

- `calMgr` *(object)* - A `CalManager` object
- `chan` *(long)* - channel number of the new Cal Set.

**Return Type**

ICal Set Interface

**Default**

Not Applicable

**Example**

```vbnet
calMgr.CreateCalSet 1
```

**C++ Syntax**

```cpp
HRESULT CreateCalSet( long ChannelNumber, ICal Set** pCal Set);
```

**Interface**

ICalManager

CreateCustomCalEx Method

**Description**

Returns IGuidedCalibration for the specified channel. With a handle to the IGuidedCalibration interface, you can query it for the following objects for properties appropriate to the calibration setup for the particular meastype (channel).

IGuidedCalibration interface is used to configure a calibration (specify connectors, cal kits, and so forth). It is also used to access any custom calibration properties required for unique application channels like Noise Figure or Gain Compression. To access these special properties, make this call on the IGuidedCalibration interface:

```plaintext
CustomInterface = IGuidedCalibration.CustomCalConfiguration();
```

The interface returned by this call can be used to set and get the custom properties on the following application cal objects:

- NoiseCal Object
- GainCompressionCal Object
- SweptIMDCal Object

**Note:** Use CreateCustomCal_Method to create FCA calibration objects.

**VB Syntax**

```plaintext
calmgr.CreateCustomCalEx (chan)
```

**Variable (Type) - Description**

- **calMgr** (Cal Manager (Object))
- **chan** (long integer) Channel number in which to create the Cal object.

**Return Type**

IGuidedCalibration

**Default**

Not Applicable

**Examples**

```plaintext
Dim guidedcal
Set guidedcal = CalManager.CreateCustomCalEx(1)
```

**See Also**

**CreateCustomMeasurementEx Method**

**Description**
Creates a new custom measurement or a new 'standard' S-Parameter measurement.

**VB Syntax**
```vbnet
app.CreateCustomMeasurementEx chanNum, MeasClass, MeasName [, window]
```

**Variable (Type) - Description**
- `app` *(object)* - An Application object
- `chanNum` *(long)* - Channel number used by the new measurement; can exist or be a new channel.
- `MeasClass` *(string)* - Measurement class of the new custom measurement object. The new custom measurement must be installed and registered on the PNA.
  
  Choose from the following:
  
  - "Standard"
  - "Vector Mixer/Converter"
  - "Scalar Mixer/Converter"
  - "Gain Compression"
  - "Gain Compression Converters"
  - "Noise Figure Cold Source"
  - "Noise Figure Converters"
  - "Swept IMD"
  - "IM Spectrum"
  - "Swept IMD Converters"
  - "IM Spectrum Converters"

- `MeasName` *(variant)* - Measurement names to create:

**window** (long) Optional argument. Number of the window the new custom measurement will be placed in. Choose between 1 and the [maximum number of windows allowed on the PNA](#). If unspecified, the measurement is placed in the active window.
**Return Type**  
IMeasurement

**Default**  
Not Applicable

**Examples**

'**To create a scalar mixer measurement in channel 2:**
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Scalar Mixer/Converter", "SC21")

'**To create a vector mixer measurement in channel 2:**
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Vector Mixer/Converter", "VC21")

**C++ Syntax**  
HRESULT put_CreateCustomMeasurementEx (long ChannelNum, BSTR guid, 
VARIANT initData, long windowNumber, IMeasurement** ppMeasurement );

**Interface**  
IApplication3

---

Last Modified:

- **2-Mar-2010**   Fixed IM spectrum converters
- **29-Oct-2009**   Added NFX
- **23-Feb-2009**   Added IMD Converters and Noise Figure I
- **18-Sep-2008**   Added IMD and IM Spectrum
- **8-Nov-2007**    Updated for NF and GCA
## CreateMeasurement Method

### Description
Creates a new measurement.

### VB Syntax
```vbnet
app.CreateMeasurement chanNum, param, lPort[, window]
```

### Variable Information

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>Application (object)</td>
<td></td>
</tr>
<tr>
<td><code>chanNum</code></td>
<td>long</td>
<td>Channel number of the new measurement; can exist or be a new channel</td>
</tr>
<tr>
<td><code>param</code></td>
<td>string</td>
<td>New parameter. Case insensitive.</td>
</tr>
</tbody>
</table>

### For S-parameters:
- Any S-parameter that can be measured by your PNA.
- Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"
- Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

### For Ratioed measurements:
- Any two receivers in your PNA separated by "/". For example: "A/R1"
- See the [block diagram](#) showing the receivers in YOUR PNA.

### For Unratioed (absolute power) measurements:
- Any receiver in the PNA. For example: "A"
- See the [block diagram](#) showing the receivers in YOUR PNA

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more.

### For ADC measurements
- Any ADC receiver in the PNA.
- For example: "AI1" indicates the Analog Input1.
- Learn more about ADC receiver measurements.

### For Balanced S-parameter measurements:
- "topology:Sabxy"

  **topology** - Choose from:

  - **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

**Sabxy** -

Where

- **a** - device output (receive) mode
- **b** - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output (receive) logical port number
- **y** - device input (source) logical port number

For example: "**sbal:sdd42**" 

See an example program

**For Imbalance and Common Mode Rejection measurements:**

"**topology:parameter**" Choose from:

<table>
<thead>
<tr>
<th>Choose this:</th>
<th>To get this:</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;SBAL:IMBSB&quot;</strong></td>
<td>single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td><strong>&quot;SBAL:CMRRSB1&quot;</strong></td>
<td>single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Sds21/Scs21)</td>
</tr>
<tr>
<td><strong>&quot;SBAL:CMRRSB2&quot;</strong></td>
<td>single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Ssd12/Ssc12)</td>
</tr>
<tr>
<td><strong>&quot;SSB:IMB1SSB&quot;</strong></td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 1</td>
</tr>
<tr>
<td><strong>&quot;SSB:IMB2SSB&quot;</strong></td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 2</td>
</tr>
<tr>
<td><strong>&quot;SSB:CMRRSSB1&quot;</strong></td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Sds31/Scs31)</td>
</tr>
<tr>
<td>String</td>
<td>Description</td>
<td>Notes</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB2&quot;</td>
<td>single-ended / single-ended to balanced common mode rejection (Sds32/Scs32)</td>
<td></td>
</tr>
<tr>
<td>&quot;BBAL:IMB1BB&quot;</td>
<td>balanced to balanced imbalance 1</td>
<td></td>
</tr>
<tr>
<td>&quot;BBAL:IMB2BB&quot;</td>
<td>balanced to balanced imbalance 2</td>
<td></td>
</tr>
<tr>
<td>&quot;BBAL:CMRRBB&quot;</td>
<td>balanced to balanced common mode rejection (Sdd21/Scc21)</td>
<td></td>
</tr>
</tbody>
</table>

**lPort** *(long)*

- **Ignored** if `param` is an S-Parameter, balanced, imbalance, or CMRR parameter.
- **Source port** if `param` is ratioed or unratioed (including ADC) measurements.
- Use 0 for **N5264A**.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**window** *(long)* Optional argument. Window number of the new measurement. Choose between 1 and the maximum number of windows allowed on the PNA. If unspecified, the measurement will be created in the Active Window.

See also [Traces, Channels, and Windows on the PNA](#).

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```csharp
app.CreateMeasurement(1, "A/R1", 1, 0)
app.CreateMeasurement(1, "a1/b1", 1, 0)
app.CreateMeasurement(1, "bbal:Sdd21", 1)
app.CreateMeasurement(1, "AI2", 2)
app.CreateMeasurement(1, "R1", 0) ' for N5264A
```

**C++ Syntax**

```csharp
HRESULT CreateMeasurement(long ChannelNum, BSTR strParameter, long lPort, long windowNumber)
```

**Interface** `IApplication`
23-Oct-2008    Added support for N5264A
24-Apr-2008    Clarify ports with string names
23-Jul-2007    Added source port link
25-Apr-2007    Updated for ADC measurements.
12-Sept-2006   MQ Updated for logical receiver notation.
## DataToMemory Method

**Description** Stores the active measurement data into memory creating a memory trace. The memory can then be displayed or used in calculations with the measurement data.

**VB Syntax**

```vbnet
meas.DataToMemory
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
meas.DataToMemory
```

**C++ Syntax**

```cpp
HRESULT DataToMemory()
```

**Interface** IMeasurement
Deembed Method

Description
De-embeds a fixture from an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the fixture removed.

When the new Cal Set is applied to a channel, the effects of the fixturing are removed from the measurement data. Do NOT enable fixturing. The effects of the fixture are removed when the new Cal Set is selected and correction is turned ON.

VB Syntax

```vb
calMgr.Deembed (cs1, cs2, s2p, port, compPwr, extrap)
```

Variable (Type) - Description

- **calMgr** (object) - A `CalManager` object
- **cs1** (String) - Name of an existing Cal Set which resides on the PNA.
- **cs2** (String) - Name of new Cal Set which contains updated error terms with fixture de-embedded.
- **s2p** (String) - Name of the S2P file which characterizes the adapter/fixture.
- **port** (Long Integer) - Port number from which fixture will be de-embedded.
- **compPwr** (Boolean)
  - **True** - When the Cal Set contains a power correction array for the fixture port, that array will be compensated for the fixture loss.
  - Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.
  - **False** - Do not compensate for loss in source power through the fixture.
- **extrap** (Boolean)
  - **True** - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.
  - **False** - Extrapolation is NOT performed (default setting).

Return Type
Not Applicable

Default
Not Applicable

Example

```vb
calMgr.Deembed  "MyCalSet", "MyNewCalSet", "Fixture.s2p", 1, True, True
```

C++ Syntax

```cpp
HRESULT Deembed (BSTR srcSet, BSTR destSet, BSTR s2p, long port, BOOL compPwr, BOOL extrap);
```

Interface
ICalManager8

</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT Delete()</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IMeasurement</td>
</tr>
</tbody>
</table>
DeleteMarker Method

**Description**
Deletes a marker from the measurement.

**VB Syntax**
`meas.DeleteMarker(Mnum)`

**Variable (Type) - Description**
- **meas** (object)
  - A Measurement
- **Mnum** (long)
  - Any existing marker number in the measurement

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
`meas.DeleteMarker(1)`

**C++ Syntax**
`HRESULT DeleteMarker(long IMarkerNumber)`

**Interface**
IMeasurement
### DeleteAllMarkers Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Deletes all of the markers from the measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>meas.DeleteAllMarkers</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>

<tr>
<td><strong>Interface</strong></td>
<td><code>IMeasurement</code></td>
</tr>
</tbody>
</table>
DeleteAllSegments Method

Description
Removes all segments from the scratch mixer.

VB Syntax
```
conv.DeleteAllSegments()
```

Variable
```
conv
```
A Converter Object

Return Type
Not Applicable

Default
Not Applicable

Examples
```
mxr.DeleteAllSegments()
```

See example program

C++ Syntax
```
HRESULT DeleteAllSegments();
```

Interface
IConverter5

Last Modified:
26-Oct-2010 New command (A.09.33)
DeleteCalSet Method

Description
Deletes a Cal Set from the set of available Cal Sets. This method immediately updates the Cal Set file on the hard drive. If the Cal Set is currently being used by a channel or does not exist, this request will be denied and an error is returned.

Using the Cal Sets collection is a convenient way to manage Cal Sets.

VB Syntax
`calMgr.DeleteCalSet (calset)`

Variable
(Type) - Description

`calMgr` (object) - A CalManager object

`calset` (string) - Cal Set to be deleted. Specify the Cal Set by GUID or Name. Use EnumerateCalSets to list the available Cal Sets by name.

Return Type
Not Applicable

Default
Not Applicable

Example
```
Set pna=CreateObject("AgilentPNA835x.Application")
Set cmgr = pna.GetCalManager
cmgr.DeleteCalSet ("MyCalSet")
```

C++ Syntax
`HRESULT DeleteCalSet( BSTR strCalset);`

Interface
ICalManager

Last Modified:
6-Mar-2008   Added Name argument
DeleteConfiguration Method

Description
Deletes the specified configuration name from the PNA. The factory configurations cannot be deleted. This is the only method of programmatically distinguishing a factory configuration from a user-named configuration.

VB Syntax
pathMgr.DeleteConfiguration name

Variable (Type) - Description
pathMgr PathConfigurationManager (object)
name (String) Configuration name to be deleted.

Return Type
Not Applicable

Default
Not Applicable

Examples
path.DeleteConfiguration "myMixer"

C++ Syntax
HRESULT StoreConfiguration (long channelNum, BSTR configName);

Interface
IPathConfigurationManager

Last Modified:
14-Dec-2006   MX New topic
DeleteSegment Method

**Description**
Removes the specified number of segments from the scratch mixer starting at the index position.

**VB Syntax**
```
conv.DeleteSegment index,count
```

**Variable**
(Type) - Description
- `conv` A Converter Object
- `index` (Long integer) Position at which to start removing segments. Valid index range is between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.
- `count` (Long integer) Optional argument. Number of segments to remove. If unspecified, 1 segment is removed.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
mxr.DeleteSegment 1,5 'Removes 5 segments beginning at the first position.
```

**C++ Syntax**
```
HRESULT DeleteSegment(long index, long count);
```

**Interface**
IConverter5

---

Last Modified:

26-Oct-2010 New command (A.09.33)
## DeleteShortCut Method

**Description**  
Removes a macro from the list of macros in the analyzer. Does not remove the file.  

**Note:** There are always 12 macro positions. They do not have to be sequential. For example, you can have number 7 but no numbers 1 to 6.

### VB Syntax
```
app.DeleteShortCut item
```

### Variable *(Type) - Description*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><code>item</code></td>
<td>(long integer) number of the macro to be deleted.</td>
</tr>
</tbody>
</table>

### Return Type
Not Applicable

### Default
Not Applicable

### Examples
```
app.DeleteShortCut 2
```

### C++ Syntax
```
HRESULT DeleteShortcut(long Number)
```

### Interface
IApplication
### DisallowAllEvents Method

<table>
<thead>
<tr>
<th>Description</th>

About Cal Window

DisplayNAWindowDuringCalAcquisition Method

Description
Set the 'show' state of the window to be displayed during a calibration.

When this command is sent, the specified window is 'flagged' to be shown during calibration. The flag is cleared when the window is closed. A Preset or Instrument State Recall also closes the window. If the same window number is reopened, this command must be sent again to show the window during a calibration. The flag is NOT saved with an instrument state.

Send this command for each additional window to show during a calibration.

VB Syntax
```
calMgr.DisplayNAWindowDuringCalAcquisition (winNum, State)
```

Variable (Type) - Description
- **calMgr** (object) - A CalManager object
- **winNum** (long) - Window number to show during a calibration. The calibration window will also be shown with this window.
  The window must already be created.
  Use NaWindows.count or app.WindowNumber to read existing window numbers.
- **state** (Boolean) Window state. Choose from:
  - **True** - Show the specified window during calibration.
  - **False** - Do NOT show the specified window during calibration.

Return Type
Not Applicable

Default
Not Applicable

Example
```
calMgr.DisplayNAWindowDuringCalAcquisition 2, True
```

C++ Syntax
```
HRESULT DisplayNAWindowDuringCalAcquisition( long WinNum, VARIANT_BOOL bVal);
```

Interface
ICalManager5

Last Modified:
- 28-Jan-2009  Removed 'Read'
- 8-Nov-2007  MX New topic
### DisplayOnlyCalWindowDuringCalAcquisition Method

**Description**
Clears the flags for windows to be shown during calibrations other than the Cal Window. To flag a window to be shown see [DisplayNAWindowDuringCalAcquisition](#)

**VB Syntax**
`calMgr.DisplayOnlyCalWindowDuringCalAcquisition`

**Variable**
- **(Type)** - **Description**
  - `calMgr` (object) - A [CalManager](#) object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
`calMgr.DisplayOnlyCalWindowDuringCalAcquisition`

See example using this command

**C++ Syntax**
```cpp
HRESULT DisplayOnlyCalWindowDuringCalAcquisition()
```

**Interface**
ICalManager5

---

**Last Modified:**
8-Nov-2007   MX New topic
## DoPrint Method

**Description**  Prints the screen to the default Printer.

**VB Syntax**  
```vb
app.DoPrint
```

**Variable**  
- **app**  An Application (object)

**Return Type**  Not Applicable

<table>
<thead>
<tr>
<th>Examples</th>
<th>C++ Syntax</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>app.DoPrint</td>
<td>HRESULT DoPrint()</td>
<td>IApplication</td>
</tr>
</tbody>
</table>

### Return Type
- **Default**  Not Applicable
DoECAL1PortEx Method

**Description**  This method replaces DoECAL1Port Method. Does a 1-Port calibration using an ECAL module. You must first have a 1-port measurement active to perform the calibration. The characterization within the ECal module that will be used for the calibration is specified by ECALCharacterizationEx. The default value is 0.

**VB Syntax**  `cal.DoECAL1PortEx [port],[module]`

---

**Variable** *(Type) - Description*

- `cal`  A Calibrator *(object)*
- `port` *(long integer)* Optional argument - Port number to calibrate. Choose from:
  1. Calibrate port 1 (default if unspecified)
  2. Calibrate port 2
- `module` *(long integer)* Optional argument. ECal module. Choose from modules 1 through 8
  Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
  Use GetECALModuleInfoEx to returns the model and serial number of each module.

**Return Type**  None

**Default**  Not Applicable

**Examples**  `cal.DoECAL1PortEx,2,2`

**C++ Syntax**  `HRESULT DoECAL1PortEx(long port, long moduleNumber = 1);`

**Interface**  ICalibrator4
DoECAL2PortEx Method

Description
This method replaces DoECAL2Port Method.
Does a 2-port calibration using an ECal module.

2-port refers to the number of ports to calibrate; NOT to the number of ECal module ports.

You must first have a measurement active to perform the calibration.
The characterization within the ECal module that will be used for the calibration is specified by ECalCharacterizationEx. The default value is 0.

VB Syntax
`cal.DoECAL2PortEx [portA],[portB],[module]`

Variable (Type) - Description

**cal**  A Calibrator (object)

**portA** (long integer) Optional argument - Number of the receive port to calibrate. Choose from:
1 - Calibrate port 1 (default, if unspecified)
2 - Calibrate port 2
3 - Calibrate port 3

And so forth for all available PNA / test set ports.

**portB** (long integer) Optional argument - Number of the source port to calibrate. Choose from:
1 - Calibrate port 1
2 - Calibrate port 2 (default, if unspecified)
3 - Calibrate port 3

And so forth for all available PNA / test set ports.

**module** (long integer) Optional argument. ECal module.
Choose from modules 1 through 8
Use IsECALModuleFoundEx to determine the number of modules connected to the PNA
Use GetECALModuleInfoEx to return the model and serial number of each module.

Return Type
None

Default
Not Applicable

Examples
`cal.DoECAL2PortEx,1,2,3`

C++ Syntax
`HRESULT DoECAL2PortEx( long portA = 1, long portB =2, long moduleNumber = 1);`

Interface ICalibrator4
1-Jan-2007   Corrected Port B default
## DoneCalConfidenceCheckECAL Method

### DoReceiverPowerCal Method

#### Description

**Note:** This command replaces DataToDivisor, LogMagnitudeOffset, Normalization, InterpolateNormalization.

Immediately performs a receiver power calibration. The connection to the receiver must be in place when this command is sent.

A Receiver Power Cal requires that the active measurement be an Unratioed power measurement.

#### VB Syntax

```
cal.DoReceiverPowerCal(param, srcPort [,pwrOffset])
```

#### Variable (Type) - Description

**cal**  
A **Calibrator** (object)

**param**  
(string) – Receiver to be calibrated. Choose any receiver in your PNA. See a block diagram of your PNA.

With PNA Rev 6.2, receivers can also be referred to using **logical receiver notation**. This notation makes it easy to refer to receivers with an **external test set** connected to the PNA. You do not need to know which physical receiver is used for each test port. Learn more.

**srcPort**  
(long integer) – Number of the port which will supply source power to the receiver during this cal.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**pwrOffset**  
(double) – Optional argument. Offset value in dB. Adjusts a receiver power cal to account for components or adapters that are added between the source port and receiver while performing this cal. Specify loss as a negative number; and gain as a positive number.

#### Return Type

None

#### Default

Not Applicable

#### Examples

```
cal.DoReceiverPowerCal "B", 1, -10
```

#### C++ Syntax

```
HRESULT DoReceiverPowerCal(BSTR parameter, long ISrcPort, double dPowerOffset);
```

#### Interface

## DoResponseCal Method

### Description
Performa and immediately applies a Response cal. Same as selecting **Normalize** from the Unguided Cal - Measure Standards page. [Learn more](#).

### VB Syntax
```
cal.DoResponseCal (measParam),(SourcePort)
```

### Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>Calibrator (object)</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>measParam</td>
<td>String</td>
<td>Measurement parameter to correct. It is NOT necessary for this measurement to be present.</td>
</tr>
<tr>
<td>SourcePort</td>
<td>long integer</td>
<td>Source port number to calibrate. Optional for S-parameter measurements. Choose from: 0 - N5264A Measurement Receiver (no source ports). 1 - Calibrate port 1 2 - Calibrate port 2 (default, if unspecified) 3 - Calibrate port 3 And so forth for all available PNA / test set ports.</td>
</tr>
</tbody>
</table>

### Return Type
None

### Default
Not Applicable

### Examples
```
cal.DoResponseCal "A/R",1
```

### C++ Syntax
```
HRESULT DoResponseCal(BSTR param, long SourcePort);
```

### Interface
ICalibrator9

---

### Embed Method

**Description**
Embeds a fixture (usually a matching network) into an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the matching network included in the correction data.

When the new Cal Set is applied to a channel, the effects of the fixture are included in the measurement data. Do NOT enable fixturing. The effects of the matching network are included when the new Cal Set is selected and correction is turned ON.

**VB Syntax**
```vbnet
calMgr.Embed (cs1, cs2, s2p, port, compPwr, extrap)
```

**Variable (Type) - Description**
- **calMgr** *(object)* - A `CalManager` object
- **cs1** *(String)* - Name of an existing Cal Set which resides on the PNA.
- **cs2** *(String)* - Name of new Cal Set which contains updated error terms with fixture embedded.
- **s2p** *(String)* - Name of the S2P file which characterizes the adapter/fixture.
- **port** *(Long Integer)* - Port number from which fixture will be embedded.
- **compPwr** *(Boolean)*
  - **True** - Increase the source power to compensate for the loss through the fixture. The result is that the specified power level will be correct at the DUT input.
  - Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.
  - **False** - Do not compensate for loss in source power through the matching network.
- **extrap** *(Boolean)*
  - **True** - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.
  - **False** - Extrapolation is NOT performed (default setting).

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```vbnet
calMgr.Embed "MyCalSet", "MyNewCalSet", "Fixture.s2p", 1, True, True
```

**C++ Syntax**
```cpp
HRESULT Embed (BSTR srcSet, BSTR destSet, BSTR s2p, long port, BOOL compPwr, BOOL extrap);
```

**Interface**
ICalManager8

**EnumerateCalSets Method**

**Description**
Returns an array of Cal Set names being stored on the PNA.

**VB Syntax**
```vbnet
value = calMgr.EnumerateCalSets
```

**Variable (Type) - Description**
- `value` *(variant)* - Variable to store the returned Cal Set names
- `calMgr` *(object)* - A `CalManager` object

**Return Type**
VARIANT array

**Default**
Not Applicable

**Example**
```vbnet
Dim pnaSet
pna=CreateObject("AgilentPNA835x.Application")
Dim catalog
catalog=pna.getcalmanager.EnumerateCalSets
For i=lbound(catalog) to Ubound(catalog)
    wscript.echo catalog(i)
Next
```

**C++ Syntax**
```c++
HRESULT EnumerateCalSets(VARIANT* names);
```

**Interface**
ICalManager4
**EnumerateItems Method**

**Description**
Returns a list of all name-value pairs (items) in the Cal Set.

**See Also**
- [Item Property](#) (Learn about Name-Value pairs.)
- [RemoveItem Method](#)

**VB Syntax**
```vbnet
names = CalSet.EnumerateItems
```

**Variable** *(Type)* | Description
---|---
`names` | (Variant array) List of string names.
`CalSet` | *(object)* - A [CalSet](#) object

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
See example

**C++ Syntax**
```cpp
HRESULT EnumerateItems (VARIANT* itemNames);
```

**Interface**

27-Apr-2009    Added note
ExecuteShortcut Method

**Description**
Executes a Macro (shortcut) stored in the analyzer. Use `app.getShortcut` to list existing macros. Use `app.putShortcut` to associate the macro number with the file.

**VB Syntax**
```vbnet
app.ExecuteShortcut index
```

**Variable**
- **app** (Type) - An Application (object)
- **index** (long integer) - Number of the macro stored in the analyzer.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.ExecuteShortcut 1
```

**C++ Syntax**
```cpp
HRESULT ExecuteShortcut(long index)
```

**Interface**
IApplication
GenerateGlobalDeltaMatchSequence Method

Description
Initiates a global delta match calibration.

Learn more about Delta match calibration.
See example of a complete Delta Match calibration.

VB Syntax
`numSteps = guided.GenerateGlobalDeltaMatchSequence conn, cKit`

Variable
(Type) - Description

`numSteps` Long Integer - Variable to store the returned number of connection steps required by the Global Delta Match Cal.

`guided` GuidedCalibration (object)

`conn` String Connector Type for port 1.

`cKit` String Cal Kit for all ports.

Return Type
Not Applicable

Default
Not Applicable

Examples
`guided.GenerateGlobalDeltaMatchSequence "APC 3.5 female", "85052B"

C++ Syntax
`HRESULT GenerateGlobalDeltaMatchSequence(BSTR port_1_conn, BSTR cal_kit, long *num_steps);`

Interface
IGuidedCalibration2
GenerateErrorTerms Method

Description
Generates the error terms for the specified calibration type, stores the error terms in a Cal Set, saves the Cal Set, and returns the Cal Set GUID.

If ALL the data for the cal type has NOT been acquired an error message is returned.

Note: The manner in which the calibration is assigned to a Cal Set (Cal Register or User Cal Set) is determined by the setting of RemoteCalStoragePreference.

VB Syntax
value = obj.GenerateErrorTerms

Variable (Type) - Description
value (String) - Variable to store the returned GUID or error message.

obj Any of the following:
GuidedCalibration (object)
SMCType (object)
VMCType (object)

Return Type String
Default Not Applicable

Examples string = SMC.GenerateErrorTerms

C++ Syntax
HRESULT GenerateErrorTerms(BSTR* calsetGUID);

Interface IGuidedCalibration
SMCType
VMCType

Last Modified:
28-Jan-2009 Fixed C++ Syntax
**GenerateSteps Method**

**Description**
Returns the number of steps required to complete the calibration.

For an ECal User Characterization this generate steps for the ECal User Characterization process. The channel must already be calibrated using the same, or greater number of PNA ports as the ECal module. Also, the PNA ports must begin with Port 1 and use sequential port numbers.

After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete a User Characterization calibration.

**VB Syntax**

```vbnet
value = obj.GenerateSteps
```

**Variable (Type) - Description**

- `value` (long) - Variable to store the returned number of steps
- `obj` Any of the following:
  - `GuidedCalibration` (object)
  - `SMCType` (object)
  - `VMCType` (object)
  - `ECalUserCharacterizer` (object)

**Return Type**
Long

**Default**
Not Applicable

**Examples**

```vbnet
value = SMC.GenerateSteps
```

**C++ Syntax**

```cpp
HRESULT put_GenerateSteps(long* steps);
```

**Interface**

**Last Modified:**
4-Nov-2008 Added ECal object
**GetAllSegments Method**

**Description**
Downloads a segment table from the PNA.

**VB Syntax**

```vbnet
segdata = Segs.GetAllSegments
```

**Variable**

- **segs**
  A `Segments (Collection)`

- **segdata**
  (Variant) A 2-dimensional array of Segment data:
  - Dimension 0 is the number of elements in each segment.
  - Dimension 1 is the number of segments that will be used.

All elements in the returned array are Variant. The type inside each Variant will be as is listed below.

The returned array will contain values for all elements regardless of the settings of `IFBandwidthOption`, `SweepTimeOption`, `SourcePowerOption` and `CouplePorts` properties. Ignore the values for the properties that are set to false.

The following is a list of dimension 0 elements for each segment:

- 0 = Segment state (Boolean True or False)
- 1 = Number of Points in this segment (Integer)
- 2 = Start Freq (Double)
- 3 = Stop Freq (Double)
- 4 = IFBW (Double)
- 5 = Dwell Time (Double)
- 6 + N = Power (Double) where N is the number of source ports of the PNA. For example, with a 4-port, 1-source PNA, indices 6 through 9 correspond to the per-segment power levels for Ports 1 to 4. Use `SourcePortCount Property` and `SourcePortNames Property` to see the available source ports for the PNA.

**Return Type**
Variant, containing an array.

**Default**
Not Applicable

**Examples**
See a VB example using this command
C++ Syntax

HRESULT GetAllSegments (VARIANT *pSegments);

Interface

**GetCalKitTypeString Method**

**Description**
Returns ECal module model number and serial number based on the index number of the attached ECal modules.

**VB Syntax**

\[ ECalID = cal.GetCalKitTypeString (module) \]

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECalID (string)</td>
<td>variable to store the returned ECal module ID information.</td>
</tr>
<tr>
<td>cal (Calibrator (object))</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>module (long integer)</td>
<td>ECal module. Choose from modules 1 through 8 Use IsECALModuleFoundEx to determine the number of modules connected to the PNA</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Not Applicable

**Examples**

```
info = cal.GetCalKitTypeString(2)
```

Example return string:

"N4691-60003 ECal 01234"

**C++ Syntax**

```
HRESULT GetCalKitTypeString(long moduleNumber, BSTR* info);
```

**Interface**

### GetCompatibleCalKits Method

**Description**

**Note:** This command replaces `CompatibleCalKits Property`.

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the PNA, and all user characterizations stored in PNA disk memory.

For ECal modules, the returned list includes the serial numbers.

See the [ECalUserCharacterizer Object](#).

Use items in the list to select the kit to be used with the `CalKitType Property`.

**VB Syntax**

```
value = guidCal.GetCompatibleCalKits (connectorType)
```

**Variable (Type) - Description**

- **value** (Variant) - Variable to store the returned list of cal kits. One-dimensional array of string values.
- **guidCal** A [GuidedCalibration](#) (object)
- **connectorType** (String) Connector type for which compatible cal kits will be returned.

Use [ValidConnectorType](#) to return a list of connector type strings.

Use [ConnectorType](#) to set the connector type for each port to be calibrated.

**Return Type**

Variant – Containing one-dimensional array of strings.

**Default**

Not Applicable

**Examples**

```vbnet
Dim kits As Variant
kits = guidedCal.GetCompatibleCalKits "Type N (50) male"
```

**C++ Syntax**

```
HRESULT GetCompatibleCalKits(BSTR connector, VARIANT* Kits);
```

**Interface**

This method returns the [AuxIO](#) interface.

**VB Syntax**  
`app.GetAuxIO`

**Variable**  
**Type** - Description  
- `app`  
  An [Application](#) (object)

**Return Type**  
IHWAuxIO

**Default**  
Not Applicable

**Example**  
```vbnet  
Dim app As AgilentPNA835x.Application  
Dim aux As IHWAuxIO  
Set aux = app.GetAuxIO  
```

**C++ Syntax**  
`HRESULT GetAuxIO (IHWAuxIO **pAux);`

**Interface**  
IApplication
Write-only

About Modifying Cal Kits

GetCalStandard Method

**Description**

Returns a handle to a calibration standard for modifying its definitions. To select a standard for performing a calibration (use Calibrator.AquireCalStandard).

**VB Syntax**

calKit.GetCalStandard(index)

**Variable**

*(Type)* - Description

- **calKit**
  A calKit *(object)*

- **index** 
  *(long)* - Number of calibration standard. Choose 1 to 30; (there are 30 cal standards in every kit).

**Return Type**

calStandard

**Default**

Not Applicable

**Examples**

Dim short As CalStandard
Set short = calKit.getCalStandard(1)
short.label = "myShort"

**C++ Syntax**

HRESULT GetCalStandard(long standardNumber, ICalStandard **pCalStd)

**Interface**

ICalKit
GetCalManager Method

Description
This method returns the ICalManager interface.

VB Syntax
app.GetCalManager()

Variable (Type) - Description

app An Application (object)

Return Type
ICalManager*

Default
Not Applicable

Example
dim app as AgilentPNA835x.Application
dim mgr as CalManager
set mgr = app.GetCalManager()

C++ Syntax
HRESULT GetCalManager( ICalManager **mgr);

Interface
IApplication

Last Modified:
30-Jan-2008 Added parenthesis
**Get CalSetByGUID Method**

**Description**
Requests a Cal Set by GUID. Returns an ICal Set interface.

**VB Syntax**
```vbnet
calMgr.GetCalSetByGUID (GUID)
```

**Variable**
- **(Type)** - **Description**
  - `calMgr` (object) - A CalManager object
  - `GUID` (string) - GUID of the Cal Set being requested.

**Return Type**
Interface object

**Default**
Not Applicable

**Example**
```vbnet
calMgr.GetCalSetByGUID (2B893E7A-971A-11d5-8D6C-00108334AE96)
```

**C++ Syntax**
```cpp
HRESULT GetCalSetByGUID( BSTR* strGUID, ICalSet* pCalSet);
```

**Interface**
ICalManager
GetCalSetCatalog Method - Superseded

Description
This method is replaced with EnumerateCalSets.

Returns a string containing a list of comma-separated GUIDs in the following format:
{FD6F863E-9719-11d5-8D6C-00108334AE96},
{1B03B2CE-971A-11d5-8D6C-00108334AE96},
{2B893E7A-971A-11d5-8D6C-00108334AE96}

Example
value = calMgr.GetCalSetCatalog

C++ Syntax
HRESULT GetCalSetCatalog(BSTR);

Interface
ICalManager

Last Modified:
6-Mar-2008    Superseded
GetCalSetUsageInfo Method

**Description**
Returns a string identifying the Cal Set currently in use by the specified channel. This method identifies the Cal Set being used by returning its GUID. This method also identifies the "Error Term set" within the Cal Set.

Error term sets are identified by integers, with set 0 belonging to the original (non-interpolated) terms. As stimulus values for a channel are changed causing interpolation to be required, a new Error Term set is constructed within the Cal Set to hold the interpolated Error Terms. The sets are sequentially numbered 1, 2, 3, and so forth. These Error Term sets are destroyed when they are no longer being used.

If there is no Cal Set in use for the given channel, the <GUID> argument is set to the empty string.

**VB Syntax**
```
calMgr.GetCalSetUsageInfo chan, GUID, setNumber
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calMgr</td>
<td>(object) - A CalManager object</td>
</tr>
<tr>
<td>chan</td>
<td>(long) - channel of the Cal Set being requested</td>
</tr>
<tr>
<td>GUID</td>
<td>(string) - variable to store the GUID of the Cal Set being requested. If there is no Cal Set in use for the given channel, the &lt;GUID&gt; argument is set to the empty string.</td>
</tr>
<tr>
<td>setNumber</td>
<td>(long) - variable to store the error term ID being requested. If the returned argument is greater than 0, the set is being interpolated.</td>
</tr>
</tbody>
</table>

**Return Type**
String, Long Integer

**Default**
Not Applicable

**Example**
```
calMgr.GetCalSetUsageInfo 1, GUID, EtermID
```

**C++ Syntax**
```
HRESULT GetCalSetUsageInfo (long lChannel, BSTR* CalSetGUID, long* etermSetID);
```

**Interface**
ICalManager

GetCalTypes Method

**Description**
Returns a list of available calibration types known to the PNA. The Standard CalTypes are the same on all PNA's, but the Custom CalTypes are not necessarily the same. They are dependent on the custom measurement in the PNA. Learn more about applying Cal Types.

See also CalibrationTypeID to apply a Cal Type containing in a Cal Set.

**VB Syntax**

```vbnet
v = mgr.GetCalTypes
```

**Variable**

- **mgr**  
  A CalManager (Object)

- **v**  
  Name/GuidPair that contains the calibration type name and associated GUID for each cal type known to the PNA.

**Return Type**

(variant) Two dimensional array.

**Examples**

```vbnet
v = CalManager.GetCalTypes
```

**C++ Syntax**

HRESULT GetCalTypes( VARIANT * NameGuidPair )

**Interface**

ICalManager2
GetComplex Method

Description
Retrieves complex data from the specified location. See also getNAComplex, getData, and getPairedData Methods.

VB Syntax
measData.getComplex location, numPts, real(), imag()

Variable (Type) - Description

measData
An IArrayTransfer interface which supports the Measurement object

location (enum NADataStore - IArrayTransfer) - Where the data you want is residing. Choose from:
0 - naRawData
1 - naCorrectedData
2 - naMeasResult
3 - naRawMemory
4 - naMemoryResult
5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

numPts (long integer) - Number of data points requested
[out] - specifies number of data elements returned
[in] - specifies the data being requested or the capacity of the arrays

real (single) - Array to store the real values

imag (single) - Array to store the imaginary values

Return Type
Single

Default
Not Applicable

Examples
Dim real(201) AS Single
Dim imag(201) AS Single
Dim pts as Integer
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.getComplex naCorrectedData, pts, real(0), imag(0)

C++ Syntax
IArrayTransfer - HRESULT getComplex(tagNADataStore DataStore, long* pNumValues, float* pReal, float* pImag)

Interface IArrayTransfer
GetConverter Method

**Description**  
This method returns a handle to a Converter object.

**VB Syntax**  
`chan.GetConverter()`

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>chan</code></td>
<td>A Channel (object)</td>
</tr>
</tbody>
</table>

**Return Type**  
IConverter

**Default**  
Not Applicable

**Example**

```vba
Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")
Dim chan As IChannel
Set chan = app.ActiveChannel
Dim convert
Set convert = chan.GetConverter()
```

**C++ Syntax**  
`HRESULT GetConverter(IConverter **obj);`

**Interface**  
IChannel

Last Modified:

2-Feb-2009  New topic
GetDataByString Method

**Description**
Retrieves variant data from the specified location in your choice of formats.

The PNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

**Equation Editor Notes:**

- When equation editor is active on a trace in a standard S-parameter channel, GetData returns the data from the parameter on the trace that was measured last. For example, for the equation “S22 + S33 + S11”, then S33 is the last measured parameter because it uses source port 3.

- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.

- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

**VB Syntax**
```
data = meas.getDataByString location, format
```

**Variable**
- **data** *(variant)* - Array to store the data.
- **meas** *(object)* - A Measurement object
- **location** *(string)* – Name of the buffer to be read. Choose from:
  - "naRawData"
  - "naCorrectedData"
  - "naMeasResult"
  - "naRawMemory"
  - "naMemoryResult"
  - "naDivisor" - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

See Data Access Map

- **format** *(enum NADATAFormat)* - Format in which you would like the data. It does not have to be the displayed format. Choose from:
  - 0 - NADATAFormat_LinMag
  - 1 - NADATAFormat_LogMag
  - 2 - NADATAFormat_Phase
3 - naDataFormat_Polar
4 - naDataFormat_Smith
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array \( \text{varData} \) (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension \( \text{varData} \) (numpts).

<table>

19-Jul-2007 Corrected example
GetData Method

**Description**
Retrieves variant data from the specified location in your choice of formats. To get smoothed data from any of the specified locations, the format must be the same as the displayed format.

The PNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

This method returns a variant which is less efficient than methods available on the `IArrayTransfer` interface.

If you plan to put this data back into analyzer, `putDataComplex` (variant data) method requires complex, two-dimensional data. Therefore, request the data in Polar format.

**Equation Editor Notes:**
- When equation editor is active on a trace in a standard S-parameter channel, `GetData` returns the data from the parameter on the trace that was measured last. For example, for the equation “S22 + S33 + S11”, then S33 is the last measured parameter because it uses source port 3.
- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.
- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

**VB Syntax**

```vbnet
data = meas.GetData location, format
```

**Variable (Type) - Description**

- **data** Variant array to store the data.
- **meas** A Measurement (object)
- **location** (enum NADataStore) - Where the data you want is residing. See Data Access Map. Choose from:
  - 0 - naRawData
  - 1 - naCorrectedData
  - 2 - naMeasResult
  - 3 - naRawMemory
  - 4 - naMemoryResult
  - 5 - naDivisor  When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using `DataToDivisor` Method.
format  (enum NADDataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar*
4 - naDataFormat_Smith*
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array varData (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension varData(numpts).

naDataFormat_Phase and naDataFormat_PhaseUnwrapped returns degrees. However, putDataScalar method accepts data in radians (not degrees) and displays in degrees.

Return Type  Variant array - automatically dimensioned to the size of the data

Default  Not Applicable

Examples

```vba
Dim varData As Variant
varData = meas.GetData(naMeasResult, naDataFormat_Phase)
'Print Data
For i = 0 to chan.NumberOfPoints-1
    Print varData(i)
Next i
```

See a C# example.

C++ Syntax

```c++
HRESULT getData(tagNADDataStore DataStore, tagDataFormat DataFormat, VARIANT *pData)
```

Interface  IMeasurement

11-Jun-2009  Added EE notes
14-Apr-2009  Added link to C#
1-Oct-2007  Added temperature formats
**GetECALModuleInfoEx Method**

**Description**
This property replaces Get ECALModuleInfo Method. Returns the following information about the connected ECAL module: model number, serial number, connector type, calibration date, min and max frequency.

The characterization within the ECAL module that this information will be read from is specified by ECALCharacterizationEx. The default value is 0.

**VB Syntax**
```vb
moduleInfo = cal.GetECALModuleInfoEx(module)
```

**Variable (Type) - Description**
- `moduleInfo` (string) - variable to store the module information
- `cal` A Calibrator (object)
- `module` (long integer) - ECAL module.
  Choose from modules 1 through 8
  Use IsECALModuleFoundEx to determine the number of modules connected to the PNA

**Return Type** String

**Default** Not Applicable

**Examples**
```vb
ingo = cal.GetECALModuleInfoEx(2)
```

Example return string:
```
ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002
```

**C++ Syntax**
```cpp
HRESULT GetECALModuleInfoEx(long moduleNumber, BSTR* info);
```

**Interface** ICalibrator4
### GetEcalUserCharacterizer Method

**Description**  
This method returns a handle to an `ECalUserCharacterizer` object.

**VB Syntax**  
`calMgr.GetEcalUserCharacterizer()`

**Variable**  
**Type** - Description  
- `calMgr`  
  A `CalManager Object (object)`

**Return Type**  
`IEcalUserCharacterizer`

**Default**  
Not Applicable

**Example**  
```vbnet
Dim mgr as ICalManager
Set mgr = app.GetCalManager
Dim ecalCharacterizer
Set ecalCharacterizer = mgr.GetECalUserCharacterizer()
```

**C++ Syntax**  
```cpp
HRESULT GetEcalUserCharacterizer( IECalUserCharacterizer **obj);
```

**Interface**  
ICalManager6

GetENRData Method

**Description**  
Read the ENR calibration data from PNA memory.

**VB Syntax**  
`vData = enr.GetENRData()`

**Variable**  
(Type) - Description

- `vData`  
Variable to store the returned ENR data. Frequency value in Hz, followed by corresponding ENR value in dB.

- `enr`  
An ENRFile (object)

**Return Type**  
Variant Array

**Default**  
Not Applicable

**Examples**  
See example program

**C++ Syntax**  
`HRESULT GetENRData (VARIANT vdata);`

**Interface**  
IENRFile

Last Modified:

2-Aug-2007   MX New topic
GetErrorCorrection Method

Description
Reads the error correction state for the channel.
Use ErrorCorrection Property to set this value.
When this command returns true, some measurements on the channel MAY not have error correction ON. This is because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use Error Correction Property.

VB Syntax
chan.GetErrorCorrection (boolean)

Variable (Type) - Description
chan A Channel (object)
boolean (boolean) Variable to store the returned value.
False - Error correction has been set OFF
True - Error correction has been set ON

Return Type
Boolean

Default
About Error Correction

Examples
chan.GetErrorCorrection(value)

C++ Syntax
HRESULT GetErrorCorrection (VARIANT_BOOL *bState)

Interface
IChannel8
GetErrorTerm Method - Superseded

**Description**

*Note:* This command is replaced by **Get ErrorTermByString Method**

Retrieves error term data that is used for error correction. The data is complex pairs. Memory for the returned Variant is allocated by the server. The server returns a variant containing a two-dimensional safe Array.

This method returns a variant which is less efficient than `getErrorTermComplex` on the ICalData interface.

[Learn about reading and writing Calibration data.](#)

**VB Syntax**

```
data = cal.getErrorTerm term, rcv, src
```

<table>

**Return Type**  
Variant

**Default**  
Not Applicable

**Examples**  
Dim varError As Variant  
varError = cal.getErrorTerm(naErrorTerm_Tracking, 2, 1)

**C++ Syntax**  
HRESULT getErrorTerm(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, VARIANT* pData)

**Interface**  
ICalibrator
GetErrorTerm Method  Superseded

Description
This command has been replaced with Get ErrorTermByString.
Returns error term data from the Cal Set. The returned data is complex pairs.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax

data = calSet.getErrorTerm(setNumber, term, rcv, src)

Variable (Type) - Description

data (Variant) Two-dimensional safe array to store the returned data. Memory for the
returned Variant is allocated by the PNA and must be released by client.
Note: See also getErrorTermComplex on the ICalData2 interface to avoid using the
variant data type.

calSet A Cal Set (object)

setNumber (Long) There can be more than one set of error terms in a Cal Set.

- SetNumber 0 contains the original set of error terms for a Cal Set.
- SetNumbers > 0 contain Interpolated error terms. Interpolated error terms are
generated when interpolation is required and destroyed when no longer used.
Learn about Interpolation.
- To determine the SetNumber in use by a channel, see GetCalSetUsagInfo

term (enum As NaErrorTerm2). Choose from:
0 - naET_Directivity (rcv = src)
1 - naET_SourceMatch (rcv = src)
2 - naET_ReflectionTracking (rcv = src)
3 - naET_TransmissionTracking (rcv ≠ src)
4 - naET_LoadMatch (rcv ≠ src)
5 - naET_Isolation (rcv ≠ src)

rcv (Long) - Receiver Port

src (Long) - Source Port

Return Type Variant

Default Not Applicable

Examples
Dim varError As Variant
varError = CalSet.getErrorTerm(0, naET_TransmissionTracking, 2, 1)
C++ Syntax

HRESULT getErrorTerm(long setID, tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, VARIANT* pData)

Interface

ICalSet
### GetErrorTermByString Method

**Description**
Returns error term data from the Cal Set by specifying the string name of the error term.

- Learn more about [Reading and Writing Cal Data](#).
- See examples of [Reading](#) and [Writing](#) Cal Set Data.
- See [GetCalSetUsageInfo](#) to determine the setNumber.

### VB Syntax

```
pdata = calset.GetErrorTermByString(setNumber, errorTerm)
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pdata</code></td>
<td>Variant</td>
<td>Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.</td>
</tr>
<tr>
<td><code>calset</code></td>
<td>A Cal Set (object)</td>
<td></td>
</tr>
<tr>
<td><code>setNumber</code></td>
<td>(Long)</td>
<td>Set number of the required Cal Set data.</td>
</tr>
</tbody>
</table>

- SetNumber 0 contains the original "master" set of error terms for a Cal Set.
- SetNumbers > 0 refers to the PNA channel number that contains the error terms. When retrieving channel error terms, Correction must be ON.

New beginning PNA Rev 7.2: The channel error term data contains interpolation, fixturing, and port extension data if each is ON.

- For Balanced Measurements, interpolation, fixturing, and port extensions can be ON independently.
- For Standard S-parameters, to get port extension data, both fixturing and port extensions must be ON.

| `errorTerm` | (String) | The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see [GetErrorTermList2](#). |

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
[See an Example](#)
C++ Syntax  HRESULT GetErrorTermByString (long SetNumber, BSTR bufferName, VARIANT* pdata);

Interface  ICalSet2
GetErrorTermComplex Method  Superseded

Description
This command has been replaced by GetErrorTermComplexByString.
Retrieves error term data from the error correction buffer. The data is in complex pairs.
Learn more about reading and writing Cal Data using COM.
This method exists on a non-default interface. If you cannot access this method, use the GetErrorTerm Method on ICalibrator.

VB Syntax
```
eData.GetErrorTermComplex term, rcv, src, numPts, real(), imag()
```

Variable (Type) - Description
- **eData**
  An ICalData pointer to the Calibrator object
- **term** (enum NAEErrorTerm) - The error term to be retrieved. Choose from:
  - naErrorTerm_Directivity_Isolation
  - naErrorTerm_Match
  - naErrorTerm_Tracking
- **rcv** (long integer) - Receiver Port
- **src** (long integer) - Source Port
- **numPts** (long integer) - on input, max number of data points to return; on output: indicates the actual number of data points returned.
- **real()** (single) - array to accept the real part of the error-term. One-dimensional for the number of data points.
- **imag()** (single) - array to accept the imaginary part of the error-term. One-dimensional for the number of data points.
<table>
<thead>
<tr>

</tr>
<tr>
<td>Rev Trans Tracking</td>
<td>naErrorTerm_Tracking</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

**Return Type** Single

**Default** Not Applicable

**Examples**

```plaintext
ReDim rel(numpts)
ReDim img(numpts)
Dim eData As ICalData
Set eData = chan.Calibrator
eData.getErrorTermComplex naErrorTerm_Directivity_Isolation, 1, 1, 201, rel(0), img(0)
```

**C++ Syntax**

```c
HRESULT raw_getErrorTermComplex(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* plmag)
```

**Interface** ICalData
GetErrorTermComplex Method  Superseded

Description
This command is replaced with Get ErrorTermComplexByString.
Returns error term data from the Cal Set. The data is in complex pairs.

Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

Note: This method exists on a non-default interface. If you cannot access this method, use the GetErrorTerm Method on ICal Set.

VB Syntax
```
iCalData2.GetErrorTermComplex setNumber, term, rcv, src, numPts, real(), imag()
```

Variable (Type) - Description

*iCalData2* An *ICalData2* pointer to the Cal Set object

*setNumber* (Long) There can be more than one set of error terms in a Cal Set.

- setNumber 0 contains the original set of error terms for a Cal Set.
- setNumbers > 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation.
- To determine the setNumber in use by a channel, see GetCalSetUsageInfo

*term* (enum NAErrorTerm2) - The error term to be retrieved. Choose from:

- 0 - naET_Directivity
- 1 - naET_SourceMatch
- 2 - naET_ReflectionTracking
- 3 - naET_TransmissionTracking
- 4 - naET_LoadMatch
- 5 - naET_Isolation

*rcv* (Long) - Receiver Port

*src* (Long) - Source Port

*numPts* (Long) An In/Out parameter.

On the way in, you specify the max number of values being requested.
On the way out, the PNA returns number of values actually returned.

*real()* (single) - array to accept the real part of the error-term. One-dimensional for the number of data points.
imag() (single) - array to accept the imaginary part of the error-term. One-dimensional for the number of data points.

**Return Type** Single

**Default** Not Applicable

**Examples**

```vba
dim numpts as long
umpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim CalSet as CalSet
set CalSet = pna.GetCalManager.GetCalSetByGUID( txtGUID )
Dim eData As ICalData2
Set eData = CalSet
eData.getErrorTermComplex 0, naET_LoadMatch, 1, 2, numpts,
r(0),i(0)
```

**C++ Syntax**

```c++
HRESULT getErrorTermComplex(long setID, tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)
```

**Interface** ICalData2
GetErrorTermComplexByString Method

**Description**
Returns error term data from the Cal Set by specifying the string name.
Learn more about **Reading and Writing Cal Data**
See examples of **Reading** and **Writing** Cal Set Data

**Note:** This method exists on a non-default interface. If you cannot access this method, use **GetErrorTermByString**

**VB Syntax**

```vb
ICalData3.GetErrorTermComplexByString setNumber, errorTerm, numPoints, real(0), imag(0)
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICalData3</td>
<td>An ICalData3 pointer to a CalSet (Object)</td>
</tr>
<tr>
<td>setNumber</td>
<td>(Long) There can be more than one set of error terms in a Cal Set.</td>
</tr>
<tr>
<td></td>
<td>• setNumber 0 contains the original set of error terms for a Cal Set.</td>
</tr>
<tr>
<td></td>
<td>• setNumbers &gt; 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation.</td>
</tr>
<tr>
<td></td>
<td>• To determine the setNumber in use by a channel, see <strong>GetCalSetUsageInfo</strong></td>
</tr>
<tr>
<td>errorTerm</td>
<td>(String) The string name of error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be &quot;Directivity(3,3)&quot;. For a list error term string names, use <strong>Get ErrorTermList2</strong></td>
</tr>
<tr>
<td>numPoints</td>
<td>(Long) An In/Out parameter. On the way in, you specify the max number of values being requested. On the way out, the PNA returns number of values actually returned.</td>
</tr>
<tr>
<td>real</td>
<td>(Single) The real component of the complex data.</td>
</tr>
<tr>
<td>imag</td>
<td>(Single) The imaginary component of the complex data.</td>
</tr>
</tbody>
</table>

**Return Type**
Single

**Default**
Not Applicable

**Examples**
See example

**C++ Syntax**

```c++
HRESULT GetErrorTermComplexByString(long etermSetID, BSTR bufferName, long* inumPoints, single* real, single* imag);
```
Interface ICaIData3
**GetErrortermList Method Superseded**

**Description**

*Note:* This command is replaced by `CalSet.getErrorTermList2`.

Returns the list of Error Terms contained in this Cal Set for the CalType specified in the `OpenCal Set` method. Learn more about reading and writing Cal Data using COM.

The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses:

- `Term (n, n)`
- `Term (m, n)`

Before calling this method you must open the Cal Set with `OpenCal Set`. If the Cal set is not open, this method returns `E_NA_Cal Set_ACCESS_DENIED`.

Use `StringToNAErrorTerm2` to convert the list entries to values that can be used with `GetErrorTerm` and `PutErrorTerm`.

*Note:* The port path designation `(m n)` indicates the ports that contribute to the error being compensated. Directivity, source match and reflection tracking are single port characteristics, designated in this list by `(n n)` where `n` equals the port being characterized.

Other terms characterize the interaction between ports. For example, the load match term is describing the match at port `(m)` while looking into port `(n)`. Thus the notation `(m n)` indicates the two ports that contribute to the loadmatch error.

**VB Syntax**

```vb
CalSet.GetErrorTermList (SetID, count, strList)
```

**Variable**

<table>
<thead>
<tr>
<th><strong>(Type)</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CalSet</code></td>
<td>(object) - A Cal Set object</td>
</tr>
<tr>
<td><code>SetID</code></td>
<td>(long) - specifies the error term set to query. Use 0 for the master set.</td>
</tr>
<tr>
<td><code>count</code></td>
<td>(long) - the number of error terms in the returned list</td>
</tr>
<tr>
<td><code>strList</code></td>
<td>(string) - comma separated list of error terms found in Cal Set</td>
</tr>
</tbody>
</table>

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vb
Dim count As Integer
Dim list As String
OpenCalSet (naCalType_TwoPortSOLT 1, 2)
GetErrorTermList (0, count, list)
CloseCalSet ()
```

Assuming the cal set contained the full set of error terms for this two-port Cal, the returned list would be:

"Directivity(1 1), SourceMatch(1 1), ReflectionTracking(1 1), TransmissionTracking(2 1), LoadMatch(2 1), Isolation(2 1)"
C++ Syntax  HRESULT GetErrorTermList (long etermSetID, long* count, BSTR* strList);

Interface  ICalSet
## GetErrorTermList2 Method

**Description**
Returns a list of error terms names found in the Cal Set containing the specified prefix.

Learn more about [Reading and Writing Cal Data](#).

See examples of [Reading](#) and [Writing](#) Cal Set Data.

**VB Syntax**

```vbnet
list = CalSet.GetErrorTermList2(setNumber, calTypePrefix)
```

**Variable**

**list** *(Variant)* Variant containing a string array of error term names.

**CalSet** *(object)* - A [CalSet](#) object

**setNumber** *(Long)* There can be more than one set of error terms in a Cal Set.

- setNumber 0 contains the original set of error terms for a Cal Set.
- setNumbers > 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. [Learn about Interpolation](#).
- To determine the setNumber in use by a channel, see [GetCalSetUsageInfo](#)

**caltypePrefix** *(String)* The string used to identify Cal Set data as belonging to a specific Cal Type. This string is used as a filter so that only the error term names of interest are returned. If the prefix is empty, all terms are returned.

An example prefix for a two port cal on ports 2 and 3 might be: "Full 2 Port Cal (2,3)".

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
See an [Example](#)

**C++ Syntax**

```cpp
HRESULT GetErrorTermList2 (long SetNumber, BSTR caltypePrefix, VARIANT* list)
```

**Interface**
ICalSet2
### GetExtendedCalInterface Method

**Description**
Returns an interface that exposes the properties of Noise Calibration.

**VB Syntax**
```vbnet
Cal2.GetExtendedCalInterface (interface)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Cal2</code></td>
<td>An ICalibrate2 (object)</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>(object) Returns a handle to the specified interface. Choose from ' &quot;NoiseCal&quot;</td>
</tr>
</tbody>
</table>

**Return Type**

**Default**

**Example**
```vbnet
dim noiseCal
dim noiseCalExtensions
set noiseCal= Get Calmanager?.CreateCustomCalEx("NoiseCal")
set noiseCalExtensions = noiseCal.GetExtendedCalInterface("INoiseCal")
```

**C++ Syntax**
```c
HRESULT GetExtendedCalInterface();
```

**Interface**
ICalibrate2

# Get ExternalTestSetIO Method

**Description**  This method returns the `IExternalTestSetIO` interface.

**VB Syntax**  `app.GetExternalTestSetIO`

**Variable**  
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

**Return Type**  `IHWExternalTestSetIO`

**Default**  Not Applicable

**Example**  
```vbnet
dim app as AgilentPNA835x.Application
dim ets as HWExternalTestSetIO
set ets = app.GetExternalTestSetIO
```

**C++ Syntax**  
```cpp
HRESULT GetExternalTestSetIO (IHWExternalTestSetIO **ptestset);
```

**Interface**  `IApplication`
GetFilterStatistics Method

Description
Returns all four Filter Statistics resulting from a SearchFilterBandwidth.
To retrieve individual filter statistics, use meas.FilterCF, meas.FilterBW,
meas.FilterLoss, meas.FilterQ properties.

VB Syntax
meas.GetFilterStatistics cf,bw,loss,q

Variable
 meas (Type) - Description
   meas A Measurement (object)
   cf,bw,loss,q Dimensioned variables to store the returned values

Return Type
(double) cf
(singe) bw,loss,q

Default
Not Applicable

Examples
'Dimension variables
Dim cf as Double
Dim bw as Single
Dim loss as Single
Dim q as Single
meas.GetFilterStatistics cf,bw,loss,q

C++ Syntax
HRESULT GetFilterStatistics(double* centerFreq, float* bw, float* loss, float* quality)

Interface
IMeasurement
Read-only

GetGuid Method

| Description | Returns a string containing the GUID identifying this Cal Set. Each Cal Set is assigned a GUID (global unique ID). GUIDs are used to retrieve and select Cal Sets on the PNA. Learn more about reading and writing Cal Data using COM. |

**VB Syntax**

\[ value = CalSet.GetGuid \]

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(string) - Variable to store the returned GUID</td>
</tr>
<tr>
<td>CalSet</td>
<td>(object) - A Cal Set object</td>
</tr>
</tbody>
</table>

**Return**

| Type | String |

**Default**

| Not Applicable |

**Examples**

\[ guid = CalSet.GetGuid 'Read \]

**C++ Syntax**

`HRESULT GetGUID( BSTR* pGUIDString);`

**Interface**

ICalSet
## InputVoltageEX Property

<table>
<thead>
<tr>
<th>Description</th>
<th>This command replaces the <code>get InputVoltage Method</code>. Reads the ADC voltage from the specified location.</th>

</tr>
<tr>
<td><strong>AuxIO</strong></td>
<td>(object) - A Hardware Auxiliary Input / Output object</td>
</tr>
<tr>
<td><strong>loc</strong></td>
<td>(Long) Location from which to read data.</td>
</tr>
</tbody>
</table>

- **For PNA-X models**; reads ADC voltages from the Power I/O connector. Choose from:
  1. Reads voltage on Analog In 1 port (pin 7).
  2. Reads voltage on Analog In 2 port (pin 8).
  3. Reads voltage on GndSens (pin 6).
  4. Reads voltage on Analog Out 1 port (pin 3).
  5. Reads voltage on Analog Out 2 port (pin 4).

- **For all other PNA models**:
  1. Reads voltage on the Analog IN (pin 14) of the AUX IO connector.
  4. Reads voltage on Analog Out 1 port (pin 3).
  5. Reads voltage on Analog Out 2 port (pin 2).

| **Return Type** | Double |
| **Default** | Not Applicable |

### Examples

```vbnet
Dim aux as HWAuxIO
Set aux = PNA.getAuxIO
volts = aux.InputVoltageEX 1
'for PNA-X, read voltage on PowerI/O pin 7
'for all other models, reads voltage on Aux I/O Analog In (pin 14)
```

### C++ Syntax

```c++
HRESULT get_InputVoltageEX (long muxLoc, double* vtVoltage);
```

### Interface

HWAuxIO2

### get_Input1 Method

**Description**
Reads a hardware latch that captures high to low transitions on Input1 of the Material Handler IO. Reading the latch causes it to reset and is ready for the next transition. The hardware latch is only capable of capturing one transition per query. Additional transitions are ignored until after the next query.

Momentarily driving Input1 high, then low, causes a transition to be detected and latched.

**VB Syntax**

```vbnet
inp1 = handlerIo.get_Input1
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inp1</code> (variant)</td>
<td>A variable to store the return value</td>
</tr>
<tr>
<td><code>handlerIo</code> (object)</td>
<td>A HandlerIO object</td>
</tr>
</tbody>
</table>

**Return Type**

Variant -

- `0` - a high to low transition occurred at Input1 since the last time it was queried.
- `1` - no high to low transition occurred.

**Default**
Not Applicable

**Examples**

```vbnet
input1 = handlerIo.get_Input1  'Read
```

**C++ Syntax**

```cpp
HRESULT get_Input1 (VARIANT* Data);
```

**Interface**

IHWMaterialHandlerIO
**GetIPConfigurationStruct Method**

**Description**
Returns an NA_IPConfiguration data structure which contains information about the current status of the PNA’s computer networking configuration. This is the same set of information that is returned in a single string by the **LANConfiguration** property.

**VB Syntax**

```
value = app.GetIPConfigurationStruct
```

**Variable**

- **(Type) - Description**
  - **value (NA_IPConfiguration)** Variable to receive the PNA IP (LAN) configuration information.
  - **app** An Application (object)

**Return Type**
NA_IPConfiguration

**Default**
Not Applicable

**Examples**

```vbnet
Dim networkConfigInfo As NA_IPConfiguration
networkConfigInfo = app.GetIPConfigurationStruct()

MsgBox “Host name = “ & networkConfigInfo.HostName
MsgBox “Domain name = “ & networkConfigInfo.DomainName
MsgBox “IP address = “ & networkConfigInfo.IPAddress

If Not networkConfigInfo.DHCPEnabled Then
    MsgBox “IP address is static”
Else
    MsgBox “IP address is dynamic”
End If

MsgBox “Subnet mask = “ & networkConfigInfo.SubNet
MsgBox “Gateway = “ & networkConfigInfo.DefaultGateway
MsgBox “Primary DNS server = “ & networkConfigInfo.DNSServer1
MsgBox “Secondary DNS server = “ & networkConfigInfo.DNSServer2
MsgBox “First suffix in DNS suffix search order = “ & networkConfigInfo.DNSSuffix1
MsgBox “Second suffix in DNS suffix search order = “ & networkConfigInfo.DNSSuffix2
MsgBox “Primary WINS server = “ & networkConfigInfo.PrimaryWINSServer
```
<table>
<thead>
<tr>
<th>C++ Syntax</th>
<th>HRESULT GetIPConfigurationStruct (tagNA_IPConfiguration * pIPConfig);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>IApplication14</td>

GetIsolationPaths Method

Description
Gets the list of paths (port pairings) for which isolation standards will be measured during calibration.

VB Syntax
value = obj.GetIsolationPaths

Variable
(Type) - Description
value (Variant) - Variable to store the returned port paths in pairs. One-dimensional array of Long Integers.

obj Any of the following:
GuidedCalibration (object)

Return Type
Variant – Containing one-dimensional array of Long Integers.

Default
No port pairs (empty Variant variable)

Examples
pathList = guidedCal.GetIsolationPaths
'displaying the paths separated by commas, with a dash (-) between the pair of port numbers comprising each path

For i = LBound(portList) To UBound(portList) Step 2
    msg = msg + CStr(portList(i)) + "-" + CStr(portList(i+1))
If i+1 < UBound(portList) Then msg = msg + ","
Next
MsgBox msg, 0, "List of isolation paths"

C++ Syntax
HRESULT GetIsolationPaths(VARIANT* pathList);

Interface
IGuidedCalibration

GetLibraryFunctions Method

Description
Returns the functions in an imported (loaded) DLL.

VB Syntax
functions = equation.GetLibraryFunctions location

Variable (Type) - Description
functions (variant) - Array to store the returned functions.

equation A MeasurementEquation object

location (string) – Full path and filename of the *.dll to be read.

Return Type
Variant array

Default
Not Applicable

Examples
functions=equation.GetLibraryFunctions "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"

C++ Syntax
HRESULT GetLibraryFunctions( BSTR filename, BSTR* functionList);

Interface
IMeasurementEquation2
Get MaterialHandlerIO Method

**Description**
This method returns the MaterialHandlerIO interface.

**VB Syntax**
```vbnet
app.GetMaterialHandlerIO
```

**Variable**
- **app** *(Type)*
  - **Description**
  - An Application *(object)*

**Return Type**
IHWMaterialHandlerIO

**Default**
Not Applicable

**Example**
```vbnet
Dim app As AgilentPNA835x.Application
Dim hand As IHWMaterialHandlerIO
Set hand = app.GetMaterialHandlerIO
```

**C++ Syntax**
```cpp
HRESULT GetMaterialHandlerIO (IHWMaterialHandlerIO **phand);
```

**Interface**
IApplication
GetNAComplex Method

**Description**  
Retrieves complex data from the specified location.  
See also `getComplex` and `getData` Method.

**VB Syntax**  
`measData.getNAComplex location, numPts, data`

**Variable**  
**Type** - Description  

- **measData**  
  An IArrayTransfer interface which supports the Measurement object

- **location**  
  (enum NADataStore) - Where the data you want is residing. Choose from:
  0 - naRawData
  1 - naCorrectedData
  2 - naMeasResult
  3 - naRawMemory
  4 - naMemoryResult
  5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using `DataToDivisor Method`.

- **numPts**  
  (long integer) - Number of data points requested
  [out] - specifies number of data elements returned
  [in] - specifies the data being requested or the capacity of the `dComplex` array

- **data**  
  (NAComplex) - A one-dimensional array of NaComplex to store the data.

**Return Type**  
NAComplex

**Default**  
Not Applicable

**Examples**  
```vbnet
Dim dComplex(201) As NaComplex
Dim measData As IArrayTransfer
Dim pts as Long
Set measData = app.ActiveMeasurement
measData.getNAComplex naCorrectedData, pts, dComplex(0)
```

**Notes**  
The data is stored as Real and Imaginary (Re and Im) members of the NaComplex user defined type. You can access each number individually by iterating through the array.

```vbnet
For i = 0 to NumPts-1
    dReal (i) = dcomplex (i).Re
    dImag (i) = dcomplex (i).Im
Next i
```

**C++ Syntax**  
```c
HRESULT getNAComplex(tagNADataStore DataStore, long* pNumValues, TsComplex* pComplex)
```
**Interface**  IArrayTransfer
### GetNumberOfGroups Method

**Description**
Returns the number of groups a channel has yet to acquire. To set the number of groups for a channel, use **Number Of Groups Method**.

**VB Syntax**

```
value = chan.GetNumberOfGroups
```

**Variable**

- **value** *(Type)*: Long Integer
  - Description: Number of groups

- **chan** *(Type)*: Channel
  - Description: (object)

**Return Type**

- **(Type)**: Long Integer

**Default**
Not Applicable

**Examples**

```vbnet
groups = chan.GetNumberOfGroups 'Read
```

**C++ Syntax**

```c++
HRESULT GetNumberOfGroups(long* numberOfGroups);
```

**Interface**

IChannel3
get_Output Method

Description
Type 1 and Type2 configurations: Returns the last value written to the selected output pin.
Type3 configuration: Returns the current state of the selected output pin. If an Input1 trigger occurs, the state may not be the same value as was written.

All configurations: Data is written using put_Output Method.

VB Syntax

```vbnet
data = handlerIo.get_Output (pin)
```

Variable

<table>

### get_OutputVoltage Method

**Description**  
E836x and PNA-L: Reads voltages on the DAC/Analog Output 1|2 of the Auxiliary IO connector.  
PNA-X: Reads voltage on the Power I/O connector AnalogOut1|2.

**VB Syntax**  
```
volts = AuxIO.get_OutputVoltage (output)
```

**Variable (Type) - Description**

- **volts** *(double)* - variable to store the return value
- **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
- **output** *(variant)* Number of the output DAC from which to read voltage. Choose from:
  1. Output 1 (Aux I/O pin 3) and (Power I/O pin 3)
  2. Output 2 (Aux I/O pin 2) and (Power I/O pin 4)

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**
```
Dim aux as HWAuxIO  
Set aux = PNA.getAuxIO  
volts = aux.get_OutputVoltage(1)  
' read voltage from Analog Out 1 (Aux I/O pin3) or (Power I/O pin3)
```

**C++ Syntax**  
```
HRESULT get_OutputVoltage( VARIANT Output, double* Voltage );
```

**Interface**  
IHWAuxIO

**Last Modified:**  
10-Jul-2007  
Added PNA-X capability
Read-only
get OutputVoltageMode Method

Description
This command returns the mode of the selected "Analog Out" line on the Auxiliary IO connector and Power I/O connector. The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done. To set the mode, use put_OutputVoltageMode Method.

VB Syntax
\[
\text{mode} = \text{auxlo.get\_OutputVoltageMode(output)}
\]

Variable (Type) - Description

- \text{mode} (enum NAOutputVoltageMode) - variable to store the returned mode.
  - naWaitEOS - While in this mode any voltage changes sent to the selected analog out will only get applied to the output between sweeps.
  - naNoWait - While in this mode any voltage changes sent to the selected analog out will occur right away without waiting until the end of a sweep, the voltage gets applied immediately.

- auxlo (object) - A Hardware Auxiliary Input / Output object

- output (double) Analog Output. Choose from 1 or 2

Return Type
enum as NAOutputVoltageMode

Default
naWaitEOS

Examples
\[
vOutMode = \text{auxIo.get\_OutputVoltageMode (1)}
\]

C++ Syntax
\[
\text{HRESULT get\_OutputVoltageMode(VARIANT Output, tagNAOutputVoltageMode* pMode)};
\]

Interface
IHWAuxIO

Last Modified:
10-Jul-2007 Added PNA-X capability
GetPairedData Method

**Description**
Retrieves pairs of data from the specified location.

**Note:** This method exists on a non-default interface. If you cannot access this method, use the **Get Data** Method on IMeasurement.

**VB Syntax**
`measData.getPairedData location, format, numPts, d1, d2`

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>measData</code></td>
<td>An IArrayTransfer interface which supports the Measurement object</td>
<td></td>
</tr>
<tr>
<td><code>location</code></td>
<td>(enum NADataStore)</td>
<td>Where the data you want is residing. <td>(single)</td>
<td>Array to store the magnitude / real values</td>
</tr>
<tr>
<td><code>d2</code></td>
<td>(single)</td>
<td>Array to store the phase / imaginary values</td>
</tr>
</tbody>
</table>

**Return Type**
Two Single arrays

**Default**
Not Applicable

**Examples**
```vbnet
Dim logm() As Single
Dim phase() As Single
Public measData As IArrayTransfer
```
Set measData = app.ActiveMeasurement
Dim numpts As Long
numPoints = app.ActiveChannel.NumberOfPoints
ReDim logm(numPoints)
ReDim phase(numPoints)

measData.getPairedData naCorrectedData, naLogMagPhase,
numPoints, logm(0), phase(0)

Print values(0), values(1)

C++ Syntax
HRESULT getPairedData(tagNADataStore DataStore, tagNAPairedDataFormat PairFormat, long* pNumValues, float* pReal, float* pImag)

Interface IArrayTransfer
get_Port Method

Description
Returns the value from the specified "readable" port.

VB Syntax
\[ \text{data} = \text{handlerIo}.\text{get}_\text{Port}(\text{port}) \]

Variable (Type) - Description

\( \text{data} \) (variant) - A variable to store the return value. The following table shows what the returned data represents:

<table>
<thead>
<tr>
<th>Port</th>
<th>MSB............</th>
<th>LSB............</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>C3...C0</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>D3...D0</td>
<td></td>
</tr>
<tr>
<td>E</td>
<td>D3...D0 + C3...C0</td>
<td></td>
</tr>
</tbody>
</table>

\( \text{handlerIo} \) (object) - A HandlerIO object

\( \text{port} \) (enum as NAMatHandlerPort) - port to get data from. Choose from:
- \( \text{naPortC} \) - (2)
- \( \text{naPortD} \) - (3)
- \( \text{naPortE} \) - (4)

Note: Reading data from the Write-only ports (A,B,F,G,H) will return an error. Ports C and D must be put in Read mode before reading from C, D, or E using PortMode Property.

Return Type Variant

Default 0

Examples
\[ \text{data} = \text{handlerIo}.\text{get}_\text{Port}(\text{naPortC}) \]

C++ Syntax
\[ \text{HRESULT get}_\text{Port}(\text{tagNAMatHandlerPort Port, VARIANT* Data}); \]

Interface IHWMaterialHandlerIO
### Description
Reads a 4-bit value from Port C of the Aux I/O connector (pins 22-25) and the Material Handler IO (pins 21-24 Anritsu) - (pins 22-25 Avantest).

**Note:** These lines are connected to both the Handler IO and Aux IO in the PNA.

### VB Syntax

```vbnet
value = AuxIO.get_PortCData
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(variant)</td>
<td>Variable to store the returned data</td>
</tr>
<tr>
<td>AuxIO</td>
<td>(object)</td>
<td>A Hardware Auxiliary Input / Output object</td>
</tr>
</tbody>
</table>

### Return Type
Integer

### Default
None

### Examples

```vbnet
value = auxIo.get_PortCData 'Reading a value of 15 when in Positive Logic indicates Port C lines C0, C1, C2, C3 are High. If in Negative Logic they are Low.
```

### C++ Syntax

```c++
HRESULT get_PortData( VARIANT* Data );
```

### Interface
IHWAuxIO
GetPortNumber Method

**Description**
Returns the port number that is associated with the specified port name. These numbers are used with several commands to specify a PNA port.

To learn more, see [Remotely Specifying a Source Port](#).

**VB Syntax**
```
value = object.GetPortNumber(portName)
```

**Variable (Type) - Description**
- **value** *(Long)* - Variable to store the returned Port Number integer value.
- **object** *(Channel object)* - always more complete than capabilities object.
- A **Capabilities (object)** - use when a channel is not available.

- **portName** *(String)* - Name of the PNA port.
  - Use [SourcePortNames Property](#) to return a list of PNA port (string) names.
  - If an external source is selected, specify the external source name that is used in the [Select an External Source dialog](#).

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
value = chan.GetPortNumber("Src2 Out1")  'Read
```

**C++ Syntax**
```
HRESULT GetPortNumber(BSTR name, long *number);
```

**Interface**
IChanne13
ICapabilities4

---

**Last Modified:**
- 12-Oct-2009 Added parens
- 23-May-2008 Added channel object
- 24-Apr-2008 Fixed example
- 30-Apr-2007 Edited for Ext Source Control
GetRaw2DData Method

**Description**
Returns raw data at all frequency and power data points for any GCA sweep. Previously 2D sweep only.

- When using SMART sweep, ALL data is returned including ALL background iteration sweeps.
- When using 2D sweeps, ALL data is returned.

Use the standard "get data" commands to return just the displayed data results (not the background sweeps).

A compression parameter must be present. Learn more.

**VB Syntax**
```vbnet
data = gca.GetRaw2DData location, format, param
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Variant array in which to store returned measurement data.</td>
</tr>
<tr>
<td>gca</td>
<td>A GainCompression (object)</td>

<td>0 - naRawData</td>
</tr>
<tr>
<td></td>
<td>1 - naCorrectedData</td>
</tr>
<tr>
<td>format</td>
<td>(enum NADataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naDataFormat_LinMag</td>
</tr>
<tr>
<td></td>
<td>1 - naDataFormat_LogMag</td>
</tr>
<tr>
<td></td>
<td>2 - naDataFormat_Phase</td>
</tr>
<tr>
<td></td>
<td>3 - naDataFormat_Polar*</td>
</tr>
<tr>
<td></td>
<td>4 - naDataFormat_Smith*</td>
</tr>
<tr>
<td></td>
<td>5 - naDataFormat_Delay -- <strong>Not valid for this command.</strong></td>
</tr>
<tr>
<td></td>
<td>6 - naDataFormat_Real</td>
</tr>
<tr>
<td></td>
<td>7 - naDataFormat_Imaginary</td>
</tr>
<tr>
<td></td>
<td>8 - naDataFormat_SWR</td>
</tr>
<tr>
<td></td>
<td>9 - naDataFormat_PhaseUnwrapped</td>
</tr>
<tr>
<td></td>
<td>10 - naDataFormat_InverseSmith</td>
</tr>
</tbody>
</table>

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-
dimensional array varData (numpts, 2) to accommodate both real and imaginary data. All scalar formats return a single dimension varData(numpts).

naDataFormat_Phase and naDataFormat_PhaseUnwrapped returns degrees.

**param** (String) Parameter of data to return. Not case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.

Choose from:

- "pin"  - (CompIn21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain"  - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch"  - (CompS11) Input match at the compression point.
- "DeltaGain"  - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Return Type** Variant Array

**Default** Not Applicable

**Examples**

data = gca.GetRaw2DData naRawData, naDataFormat_Real, "pin"

**C++ Syntax**

HRESULT GetRaw2DData(tagNADataStore location, tagNADataFormat format, BSTR data_name, VARIANT* pData);

**Interface** IGainCompression

Last Modified:

- 13-May-2011  Added returns background sweeps

- 12-May-2008  Edited for any GCA sweep
- 22-Oct-2007  MX New topic
**GetDataIm Method**

**Description**

Reads the Imaginary part of the data acquired from any GCA sweep. Previously 2D sweep only.

**VB Syntax**

```vb
data = gca.GetDataIm stim, dPoint, param
```

**Variable (Type) - Description**

- **data** Variant array in which to store returned measurement data.
- **gca** A GainCompression (object)
- **stim** (NAGCAIndexSelect)
  - **naFrequencySelect** - for the specified frequency data point, returns all of the measured data for each power stimulus.
  - **naPowerSelect** - for the specified power data point, returns all of the measured data for each frequency stimulus.
- **dPoint** Data point (Frequency or Power) for which data is returned.
- **param** Parameter of data to return. Not case-sensitive. Choose from:
  - "pin" - input power at each data point.
  - "pout" - output power at each data point.
  - "gain" - device gain (S21) at each data point.
  - "inputmatch" - input match (S11) at each data point.
  - "DeltaGain" - Measured Gain (watts) / Ref Gain (watts). Learn more.
  - "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Return Type** Variant Array

**Default** Not Applicable

**Examples**

For the fifth frequency data point, returns ‘Power Output’ imaginary (phase) data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```vb
data = gca.GetDataIm naFrequencySelect, 5, "pout"
```

For the 30th stimulus power data point, returns ‘Power Output’ imaginary (phase) data from all frequency stimulus values. If there are 201 frequency sweep points, 201 values
are returned.

```c
data = gca.GetDataIm naPowerSelect, 30, "pout"
```

**C++ Syntax**

```c
HRESULT GetDataIm(tagNAGCAIndexSelect index_select, int index,BSTR data_name, VARIANT* pData);
```

**Interface**

IGainCompression

GetSourceByRole Method - Superseded

Description
This command is replaced by: chan.RoleDevice

Returns the name of a source that is assigned to the specified role.

VB Syntax
source = conv.GetSourceByRole (role)

Variable (Type) - Description

source (String) Source name, from Source Configuration dialog, that is assigned to the specified role.

conv A Converter Object

role (String) Role for which the source name will be returned. Use GetSourceRoles for a list of valid roles.

Return Type Not Applicable

Default Not Applicable

Examples
"LO" = conv.GetSourceByRole ("RF2")

C++ Syntax
HRESULT GetSourceByRole(BSTR roleID, BSTR deviceName);

Interface IConverter

Last Modified:
3-May-2011 superseded

GetSourceRoles Method - Superseded

Description
This command is replaced by: chan.DefinedRoles

Returns the defined role names ("RF2", "LO1").

VB Syntax
conv.GetSourceRoles (roles)

Variable (Type) - Description
conv  A Converter Object
roles  (Variant array) Variable to store returned list of valid roles.

Return Type  Variant
Default  Not Applicable

Examples
conv.GetSourceRoles (roles)

C++ Syntax
HRESULT GetSourceRoles(VARIANT* roles);

Interface  IConverter

GetRequiredEtermNames

Description

Returns an array of strings specifying the error terms required by the caltype's correction algorithm in order to correct the specified parameter.

This function interrogates a specific caltype (caltypeGUID) for the list of error terms it would need in order to correct the specified parameter. All the standard S Parameter calibration types embed port specifiers in the error term name. The specific port information is gleaned from the passed parameter. For example, to query the error term requirements specific to a two port cal on ports 1 and 3, issue this with a parameter of S13 or S31. The buffer names returned will be formatted in this way:

Full 1 Port SOLT(1,3):TransmissionTracking(3,1)

VB Syntax

EtermNames = GetRequiredEtermNames(CalTypeGUID As String, Parameter As String)

Variable (Type) - Description

caltypeGUID: [in] the GUID of the desired calibration type

parameter [in] string specifying the parameter to be corrected

EtermNames [out] array of strings containing the error term names.

Note: In C++ Allocated by server. Must be freed by caller using SysFreeString.

Return Type

Not Applicable

Default

Not Applicable

Examples

enames = GetRequiredEtermNames(ctGUID, Parm)

C++ Syntax

HRESULT GetRequiredEtermNames( BSTR caltypeGUID, BSTR parameter,  VARIANT* EtermNames )

GetScalar Method

**Description**
Retrieves scalar data (ONE number per data point) from the specified location.

*Note:* This method exists on a non-default interface. If you cannot access this method, use the Get Data Method on IMeasurement.

**VB Syntax**
```
measData.getScalar location, format, numPts, data
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>measData</strong></td>
<td>An IArrayTransfer interface which supports the Measurement object</td>
</tr>
</tbody>
</table>
| **location**          | (enum NADataStore) - Where the data you want is residing. Choose from:
                         | 0 - naRawData
                         | 1 - naCorrectedData
                         | 2 - naMeasResult

                         | 12 - naDataFormat_Fahrenheit
                         | 13 - naDataFormat_Centigrade
| **numPts**            |                                                |
| **data**              |                                                |

*Note:* Polar, Smith, and Inverse Smith are invalid formats for this command. See Get Complex Method.
Learn more about Data Format.

\( numPts \)  
**long integer** - Number of data points requested  
[out] - specifies number of data elements returned  
in] - specifies the data being requested or the capacity of the \( dScalar \) array

\( data \)  
**single** - Array to store the scalar data.

**Return Type** Single  
**Default** Not Applicable

**Examples**
Dim dScalar() As Single  
Dim measData As IArrayTransfer  
Set measData = app.ActiveMeasurement  
Dim numpts as Long  
numpts = app.ActiveChannel.NumberOfPoints  
ReDim dScalar(numPoints)

measData.getScalar naCorrectedData, naDataFormat_LogMag, numpts, dScalar(0)  
Print dScalar(0), dScalar(1)

**C++ Syntax**
HRESULT getScalar(tagNADataStore DataStore, tagNADataFormat DataFormat, long* pNumValues, float* pVals)

**Interface** IArrayTransfer

Added temperature formats
**GetShortcut Method**

**Description**
Returns the Title, Path, and optional argument strings, of the specified Macro (shortcut). Use this method to list the titles and paths of macros in the analyzer.

**VB Syntax**

```vbnet
app.GetShortcut index, title, path, arguments
```

**Variable**

- **app**
  - Type: Application (object)

- **index**
  - Type: long
  - Description: Number of the macro. Use a number between 1 and 12.

- **title**
  - Type: string
  - Description: Title of the specified macro. (Appears in the softkey label)

- **path**
  - Type: string
  - Description: Pathname of the specified macro.

- **arguments**
  - Type: string
  - Description: Arguments for the specified macro

**Return Type**

String

**Default**

Not Applicable

**Example**

```vbnet
Dim t As String
Dim p As String
Dim arg As String
Dim i As Integer
For i = 1 To 12
    app.GetShortcut i, t, p, arg
    Print t, p
Next
```

**C++ Syntax**

```c++
HRESULT GetShortcut(long Number, BSTR* title, BSTR* pathname, BSTR* arguments)
```

**Interface**

IApplication

**Remarks**

Shortcuts can also be defined and accessed using the macro key on the front panel. However, the benefit of this feature is primarily for the interactive user.
**GetSnPData Method Superseded**

**Description**  
Note: this command is replaced by GetSnPDataWithSpecifiedPorts Method.

Reads SnP data from the selected measurement. Learn more about SnP that is returned from the PNA.

**VB Syntax**

```vbnet
data = meas.GetSnPData type
```

**Variable**  
(Variables) - Description

- **data**  
  Variant array to store the data.

- **meas**  
  A Measurement (object)

- **type**  
  (string) - Type of SnP data to return. If unspecified, <n> is set to 2. Choose from:
  - "S1P" returns data for the active measurement.
  - "S2P" returns data for the current 2-port measurement (4 S-parameters).
  - "S3P" returns data for the current 3 port measurement (9 S-parameters). Valid only on instruments with 3 ports or more.
  - "S4P" returns data for the current 4 port measurement (16 S-parameters). Valid only on instruments with 4 ports or more.

SnP data can be output using several data formatting options. See SnPFormat Property

**Return Type**  
Variant - 3 dimensional array.

- First dimension size is number of parameters returned.
- Second dimension size is number of points in the channel
- Third dimension size is 2 (real,imaginary)

For example:

Data(0,5,1) returns the imaginary value of the fifth data point of S11 (if the s2p request includes port #1)

**Default**  
Not Applicable

**Examples**

```vbnet
snp = meas.GetSnPData("s1p")
```

**C++ Syntax**

`HRESULT GetSnPData(BSTR snptype, VARIANT * response)`

**Interface**

IMeasurement3

---

Last Modified:
14-Nov-2008  Added returned data detail
### GetSnPDataWithSpecifiedPorts Method

**Description**

Note: This command replaces Get SnPData. This command is more explicit regarding the data to be returned, and works for PNA with multiport test sets.

Reads SnP data for the measurement by specifying the PNA port numbers. Learn more about SnP that is returned from the PNA.

**VB Syntax**

```vbnet
data = meas.GetSnPDataWithSpecifiedPorts ports
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data</code></td>
<td>(Variant) array to store the data.</td>
</tr>
<tr>
<td><code>meas</code></td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td><code>ports</code></td>
<td>(Variant Array) One-dimensional array containing the list of port numbers for which data is required.</td>
</tr>
</tbody>
</table>

**Return Type**

Variant - 3 dimensional array.

- First dimension size is number of parameters returned.
- Second dimension size is number of points in the channel
- Third dimension size is 2; format of the data is specified with SnPFormat Property.

For example:

Data(0,5,1) returns the imaginary part of the fifth data point of S11 (if the s2p request includes port #1)

**Default**

Not Applicable

**Example**

'This VBScript example can be pasted into a notepad file and run on the PNA as a macro. Learn how.

```vbnet
Dim pna
Dim meas
Dim param
Dim point
Dim snp
Dim ports

'List the port numbers for required data
ports = Array(3,4)
Set pna = CreateObject("AgilentPnA835x.application")
Set meas = pna.ActiveMeasurement
```
'limit amount of data to display
set chan=pna.ActiveChannel
chan.NumberOfPoints=2
snp = meas.GetSnPDataWithSpecifiedPorts (ports)
' returns a 3 dimensional array
' snp(param,point,data pair)
'-------------------------------------
' show me the data
For param = LBound(snp, 1) To UBound(snp, 1)
  MsgBox ("Parameter: " & (param + 1))
  For point = LBound(snp, 2) To UBound(snp, 2)
    MsgBox "Point:" & (point + 1) & "," & snp(param, point, 0) 
      & "," & snp(param, point, 1)
  Next
Next

C++ Syntax  HRESULT GetSnpDataWithSpecifiedPorts(VARIANT portsToMeasure,VARIANT*
response);

Interface  IMeasurement7

Last modified:

13-Jun-2011  Fixed data format
13-Nov-2008  Added detail to return type
9/18/06  MQ Added for multiport
getSourcePowerCalDataEx Method

Description  **Note:** This method replaces `getSourcePowerCalData Method`  
Retrieves (as variant data type) source power calibration data, if it exists, from the channel.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the `Get X-Axis Values` command to return the X-axis values in the displayed order.

**Note:** This method returns a variant which is less efficient than methods available on the `ISourcePowerCalData` interface

VB Syntax  
```vbnet
data = chan.getSourcePowerCalDataEx (buffer, srcPort)
```

Variable  **(Type) - Description**

*data*  *(variant)* – Array to store the data.

*chan*  *(object)* – A `Channel` object

*buffer*  *(enum NAPowerCalBuffer)* - The requested source power cal data buffer.

0  - `naCorrectionValues`  – Last iteration of Cal data

1  - `naPriorIterationCorrectionValues`  – Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.

The following formula can be used to determine the power reading (in dB):

\[
\text{Power reading} = \text{Target power at the source port} + \text{specified power cal offset value} + \text{‘prior’ iteration corr value} – \text{actual power corr value}.
\]

The “actual” value in this equation is returned with `naCorrectionValues`.

*srcPort*  *(long integer)* – The source port for which calibration data is being requested.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

Return Type  Variant array – automatically dimensioned to the size of the data.

Default  Not Applicable

Examples  
```vbnet
Dim varData As Variant
Const port1 As Long = 1
varData = chan.getSourcePowerCalDataEx (naCorrectionValues, port1)
'Print the data
```
For i = 0 to chan.NumberOfPoints - 1
Print varData(i)
Next i

**C++ Syntax**

```c++
HRESULT getSourcePowerCalDataEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, VARIANT *pData);
```

**Interface**

IChannel4

---

Last Modified:

- March 17, 2010 Added Prior argument
- 24-Apr-2008 Added note for string names
- 27-Jun-2007 Updated for PNA-X source port names
getSourcePowerCalDataScalarEx Method

**Description**

Note: This method replaces **getSourcePowerCalDataScalar Method**

Retrieves (as scalar values) source power calibration data, if it exists, from this channel. If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the **Get X-Axis Values2** command to return the X-axis values in the displayed order.

Note: This method exists on a non-default interface. If you cannot access this method, use the **getSourcePowerCalDataEx Method** on IChannel4.

**VB Syntax**

```vbnet
chanData.getSourcePowerCalDataScalarEx buffer, srcPort, numValues, data
```

**Variable (Type) - Description**

- **chanData** (interface) – An **ISourcePowerCalData2** interface on the Channel object.

- **buffer** (enum **NASourcePowerCalBuffer**) - The requested source power cal data buffer.
  - 0 - **naCorrectionValues**  Last iteration of Cal data.
  - 1 - **naPriorIterationCorrectionValues**  Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.

  The following formula can be used to determine the power reading (in dB):

  \[ \text{Power reading} = \text{Target power at the source port} + \text{specified power cal offset value} + \text{\'prior\' iteration corr value} - \text{actual power corr value}. \]

  The "actual" value in this equation is returned with **naCorrectionValues**.

- **srcPort** (long integer) – The source port for which calibration data is being requested.
