  Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use **chan.getPortNumber** to translate the string into a port number. To learn more see **Remotely Specifying a Source Port**.

- **numValues** (long integer) – Number of data values.

  [out] – specifies number of data values returned.

  [in] – specifies number of values being requested (this must not be larger than the capacity of the data array).

- **data** (single) – Array to store the data.

**Return Type**

Single

**Default**

Not Applicable
Examples

Dim numValues As Long
Dim scalarCalValues() As Single
Dim chanData As ISourcePowerCalData2
Const port1 As Long = 1
numValues = app.ActiveChannel.NumberOfPoints
ReDim scalarCalValues(numValues)
Set chanData = app.ActiveChannel

chanData.getSourcePowerCalDataScalarEx naCorrectionValues,
port1, numValues, scalarCalValues(0)

'Print the data
For i = 0 to numValues - 1
Print scalarCalValues(i)
Next I

C++ Syntax

HRESULT getSourcePowerCalDataScalarEx(tagNASourcePowerCalBuffer bufSelect,
long sourcePort, long *pNumValues, float *pData);

Interface

ISourcePowerCalData2

Last Modified:

17-Mar-2010       Added Prior argument
24-Apr-2008       Added note for string names
27-Jun-2007       Updated for PNA-X source port names
GetStandard Method Superseded

Description
This command has been replaced with Get StandardByString

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

VB Syntax
\[
data = \text{CalSet.getStandard}(\text{standard, rcv, src})
\]

Variable (Type) - Description
\[
data \text{ (Variant)} \text{ Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.}
\]

Note: See also getStandardComplex on the ICalData2 interface to avoid using the variant data type.

CalSet A Cal Set (object)

standard (enum NACalClass) Standard data to be read. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

rcv \textbf{(long)} - Receiver Port

src \textbf{(long)} - Source Port

\textbf{Return Type} (\textit{variant})

\textbf{Default} Not Applicable

\textbf{Examples}
\begin{verbatim}
Dim varStd As Variant
Dim varStd2 As Variant

Cal Set.OpenCalSet( naCalType_TwoPortSOLT, 1, 2)
varStd = CalSet.getStandard(naSOLT_Thru,2,1)
varStd2 = Cal Set.getStandard(naSOLT_Thru,1,2)
Cal Set.CloseCalSet( )
\end{verbatim}

\textbf{C++ Syntax} HRESULT getStandard(tagNACalClass stdclass, long ReceivePort, long SourcePort, VARIANT* pData)

\textbf{Interface} ICalSet
GetStandardByString Method

Description
Returns standard acquisition data from the Cal Set. The returned data is complex pairs.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax
`data = calSet.GetStandardByString(stdName)`

Variable (Type) - Description

| data | (Variant) Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the PNA and must be released by client.
| Note: See also Get StandardComplexByString on the ICalData2 interface to avoid using the variant data type.

| calSet | A CalSet (Object) |
| stdName | (String) The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)". |

Return Type
Variant

Default
Not Applicable

Examples
See an example

C++ Syntax
`HRESULT GetStandardByString( BSTR bufferName, VARIANT* pdata)`

Interface
ICalSet2
GetStandardComplex Method Superseded

Description
This command is replaced with GetStandardComplexByString.

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**Note:** This method exists on a non-default interface. If you cannot access this method, use the GetStandard Method on ICal Set

**VB Syntax**
```
ICalData2.getStandardComplex class, rcv, src, numPts, real(), imag()
```

**Variable** (Type) - Description

**ICalData2** An ICalData2 pointer to the Cal Set object

**class** (enum NACalClass) Standard data to be read. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

**SOLT Standards**
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

**TRL Standards**
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
rcv (long) - Receiver Port

src (long) - Source Port

numPts (Long) An In/Out parameter.
On the way **in**, you specify the **max** number of values being requested.
On the way **out**, the PNA returns number of values actually returned.

real() (single) - array to accept the real part of the calibration data. One-dimensional for the number of data points.

imag() (single) - array to accept the imaginary part of the calibration data. One-dimensional for the number of data points.

**Return Type** (single)

**Default** Not Applicable

**Examples**

Dim numpts as long
numpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim Cal Set as Cal Set
set Cal Set = pna.GetCalManager.GetCalSetByGUID( txtGUID )
Dim sData As ICalData2
Set sData = Cal Set
sdata.getStandardComplex naSOLT_Open, 1, 1, numpts, r(0), i(0)

**C++ Syntax**

HRESULT getStandardComplex(tagNACalClass stdclass, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)

**Interface** ICalData2
GetStandardComplexByString Method

Description
Returns standard acquisition data from the Cal Set.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax
ICalData3.GetStandardComplexByString stdName, lnumPoints, real(0), imag(0)

Variable (Type) - Description
ICalData3 An ICalData3 pointer to a CalSet (Object)

stdName (String) The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".

lnumPoints (Long) An In/Out parameter.
On the way in, you specify the max number of values being requested.
On the way out, the PNA returns number of values actually returned.

real (Single) The real component of the complex data.

imag (Single) The imaginary component of the complex data.

Return Value Single

Default Not Applicable

Examples See example

C++ Syntax HRESULT GetStandardComplexByString( BSTR bufferName, long* lnumPoints, float* real, float* imag);

Interface ICalData3
GetStandardsList Method  Superseded

Description

Note: This command is replaced by CalSet.getStandardList2.

Returns the list of Standards contained in this Cal Set for the CalType specified in the OpenCal Set method. Learn more about reading and writing Cal Data using COM.

The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses.

Standard (n, n),
Standard (m, n)

Before calling this method you must open the Cal Set with OpenCal Set. If the Cal Set is not open, this method returns E_NA_Cal Set_ACCESS_DENIED.

Use StringToNACalClass to convert the list entrees to values that can be used with GetStandard and PutStandard.

Note: The port path designation (m n) indicates the receive and source ports for the measurement. Shorts, opens and loads are single port devices, designated in this list by (n n) where n equals the port to which the device is connected. These devices are all characterized by reflection measurements.
The dual port thru device is characterized by both transmission and reflection measurements in order to compensate for load match and tracking terms.
The notation (n n) indicates the reflection measurement for this device.
The notation (m n) indicates the transmission measurement, where the source and receive ports are different.

VB Syntax

CalSet.GetStandardsList (count, list)

Variable (Type) - Description

CalSet (object) - A Cal Set object

count (long [out]) - indicates the number of items returned in the list

list (string) - Variable to store the returned Comma separated list of items.

Return Type String

Default Not Applicable

Examples

dim count as Integer
dim list as string
OpenCalSet (naCalType_TwoPortSOLT, 1, 2)
GetStandardsList( count, list)
CloseCalSet( )

Assuming the Cal Set contained the full set of standards for this two port cal, the returned list would be:
"Open(1 1),
Short(1 1),

1859
Load(1 1),
Thru(1 1),
Isolation(2 1),
Open(2 2),
Short(2 2),
Load(2 2),
Thru(2 2),
Isolation(1 2)
Thru(2 1),
Thru(1 2)"

**C++ Syntax**

```cpp
HRESULT GetStandardsList( long* count, BSTR* list);
```

**Interface**

ICalSet
GetStandardList2 Method

**Description**
Returns a list of standards contained by this Cal Set for the specified Cal Type.

**VB Syntax**
```
list = calset.GetStandardList2(calType)
```

**Variable (Type) - Description**
- **calset** *(object)* - A *CalSet* object
- **list** *(Variant)* - Variant containing a string array of standards for the specified *calType*.
- **calType** *(String)* - The string used to identify Cal Set data as belonging to a specific Cal Type. This string is used as a filter so that only the standard names of interest are returned. If the prefix is empty, all names are returned.

An example prefix for a two port cal on ports 2 and 3 might be: "Full 2 Port Cal (2,3)".

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
See an example

**C++ Syntax**
```
HRESULT GetStandardList2 (BSTR caltype, VARIANT* list)
```

**Interface**
ICalSet2
**GetStandardsForClass Method**

**Description**
Get the calibration standard numbers for a specified calibration class. To set the calibration number use `SetStandardsForClass Method`.

**VB Syntax**
```vbnet
calKit.GetStandardsForClass (calclassorder, std1, std2, std3, std4, std5, std6, std7)
```

**Variable (Type) - Description**
- **calKit**: A CalKit (object)
- **calclassorder (enum NACalClassOrder)**: Choose from:
  - 0 - naRefI_1_S11
  - 1 - naRefI_2_S11
  - 2 - naRefI_3_S11
  - 3 - naTran_1_S21
  - 4 - naRefI_1_S22
  - 5 - naRefI_2_S22
  - 6 - naRefI_3_S22
  - 7 - naTran_1_S12
  - 8 - naRefI_1_S33
  - 9 - naRefI_2_S33
  - 10 - naRefI_3_S33
  - 11 - naTran_1_S32
  - 12 - naTran_1_S23
  - 13 - naTran_1_S31
  - 14 - naTran_1_S13
  - 15 - naTRL_T
  - 16 - naTRL_R
  - 17 - naTRL_L
- **std1…std7 (long)**: Calibration Standard Number. Nominal values from 1 through 30. 0 indicates that a standard number has not been selected.

4-Nov-2008 Added ECal object
GetSupportedALCModes Method

**Description**
Returns the valid ALC Modes for the PNA.
See ALCLevelingMode for a list of supported ALC Modes.

**VB Syntax**
```vbnet
value = chan.GetSupportedALCModes(sourcePort)
```

**Variable (Type) - Description**
- **value** Variant Array  variable to store the returned valid ALC Modes.
- **chan** (object) - A Channel object
- **sourcePort** (long integer) - Source port.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```vbnet
modes = chan.GetSupportedALCModes(4) 'Read
```

**C++ Syntax**
```cpp
HRESULT GetSupportedALCModes(long port, VARIANT * ALCModes);
```

**Interface**
IChannel9

GetTestResult Method

**Description**

Returns the result of limit line testing. There are three ways to use this command:

- If neither optional parameter is specified, limit results for ALL data is returned.
- If one parameter is specified (*start*), the limit result for that data point is returned.
- If both parameters are specified, limit results are returned beginning with *start*, and ending with (*start*+size)-1

**VB Syntax**

```
testRes = limts.GetTestResult [start,size]
```

**Variable**

- **testRes** *(enum NALimitTestResult)* - A dimensioned variable to store test results. If a limit line is not tested, a PASS is returned.
  
  - 0 - naLimitTestResult_None
  - 1 - naLimitTestResult_Fail
  - 2 - naLimitTestResult_Pass

- **limts** A LimitTest *(object)*

- **start** *(long)* - Optional argument. A start data point number to return limit test results.

- **size** *(long)* - Optional argument. Number of data points from *start* to return limit test results.

**Return Type**

Long Integer

**Default**

Not Applicable

**Examples**

```vba
Dim testRes As NALimitTestResult
testRes = limts.GetTestResult
Select Case testRes
    Case 1
        Print "Fails"
    Case 2
        Print "Pass"
End Select
```

**C++ Syntax**

```
HRESULT GetTestResult(long lStart, long lSize, tagNALimitTestResult *pVal)
```

**Interface**

ILimitTest
GetTraceStatistics Method

Description
Returns all four Trace Statistics. To retrieve individual Trace statistics, use Mean, PeakToPeak, StandardDeviation properties. Use ShowStatistics to display the statistics of the screen.

VB Syntax
meas.GetTraceStatistics pp, mean, stdev

Variable (Type) - Description
meas (Object) - A Measurement
pp, mean, stdev (Double) - Dimensioned variables to store the returned values

Return Type
Double

Default
Not Applicable

Examples
'Dimension variables
Dim pp As Double
Dim mean As Double
Dim stdev As Double
meas.GetTraceStatistics pp, mean, stdv

C++ Syntax
HRESULT GetTraceStatistics(double* pp, double* mean, double* stdDeviation)

Interface
IMeasurement
GetXAxisValues2 Method

**Description**

Returns the channel's X-axis values into a dimensioned Typed array. GetXAxisValues2 is a convenient method for determining the frequency of each point when the points are not linearly spaced - as in segment sweep.

**Note:** This method will fail if called using a scripting client such as VBScript or Agilent Vee. (see remarks)

**Note:** In Segment Sweep, chan.**NumberOfPoints** will return the total number of data points for the combined segments.

**VB Syntax**

`chan.GetXAxisValues2 numPts, data`

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>object</td>
<td>A Channel object</td>
</tr>
<tr>
<td>numPts</td>
<td>long integer</td>
<td>Number of data points in the channel</td>
</tr>
<tr>
<td>data</td>
<td>double</td>
<td>Single dimensioned array of data matching the number of points in the channel.</td>
</tr>
</tbody>
</table>

**Return Type**

double

**Default**

Not applicable

**Examples**

```vbnet
Dim App As Application
Set App = New Application
Dim numPoints As Long
Dim values() As Double
numPoints = App.ActiveChannel.NumberOfPoints
ReDim values(numPoints)
App.ActiveChannel.GetXAxisValues2 numPoints, values(0)
Print values(0), values(1)
```

**C++ Syntax**

`HRESULT GetXAxisValues2(long* pNumValues, double* stimulus)`

**Interface**

IChannel

**Remarks:**

This method will fail if called using a scripting client such as VBScript or Agilent Vee. Use the [GetXAxisValues](#) method as a replacement for these COM environments.

This method also cannot be called using late-bound typing in Visual Basic. For instance, if, in the example above, the first line were replaced with "Dim App as Object", then this method would fail.

**IMeasurement2**

---

**Last Modified:**

15-Oct-2007  Added link to C++ example
**GetXAxisValues Method**

**Description**
Returns the channel's X-axis values. GetXAxisValues is a convenient method for determining the frequency of each point when the points are not linearly spaced - as in segment sweep.

See the [Measurement2 Interface](#) to learn how this method differs from `meas.GetXAxisValues`.

**Note:** This method returns a variant which is less efficient than `GetXAxisValues2`.

**Note:** In Segment Sweep, chan.NumberOfPoints will return the total number of data points for the combined segments.

**VB Syntax**
```vbnet
data = chan.GetXAxisValues
```

**Variable** *(Type) - Description*

- **data** Variant array to store the data.
- **chan** A Channel *(object)*

**Return Type** Variant

**Default** Not Applicable

**Examples**
```vbnet
Dim varData As Variant
Dim i As Integer
varData = chan.GetXAxisValues
'Print Data
For i = 0 To chan.NumberOfPoints - 1
    Print varData(i)
Next i
```

**C++ Syntax**
```cpp
HRESULT GetXAxisValues (VARIANT* xData)
```

**Interface** IChannel
HasCalType Method

**Description**
Verifies that the Cal Set object contains the error terms required to perform the specified correction (CalType) to an appropriate measurement.

The argument list includes specifiers for up to 3 ports. The number of arguments required depends on the CalType specified. The value for each port is set to 0 if not specified.

**VB Syntax**
```vbnet
check = CalSet.HasCalType(calType, p1, p2, p3)
```

**Variable (Type) - Description**

- `check` *(boolean)* - variable to store the returned value
  - `TRUE (1)` - Cal Set has all of the error terms necessary to apply the specified correction CalType.
  - `FALSE(0)` - Cal Set DOES NOT have all of the error terms necessary to apply the specified CalType.

- `CalSet` *(object)* - A Cal Set object

- `calType` *(enum as naCalType)* - type of correction to be applied. Choose from:

<table>
<thead>
<tr>
<th>Caltype</th>
<th>p arguments required</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - naCalType_Response_Open</td>
<td>p1</td>
</tr>
<tr>
<td>1 - naCalType_Response_Short</td>
<td>p1</td>
</tr>
<tr>
<td>2 - *naCalType_Response_Thru</td>
<td>p1 (rcv), p2 (src)</td>
</tr>
<tr>
<td>3 - *naCalType_Response_Thru_And_Isol</td>
<td>p1 (rcv), p2 (src)</td>
</tr>
<tr>
<td>4 - naCalType_OnePort</td>
<td>p1</td>
</tr>
<tr>
<td>5 - naCalType_TwoPort_SOLT</td>
<td>p1, p2</td>
</tr>
<tr>
<td>6 - naCalType_TwoPort_TRL</td>
<td>p1, p2</td>
</tr>
<tr>
<td>7 - naCalType_None</td>

<td>p1, p2, p3</td>
</tr>
<tr>
<td>9 - Custom</td>
<td>N/A</td>
</tr>
<tr>
<td>10 - naCalType_FourPort_SOLT</td>
<td>p1, p2, p3</td>
</tr>
<tr>
<td></td>
<td>(port 4 is assumed)</td>
</tr>
</tbody>
</table>

* order of port arguments is significant for these CalTypes

- `p1` *(long)* - required. This argument must be specified.
This specifies either:
- the one significant port for an open/short response cal or a 1 port cal.
- or one of the ports involved in a 2, 3, or 4 port cal
- or the receive port for a thru response / thru-isolation cal.

\( p2 \) (long) - required for any CalType involving more than one port
This specifies either:
- one of the ports involved in a 2, 3, or 4 port cal (order independent)
- or the source port for a thru response / thru-isolation cal

\( p3 \) (long) - required for 3 and 4-port cal
This specifies one of the ports involved in a 3 or 4 port cal (order independent)

**Return Type**: VARIANT_BOOL  
**Default**: Not Applicable  
**Examples**: \[ \text{value} = \text{CalSet.HasCalType(naCalType_TwoPort_TRL, 1, 2)} \]  
**C++ Syntax**: HRESULT HasCalType( tagNACalType, long port1, long port2, long port3, BOOL *pVal);

**ImportDataSet Method**

**Description** Imports existing SMC power cal data into the current SMC calibration. The conditions that were present at the time the imported cal was performed must be present in the current SMC cal:

- The source and receive port numbers must match.
- If a THRU was used for the imported cal, the same is assumed for the current cal. Likewise if the power cals were ‘separate’.
- The Input and Output frequency range of the imported power cal MUST be within the Input and Output frequency range of the current SMC calibration. Interpolation will be applied to both cal data sets when the ranges do not exactly match.

The following error messages appear (they are not written to the PNA Error Log):

- *Interpolation target is out of range. Cannot interpolate* when incompatible frequency ranges occur
- *The necessary calibration standards were not found* when the port numbers and THRU method do NOT exactly match.

**VB Syntax**

```vbnet
smc.ImportDataSet (calset, dataName)
```

**Variable (Type) - Description**

- `smc` *(SMCType (object))*
- `calset` *(String)* Name of existing SMC Cal Set from which power cal data is imported.
- `dataName` *(String)* Name of the data set. Use “POWER_STEP”.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
smc.ImportDataSet("MySMCCal", "POWER_STEP")
```

See example program

**C++ Syntax**

```cpp
HRESULT ImportDataSet(BSTR csName, BSTR dataset);
```

**Interface** SMCType4

---

Last Modified: 1875
### ImportLibrary Method

**Description**
Imports an Equation Editor DLL.

**VB Syntax**
```vbnet
equation.ImportLibrary location
```

**Variable**

- **equation** (Type) - A `MeasurementEquation` object
- **location** (string) – Full path and filename of the *.dll to be imported.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
equation.ImportLibrary "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"

**C++ Syntax**
```cpp
HRESULT ImportLibrary( BSTR filename);
```

**Interface**
IMeasurementEquation2

Initialize Method

Description

Begins a calibration.

**Note:** `chan` must be the active channel.

For ECal User Characterization, use Initialize (ECal).

VB Syntax

```vbnet
obj.Initialize (chan, useCalStorPref)
```

Variable **(Type) - Description**

- **obj**
  Any of the following:
  - `GuidedCalibration` (object)
  - `SMCType` (object)
  - `VMCType` (object)

- **chan**
  (Long) Channel number to calibrate.

- **useCalStorPref**
  (boolean)
  - **True** or **1** - Assignment of Cal Set will be based on the setting of the `RemoteCalStoragePreference` COM property.
  - **False** or **0** – If the channel currently has a selected Cal Set, the calibration will be stored to that Cal Set. Otherwise, the assignment of Cal Set is based upon the setting of the `RemoteCalStoragePreference` COM property.

Return Type

Not Applicable

Default

Not Applicable

Examples

```vbnet
smc.Initialize(2,True)
```

C++ Syntax

```cpp
HRESULT put_Initialize(long channelnumber, VARIANT_BOOL bCalPref);
```

Interface

- `IGuidedCalibration`
- `SMCType`
- `VMCType`

Last Modified:

4-Nov-2008  Added Note about ECal User Char
About ECal User Characterization

InitializeEx Method

**Description**

Note: This property replaces Initialize (ECal) Method.

Initiates a User Characterization of an ECal module. The specified channel number must be an S-parameter measurement channel. The channel must already be calibrated using the same, or greater number of PNA ports as the ECal module. Also, the calibrated PNA ports must begin with Port 1 and use sequential port numbers.

For characterizations that are to be saved to the ECal module, the User Characterization number must already be set before issuing this command using CharacterizationNumber Property. For characterizations that are to be saved to the PNA disk memory, setting the User Characterization number is not necessary.

After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete an Ecal User characterization.

**VB Syntax**

```vbscript
userChar.InitializeEx(chan, bool)
```

**Variable**

*userChar* ECalUserCharacterizer (object)

*chan* (Long) Channel number of a calibrated S-parameter channel.

*bool* (Boolean) Choose from:

- **True** Check ECal memory to ensure that a new characterization with the channel’s current number of points will fit in the module memory. Select for User Characterizations to be stored in internal ECal memory.

- **False** Skip the check. Select for User Characterizations is to be stored to PNA disk memory.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbscript
userchar.InitializeEx(2, True)
```

**C++ Syntax**

```c++
HRESULT put.InitializeEx(long chanNum,VARIANT_BOOL bCheck);
```

**Interface** IECalUserCharacterizer2

IsLibraryImported Method

**Description**
Returns whether a DLL has been imported into the PNA.

**VB Syntax**
`flag = equation.IsLibraryImported location`

**Variable (Type) - Description**
- **flag** (Boolean)
  - **True** - DLL has been imported.
  - **False** - DLL has NOT been imported.
- **equation** A MeasurementEquation object
- **location** (string) – Full path and filename of the *.dll.

**Return Type**
Variant boolean

**Default**
Not Applicable

**Examples**
`flag=equation.IsLibraryImported "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"`

**C++ Syntax**
`HRESULT IsLibraryImported(BSTR filename, VARIANT_BOOL* plImported);`

**Interface**
IMeasurementEquation2

#### Item Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns an object from the collection of objects.</th>
</tr>
</thead>
</table>
| Notes       | • The order of objects within a collection cannot be assumed.  
              • Most, but not all, PNA Collections are ‘1-based’ |

**VB Syntax**

```
Object.Item(n)
```

**Variable** *(Type) - Description*

**Object**  Any of the following *(collections)*:

- CalFactorSegments collection
- CalFactorSegmentsPMAR Collection
- Cal Sets collection
- Channels collection
- E5091Testset collection
- ECalModules Collection
- ExternalDevices Collection
- ExternalTestsets collection
- FOM collection
- GuidedCalibrationPowerSensors Collection
- LimitTest collection
- Measurements collection
- NaWindows collection
- PowerLossSegments collection
- PowerLossSegmentsPMAR Collection
- PowerSensors collection
- Segments collection
- Traces collection
- PowerMeterInterfaces Collection

*Learn more about collections in the PNA*
.Item  Optional - Item is the default property of a collections object and therefore can be called implicitly. For example, the following two commands are equivalent:

 Channels.Item(3).Averaging = 1
 Channels(3).Averaging = 1

\(\text{n (variant)}\) - number of the item in the collection.

- The **Measurements, Traces, and FOM** collections allow you to specify the name of the measurement as a string. For example:
  measCollection("CH_S11_1").InterpolateMarkers

- The **Cal Sets collection** allows you to specify the name of the cal set. For example:
  Calsets("MyCalSet").Description = "New Description"

- The **ExternalDevices Collection** allows you to specify the name of the external device. For example:
  Set extDev = externalDevices.Item("NewPMAR")

- The **GuidedCalibrationPowerSensors Collection** allows you to specify the name of the Power Sensor. For example:
  Set PowerSensor = GuidedCalibrationPowerSensors.Item.Name = "26GHzPowerSensor"

**Return Type**  (Object)

**Default**  Not Applicable

**Examples**  For \(i = 1\) to Traces.Count 1
  Traces.Item(i).YScale = .5dB
  Next i

**C++ Syntax**  HRESULT Item(VARIANT index, <interface>** pItem)

**Interfaces**  All listed above.

10-Sep-2008  Added CalSets name note
## LANConfigurationInitialize Method

**Description**
Performs an initialization (reset) of the PNA’s LAN configuration, as dictated by Section 8.14 of the LAN eXtensions for Instrumentation (LXI) standard (Version 1.1). This performs the same operation as pressing the LAN Reset button on the PNA [LAN Status dialog](#).

**VB Syntax**
```vbnet
app.LANConfigurationInitialize
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.LANConfigurationInitialize
```

**C++ Syntax**
```c++
HRESULT LANConfigurationInitialize ();
```

**Interface**
IA.Application13
## LaunchCalWizard Method

### Description
Launches the S-parameter Cal Wizard on the PNA and does not return until the Cal Wizard is dismissed.

To launch the Cal Wizard for a PNA Application, use the [LaunchDialog Method](#).

**Note:** The Cal Wizard operates on the active measurement. Therefore, activate the measurement to be calibrated before launching the Cal Wizard.

### VB Syntax
```
success = app.LaunchCalWizard(newCS)
```

### Variable
- **success** *(boolean)* - variable to store the returned value
  - **True** - The Cal was completed
  - **False** - The Cal was canceled without completing the calibration.

- **app** *(An Application object)*

- **newCS** *(boolean)*
  - **True** - Cal will be performed on a new Cal Set.
  - **False** - Cal will be performed using the existing Cal Set assigned to the channel. If no Cal Set is found, a new Cal Set will be created.

- **Return Type** Boolean

- **Default** Not Applicable

### Example
```
dim bSuccess as boolean
dim bNewCalset as boolean
bNewCalSet = false
bSuccess = app.LaunchCalWizard( bNewCalSet)
```

### C++ Syntax
```
HRESULT LaunchCalWizard(VARIANT_BOOL bCalSuccess)
```

### Interface
- IApplication

---

**Last Modified:**

5-Sep-2008  S-parameter only
LaunchDialog Method

**Description**

Launches the specified dialog box.

The Calibration Wizard dialog that appears depends on the active channel. For example, if a Gain Compression channel is active, then the GCA Cal Wizard appears. Use `meas.Activate` to activate a measurement and channel.

Remote operation returns after the dialog is dismissed.

To invoke the Cal Wizard and have it return immediately, then use `Syst:Corr:Wiz` with the SCPI Parser object.

**VB Syntax**

```
app.LaunchDialog dialog, [data]
```

**Variable**  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>dialog</td>
<td>(String) Dialog box to launch. Choose from:</td>
</tr>
<tr>
<td></td>
<td>&quot;SourcePowerCal&quot; See this dialog.</td>
</tr>
<tr>
<td></td>
<td>&quot;PowerMeterSettings&quot; See this dialog.</td>
</tr>
<tr>
<td></td>
<td>“PathConfiguration” See this dialog.</td>
</tr>
<tr>
<td></td>
<td>“CalibrationWizard” Depends on the channel</td>
</tr>
<tr>
<td></td>
<td>“CalibrationSelection” See this dialog.</td>
</tr>
</tbody>
</table>

| [data]   | (Optional argument) Reserved for future use. |

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```
app.LaunchDialog "SourcePowerCal"
```

**C++ Syntax**

`LaunchDialog( BSTR dialog, [defaultValue(0)] VARIANT dialogData)`

**Interface**

IAplication11

[See the PNA Object Model](#)
LaunchPowerMeterSettingsDialog Method

Description
Launches the Power Meter Settings dialog on the PNA. Changing certain values from that dialog will change values of the corresponding properties on this COM object.

VB Syntax
pwrCal.LaunchPowerMeterSettingsDialog

Variable (Type) - Description
pwrCal A SourcePowerCalibrator (object)

Return Type
None

Default
Not Applicable

Examples
powerCalibrator.LaunchPowerMeterSettingsDialog

C++ Syntax
HRESULT put_LaunchPowerMeterSettingsDialog();

Interface
ISourcePowerCalibrator2
### LoadConfiguration Method

**Description**
Loads the named configuration onto the specified channel. Use [Configurations Method](#) to return the configuration names that are stored on the PNA.

**VB Syntax**
```vbnet
pathMgr.LoadConfiguration ch, name
```

**Variable**
- **(Type)** - **Description**
  - `pathMgr` PathConfigurationManager *(object)*
  - `ch` *(Long)* Channel number of the configuration to be saved.
  - `name` *(String)* Configuration name. "Default" is the default factory configuration.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
path.LoadConfiguration 2, "myMixer"
```

**C++ Syntax**
```cpp
HRESULT LoadConfiguration (long channelNum, BSTR configName );
```

**Interface**
IPathConfigurationManager

---

Last Modified:

14-Dec-2006   MX New topic
LoadENRFile Method

**Description**
Loads an ENR file from disk into PNA memory. This file is typically provided by the manufacturer of the noise source.

**VB Syntax**
`enr.LoadENRFile (filename)`

**Variables**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enr</code></td>
<td>An ENRFile (object)</td>
</tr>
<tr>
<td><code>filename</code></td>
<td>(String) - Absolute path and filename of the ENR file.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
See example program

**C++ Syntax**
`HRESULT LoadENRFile(BSTR filename);`

**Interface**
IENRFile

---

Last Modified:

2-Aug-2007    MX New topic
# LoadFile Method

**Description**
Loads a previously-configured mixer attributes file (.mxr)

**VB Syntax**
```vbnet
obj.LoadFile (filename)
```

**Variable (Type) - Description**
- `obj` A [Mixer Interface](#) pointer to the [Measurement](#) (object)
  - Or
  - A [Converter Object](#)
- `filename` (String) Full path, file name, and .mxr extension of the mixer attributes file.
  - Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents".

**Return Type**
String

**Default**
Not Applicable

**Examples**
```vbnet
mixer.LoadFile ("C:/Program Files/Agilent/Network Analyzer/Documents/myMixer.mxr")
```

**C++ Syntax**
```cpp
HRESULT LoadFile(BSTR newVal)
```

**Interface**
IMixer
IConverter

---

Last Modified:

- 2-Feb-2009  Added converter
LoadTheme Method

**Description**  
Load a color theme from a disc file.

**VB Syntax**  
`colors.LoadTheme (filename)`

**Variable (Type) - Description**
- `colors` A `ComColors` (object)
- `filename` (String) - Path and filename of the theme to load.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`colors.LoadTheme = "c:/Program Files/Agilent/Network Analyzer/Colors/Theme1.colors"

**C++ Syntax**  
`HRESULT LoadTheme(BSTR filename);`

**Interface**  
`IComColors`

---

About Triggering

ManualTrigger Method

Description
Triggers the analyzer when TriggerSetup.Source = naTriggerManual.

Note: An SMC Fixed Output measurement cannot be triggered using this command. For more information, see the example program.

VB Syntax
app.ManualTrigger [sync],[timeout]

Variable (Type) - Description
app An Application (object)
[sync] (boolean) - Optional argument.
A variable set to either True or False.
True - The analyzer waits until the trigger is completed to process subsequent commands.
False - Subsequent commands are processed immediately (the default setting).

timeout (long) - Optional argument.
If sync is true, timeout sets the amount of time the PNA will wait until continuing program execution. Units are milliseconds. A value of -1 (the default setting) causes the PNA to wait indefinitely.
If sync is False, the timeout setting is ignored.

Return Type Not Applicable
Default Not Applicable

Examples
' After Manual trigger is executed, the PNA will wait 1 second to continue program execution
Dim wait as Boolean
wait = True
app.ManualTrigger wait, 1000

C++ Syntax
HRESULT ManualTrigger(VARIANT_BOOL bSynchronize, long timeout)

Interface IApplication

Last Modified:
12-Jul-2007 Modified link
**MessageText Property**

**Description**
Returns text for the specified eventID

**VB Syntax**
`app.MessageText, eventID, message`

**Variable**
*(Type) - Description*

- **app**
  An `Application` (object)

- **eventID**
  (enum `naEventID`) Choose from the list in [Working with the Analyzer's Events](#)

- **message**
  (string) - variable to store the returned message

**Return Type**
String

**Default**
Not Applicable

**Examples**
`RFNA.MessageText naEventID_ARRANGE_WINDOW_EXCEED_CAPACITY, message`

**C++ Syntax**
`HRESULT get_MessageText( tagNAEventID msgID, BSTR* message)`

**Interface**
IAplication
NextIFBandwidth Method

**Description**  
A function that returns the Next higher IF Bandwidth value. Use to retrieve the list of available IFBandwidth settings.

**VB Syntax**  
`chan.Next_IFBandwidth bw`

**Variable**  
- **Type** - `chan`  
- **Description** - A Channel (object)

- **Type** - `bw`  
- **Description** - (double) - The argument that you use to send an IFBandwidth. The function uses this argument to return the Next higher IFbandwidth.

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
```
Public pnbw As Double 'declare variable outside of procedure

pnBW = chan.IFBandwidth 'put the current IFBW in pnBW
chan.Next_IFBandwidth pnBW 'function returns the Next higher IFBandwidth.
chan.IFBandwidth = pnBW 'set IFBW to the Next value
```

**C++ Syntax**  
`HRESULT Next_IFBandwidth (double *pVal)`

**Interface**  
IChannel
**NumberofGroups Method**

**Description**
Sets the number of trigger signals the channel will receive. After the channel has received that number of trigger signals, the channel switches to Hold mode.

**VB Syntax**
```
chan.NumberOfGroups num, sync
```

**Variable (Type) - Description**

- **chan** (Channel (object))
- **num** (long integer) Number of trigger signals the channel will receive. Choose any number between 1 and 2 million.
- **sync** (boolean)
  Variable set to either:
  True - subsequent commands are not processed until the groups are complete. Do not use with manual trigger.
  False - subsequent commands are processed immediately.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**
```
chan.NumberOfGroups 5, False
```

**C++ Syntax**
```
HRESULT NumberofGroups(long count, VARIANT_BOOL bWait)
```

**Interface** IChannel
OpenCalSet Method  Superseded

**Description**
This command is no longer necessary. The CalSet.get... and put... commands that required this command have been replaced.

Open the Cal Set to read/write a particular CalType. Learn more about reading and writing Cal Data using COM.

This method is a prerequisite to several other Cal Set methods.

A Cal Set can contain more than one CalType. This method opens the Cal Set and allows access to a particular set of terms. Subsequent commands like getErrorTerm use this information to access the correct error terms in the Cal Set. For example:

```
cset.OpenCalSet (naCalType_TwoPortSOLT, 3, 2)
cset.PutErrorTerm(naDirectivity, 1, 1, Buffer)
```

The directivity error term for port 1 could belong to any number of caltypes: Full1Port (S11), Full2Port (12), Full2Port (13) or Full3Port (123). The CalType and port specifiers in OpenCalSet directs the uploaded directivity term to the correct set of error terms.

To close the Cal Set, see CloseCalSet.

### VB Syntax

```vb
CalSet.OpenCalSet (CalType, p1, p2, p3)
```

### Variable (Type) - Description

- **CalSet** *(object)* - A Cal Set object

- **CalType** *(enum as naCalType)* - type of correction to be applied. Choose from:

<table>
<thead>
<tr>
<th>CalType</th>
<th>p arguments required</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - naCalType_Response_Open</td>
<td>p1</td>
</tr>
<tr>
<td>1 - naCalType_Response_Short</td>
<td>p1</td>
</tr>
<tr>
<td>2 - *naCalType_Response_Thru</td>
<td>p1 (rcv), p2 (src)</td>
</tr>
<tr>
<td>3 - *naCalType_Response_Thru_And_Isol</td>
<td>p1 (rcv), p2 (src)</td>
</tr>
<tr>
<td>4 - naCalType_OnePort</td>
<td>p1</td>
</tr>
<tr>
<td>5 - naCalType_TwoPort_SOLT</td>
<td>p1, p2</td>
</tr>
<tr>
<td>6 - naCalType_TwoPort_TRL</td>
<td>p1, p2</td>
</tr>
<tr>
<td>7 - naCalType_None</td>
<td>N/A</td>
</tr>
<tr>
<td>8 - naCalType_ThreePort_SOLT</td>
<td>p1, p2, p3</td>
</tr>
<tr>
<td>9 - Custom</td>
<td>N/A</td>
</tr>
</tbody>
</table>
10 - naCalType_FourPort_SOLT p1, p2, p3 (port 4 is assumed)

* order of port arguments is significant for these CalTypes

\( p1 \) (long) - required. This argument must be specified.
This specifies either:
- the one significant port for an open/short response cal or a 1 port cal.
- or one of the ports involved in a 2 or 3 port cal
- or the receive port for a thru response / thru-isolation cal.

\( p2 \) (long) - required for any caltype involving more than one port
This specifies either:
- one of the ports involved in a 2 or 3 port cal (order independent)
- or the source port for a thru response / thru-isolation cal

\( p3 \) (long) - required only for 3 port cal
This specifies either:
- one of the ports involved in a 3 port cal (order independent)

**Return Type** None

**Default** Not Applicable

**Examples**

```csharp
CalSet.OpenCalSet naCalType_ThreePort_SOLT, 3, 2, 1
```

**C++ Syntax**

```csharp
HRESULT OpenCalSet ( naCalType, port1, [optional] port2, [optional] port3);
```

**Interface** ICalSet
### Parse Method

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Allows the use of COM to send a SCPI command. See a C++ example of how to return error information when using this command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>The SCPIStringParser Methods can NOT be used with SCPI Status Reporting. However, the *OPC? will work.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
scpi.Parse("SCPI command")
```

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th><strong>(Type)</strong> - <strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>scpi</code></td>
<td>A <code>ScpiStringParser</code> (object)</td>
</tr>
<tr>
<td><code>SCPI command</code></td>
<td>(string) - Any valid SCPI command</td>
</tr>
</tbody>
</table>

| **Return Type** | String |
| **Default** | Not Applicable |

**Examples**

```vbnet
Dim scpi As ScpiStringParser
Set scpi = app.ScpiStringParser
Dim startfreq As Double
startfreq = 100e6
' scpi.Parse "Sens:Freq:Start " & startfreq'Write
```

```vbnet
Dim str As String
str = scpi.Parse("Sens:Freq:Start?")'Read
```

**C++ Syntax**

```cpp
HRESULT Parse(BSTR SCPI_Command, BSTR *pQueryResponse)
```

**Interface**

IScpiParamStringParser

**Factory Preset Settings**

**Preset Method**

**Description**  
**Application Object:** Deletes all traces and windows. In addition, resets the analyzer to factory defined default settings and creates an S11 measurement named "CH1_S11_1" in window 1.

**Channel Object:** Resets the channel (object) to factory defined default settings. Does NOT delete the current measurements or add a new measurement.

**VB Syntax**  
app.Preset
chan.Preset

**Variable**  
(Type) - Description

app  An Application (object)
chan A Channel (object)

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
app.Preset

**C++ Syntax**  
HRESULT Preset()

**Interface**  
IApplication
IChannel
# PreviousIFBandwidth Method

**Description**  
A function that returns the previous IF Bandwidth value. Use to retrieve the list of available IFBandwidth settings.

**VB Syntax**  
`chan.Previous_IFBandwidth bw`

**Variable**  
**Type** - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>chan</code></td>
<td>A Channel (object)</td>
</tr>
<tr>
<td><code>bw</code></td>
<td>(double) - The argument that you use to send an IFBandwidth. The function uses this argument to return the previous IFBandwidth.</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
```vbnet
Public pnbw As Double 'declare variable outside of procedure
PreBW = chan.IFBandwidth 'put the current IFBW in PreBW
chan.Previous_IFBandwidth PreBW 'function returns the Previous IFBandwidth of the current one.
chan.IFBandwidth = PreBW 'set IFBW to the previous value
```

**C++ Syntax**  
`HRESULT Previous_IFBandwidth (double *pVal)`

**Interface**  
IChannel
### PrintToImage Method

**Description**
Saves the screen image to a bitmap file.

**VB Syntax**
```vbnet
app.PrintToFile filename
```

**Variable**
- **app** (Application (object))
- **filename** (string) Full path, file name, and extension of the screen image file.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents". Use one of the following extensions:

- .bmp - not recommended due to large file size
- .jpg - not recommended due to poor quality
- .png - recommended

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.PrintToFile "C:/Program Files/Agilent/Network Analyzer/Documents/myfile.png"
```

**C++ Syntax**
`HRESULT PrintToFile(BSTR bstrFile)`

**Interface**
IApplication
PutComplex Method

Description
Puts real and imaginary data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten. Learn more about reading and writing Cal Data using COM.

Data put in the raw data store will be re-processed whenever a change is made to the measurement attributes such as format or correction.

Data put in the measurement results store will be overwritten by any measurement attribute changes.

See also putNAComplex

VB Syntax
```
measData.putComplex location, numPts, real(), imag(), [format]
```

Variable (Type) - Description

**measData** An IArrayTransfer interface which supports the Measurement object

**location** (enum NADataStore) Where the Data will be put. Choose from:
- 0 - naRawData
- 1 - naCorrectedData
- 2 - naMeasResult
- 3 - naRawMemory
- 4 - naMemoryResult
- 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

**numPts** (long integer) - Number of data points in the channel

**real()** (single) - Array containing real data values

**imag()** (single) - Array containing imaginary data values

**format** (enum NADataFormat) optional argument - display format of the real and imaginary data. Only used if destination is naMeasResult or naMemoryResult buffer. If unspecified, data is assumed to be in naDataFormat_Polar

- 0 - naDataFormat_LinMag
- 1 - naDataFormat_LogMag
- 2 - naDataFormat_Phase
- 3 - naDataFormat_Polar
- 4 - naDataFormat_Smith
- 5 - naDataFormat_Delay
- 6 - naDataFormat_Real

1903
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhasUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vba
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.putComplex naMemoryResult, 201,
real(0), imag(0), naDataFormat_SWR
```

**C++ Syntax**
```cpp
HRESULT putComplex( tagNADataStore DataStore, long lNumValues, float* pReal,
float* pImag, tagDataFormat displayFormat)
```

**Interface**
IArrayTransfer

PutDataComplex Method

Description
Puts complex data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten.

VB Syntax
meas.putDataComplex location, data

Variable (Type) - Description
meas A measurement (object)
location (enum NADataStore) Where the Data will be put. Choose from:

0 - naRawData
1 - naCorrectedData
2 - naMeasResult
3 - naRawMemory
4 - naMemoryResult
5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

- Data put in 0 - naRawData will be re-processed whenever a change is made to the measurement attributes such as format or correction.
- Data put in 2 - naMeasResult will be overwritten by any measurement attribute changes.
- When putting data into 3 - naRawMemory:
  1. Put the analyzer in hold mode
  2. Call DataToMemory to initialize a memory buffer
  3. Call putDataComplex(naRawMemory, data)
This ensures that the memory buffer is appropriately initialized before receiving new data.

data (variant) - A two-dimensional variant array.

Note: All buffers except naMeasResult and naMemoryResult require Complex data

Return Type
Not Applicable

Default
Not Applicable

Examples
' Put 201 points worth of raw (complex) data into the measurement
' Note that an array of complex numbers is represented by a 2-D
array where the first rank is the number of points, and the 2nd rank is always size 2 (max index 1) representing the Real and Imag parts of the complex number.

' complex array of data (2nd dimension of size 2 represents Re/Im
Dim data(200,1) 
For i = 0 to 200
' Set Real part of data point i
data(i,0) = i/200;
' Set Imag part of data point i
data(i,1) = i/200;
Next
app.ActiveMeasurement.putDataComplex naRawData, data

C++ Syntax HRESULT putDataComplex(tagNADataStore DataStore, VARIANT complexData)

Interface IMeasurement
PutENRData Method

**Description**  Write ENR calibration data to PNA memory. All of the frequency and ENR data must be sent at the same time.

**VB Syntax**  
```
enr.PutENRData (vData)
```

**Variable**  
**(Type)** - **Description**

- **enr**  An [ENRFile](#) (object)
- **vData**  (Variant array) - ENR data. Frequency value in Hz, followed by corresponding ENR value in dB. Enter as many data pairs as necessary.

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  
See example program

**C++ Syntax**  
```cpp
HRESULT PutENRData(VARIANT vdata);
```

**Interface**  IENRFile

### PutErrorTerm Method - Superseded

**Description**

Note: This command is replaced by `PutErrorTermByString`.

Puts variant error term data into the error-correction buffer.

Learn about reading and writing Calibration data.

**VB Syntax**

```vba
cal.putErrorTerm(term, rcv, src, data)
```

**Variable**

- `cal` (A Calibrator **object**)
- `term` (**enum As NaErrorTerm**)
  - `naErrorTerm_Directivity_Isolation`
  - `naErrorTerm_Match`
  - `naErrorTerm_Tracking`
- `rcv` (**long integer**) - Receiver Port
- `src` (**long integer**) - Source Port
- `data` (**variant**) Error term data in a two-dimensional array (0:1, 0:numpts-1).

HRESULT putErrorTerm(tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, VARIANT varData)
```

Interface  ICalSet
PutErrorTermByString Method

**Description**
Puts error term data into the Cal Set.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

**VB Syntax**
calSet.PutErrorTermByString(errorName, vdata)

**Variable (Type) - Description**

- **calSet** (Object) A CalSet Object
- **errorName** (String) The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see GetErrorTermList2.
- **vdata** (Variant) This data array is usually two dimensional. Each element is a type single. The two elements represent the real and imaginary parts of a complex pair.

**Note:** This structure is compatible with scripting clients who can only use variants. For alternative methods that use typed arrays, see ICalData3.

**Return Type**

**Return Type**
- Not Applicable

**Default**
- Not Applicable

**Examples**

```vbnet
Dim eData As ICalData
Set eData = chan.Calibrator
eData.putErrorTermComplex naErrorTerm_Directivity_Isolation, 1, 1, 201, rel(0), img(0)
```

**C++ Syntax**

```cpp
HRESULT putErrorTermComplex(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)
```

**Interface**
- ICalData
PutErrorTermComplex Method  Superseded

Description
This command is replaced with PutErrorTermComplexByString

Puts error term data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

VB Syntax
`data.putErrorTermComplex term, rcv, src, numPts, real(), imag()`

Variable (Type) - Description

- `data` An `ICalData2` pointer to a Cal Set object
- `term` (enum `NAErrorTerm2`) - The error term to be written. Choose from:
  - 0 - naET_Directivity
  - 1 - naET_SourceMatch
  - 2 - naET_ReflectionTracking
  - 3 - naET_TransmissionTracking
  - 4 - naET_LoadMatch
  - 5 - naET_Isolation
- `rcv` (long) - Receiver Port
- `src` (long) - Source Port
- `numPts` (long) - number of data points in the real and imaginary arrays.
- `real()` (single) - array containing the real part of the calibration data. One-dimensional: the number of data points.
- `imag()` (single) - array containing the imaginary part of the calibration data. One-dimensional: the number of data points.

Return Type
Not Applicable

Default
Not Applicable

Examples
```
Dim eData As ICalData2
Set eData = app.GetCalManager.Cal Sets.Item(1)
eData.putErrorTermComplex naET_LoadMatch, 1, 2, numpts, rel(0), img(0)
```

C++ Syntax
```
HRESULT putErrorTermComplex(tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float plmag)
```
Interface  ICalData2
### PutErrorTermComplexByString Method

**Description**  
Puts error term data into the Cal Set.  
Learn more about [Reading and Writing Cal Data](#).  
See examples of [Reading](#) and [Writing](#) Cal Set Data.

**VB Syntax**  
`ICalData3.PutErrorTermComplexByString errorName, InumPoints, real(0), imag(0)`

**Variable**  
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ICalData3</code></td>
<td>An <code>ICalData3</code> pointer to a Cal Set object.</td>
</tr>
<tr>
<td><code>errorName</code></td>
<td>(String) The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be &quot;Directivity(3,3)&quot;. To determine the string names of error terms, see <a href="#">GetErrorTermList2</a>.</td>
</tr>
<tr>
<td><code>InumPoints</code></td>

</tr>
<tr>
<td></td>
<td>13 - naDataFormat_Centigrade</td>
<td></td>
</tr>
</tbody>
</table>

Learn more about Data Format.

**Note:** Smith, InverseSmith, and Polar formats are not allowed.

**numPts**

(integer) - Number of values. Usually the number of points in the trace (chan.NumberOfPoints).

**data**

(scalar) - A one-dimensional array of Scalar data matching the number of points in the current measurement.

**Return Type**

Not Applicable

**Default**

Not Applicable
Examples
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.putScalar naDataFormat_LogMag, 201, dScalar(0)

C++ Syntax
HRESULT putScalar((tagDataFormat eFormat, long lNumValues, float* pArrayOfScalar)

Interface
IArrayTransfer

Last Modified:
1-Oct-2007   Added temperature formats
PutNAComplex Method

**Description**
Puts complex data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten. The data is processed and displayed.

Data put in the naRawData store will be **re-processed** whenever a change is made to the measurement attributes such as format or correction.

Data put in the naMeasResult store will be **overwritten** by any measurement attribute changes (such as moving a marker).

**Note:** This method uses NAComplex which is a user-defined data type. If you cannot or prefer not to use this data type, use the putComplex method.

**VB Syntax**
```vbnet
measData.putNAComplex location, numPts, data, [format]
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>measData</td>
<td>An IArrayTransfer interface which supports the Measurement object</td>
</tr>
<tr>
<td>location</td>
<td>(enum NADataStore) Where the Data will be put. Choose from:</td>
</tr>
<tr>
<td>numPts</td>
<td>(long integer) - Number of data points in the channel</td>
</tr>
<tr>
<td>data</td>
<td>(NAComplex) - A one-dimensional array of Complex data matching the number of points in the current measurement.</td>
</tr>
<tr>
<td>format</td>
<td>(enum NADataFormat) - Optional argument. Format of the data. If unspecified, naDataFormat_Polar is assumed. Only used when the destination store is naMeasResult or naMemoryResult.</td>
</tr>
</tbody>
</table>

- 0 - naDataFormat_LinMag
- 1 - naDataFormat_LogMag
- 2 - naDataFormat_Phase
- 3 - naDataFormat_Polar
- 4 - naDataFormat_Smith
- 5 - naDataFormat_Delay
- 6 - naDataFormat_Real
Learn more about Data Format.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement

measData.putNAComplex naMemoryResult, 201, dRawComplex(0)
```

**C++ Syntax**

```cpp
HRESULT putNAComplex(tagNADataStore DataStore, long lNumValues, TsComplex* pArrayOfComplex, tagDataFormat displayFormat)
```

**Interface**
IArrayTransfer

Last Modified:

1-Oct-2007 Added temperature formats
**put_Output Method**

**Description**
Writes a TTL HI or TTL Low to output pins 3 or 4 of the Material Handler IO connector. Each pin also has a latched output which is written to with USER. With the latched (USER) outputs, the value is not applied to the associated pin until a positive edge is detected at INPUT1 (pin 2).

**VB Syntax**
```
handlerIo.put_Output (pin) = value
```

**Variable** *(Type) - Description*
- **handlerIo** *(object)* - A HandlerIO object
- **pin** *(enum as NAMatHandlerOutput)* - pin to write data to. Choose from:
  - **naOutput1** *(0)* - pin3
  - **naOutput1User** *(1)* - pin3 latched (applied to pin 3 on positive edge of Input1-pin2)
  - **naOutput2** *(2)* - pin4
  - **naOutput2User** *(3)* - pin4 latched (applied to pin 4 on positive edge of Input1-pin2)
- **value** *(Variant)* - Value to write to the selected pin. Choose from:
  - **0** - TTL LOW
  - **1** - TTL HIGH

**Return Type**
Not Applicable

**Default**
0

**Examples**
```
handlerIo.put_Output(naOutput1) = 1
```

**C++ Syntax**
```
HRESULT put_Output ( tagNAMatHandlerOutput Output, VARIANT Data );
```

**Interface**
IHWMaterialHandlerIO
**About the Aux I/O Connector**

**put_OutputVoltage Method**

**Description**
- **E836x and PNA-L:** Sets voltages on the DAC/Analog Output 1|2 of the Auxiliary IO connector.

- **PNA-X:** Sets voltage on the Power I/O connector AnalogOut1|2.

Read output voltages using `get_OutputVoltage` Method.

**VB Syntax**

```
AuxIO.put_OutputVoltage output, voltage
```

**Variable**

- **(Type) - Description**
  - **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
  - **output** *(variant)* - Number of the output DAC to write voltage to. Choose from:
    1. Output 1 (Aux I/O pin 3) and (Power I/O pin 3)
    2. Output 2 (Aux I/O pin 2) and (Power I/O pin 4)
  - **voltage** *(double)* - Voltage to write to the output DAC. Choose a voltage from -10 to 10

**Return Type**

None

**Default**

None

**Examples**

```
HWAuxIO.put_OutputVoltage 1,9 'set Analog Out1 to +9v
```

**C++ Syntax**

```
HRESULT put_OutputVoltage (VARIANT Output, double Voltage);
```

**Interface**

IHWAuxIO

---

**Last Modified:**

10-Jul-2007  Added PNA-X capability
Write-only

**put_OutputVoltageMode Method**

**Description**
This command sets the mode of the selected “Analog Out” line on the Auxiliary IO connector and Power I/O connector. The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done. To read the mode on each output use get_OutputVoltageMode Method.

**VB Syntax**
`auxIo.put_OutputVoltageMode (output, mode)`

**Variable (Type) - Description**
- **auxIo (Object)** An AuxIO object
- **output** Analog Output to receive mode setting. Choose from 1 or 2
- **mode (enum NAOutputVoltageMode )**
  - **naWaitEOS** - While in this mode any voltage changes sent to the selected analog out will only get applied to the output between sweeps.
  - **naNoWait** - While in this mode any voltage changes sent to the selected analog out will occur right away without waiting until the end of a sweep, the voltage gets applied immediately.

**Return Type**
NAOutputVoltageMode

**Default**
naWaitEOS

**Examples**
`auxIo.put_OutputVoltageMode 1, naWaitEOS 'Write`

**C++ Syntax**
`HRESULT put_OutputVoltageMode(VARIANT Output, tagNAOutputVoltageMode dNewMode);`

**Interface**
IHWAuxIO

---

Last Modified:
10-Jul-2007  Added PNA-X capability
**Write-only**  

**About the Handler IO Connector**

### put_Port Method

**Description**
Writes a value to the specified port. Use the `get_Port` Method to read the settings from the "readable" ports (C, D, E).

**VB Syntax**
```
handlerIo.put_Port (port, value)
```

**Variable** *(Type) - Description*

- `handlerIo` *(object)* - A HandlerIO object
- `port` *(enum as NAMatHandlerPort)* - port to put data into. Choose from:
  - `naPortA` - (0)
  - `naPortB` - (1)
  - `naPortC` - (2)
  - `naPortD` - (3)
  - `naPortE` - (4)
  - `naPortF` - (5)
  - `naPortG` - (6)
  - `naPortH` - (7)
- `value` The number of the data bits to set. The following table shows what the `value` represents:

**Note:** When writing to port G, port C must be set to output mode  
When writing to port H, both port C and port D must be set to output mode. Use Port Mode Property

<table>
<thead>

<td>B7...B0 + A7...A0</td>
<td>Write-only</td>
</tr>
</tbody>
</table>
Return Type: Not Applicable
Default: Not Applicable
Examples: `handlerIo.put_Port(naPortB, 1)`

C++ Syntax: `HRESULT put_Port ( tagNAMatHandlerPort Port, VARIANT Data );`

Interface: IHWMaterialHandlerIO

Last Modified: 21-Mar-2008  Fixed syntax
# put_PortCData Method

**Description**  
Writes a 4-bit value to Port C on the Aux I/O connector (pins 22-25) and the Material Handler IO (pins 21-24 Anritsu) - (pins 22-25 Avantest).

**Note:** These lines are connected to both the Handler IO and Aux IO in the PNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**  
```vbnet
AuxIO.put_PortCData num
```

**Variable**  
- **(Type) - Description**
  - `AuxIO` *(object)* - A Hardware Auxiliary Input / Output object
  - `num` *(variant)* - 4 bit binary value. Choose from 0-15

**Return Type**  
None

**Default**  
None

**Examples**  
```vbnet
HWAuxIO.put_PortCData 15  'If Positive Logic, Port C lines C0, C1, C2, C3 go High. If Negative Logic, they go Low.
```

**C++ Syntax**  
```c++
HRESULT put_PortCData( VARIANT Data );
```

**Interface**  
IHWAuxIO
PutDataScalar Method

**Description**

Puts formatted variant scalar data into the measurement result buffer. The data will be immediately processed and displayed. Subsequent changes to the measurement state will be reflected on the display.

Always precede this command by setting the format on the measurement to be consistent with the format of the data being sent to the analyzer. In this way, the display annotation will be correct.

Execution of this command does not change the display format.

**VB Syntax**

```vb
meas.putDataScalar format, data
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas</td>
<td>A measurement (object)</td>
</tr>
<tr>
<td>format</td>
<td>(enum NADeformFormat) Format of the data. This value is presently ignored by the PNA. Data is always presented in the current format. Choose from: 0 - naDataFormat_LinMag 1 - naDataFormat_LogMag 2 - naDataFormat_Phase 3 - naDataFormat_Polar 4 - naDataFormat_Smith 5 - naDataFormat_Delay 6 - naDataFormat_Real 7 - naDataFormat_Imaginary 8 - naDataFormat_SWR 9 - naDataFormat_PhaseUnwrapped 10 - naDataFormat_InverseSmith 11 - naDataFormat_Kelvin 12 - naDataFormat_Fahrenheit 13 - naDataFormat_Centigrade</td>
</tr>
</tbody>
</table>

**Notes:**

- The `getData` (variant) method includes a "format" argument, which allows scalar (one-dimensional) data. To put data back into the "raw" data buffer using this (putDataComplex) method, specify **Polar** format when using the `getData` method.

- **Phase** format accepts data in radians (not degrees) and displays in degrees. To convert to degrees: radians \* (57.29577951308233) = degrees. The `getData` method returns degrees if the request is for phase data.
data (variant) - A 1-dimension array of single precision floating point numbers.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
' Put 201 points worth of scalar data into the measurement
' 200 is max index, so 0 to 200 is 201 points
Dim data(200) ' array of 201 (scalar) data points
' Fill the array
For i = 0 to 200
    data(i) = i/200;
Next
app.ActiveMeasurement.putDataScalar 0, data

**C++ Syntax**
HRESULT putDataScalar(tagNADataStore DataStore, VARIANT scalarArray)

**Interface**
IMeasurement

Last Modified:
1-Oct-2007  Added temperature formats
PutShortcut Method

**Description**
Defines a Macro (shortcut) file in the analyzer. This command links a file name and path to the Macro file. The file must be put in the PNA at the location indicated by this command.

**VB Syntax**
```
app.PutShortcut index,title,path, arguments
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><code>index</code></td>
<td>(long) - Number of the macro to be stored in the analyzer. If the index number already exists, the existing macro is replaced with the new macro.</td>
</tr>
<tr>
<td><code>title</code></td>
<td>(string) - The name to be assigned to the macro</td>
</tr>
<tr>
<td><code>path</code></td>
<td>(string) - Full path, file name, and extension of the existing macro &quot;executable&quot; file.</td>
</tr>
<tr>
<td><code>arguments</code></td>
<td>(string) - Arguments that may be required for the specified macro to run.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
app.PutShortcut 1, "Test", "C:/Automation/MyTest.vbs", ""
```

**C++ Syntax**
```
HRESULT PutShortcut(long Number, BSTR title, BSTR pathname,BSTR arguments)
```

**Interface**
IApplication

### putSourcePowerCalDataEx Method

<table>
<thead>
<tr>
<th>Description</th>
<th><strong>Note:</strong> This method replaces putSourcePowerCalData Method</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Inputs source power calibration data (as variant data type) to this channel for a specific source port.</td>
</tr>
<tr>
<td></td>
<td>The effect from this command on the channel is immediate. Do NOT send ApplyPowerCorrectionValuesEX after this command as it may invalidate the uploaded data.</td>
</tr>
<tr>
<td></td>
<td>If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values command to return the X-axis values in the displayed order.</td>
</tr>
<tr>
<td></td>
<td>The calibration is not valid if the current number of points on the channel is not equal to the number of values that were input.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This method sends variant data which is less efficient than methods available on the ISourcePowerCalData interface.</td>
</tr>
</tbody>
</table>

### VB Syntax

```vbnet
chan.putSourcePowerCalDataEx buffer, srcPort, data
```

<table>
<thead>
<tr>
<th>Variable</th>
<th><strong>(Type)</strong> - <strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>(object) – A Channel object</td>
</tr>
<tr>
<td>buffer</td>
<td>(enum NASourcePowerCalBuffer) - The source power cal data buffer to write to.</td>
</tr>
<tr>
<td></td>
<td>0 - naCorrectionValues This is the only data buffer currently available.</td>
</tr>
<tr>
<td>srcPort</td>
<td>(long integer) – The source port for which calibration data is being requested.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.</td>
</tr>
<tr>
<td>data</td>
<td>(variant) – Array of source power cal data being input.</td>
</tr>
</tbody>
</table>

### Return Type
None

### Default
Not Applicable

### Examples

```vbnet
chan.putSourcePowerCalDataEx naCorrectionValues, 1, varData
```

### C++ Syntax

```csharp
HRESULT putSourcePowerCalDataEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, VARIANT varData);
```

### Interface
IChannel4
putSourcePowerCalDataScalarEx Method

Description

Note: This method replaces putSourcePowerCalDataScalar Method

Inputs source power calibration data (as scalar values) to this channel for a specific source port.

The effect from this command on the channel is immediate. Do NOT send ApplyPowerCorrectionValuesEX after this command as it may invalidate the uploaded data.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values2 command to return the X-axis values in the displayed order.

VB Syntax

```vbnet
chanData.putSourcePowerCalDataScalarEx buffer, srcPort, numValues, data
```

Variable (Type) - Description

- **chanData** (interface) – An ISourcePowerCalData2 interface on the Channel (object)
- **buffer** (enum NASourcePowerCalBuffer) - The source power cal data buffer to write to.
  - 0 - naCorrectionValues This is the only buffer currently available.
- **srcPort** (long integer) – The source port for which calibration data is being input.
  
  Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- **numValues** (long integer) – Number of data values being input.
  
  Note: If this does not equal the current number of points on the channel, the calibration will not be valid.

- **data** (single) – Array of source power cal data being input.

Return Type

None

Default

Not Applicable

Examples

```vbnet
Dim chanData As ISourcePowerCalData2
Set chanData = app.ActiveChannel
chanData.putSourcePowerCalDataScalarEx naCorrectionValues, 1, 201, scalarCalValues(0)
```

C++ Syntax

```c++
HRESULT putSourcePowerCalDataScalarEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, long numValues, float *pData);
```
Interface ISourcePowerCalData2

Last Modified:

25-Oct-2010  Added immediate note
24-Apr-2008  Added string name note
PutStandard Method Superseded

Description

This command is replaced with PutStandardByString

Puts standard acquisition data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data.

VB Syntax

CalSet.putStandard class, rcv, src, data

Variable (Type) - Description

CalSet (object) - A Cal Set object

class (enum NACalClass) Standard. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards

1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards

1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation
rcv  (long) - Receiver Port

src  (long) - Source Port

data  (variant) Error term data in a two-dimensional array (0:1, 0:numpts-1). The data must be complex pairs.

**Note:** See also Put Standard Complex on the ICalData2 interface to avoid using the variant data type.

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  See an Example

**C++ Syntax**  HRESULT putStandard(tagNACalClass stdclass, long ReceivePort, long SourcePort, VARIANT varData)

**Interface**  ICalSet
PutStandardByString

**Description**  
Puts standard acquisition data into the Cal Set.  
Learn more about [Reading and Writing Cal Data](#).  
See examples of [Reading](#) and [Writing](#) Cal Set Data.

**VB Syntax**  
```vb
PutStandardByString(stdName, vdata)
```

**Variable**  
*(Type) - Description*

- **stdName** *(String)*  
The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be “S11C(3,3)”.

- **vdata** *(Variant)*  
The variant containing a safearray of variants. This data is usually two dimensional.

**Note:** The vardata array is a safearray of variants wrapped in a variant. This structure is compatible with scripting clients who can only use variants. For alternative methods that used typed arrays, see ICalData3.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
[See an Example](#)

**C++ Syntax**  
```cpp
HRESULT PutStandardByString( BSTR bufferName, VARIANT vdata);
```

**Interface**  
ICalSet2
About Cal Sets

PutStandardComplex Method  Superseded

Description
This command is replaced with PutStandardComplexByString
Puts standards acquisition data into the Cal Set.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax
ICalData2.putStandardComplex class, rcv, src, numPts,real(),imag()

Variable  (Type) - Description
ICalData2  An ICalData2 pointer to the Cal Set object

class  (enum NACalClass) Standard. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation
$rcv$ (long) - Receiver Port

$src$ (long) - Source Port

$numPts$ (long) - The number of data points in the real and imaginary arrays.

$real()$ (single) - one-dimensional array containing the real part of the acquisition data. (0:points-1)

$imag()$ (single) - one-dimensional array containing the imaginary part of the acquisition data. (0:points-1)

**Return Type**: Not Applicable

**Default**: Not Applicable

**Examples**

Dim sdata As ICalData2
Set sdata = calmanager.CreateCal Set( 1 )
sdata.putStandardComplex naSOLT_Open, 1, 1, numpts, rel(0), img(0)

**C++ Syntax**

HRESULT putStandardComplex(tagNACalClass stdclass, long ReceivePort, long SourcePort, long lNumValues, float* pReal, float* pImag)

**Interface**

ICalData2
PutStandardComplexByString

**Description**
Puts standard acquisition data into the Cal Set.
Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data.

**VB Syntax**

```
ICalData3.PutStandardComplexByString(stdName, lnumPoints, real(o), imag(0))
```

**Variable**

- **ICalData3**
  - An ICalData3 pointer to a Cal Set object.
- **stdName**
  - (String) The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".
- **lnumpoints**
  - (long) - The number of data points in the real and imaginary arrays.
- **real**
  - (Single) The real component of the complex data.
- **imag**
  - (Single) The imaginary component of the complex data.

**Return Value**
Single

**Default**
Not Applicable

**Examples**
See an Example

**C++ Syntax**

```
HRESULT PutStandardComplexByString(BSTR bufferName, long InumPoints, float* real, float* imag);
```

**Interface**
ICalData3
### Quit Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Terminates the Network Analyzer application.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.Quit</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>app</code></td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>app.Quit</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT Quit()</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td><code>IApplication</code></td>
</tr>
<tr>
<td><strong>Remarks</strong></td>
<td>Under the rules of COM, the server should not exit until all references to it have been released. This method is a brute force way of terminating the application. Be sure to release all references (or terminate the client program) before attempting to restart the Network Analyzer application. An alternate approach to terminating the application is to make the application invisible <em>(app.Visible = False)</em> and release all references. The server will shutdown.</td>
</tr>
</tbody>
</table>
Read-only

ReadData Method

Description
Reads a 13-bit data word from the specified address. Data is read using the AD0 through AD12 lines of the external test set connector. The instrument generates the appropriate timing signals. It automatically controls timing signals LDS, LAS and RLW to strobe the address, and then read the data, from the external test set. See the timing diagram for Address and Data I/O read.

VB Syntax
value = ExtIO.ReadData (address)

Variable (Type) - Description
value (variant) - Variable to store the returned data
ExtIO (object) - An ExternalTestSetIO object
address (variant) - address to read data from.

Return Type
Variant

Default
Not Applicable

Examples
value = ExtIO.ReadData (15)

C++ Syntax
HRESULT ReadData (VARIANT Address, VARIANT* Data);

Interface
IHWExternaTestSetIO
ReadRaw Method

Description
Reads a 16-bit value from the external test set. The 16-bit value is comprised of lines AD0 - AD12, Sweep Holdoff In and Interrupt In (inverted).

When this command is used the analyzer does NOT generate the appropriate timing signals; it simply reads the lines. The user needs to first use the WriteRaw method to do the initial setup. The RLW line (pin25) must be set to the appropriate level in order to read the test set connected.

Below is the format of data that is read with ReadRaw:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Bit</th>
<th>Signal name</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>0</td>
<td>AD0*</td>
</tr>
<tr>
<td>23</td>
<td>1</td>
<td>AD1*</td>
</tr>
<tr>
<td>11</td>
<td>2</td>
<td>AD2*</td>
</tr>
<tr>
<td>10</td>
<td>3</td>
<td>AD3*</td>
</tr>
<tr>
<td>9</td>
<td>4</td>
<td>AD4*</td>
</tr>
<tr>
<td>21</td>
<td>5</td>
<td>AD5*</td>
</tr>
<tr>
<td>20</td>
<td>6</td>
<td>AD6*</td>
</tr>
<tr>
<td>19</td>
<td>7</td>
<td>AD7*</td>
</tr>
<tr>
<td>6</td>
<td>8</td>
<td>AD8*</td>
</tr>
<tr>
<td>5</td>
<td>9</td>
<td>AD9*</td>
</tr>
<tr>
<td>4</td>
<td>10</td>
<td>AD10*</td>
</tr>
<tr>
<td>17</td>
<td>11</td>
<td>AD11*</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
<td>AD12*</td>
</tr>
<tr>
<td>2</td>
<td>13</td>
<td>Sweep Holdoff In</td>
</tr>
<tr>
<td>13</td>
<td>14</td>
<td>Interrupt In (inverted internally)</td>
</tr>
<tr>
<td>na</td>
<td>15</td>
<td>Always Zero, grounded internally</td>
</tr>
</tbody>
</table>
*These lines are dependent on the state of RLW (pin25).
Writing a 0(low) to RLW will set lines AD0-AD12 to write mode.
Writing a 1(high) to RLW will set lines AD0-AD12 to read mode.

**VB Syntax**

```
value = ExtIO.ReadRaw (address)
```

**Variable (Type) - Description**

- **value** (variant) - Variable to store the returned data
- **ExtIO** (object) - An External IO object
- **address** (variant) - Address to read data from

**Return Type**

Real

**Default**

Not Applicable

**Examples**

```
value = ExtIO.ReadRaw (address)
```

**C++ Syntax**

```
HRESULT ReadRaw( VARIANT* Input );
```

**Interface**

IHWExternalTestSetIO
### ReCalculate Method

Recall Method

**Description**
Recalls a measurement state, calibration state, or both, from the hard drive into the analyzer.

Use `app.Save()` to save files.

**VB Syntax**
`app.Recall(filename.ext)`

**Variable**
- **app**: An `Application` object
- **filename.ext**: Full path, file name, and extension, of the file.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"
Use one of the following extensions:

- `.sta` - Instrument State
- `.cal` - Calibration file
- `.cst` - Both Instrument State and Calibration reference
- `.cti` - Citifile (data will always be formatted. See Recalling Citifiles Using the PNA)
- `.csa` - Instrument state and calibration data (not a reference pointer).

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
`app.Recall("C:/Program Files/Agilent/Network Analyzer/Documents/MyState.cst")` 'Recalls "mystate.cst" from the specified folder

**C++ Syntax**
HRESULT Recall(BSTR bstrFile)

**Interface**
IApplication
### Recall Kits Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Recalls the calibration kits definitions that were stored with the SaveKits command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.RecallKits</code></td>

</tr>
</tbody>
</table>
**Remove Method**

**Description**
Removes an item from a collection of objects.

**VB Syntax**
`Object.Remove item`

**Variable**
*(Type)* - Description

- **Object**
  Any of the following *(objects)*
  - `CalFactorSegments` collection
  - `CalFactorSegmentsPMAR` Collection
  - `Cal Sets` collection
  - `Channels Collection`
  - `ExternalDevices` Collection
  - `GuidedCalibrationPowerSensors` Collection
  - `Measurements` collection
  - `NAWindows` collection
  - `PowerLossSegments` collection
  - `PowerLossSegmentsPMAR_Collection`
  - `Segments` collection

**Note:** `Segments`, `CalFactorSegments`, and `PowerLossSegments` have an OPTIONAL argument `[size]` referring to the number of segments to remove, starting with the `item` parameter.

**Note:** `Segments` - When ALL segments are deleted, `SweepType` is automatically set to Linear because there are no segments to sweep.

- **item** *(variant)* - Collection Item number to be removed.
  **Note:** The `ExternalDevices` Collection requires that you specify `item` as the string name of the device. For example:
  `extDevices.Remove ('mySource')`

**Return Type**
Not Applicable

**Default**
Not Applicable
Examples

Measurements.Remove 3 'Removes the third measurement in the collection
segments.Remove 2,20 'Removes 20 segments (2 - 21)

C++ Syntax

HRESULT Remove(VARIANT index); //Measurements
HRESULT Remove(VARIANT index); //Cal Sets
HRESULT Remove(long windowNumber); //NAWindows
HRESULT Remove(VARIANT index, long size); //Segments
HRESULT Remove(VARIANT index, long size); //CalFactorSegments(PMAR)
HRESULT Remove(VARIANT index, long size); //PowerLossSegments(PMAR)
HRESULT Remove(BSTR name) //ExternalDevices
HRESULT Remove(VARIANT index) // Channels - specify collections index, not the channel number.
HRESULT Remove(VARIANT index); //GuidedCalibrationPowerSensors

Interface

**About Modifying Cal Kits**

### RestoreCalKitDefaults Method

**Description**
Restores the original properties of the specified Cal Kit, overwriting the last definition with the factory defaults.

**NOTE**: ONLY works with PNA releases 1.0 through 1.6.

**VB Syntax**

```vbnet
app.RestoreCalKitDefaults calKit
```

**Variable (Type) - Description**

- **app** An Application (object)
- **calKit** (enum NACalKit) - Calibration Kit to restore. Choose from:
  1. naCalKit_85032F_N50
  2. naCalKit_85033E_3_5
  3. naCalKit_85032B_N50
  4. naCalKit_85033D_3_5
  5. naCalKit_85038A_7_16
  6. naCalKit_85052C_3_5_TRL
  7. naCalKit_User7
  8. naCalKit_User8
  9. naCalKit_User9
  10. naCalKit_User10

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
app.RestoreCalKitDefaults naCalKit_MechKit10
```

**C++ Syntax**

```
HRESULT RestoreCalKitDefaults(tagNACalKit kit)
```

**Interface** IApplication
## RestoreCalKitDefaultsAll Method

**Description**
Restores the original properties of ALL of the Cal Kits, overwriting the last definitions with the factory defaults.

**NOTE:** ONLY works with PNA releases 1.0 through 1.6.

### VB Syntax
`app.RestoreCalKitDefaultsAll`

### Variables

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

### Return Type
Not Applicable

### Default
Not Applicable

### Examples
`app.RestoreCalKitDefaultsAll`

### C++ Syntax
`HRESULT RestoreCalKitDefaultsAll()`

### Interface
IAplication
About PNA Preferences

**RestoreDefaults Method**

**Description**
Resets the PNA preferences to their factory default settings.

**VB Syntax**
`pref.RestoreDefaults`

**Variable** *(Type)* - Description
- `pref` A `Preferences (object)`

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
`pref.RestoreDefaults`

**C++ Syntax**
`HRESULT RestoreDefaults()`

**Interface**
IPreferences9

---

Last Modified:

24-Apr-2008 MX New topic
### Resume Method

**Description**  
Resumes the trigger mode of all channels that was in effect before sending the `channels.Hold` method. `Channels.Hold` must be sent before `channels.Resume`, using the same instance of the `Channels` object.

**VB Syntax**  
`chsns.Resume`

**Variable**  
*(Type)*  - Description

- `chsns` - A Channel collection *(object)*

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`chsns.Resume`

**C++ Syntax**  
`HRESULT Resume();`

**Interface**  
IChannels2
Save Method

**Description**
Saves the appropriate content to the hard drive depending on the extension that is provided.

Some saved files can be recalled using `app.Recall`, depending on the content.

**VB Syntax**
```
app.Save(filename.ext)
```

**Variable**

- **`app`** - *Type* - *Description*
  
  `app` - An Application (object)

- **`filename.ext`** - *Type* - *Description*
  
  `filename.ext` - Full path, file name, and extension of the file.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

Use one of the following extensions:

- **.cst** - Saves both Instrument State and Cal Set reference - Recalls a calibrated measurement. (Recallable)
- **.sta** - Saves Instrument State only - recalls the instrument state without calibration. (Recallable)
- **.cal** - Calibration file – saves the active Cal Sets currently in use by any channel. Use this mode for archival purposes only. All Cal Sets are saved to a Cal Set data file. This mode provides a method of safeguarding calibration data. This data can be restored to the list of Cal Sets available in the instrument. (Recallable)
- **.csa** - Saves both instrument state AND actual calibration data, not a reference pointer to the Cal Set.
- **.prn** - Saves active trace in comma-separated format (not recallable)
- **.bmp** - Saves a Bitmap of the screen (not recallable)
- **.s1p** - Saves 1-port measurement data
- **.s2p** - Saves 2-port measurement data
- **.s3p** - Saves 3-port measurement data
- **.s4p** - Saves 4-port measurement data

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
app.Save("C:/Program Files/Agilent/Network Analyzer/Documents/Newfolder/MyState.cst") 'Saves "mystate.cst" to the specified folder
```
**C++ Syntax**  HRESULT Save(BSTR bstrFile)

**Interface**  IApplication

Last Modified:

26-Jun-2007  Corrected example
Save Method

**Description**  Saves the current Cal Set to disk. This is the recommended method for saving a Cal Set.

Learn more about reading and writing Cal data using COM

**VB Syntax**  
`CalSet.Save`

**Variable**  
*CalSet* (object) - A *CalSet* object

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  
`myCalSet.Save`

See [Copy Method](#) for an example application of this command.

**C++ Syntax**  
`HRESULT Save();`

**Interface**  ICalSet
SaveCalSets Method  Superseded

**Description**
This command is replaced by `ICalSet::Save` which saves the data for only the current Cal Set to the disk.

Writes new or changed Cal Sets to disk. All Cal Sets are saved in a single file. This file is updated at the following times:

- When a Cal Set has been deleted.
- When a calibration has been performed through the front panel interface.
- When this method is called.
- When `ICalSet::Save` is called.

Learn more about reading and writing Cal data using COM

**VB Syntax**
```vbnet
object.SaveCalSets
```

**Variable**
- **(Type) - Description**
  - `object` (object) - A CalManager object or a Calibrator object

**Return Type**
None

**Default**
Not Applicable

**Example**
```vbnet
calMgr.SaveCalSets
```

**C++ Syntax**
```cpp
HRESULT SaveCalSets();
```

**Interface**
`ICalManager`
`ICalibrator`
SaveCitiDataData Method - Superseded

app.SaveCitiFormattedData("C:/Program Files/Agilent/Network Analyzer/Documents/Newfolder/myFDCitifile.cti") 'Saves "myFDCitifile.cti" to the specified folder
```

### C++ Syntax
```cpp
HRESULT SaveCitiFormattedData (BSTR bstrFile)
```

### Interface
IApplication5
### SaveData Method

**Description**
Stores trace data to the following file types: *.prn, *.cti, *.csv, *.mdf

To save snp files, use `WriteSnpFileWithSpecifiedPorts`.

To save instrument state and calibration files, use `Save`.

This command replaces the following:
- `SaveCitiDataData Method`
- `SaveCitiFormattedData Method`
- `CitiContents Property`
- `CitiFormat Property`

Some saved files can be recalled using `app.Recall`, depending on the content.

**VB Syntax**

```vb
app.SaveData filename, type, scope, format, selector
```

**Variable (Type) - Description**

- `app` An `Application` (object)
- `filename` (string) - Full path, file name, and extension of the file.

Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents"

### Parameters

<table>
<thead>
<tr>
<th>Type of file to save</th>
<th>&lt;type&gt; (String)</th>
<th>&lt;scope&gt; (String)</th>
<th>&lt;format&gt; (String)</th>
<th>&lt;selector&gt; (Integer)</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.prn</td>
<td>&quot;PRN Trace Data&quot;</td>
<td>&quot;Trace&quot;</td>
<td>&quot;Displayed&quot;</td>
<td>Measurement number</td>
</tr>
<tr>
<td>*.cti (unformatted)</td>
<td>&quot;Citifile Data Data&quot;</td>
<td>&quot;Trace&quot; or &quot;Auto&quot;</td>
<td>&quot;RI&quot;</td>
<td>Measurement number</td>
</tr>
<tr>
<td>*.cti (unformatted)</td>
<td>&quot;Citifile Data Data&quot;</td>
<td>&quot;Displayed&quot;</td>
<td>&quot;RI&quot;</td>
<td>1</td>
</tr>
</tbody>
</table>

Example: `app.SaveData "myData.prn","PRN Trace Data","Trace","Displayed",2`

Example: `app.SaveData "myData.cti","Citifile Data Data","AUTO","RI",3`

**Example**

```vb
app.SaveData "myData.cti","Citifile Data Data","AUTO","RI",3
```
**Example:** `app.SaveData "myData.cti","Citifile Formatted Data","AUTO","RI",3`  

<table>
<thead>
<tr>
<th><em>cti</em> (formatted)</th>
<th>&quot;Citifile Formatted Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.cti","Citifile Formatted Data","AUTO","MA",3`  

<table>
<thead>
<tr>
<th><em>cti</em> (formatted)</th>
<th>&quot;Citifile Formatted Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot; or &quot;Displayed&quot;</th>
<th>-1</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.cti","Citifile Formatted Data","DISPLAYED","MA",-1`  

<table>
<thead>
<tr>
<th><em>csv</em></th>
<th>&quot;CSV Formatted Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.csv","CSV Formatted Data","Trace","DB",3`  

<table>
<thead>
<tr>
<th><em>csv</em></th>
<th>&quot;CSV Formatted Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>-1</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.csv","CSV Formatted Data","displayed","RI",-1`  

<table>
<thead>
<tr>
<th><em>mdf</em></th>
<th>&quot;MDIF Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;Displayed&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.mdf","MDIF Data","trace","displayed",1`  

<table>
<thead>
<tr>
<th><em>mdf</em></th>
<th>&quot;MDIF Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot;</th>
<th>-1</th>
</tr>
</thead>
</table>

**Example:** `app.SaveData "myData.mdf","MDIF Data","displayed","displayed",-1`  

**Notes (for above file types)**  
Use `meas.Number` to read the measurement number of a trace.

**Scope:**  
"Trace" - specified measurement number only.
"Displayed" - all displayed measurements.
"Auto" - for all Standard Meas Class (S-parameter) channels:

- When correction is OFF, saves the specified trace
- When correction is ON, saves all corrected parameters associated with the
calibrated ports in the Cal Set.

"Auto" - for all other channels:

- When correction is OFF or ON, saves the specified trace

The following parameter combinations save *.csv files in specific formats for GCA and Swept IMD classes:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>&lt;type&gt;</th>
<th>&lt;scope&gt;</th>
<th>&lt;format&gt;</th>
<th>&lt;selector&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(String)</td>
<td>(String)</td>
<td>(String)</td>
<td>(Integer)</td>
</tr>
</tbody>
</table>

**GCA channels ONLY:**

- "GCA Sweep Data"
- "Auto"
- "DB"

Example: app.SaveData "myData.csv","GCA Sweep Data","Auto","db",1

**Swept IMD channels ONLY:**

- "IMD Sweep Data"
- "Auto"
- "DB"

Example: app.SaveData "myData.csv","IMD Sweep Data","Auto","db",1

**Return Type** Not Applicable

**Default** Not Applicable

**C++ Syntax**

```c++
HRESULT SaveData(BSTR File, BSTR Type, BSTR Scope, BSTR Format, Long selector);
```

**Interface** IApplication18

Last Modified: 9-Apr-2010  MX New topic
SaveENRFile Method

Description
Saves an ENR table to disk.

VB Syntax
enr.SaveENRFile (filename)

Variable
- **enr**: An ENRFile (object)
- **filename**: (String) - Absolute path and filename of the ENR file.

Return Type
Not Applicable

Default
Not Applicable

Examples
See example program

C++ Syntax
HRESULT SaveENRFile(BSTR filename);

Interface
IENRFile

Last Modified:
2-Aug-2007  MX New topic
SaveFile Method

Description
Saves the mixer/converter test setup to a mixer attributes (.mxr) file.

VB Syntax
obj.SaveFile (filename)

Variable (Type) - Description

obj
A Mixer Interface pointer to the Measurement (object)
Or
A Converter Object

filename
(String) Full path, file name, and .mxr extension of the file.
Files are typically stored in "C:/Program Files/Agilent/Network Analyzer/Documents".

Return Type
String

Default
Not Applicable

Examples
mixer.SaveFile ("C:/Program Files/Agilent/Network Analyzer/Documents/myMixer.mxr")

C++ Syntax
HRESULT SaveFile(BSTR newVal)

Interface
IMixer
IConverter

Last Modified:
2-Feb-2009 Added Converter
SaveToDiskMemory Method

Description
Saves the User Characterization to PNA disk memory. To save to ECal internal memory, use \texttt{SaveToECal Method}. User Characterization can be saved to both PNA disk memory and ECal module memory.

\textbf{Note:} An ECal confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

VB Syntax
\texttt{userChar.SaveToDiskMemory (name)}

Variable \textbf{(Type)} - Description
\begin{itemize}
\item \texttt{userChar} An \texttt{ECalUserCharacterizer (object)}
\item \texttt{name} (String) User characterization name. Although there is no limit to the number of characters, only about 10 characters appear in the Cal Wizard dialog when selecting a user characterization for use.
\end{itemize}

Return Type
Not Applicable

Default
Not Applicable

Examples
\texttt{userChar.SaveToDiskMemory "DUT1"}

C++ Syntax
\texttt{HRESULT SaveToDiskMemory(BSTR name);}

Interface
\texttt{IECalUserCharacterizer2}

Last Modified:
- 15-Jun-2010 Added Note
- 25-Aug-2009 MX New topic
## SaveToECal Method

**Description**  
Saves the User Characterization to the ECal module. This can take several minutes to complete. To save to PNA disk memory, use [SaveToDiskMemory Method](#). User Characterization can be saved to both PNA disk memory and ECal module memory.

**VB Syntax**  
`userChar.SaveToECal`

**Variable**  
(Variable) - Description

- `userChar` - An [ECalUserCharacterizer](#) (object)

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`userChar.SaveToECal`

**C++ Syntax**  
`HRESULT SaveToECal();`

**Interface**  
IECalUserCharacterizer

**SearchPowerNormalOperatingPoint Method**

**Description**
Initiates a PNOP marker search.
Turns on and sets markers 1, 2, 3, and 4 to calculate various PNOP parameters.
First set **BackOff** and **PinOffset**.
To turn off these markers, either turn them off individually or **DeleteAllMarkers**.
To search a **UserRange**, first activate marker 1 and set the desired UserRange. Then send the SearchPowerNormalOperatingPoint command. The user range applies only to marker 1 searching for the max value. The other markers may fall outside the user range.

**VB Syntax**
```
pnop.SearchPowerNormalOperatingPoint( )
```

**Variable**
- **Type** - **Description**
  - `pnop` A **PNOP (object)**

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
pnop.SearchPowerNormalOperatingPoint
```
See example program

**C++ Syntax**
```

SearchFilterBandwidth Method

**Description**
Searches the measurement data with the current BandwidthTarget (default is -3). To continually track the filter bandwidth, use BandwidthTracking.

This feature uses markers 1-4. If not already, they are activated. To turn off these markers, either turn them off individually or DeleteAllMarkers.

The bandwidth statistics are displayed on the analyzer screen. To get the bandwidth statistics, use either GetFilterStatistics or FilterBW, FilterCF, FilterLoss, or FilterQ.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To search a UserRange with the bandwidth search, first activate marker 1 and set the desired UserRange. Then send the SearchFilterBandwidth command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

**VB Syntax**
meas.SearchFilterBandwidth

**Variable**
- **meas** A Measurement (object)

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
meas.SearchFilterBandwidth

**C++ Syntax**
HRESULT SearchFilterBandwidth()

**Interface**
IMeasurement

About Mixer/Converter Settings

SegmentCalculate Method

**Description**
Calculates the specified parameter for the segment.

**VB Syntax**

```vb
conv.SegmentCalculate index, param
```

**Variable (Type) - Description**

- **conv** (A Converter Object)
- **index** (Long integer) Segment for which calculation is performed. Choose a segment between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the **Applied Mixer**.
- **param** (Enum as ConverterCalculation) Mixer port for which to calculate start and stop frequencies. Choose from:

<table>
<thead>
<tr>
<th>enum</th>
<th>1st or only stage requires:</th>
<th>In addition, 2nd stage requires:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 naCalculateINPUT</td>
<td>• Output Start and Stop frequencies</td>

Write-only

SelectCalSet Method

**Description**
Selects and applies a Cal Set to the specified channel.

**Note:** Error Correction is not automatically applied as a result of this command being issued. If there is more than one Cal Type in the Cal Set, you must explicitly choose the Cal Type you want to apply. (See meas.Caltype)

**VB Syntax**
```
channel.SelectCalSet calSet, restore
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>(object) - A Channel object</td>
</tr>
<tr>
<td>calSet</td>
<td>(string) - Cal Set to make active. Specify the Cal Set by GUID or Name. Use EnumerateCalSets to list the available Cal Sets.</td>
</tr>
<tr>
<td>restore</td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - The stimulus stored with the cal set will be applied to the channel.</td>
</tr>
<tr>
<td></td>
<td>False (0) - If a conflict is detected between the existing channel settings and the Cal Set stimulus settings, then the following will occur:</td>
</tr>
<tr>
<td></td>
<td>If interpolation is ON, then interpolation will be attempted. This may fail if the channel frequency is outside the range of the Cal Set.</td>
</tr>
<tr>
<td></td>
<td>If interpolation is OFF, the selection will be abandoned and an error is returned:</td>
</tr>
<tr>
<td></td>
<td>E_NA_CAL_STIMULUS_VALUES_EXCEEDED</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```
channel.SelectCalSet GUID, 1
chan.SelectCalSet "MyCalSet", 0
```

**C++ Syntax**
```
HRESULT SelectCalSet (BSTR strCset, bool bRestore);
```

**Interface**
IChannel

---

**Last Modified:**
29-Nov-2007    Modified to accept name
**SetAllSegments Method**

**Description**
Uploads a segment table to the PNA replacing any existing segment table. Segments must be ascending in frequency and non-overlapping. If they are not, the segments are 'adjusted' as they are from the User Interface control. The total number of points for all segments cannot exceed the PNA maximum number of points for a sweep.

**VB Syntax**
```
Segs.SetAllSegments (segdata)
```

**Variable**

- `segs`  A `Segments (Collection)`

- `segdata`  (Variant) A 2-dimensional array of Segment data:

  - dimension 0 is the number of elements in each segment.
  - dimension 1 is the number of segments that will be used.

The following is a list of dimension 0 elements for each segment:

**Note:** All elements must be dimensioned as either ALL Double or ALL Variant.

- 0 = Segment state (Boolean True or False)
- 1 = Number of Points in this segment (Integer)
- 2 = Start Freq (Double)
- 3 = Stop Freq (Double)
- 4 = IFBW (Double) optional
- 5 = Dwell Time (Double) optional
- 6 + = Power (Double) optional; see table below.

The first four data elements must always be supplied. After those values, data must be supplied for successive optional elements. For example, to set dwell time values, you must also supply IFBW values, because IFBW (#4) precedes dwell time (#5) in the array order.

The `IFBandwidthOption`, `SweepTimeOption`, and `SourcePowerOption` settings do NOT affect the order in which elements are interpreted.

The number of elements to supply for Power depends on the following two settings:

1. `SourcePowerOption` = True allows segments to have independent power levels.
2. `CouplePorts` = False allows different power levels for each test port.
<table>
<thead>
<tr>
<th>CouplePorts</th>
<th>SourcePowerOption</th>
<th>Number of Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>Each port has its own channel-wide power setting, which is set using TestPortPower. Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>Provide 6 elements + total number of ports. The first 7 elements are still interpreted the same. The remaining elements (in-order) are interpreted as the power levels to set on that segment for Ports 2 through N, where N is the total number of ports currently enabled for the PNA or for a PNA with multiport external test set.</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>Provide exactly 7 elements per segment. The last element (power) is honored.</td>
</tr>
</tbody>
</table>

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  See a VB example using this command

See a C++ example using this command

**C++ Syntax** HRESULT SetAllSegments (VARIANT Segments );

**Interface**  ISegments2

SetBBPorts Method

**Description**  For a Balanced - Balanced device type, maps the PNA ports to the DUT ports. Set the Balanced device type using the **DUTTopology Property**

**VB Syntax**  
```vbnet
balTopology.SetBBPorts p1Pos, p1Neg, p2Pos, p2Neg
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>balTopology</code></td>
<td>A <strong>BalancedTopology (object)</strong></td>
</tr>
<tr>
<td><code>p1Pos</code>, <code>p1Neg</code>, <code>p2Pos</code>, <code>p2Neg</code></td>
<td>(Long Integer) PNA port number that connects to each of the following DUT ports:</td>
</tr>
</tbody>
</table>

**Return Type**  Not applicable - To read port mappings, use the **BalancedTopology** properties.

**Default**  Not Applicable

**Examples**  
```vbnet
balTop.SetBBPorts 1,2,3,4
```

**C++ Syntax**  
```c++
HRESULT SetBBPorts (long p1Pos, long p1Neg, long p2Pos, long p2Neg)
```

**Interface**  IBalancedTopology
SetCalInfo Method

Description
Specifies the type of Unguided calibration. This method should be the first method called on the calibrator object. It prepares the internal state for the rest of the calibration.

Note: You can NOT perform a 3 or 4-port cal using SetCalInfo even though there is enumCalTypes. You must use the GuidedCalibration object.

Learn more about reading and writing Cal data using COM

The analyzer can measure both ports simultaneously, assuming you have two of each standard type. For a 2-port cal, See cal.Simultaneous2PortAcquisition

VB Syntax
```vbnet
cal.SetCalInfo (type,rcvPort,srcPort)
```

Variable (Type) - Description

- **cal**: A Calibrator (object)
- **type**: (enum NACalType) - Calibration type. Choose from:
  - 0 - naCalType_Response_Open
  - 1 - naCalType_Response_Short
  - 2 - naCalType_Response_Thru
  - 3 - naCalType_Response_Thru_And_Isol
  - 4 - naCalType_OnePort
  - 5 - naCalType_TwoPort_SOLT
  - 6 - naCalType_TwoPort_TRL
  - 7 - naCalType_None
  - 8 - naCalType_ThreePort_SOLT
  - 9 - Custom
  - 10 - naCalType_FourPort_SOLT

Note: For 1-port cals, the source port = receiver port. For 2, 3,4-port SOLT and TRL, it doesn't matter which port is specified as source and receiver

- **rcvPort**: (long integer) - Receiver Port
- **srcPort**: (long integer) - Source Port

Return Type
NACalType

Default
7- naCalType_None

Examples
```vbnet
cal.setCalInfo(naCalType_Response_Open, 1, 1)
```
C++ Syntax  HRESULT SetCalInfo(tagNACalType calType,long portA, long portB)

Interface  ICalibrator
### SetCalInfoEx Method (for source power cals)

**Description**
This command replaces SetCalInfo2 Method.

Specifies the channel and the source port to be used for the source power calibration about to be performed.

**VB Syntax**
```vbnet
powerCalibrator.SetCalInfoEx channel, srcPort, [powerOffset,] [display]
```

**Variable**
- **(object)** - A `SourcePowerCalibrator` object
- **channel** *(long integer)* - Number of the PNA channel (not power meter channel) on which the source power cal will be performed. If the channel does not already exist, it will be created.
- **srcPort** *(long integer)* - Port number on which the source power cal will be performed.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **[powerOffset]** *(double)* - Optional argument. Sets or returns a power level offset from the PNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT. Following the calibration, the PNA power readouts are adjusted by this value. This argument performs the same function as `chan.SourcePowerCalPowerOffset Property`.

- **[display]** *(boolean)* - Optional argument. Enables and disables the display of power readings on the PNA screen. After the source power cal data is acquired, this setting is reset to ON. If unspecified, value is set to ON.
  - **True** - Display of power readings is ON
  - **False** - Display of power readings is OFF

**Return Type**
None

**Default**
Not Applicable

**Examples**
```vbnet
powerCalibrator.SetCalInfoEx 1, 1, -10, True
```

**C++ Syntax**
```cpp
HRESULT SetCalInfoEx( long Channel, long SourcePort, double PowerOffset = 0.,
VARIANT_BOOL bDisplay = VARIANT_TRUE);
```

**Interface**
`ISourcePowerCalibrator4`

---

Last Modified: 1994
24-Apr-2008  Added note for string names
30-Apr-2007  Edited for src strings
SetCenter Method

**Description**
Changes the center stimulus to the stimulus value of the marker. The start stimulus stays the same and the stop is adjusted.

This command does not work with channels that are in CW or Segment Sweep mode.

**VB Syntax**
mark.SetCenter

**Variable (Type) - Description**

*mark*  A Marker (object)

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
mark.SetCenter

**C++ Syntax**
HRESULT SetCenter()

**Interface**
IMarker
### SetCW Method

**Description**  
Changes the analyzer to sweep type CW mode and sets the CW frequency to the marker’s frequency. Does not change anything if current sweep type is other than a frequency sweep.

**VB Syntax**  
`mark.SetCW`

**Variable**  
*(Type)* - Description

- `mark`  
  A Marker *(object)*

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`mark.SetCW`

**C++ Syntax**  
`HRESULT SetCW()`

**Interface**  
IMarker
**SetCWFreq Method**

**Description**
Sets the CW frequency to the frequency of the active marker. Does NOT change sweep type.

Use ONLY when the current sweep type is sweeping frequency - NOT available in CW or Power Sweep.

Use this command to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep Type to naPowerSweep or naCWTimeSweep.

**VB Syntax**
mark.SetCWFreq

**Variable** *(Type) - Description*
mark A Marker *(object)*

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
mark.SetCWFreq

**C++ Syntax**
HRESULT SetCWFreq()

**Interface**
IMarker3

Last Modified:

SetDUTPorts Method

Description
Sets the PNA to DUT port map for FCA measurements. Use DeviceInputPort and DeviceOutputPort to read these values. Changing the ports may limit your ability to use an internal second source. If a selected port is shared by one of the sources, then that source will not be available as an LO source. Learn more about Internal second sources.

VB Syntax
mixer.SetDUTPorts (inputPort, outputPort)

Variable (Type) - Description
mixer A IMixer Interface pointer to the Meas (object)
inputPort (Long) PNA port to be connected to the DUT input.
  - For SMC, choose any unused PNA port.
  - For VMC, set to 1
outputPort (Long) PNA port to be connected to the DUT output. Choose any unused port for SMC and VMC.

Return Type Not Applicable
Default 1,2
Examples mixer.SetDUTPorts =2,1

C++ Syntax HRESULT SetDutPorts(long inputPort, long OutputPort);

Interface IMixer8

Last Modified:
23-Apr-2008 New topic.

### SetFailOnOverRange Method

**Description**  
When set TRUE, configures the analyzer to report outOfRange conditions with an error code. Any overrange error will return E\_NA\_LIMIT\_OUTOF RANGE\_ERROR

**Note:** This method is for the benefit of VB clients. The analyzer automatically adjusts overrange conditions to the closest acceptable setting. The VB user will not see that an overrange occurred because the HRESULT is not returned if it has a success code. For more information, see Events/OverRange.

<table>
<thead>
<tr>
<th>VB Syntax</th>
<th>app.SetFailOnOverRange state</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>state</td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - Overrange conditions report an error code</td>
</tr>
<tr>
<td></td>
<td>False (0) - Overrange conditions report a success code</td>
</tr>
</tbody>
</table>

**Return Type**  
Not Applicable

**Default**  
False (0)

**VB Example**  
```vbnet
app.SetFailOnOverRange TRUE
On Error Goto ERRHANDLER

' the following overrange will cause ERRHANDLER to be invoked

channel.StartFrequency = 9.9 GHZ
exit

ERRHANDLER:
  print "something failed"
```

**C++ Syntax**  
HRESULT put_SetFailOnOverRange(VARIANT_BOOL mode)

**Interface**  
IAplication
Write only
SetIsolationPaths Method

Description
Adjusts the list of paths (port pairings) for which isolation standards will be measured during calibration.

VB Syntax
`guidedCal.SetIsolationPaths specifier, pathList`

Variable (Type) - Description

obj
Any of the following:

GuidedCalibration (object)

specifier (Enum) - Choose from:

0 - naPathsAll - Measure isolation on all pairings of the ports that are to be calibrated.

1 - naPathsNone - Do not measure isolation on any pairing of the ports to be calibrated.

2 - naPathsAdd - Add one or more specific pairings of ports to the list of port pairings for which isolation will be measured.

3 - naPathsRemove - Remove one or more specific pairings of ports from the list of port pairings for which isolation will be measured.

pathlist (Variant) - port numbers in pairs. One-dimensional array of Long Integers.

Note: pathList is evaluated only when specifier is naPathsAdd or naPathsRemove. For naPathsAll and naPathsNone, pathList is ignored.

Return Type
Not Applicable

Default
Not Applicable

Examples
```
Dim pathList
'selecting to measure isolation on all possible paths for the
ports about to be calibrated
guidedCal.SetIsolationPaths naPathsAll, pathList

'now removing the paths 1-to-2, 2-to-3 and 2-to-4 from the set of all paths
pathList = Array(1,2,2,3,2,4)
guidedCal.SetIsolationPaths naPathsRemove, pathList
```

C++ Syntax
`HRESULT SetIsolationPaths(enum NAPortPathSpecifier specifier, VARIANT pathList);`

Interface
IGuidedCalibration3

Last Modified:
16-Apr-2007  MX New topic
SetIPConfiguration Method

Description
Modifies settings of the PNA computer networking configuration.

VB Syntax
```vb
app.SetIPConfiguration AutoIPAddress, DNSServer1, DNSServer2, HostName, DomainName, IPAddress, SubNet, Gateway, DNSSuffix1, DNSSuffix2
```

or
```vb
retStr = app.SetIPConfiguration (AutoIPAddress, DNSServer1, DNSServer2, HostName, DomainName, IPAddress, SubNet, Gateway, DNSSuffix1, DNSSuffix2)
```

Variable (Type) - Description

- **app** An **Application** (object)

  **AutoIPAddress** (boolean) - Choose either:
  
  **True** - PNA is assigned an IP address by a DHCP server, or will use AutoIP (Dynamic Link-Local Addressing) if DHCP server not found.
  
  **False** – PNA will use the static IP address value specified by IPAddress.

  **DNSServer1** (string) IP address of primary DNS server.

  When AutoIPAddress = True and an empty string is specified for DNSServer1, the PNA will attempt to obtain the addresses of primary and secondary DNS servers automatically.

  When AutoIPAddress = False, an IP address must be specified for DNSServer1 and/or DNSServer2 or else the PNA’s host name will not be resolvable on the computer network.

  **DNSServer2** (string) IP address of secondary DNS server. When specifying an empty string for DNSServer1, then specify an empty string here also.

  **HostName** (string) DNS host name (computer name) to be assigned to this PNA.

  **Note**: If specifying a name different than the PNA’s current host name, the change will not take effect until after you reboot the PNA.

  **DomainName** (string) DNS domain name associated with this PNA.

  **IPAddress** (string) Static IP address to assign to this PNA when AutoIPAddress = False. When AutoIPAddress = True, the value of IPAddress is ignored.

  **SubNet** (string) Subnet mask value to assign to the PNA network configuration.

  **Gateway** (string) Gateway address to assign to the PNA network configuration.

  **DNSSuffix1** (string) Primary suffix to set in the PNA DNS suffix search order. An empty string is allowed.
**DNSSuffix2** *(string)* Secondary suffix to set in the PNA DNS suffix search order. An empty string is allowed.

**retStr** *(string)* String returned by this method should be ignored. It is intended for Agilent diagnostic use.

**Return Type** String

**Default** Not Applicable

**Examples**
```plaintext
app.SetIPConfiguration True, "", "", "MyHostName", "MyRegion.MyCompany.com", "", "255.255.255.0", "123.45.67.890", "", ""

app.SetIPConfiguration False, "123.456.78.90", "234.56.78.901", "MyHostName", "MyRegion.MyCompany.com", "123.456.789.0", "255.255.255.0", "123.45.67.890", "MyCompany.com", ""
```

**C++ Syntax**
```c++
HRESULT SetIPConfiguration(VARIANT_BOOL AutoIPAddress, BSTR DNSServer1, BSTR DNSServer2, BSTR HostName, BSTR DomainName, BSTR IPAddress, BSTR SubNet, BSTR Gateway, BSTR DNSSuffix1, BSTR DNSSuffix2, BSTR *pRetStr);
```

SetPortMap Method

Description
Set the DUT-to-PNA port mapping for the Noise Figure, Gain Compression, IMD, IMDx, IMS, or IMSx measurement.

For Noise Figure:
Port mapping is allowed ONLY when NoiseReceiver is set to naStandardReceiver.

When setting IMD and IMS channels:

- When input is 1, output can be 2 or 4.
- When input is 3, output must be 4.
- This setting is necessary only when using the limited port mapping feature. Learn more.

VB Syntax
obj.SetPortMap in,out

Variable (Type) - Description

obj
A GainCompression (object) or
A SweptIMD (object) or
An IMSpectrum (object)
A NoiseFigure (object) - See example program

in
PNA port which is connected to the DUT input.

out
PNA port which is connected to the DUT output.

Return Type
Not Applicable

To read port map, use:
DeviceInputPort Property
DeviceOutputPort Property

Default
1,2

Examples
gca.SetPortMap 2,1

C++ Syntax
HRESULT SetPortMap(long input_port,long output_port);
Interface  IGainCompression
         ISweptIMD
         ISpectrum
         INoiseFigure6

Last Modified:

SetSBPorts Method

**Description**
For a Single-ended - Balanced device type, maps the PNA ports to the DUT ports.
Set the Single-ended - Balanced device type using the DUTTopology Property.

**VB Syntax**
`balTopology.SetSBPorts se, bPos, bNeg`

**Variable (Type) - Description**

- `balTopology` A **BalancedTopology** **(object)**
- `se, bPos, bNeg` PNA port number that connects to each of the following DUT ports:

![Diagram](image)

**Return Type**
Not applicable - To read port mappings, use the **BalancedTopology** properties.

**Default**
Not Applicable

**Examples**
`balTop.SetSBPorts 1, 2, 3`

**C++ Syntax**
`HRESULT SetSBPorts (long se, long bPos, long bNeg)`

**Interface**
IBalancedTopology
SetSSBPorts Method

**Description**
For a Single-ended - Single-ended - Balanced device type, maps the PNA ports to the DUT ports.

Set the Single-ended - Single-ended - Balanced device type using the `DUTTopology Property`.

**VB Syntax**
`balTopology.SetSSBPorts se, se2, bPos, bNeg`

**Variable**

<table>
<thead>

</tr>
<tr>
<td><code>se, se2, bPos, bNeg</code></td>
<td>PNA port number that connects to each of the following DUT ports:</td>
</tr>
</tbody>
</table>

![Diagram of Single-ended Port 1, Single-ended Port 2, DUT, Bal Port 3, <bPos>, <bNeg>]

**Return Type**
Not applicable - To read port mappings, use the `BalancedTopology` properties.

**Default**
Not Applicable

**Examples**
`balTop.SetSSBPorts 1, 2, 3, 4`

**C++ Syntax**
`HRESULT SetSSBPorts (long se, long se2, long bPos, long bNeg)`

**Interface**
`IBalancedTopology`
SetupMeasurementsForStep Method

Description
Show the Cal Window, and optionally one or more other specific windows, before acquiring a Cal standard. This command will cause the Cal Window to display the specific measurements that are to be made for that particular Cal standard.

See custom Cal window commands.

VB Syntax
`guidedCal.SetupMeasurementsForStep (n)`

Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>guidedCal</code></td>
<td>A <code>GuidedCalibration</code> (object)</td>
</tr>
</tbody>
</table>

`n` Step number in the calibration process.
Use `GenerateSteps` to determine the total number of steps.
Use `GetStepDescription` to read the description of each step.

Return Type
Not Applicable

Default
Not Applicable

Examples
`guidedCal.SetupMeasurementsForStep 3`

See example using this command

C++ Syntax
`HRESULT SetupMeasurementsForStep(long step);`

Interface
`IGuidedCalibration4`
Write-only

**SetStandardsForClass Method**

**Description**  Set the calibration standard numbers for a specified calibration class. To read the calibration standard numbers use `GetStandardsForClass Method`.

**VB Syntax**  `calKit.SetStandardsForClass (calclassorder, std1, std2, std3, std4, std5, std6, std7)`

**Variable (Type) - Description**

- `calKit`  A CalKit (object)

  - `calclassorder`  (enum NACalClassOrder)  Cal Class. Choose from:
    - 0 - naRefl_1_S11
    - 1 - naRefl_2_S11
    - 2 - naRefl_3_S11
    - 3 - naTran_1_S21
    - 4 - naRefl_1_S22
    - 5 - naRefl_2_S22
    - 6 - naRefl_3_S22
    - 7 - naTran_1_S12
    - 8 - naRefl_1_S33
    - 9 - naRefl_2_S33
    - 10 - naRefl_3_S33
    - 11 - naTran_1_S32
    - 12 - naTran_1_S23
    - 13 - naTran_1_S31
    - 14 - naTran_1_S13
    - 15 - naTRL_T
    - 16 - naTRL_R
    - 17 - naTRL_L

  - `std1…std7`  (long)  Calibration Standard Number. Choose from 1 through 30. Std2 through Std7 are optional.

**Return Type**  Not applicable
**Default**  Not applicable

**Examples**  
- `calkit.SetStandardsForClass naRefl_3_S11, 3, 5, 6`
- `calkit.SetStandardsForClass naTran_1_S21, 4`

**C++ Syntax**  
`HRESULT SetStandardsForClass(NACalClassOrder calclassorder, long std1, long std2, long std3, long std4, long std5, long std6, long std7)`

**Interface**  
ICalKit
**SetStart Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Changes the start stimulus to the stimulus value of the marker. The stop stimulus stays the same and the span is adjusted. This command does not work with channels that are in CW or Segment Sweep mode.</th>

<td>IMarker</td>
</tr>
</tbody>
</table>
### SetStop Method

**Description**
Changes the stop stimulus to the stimulus value of the marker. The start stimulus stays the same and the span is adjusted. This command does not work with channels that are in CW or Segment Sweep mode.

**VB Syntax**
`mark.SetStop`

**Variable**
- **(Type)**: Description
- **mark**: A Marker (object)

**Return Type**: Not Applicable

**Default**: Not Applicable

**Examples**
`mark.SetStop`

**C++ Syntax**
`HRESULT SetStop()`

**Interface**: IMarker
ShowMarkerReadout Method

Description
Shows and Hides the Marker readout for the active marker in the upper-right corner of the window.

VB Syntax
`win.ShowMarkerReadout state`

Variable
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win</code></td>
<td>A NAWindow (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - Show the Marker readout</td>
</tr>
<tr>
<td></td>
<td>False (0) - Hide the Marker readout</td>
</tr>
</tbody>
</table>

Return Type
Not Applicable

Default
Not Applicable

Examples
`win.ShowMarkerReadout True`

C++ Syntax
`HRESULT ShowMarkerReadout(VARIANT_BOOL bState)`

Interface
INAWindow
ShowStatusBar Method

**Description**
Shows and Hides the Status Bar. The Status Bar is located across the bottom of the display. The following information is shown for the active measurement:

- Channel number
- Parameter
- Correction On or Off
- Remote or Local operation

**VB Syntax**

```vbnet
app.ShowStatusBar state
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - Show the Status Bar</td>
</tr>
<tr>
<td></td>
<td>False (0) - Hide the Status Bar</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
app.ShowStatusBar True
```

**C++ Syntax**

```c++
HRESULT ShowStatusBar (VARIANT_BOOL bState)
```

**Interface**

IApplication
**ShowStimulus Method**

**Description**
Shows and Hides the Stimulus (X-axis) information located at the bottom of the display. The start and stop stimulus values are shown for the active measurement.

**VB Syntax**
```
app.ShowStimulus state
```

**Variable**
(Type) - Description

- **app**
  An Application (object)

- **state**
  (boolean) -
  True (1) - Show the Stimulus information
  False (0) - Hide the Stimulus information

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
app.ShowStimulus True
```

**C++ Syntax**
```
HRESULT ShowStimulus(VARIANT_BOOL bState)
```

**Interface**
IApplciation
ShowTable Method

Description
Shows or hides the specified table for the window's active measurement in the lower part of the window.

VB Syntax
```
win.ShowTable value
```

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>win</td>
<td>A NAWindow (object)</td>
<td></td>
</tr>
<tr>

<tr>
<td></td>
<td>0 - naTable_None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>1 - naTable_Marker</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2 - naTable_Segment</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3 - naTable_Limit</td>
<td></td>
</tr>
</tbody>
</table>

Return Type
Not Applicable

Default
Not Applicable

Examples
```
win.ShowTable naTable_limit
```

C++ Syntax
HRESULT ShowTable (tagNATableType table)

Interface
INAWindow
## ShowTitleBars Method

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Shows and Hides the Title Bars. The Title Bars are across the top of the Network Analyzer Window and each of the measurement windows. The Window name is shown in the Title Bar.</th>
</tr>
</thead>
<tbody>

<td>IApplication</td>
</tr>
</tbody>
</table>
ShowToolbar Method

**Description**
Shows and Hides the specified Toolbar.

**VB Syntax**
```vbnet
app.ShowToolbar toolbar, state
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>toolbar</td>
<td>(enum NAToolbarType) - The toolbar to show or hide. Choose from:</td>
</tr>
<tr>
<td>state</td>
<td>(boolean) -</td>
</tr>
<tr>
<td>true (1)</td>
<td>Show the specified toolbar</td>
</tr>
<tr>
<td>false (0)</td>
<td>Hide the specified toolbar</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
1 - naToolbar_ActiveEntry showing; all others hiding.

**Examples**
```vbnet
app.ShowToolbar 1,1 'shows the active entry toolbar
```

**C++ Syntax**
```cpp
HRESULT ShowToolbar(tagNAToolbarType toolbar, VARIANT_BOOL bState)
```

**Interface**
IAplication
Single Method

Description
Sets the trigger count to 1 which will cause the channel to respond once to the trigger source.

How the channel responds to a single trigger depends on the trigger mode (point, trace, and so forth.)

With the exception of the 'sync' argument, this command behaves like the channel 'single' setting from the user interface.

This setting has implications on Calibration. Learn more.

VB Syntax
\[
\text{chan.Single \{sync\}}
\]

Variable (Type) - Description

\text{chan} \quad \text{A Channel (object)}

\{sync\} \quad \text{boolean} \quad \text{-Optional argument.}

- \textbf{True} - The PNA waits (blocks execution) until the entire acquisition process is completed.
- \textbf{False} - The PNA returns immediately - does NOT wait for acquisition to complete (non-blocking). Default setting.

When trigger source is set to Manual:

- with \texttt{sync = True}, trigger source automatically changes to Internal which sends AND allows one trigger signal, then changes back to Manual.
- with \texttt{sync = False}, a trigger signal must also be sent using \texttt{app.ManualTrigger Method}.

Return Type
Not Applicable

Default
Not Applicable

Examples
\[
\text{sync = True} \\
\text{chan.Single sync}
\]

C++ Syntax
\[
\text{HRESULT Single(VARIANT_BOOL bWait)}
\]

Interface
IChannel
Store Method

Description
Saves the path configuration currently associated with channel (ch) to the specified configuration name.

This command is identical to PathConfigurationManager.StoreConfiguration Method.

VB Syntax
pathMgr.StoreConfiguration ch, name

Variable
(pathMgr - type - Description)

pathMgr  PathConfigurationManager (object)

ch  (Long) Channel number of the configuration to be saved.

name  (String) Configuration name. Factory configurations can NOT be overwritten. Specifying the name of a pre-defined factory configuration will result in an error.

Return Type
Not Applicable

Default
Not Applicable

Examples
path.StoreConfiguration(2) "myMixer"

C++ Syntax
HRESULT StoreConfiguration( long channelNum, BSTR configName );

Interface
IPathConfigurationManager

StringToNACalClass Method

Description
Converts the returned strings from GetStandardsList into the enumeration (NACalClass) and the port numbers required for PutStandard and GetStandard methods that transmit data in and out of the Cal Set.

Learn more about reading and writing Cal data using COM.

VB Syntax
CalSet.StringToNACalClass (list, std, rcv, src)

Variable (Type) - Description

CalSet (object) - A Cal Set object

list (string) - a string containing the textual description of the standard.

std (enum NACalClass) Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation
rcv (long) - port number of the receiver

src (long) - port number of the source

Return Type Not Applicable

Default Not Applicable

Examples guid = CalSet.StringToNACalClass(list, std, rcv, src)

C++ Syntax HRESULT StringToNACalClass( BSTR* str, NACalClass* item, long *rcv, long *src);

Interface ICalSet
StringToNAErrorTerm2 Method

Description  Converts the returned strings from GetErrorTermList into the enumeration (NAErrorTerm2) and the port numbers required for PutErrorTerm and GetErrorTerm methods that transmit data in and out of the Cal Set.

Learn more about reading and writing Cal data using COM

VB Syntax  
```vbnet
CalSet.StringToNAErrorTerm2 (list, eterm, rcv, src)
```

Variable (Type) - Description

Cal Set (object) - A Cal Set object

list (string) - a string containing the textual description of the error term.

eterm (enum As NaErrorTerm2). Choose from:
- 0 - naET_Directivity (rcv = src)
- 1 - naET_SourceMatch (rcv = src)
- 2 - naET_ReflectionTracking (rcv = src)
- 3 - naET_TransmissionTracking (rcv != src)
- 4 - naET_LoadMatch (rcv != src)
- 5 - naET_Isolation (rcv != src)

rcv (long) - port number of the receiver

src (long) - port number of the source

Return Type  Not Applicable

Default  Not Applicable

Examples  
```vbnet
CalSet.StringToNAErrorTerm2 str, term, rcv, src
```

C++ Syntax  
```cpp
HRESULT StringToNAErrorTerm2 (BSTR* str, NAErrorTerm2* item, long *rcv, long *src);
```

Interface  ICalSet
Write-only

SweepOnlyCalChannelDuringCalAcquisition Method

Description
Clears ALL flags for channels to sweep during calibration except the Cal channel. To flag a channel, see AllowChannelToSweepDuringCalAcquisition Method.

VB Syntax
`calMgr.SweepOnlyCalChannelDuringCalAcquisition`

Variable
- **Type** - Description
  - `calMgr` (object) - A CalManager object

Return Type
Not Applicable

Default
Not Applicable

Example
`calMgr.SweepOnlyCalChannelDuringCalAcquisition`

See example using this command

C++ Syntax
`HRESULT SweepOnlyCalChannelDuringCalAcquisition()`

Interface
ICalManager5

Last Modified:
8-Nov-2007    MX New topic
TestsetCatalog Method

Description
Returns a list of supported testsets.

VB Syntax
\[ data = Tsets.TestsetCatalog \]

Variable
\textbf{(Type) - Description}

\begin{itemize}
  \item \textit{data} \textbf{(variant array)} - Variable to store the returned data.
  \item \textit{Tsets} \textbf{(object)} - An \texttt{ExternalTestSets} collection
\end{itemize}

Return Type
Variant

Default
Not Applicable

Examples
\texttt{value = Tsets.TestsetCatalog}

C++ Syntax
\texttt{HRESULT TestsetCatalog (VARIANT* Data);}

Interface
\texttt{IEexternaTestSets}
**UserPreset Method**

**Description**
Performs a User Preset. There must be an active User Preset state file (see UserPresetLoadFile and UserPresetSaveState) or an error will be returned.

Regardless of the state of the User Preset Enable checkbox, the app.Preset command will always preset the PNA to the factory preset settings, and app.UserPreset will always perform a User Preset.

**VB Syntax**
```vbnet
app.UserPreset
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.UserPreset
```

**C++ Syntax**
```c++
HRESULT UserPreset()
```

**Interface**
IAplication6
UserPresetLoadFile Method

**Description**
Loads an existing instrument state file (.sta or .cst) to be used for User Preset. Subsequent execution of `app.UserPreset` will cause the PNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `app.Preset` command will always preset the PNA to the factory preset settings, and `app.UserPreset` will always perform a User Preset.

**VB Syntax**

```vbnet
app.UserPresetLoadFile (file)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>app</strong></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><strong>file</strong></td>
<td>(String) Full path, name, and extension of the file to be loaded.</td>
</tr>
</tbody>
</table>

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vbnet
app.UserPresetLoadFile ("C:/Program Files/Agilent/Network Analyzer/Documents/10MHzto20GHz.sta")
```

**C++ Syntax**

```cpp
HRESULT UserPresetLoadFile (BSTR bstrFile)
```

**Interface**

IApplication6
Write-only

UserPresetSaveState Method

**Description**  Saves the current instrument settings as UserPreset.sta. Subsequent execution of `app.UserPreset` will cause the PNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `app.Preset` command will always preset the PNA to the factory preset settings, and `app.UserPreset` will always perform a User Preset.

**VB Syntax**  
```
app.UserPresetSaveState
```

**Variable**  
(Type) - Description

- `app`  An `Application` (object)

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  
```
app.UserPresetSaveState
```

**C++ Syntax**  
```
HRESULT UserPresetSaveState()
```

**Interface**  `IApplication6`
## WriteData Method

**Description**  
Writes a 13-bit value to the specified address using the AD0 through AD12 lines of the external test set connector. The PNA generates the appropriate timing signals. It automatically controls timing signals LDS, LAS and RLW to strobe the address, then the data, to the external test set. See the [timing diagram](#) for Address and Data I/O read.

**VB Syntax**  
```
ExtIO.WriteData (address) = value
```

**Variable (Type) - Description**

| ExtIO  | (object) - An External IO object |
| address | (variant) - Address to be written to. |
| value   | (variant) - 13-bit word to write |

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
```
ExtIO.WriteData (15) = 12
```

**C++ Syntax**  
```
HRESULT WriteData(VARIANT Address, VARIANT Data);
```

**Interface**  
IHWExternalTestSetIO
Write-only

About the ExtTestSetIO connector

**WriteRaw Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Writes a 16-bit value to the external test set connector lines AD0 - AD12, RLW, LAS and LDS. The analyzer does NOT generate the appropriate timing signals. The user has control of all 16 lines using this write method.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> When RLW (pin 25) is set to 1 (high) it causes lines AD0 - AD12 to float. It disables their output latches and sets the hardware for reading. LDS and LAS are not affected by this behavior.</td>
<td></td>
</tr>
</tbody>
</table>

Below is the format of data that is written with WriteRaw:

* This Output will float if RLW (bit-13) is set high

<table>

VB Syntax  
\textit{ExtIO.WriteRaw value}

**Variable**  
(\textbf{Type}) - Description

\textit{ExtIO} (\textbf{object}) - An External IO object

\textit{value} (\textbf{variant}) - Data to be written

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
\texttt{ExtIO.WriteRaw 12}

**C++ Syntax**  
\texttt{HRESULT WriteRaw( VARIANT Output );}

**Interface**  
IHWExternalTestSetIO
Write-only

**WriteSnpFileWithSpecifiedPorts Method**

**Description**  
**Note:** This command replaces `app.Save (.snp)`. This command is more explicit regarding the data to be saved, and works for PNAs with multiport test sets.  
Saves SnP data to the specified file. Learn more about SnP data.

**VB Syntax**  
`data = meas.WriteSnpFileWithSpecifiedPorts ports, filename`

**Variable**  
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>data</em></td>
<td>(Variant) array to store the data.</td>
</tr>
<tr>
<td><em>meas</em></td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td><em>ports</em></td>
<td>(Variant Array) One dimensional array containing a list of port numbers for which snp data is requested.</td>
</tr>
<tr>
<td><em>filename</em></td>
<td>(string) Full path, filename, and suffix to store the data.</td>
</tr>
</tbody>
</table>

  The suffix is not checked for accuracy. If saving 2 ports, specify "filename.s2p"; If saving 3 ports, specify "filename.s3p." and so forth.

  SnP data can be output using several data formatting options. See [SnPFormat Property](#).

**Return Type**  
Variant array - automatically dimensioned to the size of the data.

**Default**  
Not Applicable

**Examples**  
'This VBScript example can be pasted into a notepad file and run on the PNA as a macro. Learn how.

```vbscript
Set pna = CreateObject("AgilentPnA835x.application")
Set meas = pna.ActiveMeasurement

'List the port numbers for required data
ports = Array(1,2,4)

'specify where to save the data
filename="C:/Program Files/Agilent/Network Analyzer/Documents/MyData.s3p"
meas.WriteSnpFileWithSpecifiedPorts ports, filename
```

**C++ Syntax**  
`HRESULT WriteSnpFileWithSpecifiedPorts(VARIANT portsToMeasure,BSTR filename);`

**Interface**  
IMeasurement7
9/18/06   MQ Added for multiport
OnCalEvent

**Description**  Triggered by a calibration event. See a list of [CAL Events](#).

**Note:** Some Severe Events are also used as Error Messages

**VB Syntax**

```vbnet
Sub app_OnCalEvent(ByVal eventID As Variant, ByVal chanNum As Variant, ByVal measNum As Variant)

Variable (Type) - Description

- **app**  An Application (object)
- **eventID**  Code number of the event which occurred
- **chanNum**  Channel Number of the event
- **measNum**  Measurement Number of the event

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**

```vbnet
Sub pna_OnCalEvent(ByVal eventID As Variant, ByVal channelNumber As Variant, ByVal measurementNumber As Variant)
    MsgBox ("A Calibration event has occured")
End Sub
```

**C++ Syntax**

C++ Example

The following example uses the smart pointer created by Microsoft Visual Studio. The calls to CoInitialize and CoUninitialize open and close the COM libraries.

Also notice that the pointers local to the main routine are explicitly released. When smart pointers go out of scope, they will perform this duty implicitly. However, we are calling CoUninitialize before they have the chance to be destroyed, so we are obliged to release them.

```c++
// An example program to illustrate the use of #import to bind to the
// PNA type library.
//

#ifndef _UNICODE
#define _UNICODE
#endif
#include "stdafx.h"
#include "stdio.h"
#include "math.h"

/////////////////////////////////////////////
// import the network analyzer type library
/////////////////////////////////////////////
#import "C:/Program Files/Common Files/Agilent/Pna/835x.tlb" no_namespace,
named_guids
/////////////////////////////////////////////
// include the error definitions for the PNA so we can implement
// error handling.
/////////////////////////////////////////////
#include "C:/Program Files/Common Files/Agilent/Pna/errorsystemmessage.h"

IApplicationPtr pNA; // top level application pointer
float fScalarData [1601]; // global buffer for data retrieval
float fScalarData2[1601];
DWORD dwCookie;

/////////////////////////////////////////////
// SetupChannel:
/////////////////////////////////////////////
// input: pointer to the channel
// function: sets properties on the channel
/////////////////////////////////////////////
void SetupChannel(IChannelPtr pChannel)
{
  pChannel->put_StartFrequency( 1.2E9 );
  pChannel->put_StopFrequency ( 4.2E9 );
  pChannel->put_NumberOfPoints ( 201);
}
```
void AcquireData( IChannelPtr pChannel )
{
    pChannel->Single( TRUE );

}

CoUninitialize();
return 0;
}
Reading Cal Set Data using COM

This example iterates over the entire collection of Cal Sets that currently reside in the PNA. It reads the entire list of error term strings from each Cal Set and queries the data for each term. It then does the same for the standards data.

Learn more about Reading and Writing Calibration data using COM.
Learn more about Cal Sets.
See example: Writing Cal Set Data using COM

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as CalSets.vbs. Learn how to setup and run the macro.

```vbs
Dim pna
Dim cset
Dim calsets

' create the pna object
' to run on a remote PC, substitute 'name' for the full computer name of your PNA
' to run as a macro on the PNA, remove ,"name"
Set pna = CreateObject("AgilentPNA835x.Application", "name")

wscript.echo pna.IDString

' obtain the calset collection
Set calsets = pna.GetCalManager.calsets

' loop thru the calsets
Dim c
For c = 1 To calsets.count
Set cset = calsets.Item(c)

' wscript.echo prints values to a message box
wscript.echo "calset = ", cset.GetGUID, cset.Description

' iterate through error terms data
Dim vterms,fdata
vterms = cset.GetErrorTermList2(0, "")
if (Not IsEmpty(vterms)) then
For i = LBound(vterms) To UBound(vterms)
    wscript.echo vterms(i)
    vdata = cset.GetErrorTermByString(0,vterms(i))
fdata = cset.GetErrorTermStimulus(0,vterms(i))
    wscript.echo vdata(1,0), vdata(1,1)
    wscript.echo fdata(1,0), fdata(1,1)
Next
end if

' iterate through standards data
```
vterms = cset.GetStandardList2("")
if (Not IsEmpty(vterms)) then
For i = LBound(vterms) To UBound(vterms)
  wscript.echo vterms(i)
  vdata = cset.GetStandardByString( vterms(i) )
  wscript.echo vdata(1,0), vdata(1,1)
Next
end if
Next

Intro to Examples

Getting Trace Data from the Analyzer

This Visual Basic program:

- Retrieves Scalar Data from the Analyzer and plots it.
- Retrieves Paired Data from the Analyzer and plots it.
- Retrieves Complex Data from the Analyzer and plots it.

To use this code, prepare a form with the following:

- Two MSCharts named MSChart1 and MSChart2
- Three buttons named GetScalar, GetPaired, GetComplex

Note: You can get MSChart in Visual Basic by clicking Project / Components / Microsoft Chart Control

```vbnet
'Put this in a module
Public dlocation As NADataStore
Public numpts As Long
Public fmt As NADataFormat
Public app As Application
Public measData As IArrayTransfer
Public chan As Channel

Sub Form_Load()
    'Change analyzerName to your analyzer's full computer name
    Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")
    Set measData = app.ActiveMeasurement
    Set chan = app.ActiveChannel

    'To pick a location to get the data from remove the comment from one of these
    dlocation = naDataStore
    'dlocation = naCorrectedData
    'dlocation = naMeasResult
    'dlocation = naRawMemory
    'dlocation = naMemoryResult

    'setup MSChart1 and MSChart2
    'right click on the chart and select:
    ' - line chart
    ' - series in rows
End Sub

Sub GetComplex_Click()
    ReDim Data(numpts) As NAComplex
    Dim Real(201) As Single
    Dim Imag(201) As Single
    numpts = chan.NumberOfPoints
```
'You cannot change the format of Complex Data
Call trigger
'get data
measData.GetNAComplex dlocation, numpts, Data(0)
'plot data
Dim i As Integer

For i = 0 To numpts - 1
    Real(i) = Data(i).Re
    Imag(i) = Data(i).Im
Next i
MSChart1 = Real()
MSChart2.Visible = True
MSChart2 = Imag()
Call Sweep
End Sub

Sub GetPaired_Click()
ReDim Real(numpts) As Single
ReDim Imag(numpts) As Single
numpts = chan.NumberOfPoints

' To pick a format, remove the comment from one of these
fmt = naLogMagPhase
'fmt = naLinMagPhase
Call trigger
'Get data
measData.getPairedData dlocation, fmt, numpts, Real(0), Imag(0)
'Plot Scalar
MSChart1 = Real()
MSChart2.Visible = True
MSChart2 = Imag()
Call Sweep
End Sub

Sub GetScalar_Click()
ReDim Data(numpts) As Single
numpts = chan.NumberOfPoints

'To pick a format remove the comment from one of these
fmt = naDataFormat_LogMag
'fmt = naDataFormat_LinMag
'fmt = naDataFormat_Delay
'fmt = naDataFormat_Phase
'fmt = naDataFormat_Real
'fmt = naDataFormat_Imaginary
Call trigger
'Get data
measData.GetScalar dlocation, fmt, numpts, Data(0)
'Plot Data
MSChart1 = Data()
MSChart2.Visible = False
Call Sweep
End Sub

Sub trigger()
    'The analyzer sends continuous trigger signals
    app.TriggerSignal = naTriggerInternal
    'The channel will only accept one, then go into hold
    'Sync true will wait for the sweep to complete
    sync=True
    chan.Single sync
End Sub

Sub Sweep()
    'The channel goes back to accepting all triggers
    chan.Continuous
End Sub
Perform a Guided Calibration using COM

This example uses the GuidedCalibration interface to perform either a 2-port or 4-port calibration. Learn more about Reading and Writing Calibration data using COM.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as Calibrate.vbs. Learn how to setup and run the macro.

```
Set pna = CreateObject("AgilentPNA835x.Application")
Set calMgr = pna.GetCalManager
Set guidedCal = calMgr.GuidedCalibration
Set chan = pna.ActiveChannel
chanNum = chan.ChannelNumber
' Initialize guided cal to be performed on the active channel.
' The boolean argument of True indicates to store the cal only
' in the channel's calibration register.  If instead you wish
' to create a new calset that the new cal will get stored to,
' comment out this next line and uncomment the three lines below it.
guidedCal.Initialize chanNum, True
'Set calset = calMgr.CreateCalSet(chanNum)
'chan.SelectCalSet calset.GetGUID, True
'guidedCal.Initialize chanNum, False

' To perform 2-port cal, Uncomment the following
' Then comment the 4-port cal

' Do 2-port cal
'TwoPortGuidedCal

' Do 4-port cal
FourPortGuidedCal

Sub TwoPortGuidedCal()
' Select the connectors
guidedCal.ConnectorType(1) = "APC 3.5 female"
guidedCal.ConnectorType(2) = "APC 3.5 male"
For i = 3 To pna.NumberOfPorts
  guidedCal.ConnectorType(i) = "Not used"
Next
value = MsgBox("Connectors defined for Ports 1 and 2")
' Select the Cal Kit for each port being calibrated.
guidedCal.CalKitType(1) = "85052D"
guidedCal.CalKitType(2) = "85052D"
' To use an ECal module instead, comment out the above two lines
```
' and uncomment the appropriate lines below:
' Your ECal module must already be connected
' via USB to the PNA.
'guidedCal.CalKitType(1) = "N4691-60004 ECal"
'guidedCal.CalKitType(2) = "N4691-60004 ECal"
' Non-factory characterizations are specified as follows:
'guidedCal.CalKitType(1) = "N4691-60004 User 1 ECal"
' When two or more ECal modules with the same model number are connected
' also specify the serial number as follows:
'guidedCal.CalKitType(1) = "N4691-60004 ECal 01234"
' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:
'guidedCal.CalKitType(1) = "N4691-60004 MyDskChar ECal 01234"

MsgBox("Cal kits defined for Ports 1 and 2")

' Initiate the calibration and query the number of steps
numSteps = guidedCal.GenerateSteps
' Measure the standards, compute and apply the cal
MeasureAndComplete(numSteps)
End Sub

Sub FourPortGuidedCal()
' Select the connectors
guidedCal.ConnectorType(1) = "APC 3.5 female"
guidedCal.ConnectorType(2) = "APC 3.5 female"
guidedCal.ConnectorType(3) = "APC 3.5 female"
guidedCal.ConnectorType(4) = "APC 3.5 female"
' If a PNA which has more than 4 ports
For i = 5 To pna.NumberOfPorts
  guidedCal.ConnectorType(i) = "Not used"
Next
value = MsgBox("Connectors defined for Ports 1 to 4")
' Select the Cal Kit for each port being calibrated.
guidedCal.CalKitType(1) = "85052D"
guidedCal.CalKitType(2) = "85052D"
guidedCal.CalKitType(3) = "85052D"
guidedCal.CalKitType(4) = "85052D"
' To use an ECal module instead, comment out the above four lines
' and uncomment the following four lines.
' Replace N4691-60003 with your own ECAL model followed by 'Ecal'.
' Your ECal module must already be connected to a PNA USB port.
' See above for ECal options
'guidedCal.CalKitType(1) = "N4431-60003 ECal"
'guidedCal.CalKitType(2) = "N4431-60003 ECal"
'guidedCal.CalKitType(3) = "N4431-60003 ECal"
'guidedCal.CalKitType(4) = "N4431-60003 ECal"

value = MsgBox("Cal kits defined for Ports 1 to 4")
' Initiate the calibration

guidedCal.GenerateSteps

' If your selected cal kit is not a 4-port ECal module which can
' mate to all 4 ports at once, then you may want to choose which
'thru connections to measure for the cal. You must measure at
'least 3 different thru paths for a 4-port cal (for greatest
'accuracy you can choose to measure a thru connection for all 6
'pairings of the 4 ports). If you omit this command, the default
'is to measure from port 1 to port 2, port 1 to port 3, and
'port 1 to port 4. For this example we select to measure
'from port 1 to port 2, port 2 to port 3, and port 2 to port 4.

portList = Array(1,2,2,3,2,4)
guidedCal.ThruPortList = portList

' Re-generate the connection steps to account for the thru changes

numSteps = guidedCal.GenerateSteps

' Measure the standards, compute and apply the cal

MeasureAndComplete(numSteps)

End Sub

Sub MeasureAndComplete(ByVal numSteps)

value = MsgBox("Number of steps is " + CStr(numSteps))

' Measure the standards
'The following series of commands shows that standards
'can be measured in any order. These steps acquire
'measurement of standards in reverse order.
'It is easiest to iterate through standards using
'a For-Next Loop.

For i = NumSteps To 1

step = "Step " + CStr(i) + " of " + CStr(numSteps)
strPrompt = guidedCal.GetStepDescription(i)
value = MsgBox(strPrompt, vbOKOnly, step)
guidedCal.AcquireStep i

Next

' Conclude the calibration

guidedCal.GenerateErrorTerms

MsgBox ("Cal is done!")

End Sub

5-Apr-2011   Edited for ECal options

20-Jan-2007   Added any order to steps.
Perform a Source Power Cal using COM

This program can be run in either Visual Basic 6 or as a VBScript program. The PNA can run *.vbs programs as macros.

This program demonstrates:

- Performing a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations
See an example that Uploads a Source Power Cal

---

See Other COM Example Programs

---

To run this program, you need:

- One of the following power meters connected to the PNA through GPIB: E4416A, E4417A, E4418A/B, E4419A/B, 437B, 438A, EPM-441A, EPM-442A

Note: If your power meter is other than these, you can create your own Power Meter Driver using our template.

- Your PC and PNA both connected to a LAN (for communicating with each other).

To make this program work in VBS, save the following code in a text editor file such as Notepad and save as *.vbs.

To make this program work in Visual Basic 6:

1. Create a new project
2. Click Project, Add New Module, click Open.
3. Paste the following code into the code window.
4. Delete the first two lines (comment and Main)
5. Click Project, Properties. Under Startup Object, select Sub Main
6. Click Project, References, and select the Agilent PNA Series Type Library.

```vbnet
' Run the Main subroutine
Main
Public Sub Main()
Dim PNA, chan, pwrcal ' PNA COM objects
Const naPowerMeter = 0, naPowerMeterAndReceiver = 1 ' enum NASourcePowerCalMethod
Const naPowerSensor_A = 0 ' enum NAPowerAcquisitionDevice
Const naCorrectionValues = 0 ' enum NASourcePowerCalBuffer
```
Const port = 2  ' PNA port #2 as source port
Const offset = 0  ' cal power offset value
Const bDisplay = True  ' whether to display data during acquire

Dim stimulus, calvalues, strResult

' Instantiate our PNA COM objects
Set PNA = CreateObject("AgilentPNA835x.Application")
Set chan = PNA.Channels(1)
Set pwrcal = PNA.SourcePowerCalibrator

' Set the number of sweep points to 21 on Channel 1.
chan.NumberOfPoints = 21

' Specify the GPIB address of the power meter  
' that will be used in performing the calibration.
pwrcal.PowerMeterGPIBAddress = 13

' Turn use of the loss table OFF (this assumes there is  
' virtually no loss in the RF path to the power sensor  
' due to a splitter, coupler or adapter).
pwrcal.UsePowerLossSegments = False

' Turn frequency checking OFF (so one power sensor is used for the entire cal  
' acquisition sweep regardless of frequency span).
pwrcal.UsePowerSensorFrequencyLimits = False

' Specify a nominal power accuracy tolerance (IterationsTolerance) in dB for the  
' calibration, and the maximum number of iterations to adjust power at each point,  
' attempting to achieve within tolerance of the desired power. If at any stimulus  
' point the power fails to reach within the set tolerance of the desired power  
' after the maximum number of iterations, the power at that point will be set to the  
' value determined by the last iteration (the Source Power Cal dialog box will  
' indicate the FAIL, but we can still apply the cal if desired when it's complete).  
' Each iteration is based upon a SETTLED power reading (see comments preceding the  
' next two properties below).
pwrcal.IterationsTolerance = 0.1
pwrcal.MaximumIterationsPerPoint = 3

' The worst-case window of power uncertainty (for a calibration which meets  
' tolerance) is the sum of the iteration tolerance and the power meter settling  
' tolerance (which is described below).
' At each stimulus point, the PNA takes power meter readings and determines when  
' they have settled by comparing the magnitude difference between consecutive  
' readings versus a nominal dB tolerance limit (ReadingsTolerance) on that magnitude  
' difference. When consecutive readings are within tolerance of each other, or  
' if they are not within tolerance but we've taken a maximum number of readings  
' (ReadingsPerPoint), the PNA does a weighted average of the readings taken at that  
' stimulus point and that is considered our settled power reading.
pwrcal.ReadingsTolerance = 0.1
pwrcal.ReadingsPerPoint = 5
Setup of information pertaining to this specific cal acquisition. Includes the method (type of devices) that will be used to perform the cal -- choose either naPowerMeter or naPowerMeterAndReceiver. naPowerMeterAndReceiver uses the power meter for the first iteration of each point and the PNA's reference receiver for subsequent iterations, so is much faster than using power meter only naPowerMeter.

But the power meter accounts for compression when calibrating at the output of an active device, whereas the reference receiver cannot unless it is coupled to the cal reference plane (on a PNA which allows direct access to the receivers).

'offset' specifies if the cal power level is offset (positive value for a gain, negative value for a loss) from the PNA port power setting on the channel when no source power cal is active. This is to account for components between the PNA test port and cal reference plane. In this example, we will calibrate at the PNA test port, so there is no offset (it is zero).

'bDisplay' indicates whether to display the source power cal dialog during the source power cal acquisition (the dialog will chart the corrected power readings).

```
pwrcal.SetCalInfo2 naPowerMeter, chan.channelNumber, port, offset, bDisplay
```

Perform synchronous source power cal acquisition sweep using the sensor attached to Channel A of the power meter. This assumes that the power sensor is already connected to Port 2 of the PNA.

```
pwrcal.AcquirePowerReadings naPowerSensor_A, True
```

Conclude the calibration. This applies the cal data to PNA channel memory, and turns the correction ON for Port 2 on Channel 1, but does NOT save the calibration.

```
pwrcal.ApplyPowerCorrectionValues
```

At this point, if you choose to save the instrument state as a ".CST" file, the calibration will be saved with the instrument state in that file.

```
stimulus = chan.GetXAxisValues
```

Read the stimulus values from Channel 1.

```
calvalues = chan.getSourcePowerCalDataEx(naCorrectionValues, port)
```

Read the source power correction data.

```
strResult = "Stimulus" & Chr(9) & Chr(9) & "Cal Value" & Chr(10)
For i = 0 To UBound(stimulus)
    strResult = strResult & stimulus(i) & Chr(9) & calvalues(i) & Chr(10)
Next
MsgBox strResult
End Sub
Perform an Unguided Cal using COM

This example uses the ICalibrator interface to do the following:

- perform a two port calibration
- retrieve the error term data
- retrieve the standard data (cal acquisition data)

Learn more about Reading and Writing Calibration data using COM.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as Calibrate.vbs. Learn how to setup and run the macro.

dim pna
' To run from an external PC, substitute your PNA Name and use the following command.
' set pna = CreateObject("AgilentPNA835x.Application", "PNA Name")
set pna = CreateObject("AgilentPNA835x.Application")
dim calibrator
set calibrator=pna.activechannel.calibrator

wscript.echo "setcalinfo for two port cal"
calibrator.setcalinfo 5,1, 2

' only have one set of standards
calibrator.Simultaneous2PortAcquisition = false

'first acquire forward reflection standards, then reverse

vardata = calibrator.GetStandard(t, 2,1)

next
Perform an Unknown Thru or TRL Cal

The following program performs either a 2-port SOLT Unknown Thru Cal or a 2-port TRL Cal. The 85052C Cal Kit used in this program contains both types of standards. This program can be run on 2-port or 4-port PNAs. When run on a multiport (4 or more ports) PNA, which does not have a reference receiver per port, a Delta Match Cal is required. See example of Delta Match Cal.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Unknown.vbs. Learn how to setup and run the macro.

```
Sub PerformUnknownThruOrTRLCal()
   ' Create / Get the PNA application.
   Set app = CreateObject("AgilentPNA835x.Application")
   ' Get the cal manager object
   Set calMgr = app.GetCalManager
   ' Get the guided cal object
   Set guidedCal = calMgr.GuidedCalibration
   Set chan = app.ActiveChannel
   chanNum = chan.ChannelNumber
   
   ' Initialize guided cal to be performed on the active channel.
   ' The boolean argument of True specifies the creation of a new calset
   ' for storing the new calibration.
   guidedCal.Initialize chanNum, True

   ' Specify connectors for Ports 1 and 2
   guidedCal.ConnectorType(1) = "APC 3.5 female"
   guidedCal.ConnectorType(2) = "APC 3.5 male"

   ' If your PNA has more than 2 ports, uncomment one or both of
   ' these next two lines, to explicitly specify this is
   ' just a 2-port cal.
   'guidedCal.ConnectorType(3) = "Not used"
   'guidedCal.ConnectorType(4) = "Not used"

   ' Specify cal kit for Ports 1 and 2
   guidedCal.CalKitType(1) = "85052C"
   guidedCal.CalKitType(2) = "85052C"

   ' Since the 85052C cal kit contains SOLT standards and also TRL
   ' standards, these next lines determine whether the cal becomes
   ' unknown thru (SOLT), or TRL.
   ' Specify cal and Thru method
   guidedCal.PathCalMethod (1,2) = "SOLT"
   guidedCal.PathThruMethod (1,2) = "Undefined Thru"

   ' To set up the cal as TRL, comment the previous line and uncomment this next line.
   ' The Thru method is set by default.
   guidedCal.PathCalMethod (1,2) = "TRL"
End Sub
```
' Initiate the calibration and query the number of steps
numSteps = guidedCal.GenerateSteps
MsgBox "Number of steps is " + CStr(numSteps)

' Query the list of ports that need delta match
portList = guidedCal.PortsNeedingDeltaMatch
If portList contains just one element and it's value is 0, then that indicates none of the ports being calibrated require delta match data.
' If each testport on the PNA has it's own reference receiver (R channel), then delta match is never needed, so portList will always be just 0.
lowerBound = LBound(portList)
If (UBound(portList) <> lowerBound) Or (portList(lowerBound) <> 0) Then
  ' Delta match data is required for at least one port.
  ' For this example, we assume a Global Delta Match Cal has previously been performed so the Global Delta Match CalSet exists.
  ' Supplying an empty string to ApplyDeltaMatchFromCalSet indicates to use the Global Delta Match CalSet.
  MsgBox "here"
guidedCal.ApplyDeltaMatchFromCalSet ""
End If

' Measure the standards
For i = 1 To numSteps
  step = "Step " + CStr(i) + " of " + CStr(numSteps)
  strPrompt = guidedCal.GetStepDescription(i)
  retVal = MsgBox(strPrompt, vbOKCancel, step)
  If retVal = vbCancel Then Exit Sub
  guidedCal.AcquireStep i
Next

' Conclude the calibration
guidedCal.GenerateErrorTerms
MsgBox "Cal is done!"

End Sub
Perform Global Delta Match Cal

The following program performs a Global Delta Match Calibration. This is required when performing an Unknown Thru cal or TRL cal on PNAs without a reference receiver for each test port. See example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Delta.vbs. Learn how to setup and run the macro.

```vbs
Sub PerformGlobalDeltaMatchCal()
    ' Create / Get the PNA application.
    Set app = CreateObject("AgilentPNA835x.Application")
    ' Get cal manager object
    Set calMgr = app.GetCalManager
    ' Get guided cal object
    Set guidedCal = calMgr.GuidedCalibration

    ' Initiate a Global Delta Match calibration, choosing connector and cal kit
    numSteps = guidedCal.GenerateGlobalDeltaMatchSequence("APC 3.5 female", "85033D/E")
    MsgBox "Number of steps is " + CStr(numSteps)

    ' Measure the standards
    For i = 1 To numSteps
        step = "Step " + CStr(i) + " of " + CStr(numSteps)
        strPrompt = guidedCal.GetStepDescription(i)
        retVal = MsgBox(strPrompt, vbOKCancel, step)
        If retVal = vbCancel Then Exit Sub
        guidedCal.AcquireStep i
    Next

    ' Conclude the calibration
    guidedCal.GenerateErrorTerms
    MsgBox "Cal is done!"

End Sub
```
Perform a Guided Cal with C#

The following example performs a 2-port or 4-port Guided Cal using C#.

**Note:** Replace `<remote host name>` with the full computer name of your PNA.

Learn more about using .NET with the PNA

```csharp
AgilentPNA835x.IApplication pna;
    AgilentPNA835x.ICalManager3 calMgr;
    AgilentPNA835x.IGuidedCalibration guidedCal;
    AgilentPNA835x.IChannel chan;

// Select the Cal Kit for each port being calibrated.
guidedCal.set_CalKitType(1,"85052D");
guidedCal.set_CalKitType(2,"85052D");
guidedCal.set_CalKitType(3,"85052D");
guidedCal.set_CalKitType(4, "85052D");

// To use an ECal module instead, comment out the above four lines
// and uncomment the following four lines.
// Replace N4691-60003 with your own ECAL model followed by 'ECal'.
// Your ECal module must already be connected to a PNA USB port.
//guidedCal.CalKitType(1) = "N4431-60003 ECal";
//guidedCal.CalKitType(2) = "N4431-60003 ECal";
//guidedCal.CalKitType(3) = "N4431-60003 ECal";
//guidedCal.CalKitType(4) = "N4431-60003 ECal";
MessageBox.Show("Cal kits defined for Ports 1 to 4");

// Initiate the calibration
guidedCal.GenerateSteps();

// If your selected cal kit is not a 4-port ECal module which can
// mate to all 4 ports at once, then you may want to choose which
// thru connections to measure for the cal. You must measure at
// least 3 different thru paths for a 4-port cal (for greatest
// accuracy you can choose to measure a thru connection for all 6
// pairings of the 4 ports). If you omit this command, the default
// is to measure from port 1 to port 2, port 1 to port 3, and
// port 1 to port 4. For this example we select to measure
// from port 1 to port 2, port 2 to port 3, and port 2 to port 4.
long[] portList = new long[6]{1,2,2,3,2,4};
guidedCal.ThruPortList = portList;
// Re-generate the connection steps to account for the thru changes
int numSteps = guidedCal.GenerateSteps();
MeasureAndComplete(numSteps);

}

void MeasureAndComplete(int numSteps)
{
    MessageBox.Show("Number of steps is " + numSteps.ToString());

    // Measure the standards
    // The following series of commands shows that standards
    // can be measured in any order. These steps acquire
    // measurement of standards in reverse order.
    // It is easiest to iterate through standards using
    // a For-Next Loop.
    for (int i = numSteps; i >= 1; --i)
    {
        string strPrompt = guidedCal.GetStepDescription(i);
        MessageBox.Show(strPrompt);
        guidedCal.AcquireStep(i);
    }

    // Conclude the calibration
    guidedCal.GenerateErrorTerms();
    MessageBox.Show("Cal is done");
}
Perform an ECal using COM

This example uses the GuidedCalibration interface to perform a 2-port ECal calibration. Learn more about Reading and Writing Calibration data using COM.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as ECal.vbs. Learn how to setup and run the macro.

How to setup and run the macro.

ECalUserCharacterizer Object

About User Characterization

---

```vbs
Option Explicit
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim calMgr
Set calMgr = pna.GetCalManager

' Get ECal User Characterizer COM object
Dim ecalCharacterizer
Set ecalCharacterizer = calMgr.GetECalUserCharacterizer

' Substitute here the model number and serial number of your own ECal.
' Note that this example corresponds to a 4-port ECal module with
' serial number 00001. If instead you have a 2-port ECal module,
' their model numbers are '5x5' numbers -- for example, 'N4691-60001'.
Dim ecalModelNum
ecalModelNum = "N4433A"
Dim ecalSerialNum
ecalSerialNum = "00001"
ecalCharacterizer.ECalID = ecalModelNum & "," & ecalSerialNum
MsgBox "ECal module to be characterized is: " & ecalCharacterizer.ECalID

' Set which user characterization number (1-12) the new characterization
' will be stored to in the ECal module when it is done. If you intend to
```
' store your user characterization just to PNA Disk Memory and NOT the 
' ECal module's memory, then omit the setting of this property.

calCharacterizer.CharacterizationNumber = 1

' The following commented-out lines of code show how you can access 
' the list of connector type names you can set for the ports of an 
' ECal when you user-characterize it. However, please note that if 
' you are writing the user characterization to the ECal module's memory, 
' as of yet only the Factory Defined set of connector choices will work 
' properly (see the ValidConnectorType property).

' If you will be saving your characterization to just 
' PNA Disk Memory only, then all connector names returned by this call 
' will work, user-defined connector names as well as factory-defined.

'Dim connTypeArray
'connTypeArray = calCharacterizer.ValidConnectorTypes
'MsgBox connTypeArray(1)

' Access element 1 in the string array
' For each port of the ECal module, specify which connector type 
' is at the end of the adapter (or cable or fixture) that is 
' connected to that port of the ECal for the characterization 
' (must be one of the connector types that is included in the 
' list that the ValidConnectorTypes method returns). The default 
' is "No adapter", which assumes you are characterizing that port 
' of the ECal "as is" (nothing attached to it). So in this example, 
' Ports C and D of the ECal are being characterized to just the 
' ECal's connectors.

calCharacterizer.ConnectorType(1) = "APC 3.5 male" ' ECal Port A
calCharacterizer.ConnectorType(2) = "APC 3.5 male" ' ECal Port B

' As with the connector types, the information set in these next 
' few properties also gets stored within the characterization.
' Set the name of the person and/or company that is producing 
' this characterization.

calCharacterizer.UserName = "John Doe, Acme Inc."

' Set user-specified description of the PNA being used.

calCharacterizer.UserDescriptionOfPNA = "SN US12345678"

' Set descriptions of what you have connected to the ECal module's 
' ports for the characterization.
ecalCharacterizer.PortDescription(1) = "3.5 mm adapter, SN 00001" ' Port A of the ECal
ecalCharacterizer.PortDescription(2) = "3.5 mm adapter, SN 00002" ' Port B of the ECal
' Begin a user characterization on Channel 1.
' If you will be storing this characterization to the ECal module's memory, then
' the boolean argument to this command should be set to True. If you will be storing
' this characterization to PNA disk memory ONLY, then you should specify False for
' that argument. In this example we will be storing the characterization to both
' module memory and PNA disk memory, so we use True.
ecalCharacterizer.InitializeEx 1, True

Perform a Comprehensive 2-Port Guided Cal

This example program performs a Guided Calibration on the active channel between ports 1 and 2. The following calibration features are demonstrated:

- Guided Power Cal
- Optional functions when using ECal
- Select the Thru method
- Save to a new CalSet

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the PNA hard drive as CompGuided.vbs. Learn How to setup and run the macro.

**ECAL Confidence Check**

This Visual Basic program:

- Initializes the PNA objects.
- Performs a complete ECAL confidence check

Before using this code:

- The active channel must contain an S11 measurement with a 1-port or N-port calibration
- Prepare a form with two buttons named `cmdRun` and `cmdQuit`

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

```vbnet
Private oPNA As AgilentPNA835x.Application
Private oChan As Channel
Private oCal As Calibrator
Private oMeas As Measurement

Private Sub cmdRun_Click()
    Dim iMeasIndex As Integer
    Set oPNA = CreateObject("AgilentPNA835x.Application", "MachineName")
    Set oChan = oPNA.ActiveChannel
    Set oCal = oChan.Calibrator

    iMeasIndex = 1

    ' Loop through measurements until an S11 on the active channel
    ' is found, or the end of the measurement collection is reached.
    Do
        Set oMeas = oPNA.Measurements(iMeasIndex)
        If oMeas.Parameter = "S11" And _
            oMeas.channelNumber = oChan.channelNumber Then Exit Do
        iMeasIndex = iMeasIndex + 1
        If iMeasIndex > oPNA.Measurements.Count Then
            MsgBox "No S11 measurement found on the active channel." _
                & " Create an S11 measurement, then try again."
    Loop
```

2097
Exit Sub
End If
Loop

' Set up trace view so we are viewing only the data trace.
oMeas.View = naData

' Acquire the S11 confidence check data from ECal Module A
' into the memory buffer.
oCal.AcquireCalConfidenceCheckECALEx "S11", 1

' Turn on trace math so the trace shows data divided by memory.
' You can be confident the S11 calibration is reasonably good if
' the displayed trace varies no more than a few tenths of a dB
' from 0 dB across the entire span.
oMeas.TraceMath = naDataDivMemory
End Sub

Sub cmdQuit_Click()

' Turn off trace math
' in case someone clicks Quit without having clicked Run
If oMeas <> Nothing Then oMeas.TraceMath = naDataNormal

' Conclude the confidence check to set the ECal module
' back to it's idle state.
If oCal <> Nothing Then oCal.DoneCalConfidenceCheckECAL

' End the program
End
End Sub
Writing Cal Set Data using COM

This example creates a Cal Set and then writes data to the Cal Set.

Learn more about Reading and Writing Calibration data using COM.
Learn more about Cal Sets.
See example: Reading Calset Data

---

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as CalSetsWrite.vbs. Learn how to setup and run the macro.

```vbs
' This sub creates phony data
Sub InitPhonyData()
    Dim i
    Dim numpts
    WScript.Echo "init phony"
    numpts = PNA.ActiveChannel.NumberOfPoints
    ReDim v(numpts - 1, 1)
    For i = 0 To numpts - 1
        v(i, 0) = i
        v(i, 1) = 0
    Next
End Sub

' This sub creates a Cal Set, then writes the phony data to it
Sub PutPhonyData()
    Dim cmgr
    Dim cset
    WScript.Echo "putphony"
    Set cmgr = PNA.GetCalManager
    Set cset = cmgr.CreateCalSet(1)
    Cset.OpenCalSet naCalType_OnePort, 1
    const directivity = 0
    const sourcematch = 1
    const reflectiontracking = 2
    cset.putErrorTerm directivity, 1, 1, v
    cset.putErrorTerm sourcematch, 1, 1, v
    cset.putErrorTerm reflectiontracking, 1, 1, v
    cset.CloseCalSet
```

2099
cset.Description = "Phony One Port"
cset.save
End Sub
Upload a Source Power Cal using COM

This program can be run in either Visual Basic 6 or as a VBScript program. The PNA can run *.vbs programs as macros.

This program demonstrates:

- Uploading a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations

See Other COM Example Programs

To run this program you need:

- Your PC and PNA both connected to a LAN (for communicating with each other).

To make this program work in VBS, save the following code in a text editor file such as Notepad and save as *.vbs.

To make this program work in Visual Basic 6:

1. Create a new project
2. Click Project, Add New Module, click Open.
3. Paste the following code into the code window.
4. Delete the first two lines (comment and Main)
5. Click Project, Properties. Under Startup Object, select Sub Main
6. Click Project, References, and select the Agilent PNA Series Type Library.

```vbs
Public Sub Main()
    Dim PNA, chan ' PNA COM objects
    Const naCorrectionValues = 0 ' enum NASourcePowerCalBuffer
    Const port = 2 ' PNA port #2 as source port
    Dim stimulus, calvalues
    Dim power, calpower, strResult
    ' Instantiate our PNA COM objects
    Set PNA = CreateObject("AgilentPNA835x.Application")
    Set chan = PNA.Channels(1)
    ' Code for uploading source power calibration...
    ' Code for reading calibration data...
End Sub
```
' Set the number of sweep points to 2 on Channel 1.
chan.NumberOfPoints = 2

' Ensure there's currently no source power cal on for this channel and port.
chan.SourcePowerCorrection(port) = False

' Specify if the cal power level is offset (positive value for a gain, negative value for a loss) from the PNA port power setting on the channel when no source power cal is active. This is to account for components between the PNA test port and cal reference plane.
' In this example, let's set up our calibration at the output of an amplifier with 15 dB gain.
chan.SourcePowerCalPowerOffset(port) = 15

' Send our source power correction data to the PNA. For purpose of simplicity in this example, we'll set up for no correction (0) at our start stimulus and 0.5 dB at our stop stimulus (recall that our sweep currently has just 2 points).
calvalues = Array(0, 0.5)
chan.putSourcePowerCalDataEx naCorrectionValues, port, calvalues

' Set the number of sweep points to 21 on Channel 1.
chan.NumberOfPoints = 21

' Read the fixed power level for this port on Channel 1.
power = chan.TestPortPower(port)

' Turn the source power cal on.
chan.SourcePowerCorrection(port) = True

' Again read the fixed power level for this port on Channel 1 (with our calibration turned on, this should now include the 15 dB offset we indicated our power amplifier provides).
calpower = chan.TestPortPower(port)

' Read the stimulus values from Channel 1.
stimulus = chan.GetXAxisValues

' Read back the source power correction data, now interpolated for 21 points
calvalues = chan.getSourcePowerCalDataEx(naCorrectionValues, port)

' Print the data using a message box (here, Chr returns the ASCII characters for Tab (9) and Linefeed (10)).
strResult = "PNA port power = " & power & Chr(10)
strResult = strResult & "Power at reference plane = " & calpower & Chr(10) & hr(10)
strResult = strResult & "Stimulus" & Chr(9) & Chr(9) & "Cal Value" & Chr(10)
For i = 0 To UBound(stimulus)
  strResult = strResult & stimulus(i) & Chr(9) & calvalues(i) & Chr(10)
Next
MsgBox strResult
End Sub
Upload and Download Segment Table

These example programs use the `SetAllSegments_Method` and `GetAllSegments Method` to do the following:

- Creates a 2-dimensional array (7 x 10) 7 data elements that define each segment x 10 segments
- Uploads the data to the PNA
- **Downloads a segment table** from the PNA

This program does not make sweep type = segment or show the segment table. The comments indicate the order in which the segment elements are specified: Index 0 - segment state, Index 4 is IFBW, and so forth.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as *.vbs. Learn how to setup and run the macro.

```vbs
' Create the application instance, and preset the application
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset

Dim chan
Set chan = app.ActiveChannel
chan.sweeptype = 4

Dim segs

Create and Cal an SMC Measurement

This example creates and calibrates an SMC measurement. To run this example without modification you need the following:

- A Mixer setup file saved on the PNA: C:/Program Files/Agilent/Network Analyzer/Documents/Mixer/MyMixer.mxr.
- If the mixer file uses an external LO source, it must be connected and configured.
- An ECal module that covers the frequency range of the measurement.
- A power meter must be available to the PNA. This can be accomplished either by attaching the meter to the PNA via a GPIB cable, or by using SCPI over LAN.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as SMC.vbs. Learn how to setup and run the macro.

8-Mar-2011   Updated for A.09.33
Create and Cal a VMC Measurement

The following example program sets up a 1-stage mixer, then performs a VMC calibration using an N4691-60004 ECAL module.

By removing the comments ( ` ) at the start of the BLUE code, it can also do the following:

- Use a mechanical cal kit
- Perform manual ECAL orientation
- Load a Mixer Characterization
- Perform a Mixer Characterization ONLY

Create an SMC Fixed Output Measurement with COM

This VBScript example creates a calibrated SMC fixed output measurement using a controlled LO. Then a single sweep is taken and data is retrieved.

Requirements:

- If an external LO is used, it should be configured to match the LOName property of the mixer object.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```vb
option explicit
' Utility function
function ToString(complexDataArray)
    dim dataAsString
    dim point
    for point = 0 to UBound(data)
        dataAsString = dataAsString & "(" & data(point,0) & "," & data(point,1) & ")"
    next
    ToString = dataAsString
end function
dim app
set app = createobject("agilentpna835x.application")
app.preset
' Put the channel in hold (highly recommended)
app.ActiveChannel.Hold 1
' Delete the standard measurement
app.ActiveMeasurement.Delete
' Create an SC21 measurement
app.CreateCustomMeasurementEx 1, "Scalar Mixer/Converter","SC21"
' Set the number of points to 11
app.ActiveChannel.NumberOfPoints = 11
' Setup the mixer parameters for a swept LO, fixed output measurement
dim mixer
set mixer = app.ActiveMeasurement
mixer.InputStartFrequency = 200e6
```
mixer.InputStopFrequency = 700e6
mixer.LORangeMode(1) = 0  ' 0 = Swept mode
mixer.OutputFixedFrequency = 3.4e9
mixer.InputPower = -17
mixer.LOPower(1) = 10
'mixer.LOName(1) = "8360"
'The CALCULATE method calculates the LO frequency from the other parameters,
'It also applies ALL mixer parameters to the channel.
mixer.Calculate 3  ' Calculate the LO range
' Create an S11 in the same channel
app.CreateCustomMeasurementEx 1, "Scalar Mixer/Converter","S11"
dim S11Meas
set S11Meas = app.ActiveMeasurement
' Create an IPwr in the same channel
app.CreateCustomMeasurementEx 1, "Scalar Mixer/Converter","IPwr"
' Create an OPwr in the same channel
app.CreateCustomMeasurementEx 1, "Scalar Mixer/Converter","OPwr"
' Perform a single sweep synchronously.
app.ActiveChannel.Single 1
' Retrieve the SC21 data
dim data
'Get the calibrated values in polar format
data = mixer.GetData(1,3)  ' 1 = naCorrectedData, 3 = naDataFormat_Polar
wscript.echo "SC21=" & ToString(data)
' Retrieve the S11 data
'Get the calibrated values in polar format
data = S11Meas.GetData(1,3)  ' 3 = naDataFormat_Polar
wscript.echo "S11=" & ToString(data)
Create a Segmented Sweep for Mixers

This example program shows how to setup a segment sweep in FCA.
This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the PNA hard drive as Seg.vbs.

Learn how to setup and run the macro.

Use an Existing Power Cal During an SMC Cal

This example shows how to use an existing Source Power Cal instead of the power cal that is performed during an SMC calibration. To run this program without modification, you need the following:

- A Mixer setup file saved on the PNA: C:/Program Files/Agilent/Network Analyzer/Documents/Mixer/MyMixer.mxr.
- If the mixer file uses an external LO source, it must be connected and configured.
- An ECal module that covers the frequency range of the measurement.
- An SMC cal set named "SMC_CAL". This is the cal set that source power correction data will be imported from. The input and output frequency ranges of the cal set must cover the corresponding ranges used during calibration, or guided cal initialization will fail.

Error Messages

- If you attempt to import power cal data from an SMC calset that uses different ports than the ones currently in use, the message “The necessary calibration standards were not found.” will appear.
- If the imported Cal Set does not cover the frequency range of the current cal, the message “Interpolation target is out of range. Cannot interpolate.” will appear.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as SMC.vbs. Learn how to setup and run the macro.

Create a Pulsed Measurement

**Note:** This example applies only to the E836x Opt H11. For PNA-X see [PNA-X Create a Narrowband Pulsed Measurement](#).

The following example demonstrates how to create a narrowband pulsed measurement using the Pulsed Application DLL. It first gets valid configuration settings and then uses those settings to configure the PNA and external pulsed generators.

To run this program, you need:

- **Pulsed Application** (Option H08)
- External Pulse Generators
- External Pulse Modulator / Pulse Bias

**See Also**

- Learn how to [install and register the pulsed .dll](#) on your PC
- See the [ConfigureNarrowBand3](#) Method for sending and returning parameters to the .dll.
- See the documentation for the following [COM IF Configuration](#) commands.
- See the [SCPI IF Configuration](#) commands.
- Learn about the **Pulsed Application**.

```vba
' Interfaces
Dim OApp As AgilentPNA835x.Application
Dim OIF As AgilentPNA835x.IFConfiguration

' Pulsed parameters
Dim DPRF As Double
Dim DOffset As Double
Dim DSampleRate As Double
Dim LNumTaps As Long
Dim LBW As Long
Dim IPrecision as Integer
Dim BPG81110 As Boolean
Dim BFixedPRF As Boolean

' pulsed DLL interface
Dim OPulsed As New AgilentPNAPulsed.Application
DPRF=5123 'Hz
LBW=100 'Hz
BPG81110=True 'Using the Agilent 81110A Pulse Generator
BFixedPRF=True 'Do not change the PRF during filter alignment. Only adjust the IFBW.

' Calculate precision of pulse generators so that the config function returns the correct precision with the right filter. For example, DPRF=5000 Hz with a pulse
```
generator that will only take a total of four numeric values
' (5.123 kHz)
'->log10(DPRF)=3.709
'->int(3.709)=3
'->3-3=0

'The algorithm will use a 10^x value for decrementing the PRF for null computation. This means that the first numeric digit from the right should be the one that is decremented by the pulsed algorithm (i.e. 5.122 kHz) to compute the filter nulls. This ensures that the pulse generators receive a PRF that is within their precision with the associated nulling IFBW.
IPrecision = Int(Flog10(CSng(DPRF))) - 3

'Send desired pulsed parameters to the pulsed configuration DLL. The DLL will return a new set of pulse parameters that provide the proper filter nulling.
OPulsed.ConfigNarrowBand3 DPRF, LNumTaps, LBW, DOffset, DSampleRate, IPrecision, BFixedPRF,BPG81110

'Send configuration to PNA

'Set PNA IFBW close to that returned by pulsed algorithm. This ensures that the proper settling time is set on the PNA.
OApp.ActiveChannel.IFBandwidth = LBW
OIF.IFFilterSamplePeriodMode = naMANUAL
OIF.IFFilterSamplePeriod = DSampleRate
OIF.IFFilterSource = naIFFilterSourceManual
OIF.IFFilterSampleCount = LNumTaps
OIF.IFGateEnable = True
OApp.ActiveChannel.FrequencyOffsetState = naON
OApp.ActiveChannel.FrequencyOffsetFrequency = DOffset

'Set receivers to medium gain setting
OIF.IFGainMode("ALL") = naMANUAL
OIF.IFGainLevel("A") = 1
OIF.IFGainLevel("B") = 1
OIF.IFGainLevel("R1") = 1
OIF.IFGainLevel("R2") = 1

Public Function Flog10(SGNum As Single) As Single
Flog10 = Log(SGNum) / Log(10)
End Function

'Enter Code here to send configuration to external pulse generators
Create a Balanced Measurement using COM

The following program creates several Balanced measurements in separate windows, generates markers, calculates statistics, and sets limit lines and queries results.

Note: By their nature, balanced measurements are extremely sensitive to phase differences between the two RF paths that make up the balanced port, especially at higher frequencies. A good calibration (not performed in this example) is critical to achieving good balanced measurement results.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as BalancedCOM.vbs. Learn how to setup and run the macro.

```vbs
' PNA application object
Dim app

' Channel 1 object
Dim chan1

' start of marker/limit testing range
Dim minTestStimulus

' end of marker/limit testing range
Dim maxTestStimulus

' Set to true if you want additional balanced measurements.
Dim AdditionalMeasurements
AdditionalMeasurements = 1

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
' Preset the instrument
app.Preset
' Get the Channel 1 object
Set chan1 = app.Channels(1)
' Stop data taking for now.
chan1.Hold true
' Set up the start / stop frequency for Channel 1 sweep.
MHZ = 1000000
GHZ = 1000*MHZ
chan1.StartFrequency = 10 *MHZ
chan1.StopFrequency = 1 *GHZ
chan1.NumberOfPoints = 801
' Define our test frequency range
minTestStimulus = 100*MHZ
maxTestStimulus = 900*MHZ
' This example uses DUT topology Bal-Bal -
' a DUT with a balanced input and balanced output.
' Port mapping for our DUT:
' logical port 1 = physical ports 1 and 4
```
logical port 2 = physical ports 2 and 3
The default is:
logical port 1 = physical ports 1 and 2
logical port 2 = physical ports 3 and 4

logical 1             logical 2
1 --------|                |---- 2 +
|          | DUT               |
4 --------|------------------|---- 3 -

chan1.BalancedTopology.SetBBPorts 1, 4, 2, 3

Now we create some Bal-Bal measurements.
By creating Bal-Bal measurements ("BBAL:..."),
the channel is set to Bal-Bal topology,
so it is not necessary to do this explicitly
with the BalancedTopology.DUTTopology command.
We do it here just for clarity:

chan1.BalancedTopology.DUTTopology = 2
0 == SE-Bal, 1 == SE-SE-Bal, 2 == Bal-Bal

Create four windows, each showing one category of balanced measurement:
Create Forward Transmission Measurements in Bal-Bal topology on Channel 1, window 1

differential mode transmission
app.CreateMeasurement 1, "BBAL:SDD21",1,1
Set sdd21_1 = app.ActiveMeasurement

differential to common mode conversion
app.CreateMeasurement 1, "BBAL:SCD21",1,1
Set scd21_1 = app.ActiveMeasurement

common to differential mode conversion
app.CreateMeasurement 1, "BBAL:SDC21",1,1
Set sdc21_1 = app.ActiveMeasurement

common mode transmission
app.CreateMeasurement 1, "BBAL:SCC21",1,1
Set scc21_1 = app.ActiveMeasurement

Optionally create some additional measurements
If AdditionalMeasurements Then

Create (logical) Port 1 reflection measurements, channel 1, window 2
app.CreateMeasurement 1, "BBAL:SDD11",1,2 ' differential mode reflection
app.CreateMeasurement 1, "BBAL:SCD11",1,2 ' C to D mode conversion reflection
app.CreateMeasurement 1, "BBAL:SDC11",1,2 ' D to C mode conversion reflection
app.CreateMeasurement 1, "BBAL:SCC11",1,2 ' common mode reflection
' Create Reverse Transmission Measurements, channel 1, window 3
app.CreateMeasurement 1, "BBAL:SDD12",1,3 ' differential mode transmission
app.CreateMeasurement 1, "BBAL:SCD12",1,3 ' differential to common mode conversion
app.CreateMeasurement 1, "BBAL:SDC12",1,3 ' common to differential mode conversion
app.CreateMeasurement 1, "BBAL:SCC12",1,3 ' common mode transmission

' Create (logical) Port 2 reflection measurements in window 4
app.CreateMeasurement 1, "BBAL:SDD22",1,4 ' differential mode reflection
app.CreateMeasurement 1, "BBAL:SDC22",1,4 ' C to D mode conversion reflection
app.CreateMeasurement 1, "BBAL:SCD22",1,4 ' D to C mode conversion reflection
app.CreateMeasurement 1, "BBAL:SCC22",1,4 ' common mode reflection

End If

Create an IM Spectrum Measurement

This VBScript example creates IM Spectrum measurement based on passed parameters. This subprogram is extracted from the macro on the PNA that produces an IM spectrum channel from the Marker function. You can see the entire program at C:/Program Files/Agilent/Network Analyzer/Applications/IMD/IMD.VBS. This VBScript (*.vbs) program must be used as part of a program that supplies the required parameters. When complete, it can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as IMD.vbs.

Learn how to setup and run the macro.

See SweptIMD Object.

```
'' SetupIMSpectrum
'' Setup an IM Spectrum (non-converter) channel based upon supplied parameters
sub SetupIMSpectrum(app, MkrPos, ToneSpacing, TonePower)
    dim objIMXChan, objIMDChan
    dim Fstart, Fstop, NumPoints, ToneFc

    set objIMXChan = objIMSChan.CustomChannelConfiguration
    set objIMDChan = objSIMDChan.CustomChannelConfiguration

    NumPoints = objSIMDChan.NumberOfPoints
    select case objIMDChan.SweepType
        case naIMDToneCWSweep
            ToneFc = objIMDChan.FrequencyCenter
        case naIMDTonePowerSweep
            Fstart = objIMDChan.TonePowerStart(0)
            Fstop = objIMDChan.TonePowerStop(0)
            TonePower = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)
            ToneFc = objIMDChan.FrequencyCenter
        case naIMDToneCenterFreqSweep
            Fstart = objIMDChan.FrequencyCenterStart
```

2132
Fstop = objIMDChan.FrequencyCenterStop
ToneFc = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)

case naIMDDeltaFrequencySweep
    ToneFc = objIMDChan.FrequencyCenter
    Fstart = objIMDChan.DeltaFrequencyStart
    Fstop = objIMDChan.DeltaFrequencyStop
    ToneSpacing = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)
end Select

objIMXChan.FrequencyCenter = ToneFc
objIMXChan.DeltaFrequency = ToneSpacing
objIMXChan.TonePower(0) = TonePower
objIMXChan.TonePower(1) = TonePower
app.ActiveMeasurement.Trace.ReferenceValue = TonePower + 10
objIMSChan.continuous
end Sub
Create an iTMSA Measurement

The following VB Script example shows how to create an iTMSA measurement with Power Sweep. Click each link to see a detailed description of each command.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as Testset.vbs. Learn how to setup and run the macro.

```vbs
dim app 'PNA App
dim meas 'Measurement
dim balancemeas
dim balstimulus
dim chan

set app = createobject("agilentpna835x.application")
set chan = app.activechannel
chan.SweepType = 2 ' Set the sweep type to power sweep

set meas = app.ActiveMeasurement
set balancemeas = meas.BalancedMeasurement
balancemeas.BalancedTopology.DUTTopology = 2 ' Bal-Bal topology
balancemeas.BalancedStimulus.Mode = 1 ' Turn on true mode

' The PNA-X balanced port numbers are always (0)=Bal 1; (-1)=Bal2
chan.StartPowerEx(0) = -5 ' Set the balanced port 1 start power to -5 dbm
chan.StopPowerEx(0) = 5 ' Set the balanced port 1 stop power to 5 dbm
chan.StartPowerEx(-1) = -10 ' Set the balanced port 2 start power to -5 dbm
chan.StopPowerEx(-1) = 0 ' Set the balanced port 2 stop power to 5 dbm
```

Create and Cal a Noise Figure Measurement

This example program creates a Noise Figure measurement, then calibrates the measurement. You MUST change the ECal Identification strings (in Blue font).

Optional: Uncomment the following lines (in Blue font) to change these settings:

- Noise Receiver = Noise Receiver to Std (PNA) Receiver
- Cal Method = "Vector" to "Scalar"
- Receiver Characterization Method = "NoiseSource" to "Power Meter"

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Noise.vbs. Learn how to setup and run the macro.

Create and Cal an NFX Measurement

This program does the following:

- Setup a Noise Figure SC21 Measurement
- Calibrate Noise Figure channel
- Optional - Configure for an Embedded LO

To run this program, make the following edits, highlighted in **yellow**:

- Set `host` to your PNA computer name
- Set `tunerECal` and `pullECal` to your ECal model and info
- Set `ENR` to correct file name and location
- Set `connector types` for ECal, power sensor, and noise source

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as NFX.vbs. [Learn how to setup and run the macro.](#)

ENR File Management Example

This VB Script program illustrates ENR file management using COM commands.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as Calibrate.vbs. Learn how to setup and run the macro.

See Other COM Example Programs

' Sample VBS program illustrating COM commands for ENR file management.

option explicit

dim pna ' application
dim enr ' ENRFile object
dim scpi, hostname

set pna=CreateObject("agilentpna835x.application")
set scpi = pna.ScpiStringParser
set enr = pna.ENRFile

' Generate data to put in ENR file
Dim vdata(3)
vdata(0) = 100E6 ' first frequency point
vdata(1) = 14.532 ' first ENR value
vdata(2) = 20E9 ' second frequency point
vdata(3) = 15.731 ' second ENR value

' send data to ENRFile object
enr.PutENRData(vdata)

' Set noise source serial number
enr.ENRSN = "ABCD1234"

' Write ENR file to disk
enr.SaveENRFile("C:/Program Files/Agilent/Network Analyzer/Documents/sample.enr")

Events with C++

The following code, along with the Header file, shows how to use the PNA Events.

Download the Header file 'preventcatcher.h'

```cpp
#include <atlbase.h>
#include <atcom.h>
#include <iostream>
#import "835x.tlb" no_namespace,raw_interfaces_only,named_guids
#include "pnaeventcatcher.h"

inline void HR(HRESULT hr)
{
    if (FAILED(hr))
        throw hr;
}

class MyEventCatcher : public CPNAEventCatcher
{

public:
    MyEventCatcher()
    {
        CoInitialize(NULL);
        CComPtr<IApplication> app;
        HR(app.CoCreateInstance(CLSID_Application));
        CPNAEventCatcher::SubscribeCatcher(app);
        HR(app->AllowAllEvents());
    }

    ~MyEventCatcher()
    {
        CPNAEventCatcher::Release();
        CoUninitialize();
    }
};
```
virtual void OnMeasurementEvent(long eventID, long measurementNumber) {}
virtual void OnChannelEvent(long eventID, long ch)
{
    if (eventID == 0x68070709L) // MSG_ALL_SWEEPS_COMPLETED_AND_PROCESSED
    {
        static int i = 0;
        ++i;
        std::cout << "Sweep:" << i << std::endl;
    }
}

In a .cpp file, (just like most ATL projects) you must have a declared an instance of CComModule. This will work:
CComModule _Module;

Remember that you are now the "Server" and the PNA is the Client. That makes DCOM a bit complicated.
This code was tested in VS2005 using a wizard generated MFC MDI project.

FOM Examples

All three VBScript examples in this topic create a FOM measurement with the following attributes:

- Sweep the Source (input) from 1 GHz to 2 GHz
- Sweep the Receivers (output) from 2 GHz to 3 GHz
- You provide an LO at 1 GHz

Learn more about Frequency Offset Mode

These programs can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as FOM.vbs. Learn how to setup and run the macro.

The following example will run on any PNA model with FOM (opt 080). However, these commands have no provisions for internal second source. It uses commands introduced before 'enhanced FOM' was released for the A.07.10 release.

```
set app = CreateObject("Agilentpna835x.application")
set chan = app.ActiveChannel
chan.startFrequency = 1e9
chan.StopFrequency = 2e9
' set the receiver frequencies to be 2e9->3e9
chan.FrequencyOffsetFrequency = 1e9
chan.FrequencyOffsetState = 1
```

The following example can be run ONLY on a PNA with revision A.07.10 or later and has FOM (opt 080). It uses new FOM commands. See FOMRange object.

```
set app = CreateObject("Agilentpna835x.application")
set chan = app.ActiveChannel
chan.startFrequency = 1e9
chan.StopFrequency = 2e9
' set the receiver frequencies to be 2e9->3e9
chan.fom("Receivers").Offset = 1e9
chan.fom.State = 1
```

The following example can be run ONLY on a PNA with a second internal source, has revision A.07.10 or later, and has FOM (opt 080). It uses the internal 2nd source for the fixed LO frequency.
set app = CreateObject("Agilentpna835x.application")
set chan = app.ActiveChannel
chan.startFrequency = 1e9
chan.StopFrequency = 2e9
' set the receiver frequencies to be 2e9->3e9
chan.fom("Receivers").Offset = 1e9
chan.fom("Source2").Coupled = 0
chan.fom("Source2").StartFrequency = 1e9
chan.fom("Source2").StopFrequency = 1e9
' turn off port coupling
chan.coupleports = 0
' set LO to 10 dBm
chan.TestPortPower(3) = 10
'Turn ON port 3, our LO signal on our 2 source PNA
chan.SourcePortMode(3) = 1
chan.fom.State = 1
Limit Line Testing with COM

This Visual Basic program:

- Turns off existing Limit Lines
- Establishes Limit Lines with the following settings:
  - Frequency range - 4 GHz to 8 GHz
  - Maximum value - (10dB)
  - Minimum value - (-30dB)
- Turns on Lines, Testing, and Sound

If using Global Pass/Fail to report limit results, trigger the PNA after configuring and enabling Limit lines.

```vbnet
Public limts As LimitTest
Set limts = meas.LimitTest
'All Off
For i = 1 To 20
    limts(i).Type = naLimitSegmentType_OFF
Next i

'Set up Limit Lines
limts(1).Type = naLimitSegmentType_Maximum
limts(1).BeginResponse = 10
limts(1).EndResponse = 10
limts(1).BeginStimulus = 4000000000#
limts(1).EndStimulus = 8000000000#
limts(2).Type = naLimitSegmentType_Minimum
limts(2).BeginResponse = -30
limts(2).EndResponse = -30
limts(2).BeginStimulus = 4000000000#
limts(2).EndStimulus = 8000000000#

'Turn on Lines, Testing, and Sound
limts.LineDisplay = 1
limts.State = 1
limts.SoundOnFail = 1
```
Modify Display Colors

This VBScript example modifies display colors, modifies trace1 colors, then saves and recalls the theme.

These programs can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as FOM.vbs. Learn how to setup and run the macro.

```vbnet
function RGB(R, G, B)
    RGB = R + G*(2^8) + B*(2^16)
end Function

shell.AppActivate "PNA Series Network Analyzer"
Set app = CreateObject("AgilentPNA835X.Application")
app.preset
Set colors = app.Preferences.DisplayColors
' Uncomment the following line to modify Print colors
'    Set colors = app.Preferences.PrintColors
colors.ResetTheme()
    colors.background = RGB(64,0,64)  ' purple
displaycolors.grid = RGB(0,255,128)  ' greenish
colors.activeLabels = RGB(0,0,255)  ' blue
colors.inactiveLabels = RGB(255,0,0)  ' red
colors.failedTraces = RGB(255,128,64) ' orange
dim Trace1
Set Trace1 = colors.Trace(1)
    Trace1.DataAndLimits = RGB(1,251,1)  ' green
    Trace1.Memory = RGB(251,1,1)  ' red
    Trace1.Markers = RGB(251,251,251)  ' white
    Trace1.MemoryMarkers = RGB(1,251,251)  ' green + blue
colors.StoreTheme("c:/Program Files/Agilent/Network Analyzer/Colors/Theme1.colors")
colors.LoadTheme("c:/Program Files/Agilent/Network Analyzer/Colors/Theme1.colors")
```
E5091 Testset Control

The following VB Script example exercises the COM commands used to control the E5091A testset.

For a description of each command, see E5091 Testsets collection.

```
Sub Main()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Dim testsets As E5091Testsets
    Set testsets = pna.E5091Testsets
    Dim tset1 As E5091Testset
    Set tset1 = testsets(1)
    tset1.OutputPort(1, 3) = naE5091PortR2
    tset1.ControlLines(1) = 5
    tset1.ShowProperties = True
    tset1.Enabled = True
    MsgBox tset1.ID
    MsgBox tset1.Enabled
    MsgBox tset1.ShowProperties
    ' NumberOfPorts property returns 0 when testset not connected
    MsgBox tset1.NumberOfPorts
    MsgBox tset1.OutputPort(1, 3)
    MsgBox tset1.ControlLines(1)

    Dim tset2 As E5091Testset
    Set tset2 = testsets(2)
    tset2.Enabled = True
    tset2.ShowProperties = True
    MsgBox tset2.Enabled
    MsgBox tset2.ShowProperties
End Sub
```
Errors and the SCPIStringParser Object

This C++ program uses the SCPIStringParser.Parse command to detect the failed HRESULT and interrogate the errorInfo object for more details.

// scpierrors.cpp : Defines the entry point for the console application.
//

#include <iostream>
#include "afx.h"
#include "atlib.h"
# import "C:/program files/common files/agilent/pna/835x.tlb" raw_interfaces_only, no_namespace, named_guids
using namespace std;
HRESULT SendScpiCommand( IScpiStringParser* parser, CComBSTR& cmd, CComBSTR& response)
{
    CComBSTR bstr;
    HRESULT hr = parser->Parse(CComBSTR(cmd), &response);
    if (FAILED(hr))
    {
        // see if this interface supports ErrInfo
        CComPtr<ISupportErrorInfo> spSupportsErrInfo;
        if (SUCCEEDED(parser->QueryInterface(&spSupportsErrInfo)))
        {
            // it does, so let's get the errorinfo object
            CComPtr<IErrorInfo> spErrorInfo;
            if (SUCCEEDED(GetErrorInfo(0, &spErrorInfo)))
            {
                CComBSTR errStr;
                spErrorInfo->GetDescription(&errStr);
                std::cout << "ERROR: " << CString(errStr) << std::endl;
            }
        }
    }
    return hr;
}
int main()
{
    CoInitialize(NULL);
    {
        CComBSTR response;
        CComPtr<IApplication> spPNA;
        CComPtr<IScpiStringParser> spSCPI;
        if (SUCCEEDED(spPNA.CoCreateInstance(CLSID_Application)))
        {
            spPNA->get_ScpiStringParser(&spSCPI);
            SendScpiCommand(spSCPI, CComBSTR("SYSTEM:PRESET"), response);
            SendScpiCommand(spSCPI, CComBSTR("CALC:PAR:CAT?"), response);
            std::cout << CString(response) << std::endl;
            SendScpiCommand(spSCPI, CComBSTR("THIS:IS:A:SYNTAX:ERROR"), response);
        }
    }
    CoUninitialize();
    return 0;
}
**External Testset Control**

The following VB Script example exercises the COM commands used to control the Z5623AK64 testset. For a description of each command, see TestsetControl Object.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as Testset.vbs. Learn how to setup and run the macro.

```vbnet
' Demonstrate some COM commands for external testsets.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Sub DemoTestset(na)
    Dim testsets, tset1
    Dim portNum
    Dim chNum, address
    Set testsets = na.ExternalTestsets
    chNum = 1

    ' Load a configuration file.
    ' NOTE: the K64 testset is only compatible with 4-port analyzers.
    address = 0
testsets.Add "Z5623AK64", address

    ' Get the testset object
    ' in the testsets collection.
    Set tset1 = testsets(1)

    ' Show the selections available for each port.
    For portNum = 1 To 4
        MsgBox("Port " & CStr(portNum) & " catalog: " & tset1.PortCatalog(portNum))
    Next

    ' Set port mappings on channel 1.
tset1.OutputPorts(chNum) = "5 ext R,2 int R,3 int R,6 int R"
End Sub
```
' Set control lines.
tset1.ControlLines(chNum) = 85

' Set label.
tset1.Label(chNum) = "Some label"

' Enable external testset control. This automatically enables status bar display as well.
tset1.Enabled = True
End Sub

' The testset used in this demo is only usable on 4-port analyzers
If (pna.NumberOfPorts <> 4) Then
MsgBox("This program only runs on 4-port analyzers.")
Else
DemoTestset(pna)
End If
PathConfiguration Example

**Note:** These commands are accessible only for PNA-X models.

These Visual Basic and C# examples exercise various commands on the:

- PathConfigurationManager Object
- PathConfiguration Object
- PathElement Object

**VB Example**

```vbnet
' Create / Get the PNA application
Dim app
Set app = CreateObject("AgilentPNA835x.Application")

' Preset the instrument
app.Preset

' Get a channel interface on which to operate
Dim chan
Set chan = app.ActiveChannel

' Modify the Default configuration, and save it as "My Config"
chan.PathConfiguration = "Default"

' Set the "Combiner" element to value "Reversed"
chan.PathConfiguration.Element("Combiner").Value = "Reversed"

' Set the "Src1" element to value "High Power"
chan.PathConfiguration.Element("Src1").Value = "High Power"

' Change the description text
chan.PathConfiguration.DescriptionText = "Connect J8 to J9."

' Store the modified configuration
chan.PathConfiguration.Store ("My Config")

' Set the instrument’s path config back to the default (req. 8)
chan.PathConfiguration = "Default"

' Load a previously saved configuration onto channel 1
app.PathConfigurationManager.Load 1, "My Config"
```

**C# Example**

```csharp
// Create / Get the PNA application
Dim app
Set app = CreateObject("AgilentPNA835x.Application")

// Preset the instrument
app.Preset

// Get a channel interface on which to operate
Dim chan
Set chan = app.ActiveChannel

// Modify the Default configuration, and save it as "My Config"
chan.PathConfiguration = "Default"

// Set the "Combiner" element to value "Reversed"
chan.PathConfiguration.Element("Combiner").Value = "Reversed"

// Set the "Src1" element to value "High Power"
chan.PathConfiguration.Element("Src1").Value = "High Power"

// Change the description text
chan.PathConfiguration.DescriptionText = "Connect J8 to J9."

// Store the modified configuration
chan.PathConfiguration.Store ("My Config")

// Set the instrument’s path config back to the default (req. 8)
chan.PathConfiguration = "Default"

// Load a previously saved configuration onto channel 1
app.PathConfigurationManager.Load 1, "My Config"
```
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");

AgilentPNA835x.Application pna = (AgilentPNA835x.Application)Activator.CreateInstance(pnaType);

AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;

// Preset the Instrument
pna.Preset();

// Modify the Default configuration, and save it as "My Config"
chan.set_PathConfiguration("Default");

// Set the "Combiner" element to value "Reversed"
chan.get_PathConfiguration().get_Element("Combiner").Value = "Reversed";

// Change the description text
chan.get_PathConfiguration().DescriptionText = "Connect J8 to J9."

// Store the modified configuration
chan.get_PathConfiguration().Store("My Config");

// Set the instrument’s path config back to the default (req. 8)
chan.set_PathConfiguration("Default");

// Load a previously saved configuration onto channel 2
pna.PathConfigurationManager.LoadConfiguration(1, "My Config");
Create a Narrowband Pulsed Measurement using the PNA-X and COM

The following COM example demonstrates how to create a narrowband pulsed measurement using the Pulsed Application DLL on the PNA-X.

See the example program for the E836x PNA models.

See the example program for wideband pulsed measurements on the PNA-X.

It first gets valid configuration settings and then uses those settings to configure the PNA and internal pulsed generators.

To run this program, you need:

- PNA-X
- Pulsed Application (Option H08)

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as BalancedCOM.vbs. Learn how to setup and run the macro.

See Also

Setup Basic Measurements

This VBScript program sets up four basic s-parameter measurements in four windows, all in a single channel. Handles are created to the measurement, channel, and window objects so that subsequent settings can be made for each.

**Note:** This is only an example. This is not necessarily the most efficient way to make basic S-parameter measurements.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Basic.vbs. Learn how to setup and run the macro.

See PNA Object Model

See CreateSParameterEx

See Other COM Example Programs

```vbscript
Set pna = CreateObject("AgilentPNA835x.Application")
pna.Preset
' Get a handle to the preset channel 1, S11 meas, and window(1)
set meas1=pna.ActiveMeasurement
set chan1=pna.ActiveChannel
set win1=pna.ActiveNAWindow
' Creates a new S21 measurement in New window(2)
pna.CreateSParameterEx 1,2,1,2,2
set meas2=pna.ActiveMeasurement
set win2=pna.ActiveNAWindow
' Creates a new S12 measurement in New window(3)
pna.CreateSParameterEx 1,1,2,1,3
set meas3=pna.ActiveMeasurement
set win3=pna.ActiveNAWindow
' Creates a new S22 measurement in New window(4)
pna.CreateSParameterEx 1,2,2,2,4
set meas4=pna.ActiveMeasurement
set win4=pna.ActiveNAWindow
'Make settings
'set Stop Frequency for channel
chan1.StopFrequency=1e9
' set Display formats
meas1.format=1 'Lin Mag
```
meas2.format=2 'Log Mag
meas3.format=3 'Phase
meas4.format=4 'Smith
'Show title in all windows
win1.title="Win #1"
win2.title="Win #2"
win3.title="Win #3"
win4.title="Win #4"

**Setup Compression Marker**

This example program does the following:

- Creates a compression marker
- Queries the Power Out and Power In values

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as CompMkr.vbs. Learn how to setup and run the macro.

See the FIFO object.

---

**See Other COM Example Programs**

```vbscript
Set app = CreateObject("AgilentPNA835X.Application")
set meas = app.activemeasurement

'get the COM marker object
'and create marker1
set mark = meas.marker(1)

'set the compression level
mark.compressionlevel = 1.5

'make it a compression marker
'and find the compression point
mark.searchcompressionpoint

'return power out and power in
'power in
dim answer
answer = mark.compressionpin
wscript.echo("pin: " & answer)

'power out
answer = mark.compressionpout
wscript.echo("pout: " & answer)
```

Set Up an Embedded LO Measurement

This VBScript example creates a Converter measurement for a converter with an Embedded LO.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Noise.vbs. Learn how to setup and run the macro.

```vbscript
option explicit
dim app
dim chan
dim host
host = <your PNA computer name here>
set app = CreateObject("Agilentpna835x.application", host)
app.reset
' create NFX traces
app.CreateCustomMeasurementEx 1, "Noise Figure Converters", "NF", 1
app.CreateCustomMeasurementEx 1, "Noise Figure Converters", "SC21", 1
'set channel and application objects
set chan = app.ActiveChannel
set nfx = chan.CustomChannelConfiguration
dim converter
set converter = chan.GetConverter()
dim calMgr
set calMgr = app.GetCalManager
dim nfxCal
set nfxCal = CalMgr.CreateCustomCalEx(1)
dim nfxCalExt
set nfxCalExt = nfxCal.CustomCalConfiguration
'dim ELO
'set ELO = converter.ConverterEmbeddedLO
' Set embedded LO properties
ELO.NormalizePoint = 101
ELO.TuningMode = 0 ' Broadband and precise
ELO. TuningIFBW = 3.0e4
ELO.MaxPreciseTuningIterations = 5
```
ELO.PreciseTuningTolerance = 1
ELO.TuningSweepInterval = 1
ELO.IsOn = true
chan.Single 1

Setup FastCW and FIFO

This example program does the following:

- Setup an A/R and B/R measurement
- Turn ON point averaging
- Set external edge triggering (commented out)
- Set FIFO and Fast CW
- Write data into FIFO data buffer
- Read FIFO data buffer

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as FIFO.vbs. Learn how to setup and run the macro. See the FIFO object.

See Other COM Example Programs

```vbs
dim app
set app = createobject("Agilentpna835x.application")
' Setup and measure A/R and B/R
app.Reset
app.CreateMeasurement 1,"A/R1",0
app.CreateMeasurement 1,"B/R1",0
' Set IFBW to 600khz (400thousand pts/second)
app.activeChannel.IFBandwidth = 600e3
' Point Averaging Count = 10
app.activeChannel.AverageMode = 0 ' point
app.activeChannel.averagingFactor = 10
app.ActiveChannel.averaging = 1 ' turn on
' Edge triggering - positive edge
'app.TriggerSetup.ExternalTriggerConnectionBehavior(1) = 2 ' BNC1 = trigger positive edge
'app.TriggerSetup.Source = 2 ' external
'app.ActiveChannel.TriggerMode = 0 'point
' Setup FIFO and Fast CW count
```
app.ActiveChannel.Hold 1 ' hold - synchronous
app.FIFO.State = 1' turn on FIFO
app.FIFO.Clear
app.activechannel.sweeptype = 3 ' CW sweep
app.activechannel.fastcwpointcount = 1000000' set the point count to 1million
app.activechannel.single 1 ' synchronous single
' the single will wait until the end of sweep.
'You do not have to wait until end of sweep to start emptying FIFO.
points = app.fifo.datacount
msgbox points
' points == 2000000 ' points = 2million. Took 5 seconds to acquire
For I = 0 to 1 ' 2 iterations (2 parameters * 2 sets of 1 million)
Dim data
Data = app.fifo.data(1000000)
Next
msgbox data(0)
Setup Noise Figure Port Mapping

This program demonstrates how to change source and receive ports when measuring noise figure. It assumes that option 029 ("Fully Corrected Noise Figure") is installed.

If only option 028 ("Noise figure measurements using standard receivers") is installed, switching ports is simpler, since only one noise receiver selection is available.

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as NF.vbs. Learn how to setup and run the macro.

```vbnet
option explicit
' Noise receiver enumerations
dim naStandardReceiver, naNoiseReceiver
' standard PNA receiver
naStandardReceiver = 0
' dedicated noise receiver (option 029 only)
aNoiseReceiver = 1
dim pna, windowNum, channelNum
set pna = CreateObject("Agilentpna835x.application")
windowNum = 1
channelNum = 1
pna.Reset
' Create Noise Figure measurement
dim noise,noiseChan,noiseConfig
set noise = pna.CreateCustomMeasurementEx(channelNum, "Noise Figure Cold Source", "NF", windowNum)
set noiseChan = pna.ActiveChannel
' provides access to noise-specific channel properties
set noiseConfig = noiseChan.CustomChannelConfiguration
'To change from the default input/output port settings of
' source port = PNA1, receive port = PNA2,
' you must first change the noise receiver,
```
' then select the desired ports.
dim srcPort, rcvPort
' set port mapping to source port = PNA3, receive port = PNA4
srcPort = 3
rcvPort = 4
' use PNA receiver for noise measurements
noiseConfig.NoiseReceiver = naStandardReceiver
noiseConfig.SetPortMap srcPort, rcvPort
' To revert back to using the noise receiver, the source
' and receive ports must be set to their default values
' BEFORE switching to the noise receiver.
' Otherwise, a COM exception will be thrown.
' restore defaults: source=PNA1, receiver=PNA2
noiseConfig.SetPortMap 1,2
' use dedicated noise receiver for noise measurements
noiseConfig.NoiseReceiver = naNoiseReceiver
Setup Phase Control

'turn on 3 and 1
chan.SourcePortMode(1) = 1
chan.SourcePortMode(3) = 1
chan.SweepType = 5 'Phase sweep
Set phase = chan.PhaseControl
'set port3's control parameter to R3/C
phase.PhaseParameter(3) = "R3/C"
'notice the reference port should not included in the parameter
```
phase.PhaseReferencePort(3) = 1

'Set port3 to PAR mode

phase.PhaseControlMode(3) = 1 'PhaseControlParameter mode

phase.FixedRatioedPower(3) = 3

phase.StartPhase(3) = 0

phase.StopPhase(3) = 180
Setup PNOP and PSAT Marker Search

This example program does the following:

- Sets up measurement for either PNOP or PSAT marker search
- Sets parameters for search
- Reads a parameter for each

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as SearchMkr.vbs. Learn how to setup and run the macro.

```
Set app = CreateObject("AgilentPNA835X.Application")
app.Preset
set meas = app.activemeasurement
'View Power Out vs Power In
meas.ChangeParameter "B", 1
'perform power sweep
set chan = app.ActiveChannel
chan.SweepType = 2
chan.StartPower = -5
chan.StopPower = 0
'-------------------
'Choose marker search
resp=Msgbox ("PNOP (yes) or PSAT (no)", 4, "PNA Marker Search Demo")
if resp=6 then
  PNOP1()
Else
  PSAT1()
End If
'-------------------
'PSAT marker search
Sub PSAT1()
set psat = meas.PSaturation
```
psat.PMaxBackOff = .3
psat.SearchPowerSaturation

' Read PSAT Parameter
dim answer
answer=psat.GainSaturation
wscript.echo("Gain Sat: ", answer)
End Sub

'--------------------
' PNOP marker search
Sub PNOP1()
set pnon = meas.PNOP
pnon.BackOff = 2
pnon.PinOffset = 1
pnon.SearchPowerNormalOperatingPoint

' Read PNOP Parameter
dim answer
answer=pnon.Gain
wscript.echo("PNOP Gain: ", answer)
End Sub
Setup Receiver Leveling

The following VB Script example exercises the COM commands used to setup Receiver Leveling.

See Also
About Receiver Leveling
RxLevelingConfiguration Object

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save on the PNA hard drive as RxLevel.vbs. Learn how to setup and run the macro.

```
' Demonstrate some COM commands for Receiver Leveling.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim chan
Set chan = pna.ActiveChannel
Dim RxLevel
Set RxLevel = chan.GetRxLevelingConfiguration
Dim srcPort
srcPort = 1
pna.Preset
RxLevel.ReferenceReceiver(srcPort) = "R1"
RxLevel.Tolerance(srcPort)= 0.02
RxLevel.IterationNumber(srcPort)= 10
RxLevel.FastMode(srcPort)=True
RxLevel.LevelingIFBW(srcPort)= 100
RxLevel.PowerOffset(srcPort)= 0
RxLevel.PowerMax(srcPort)= 20

Show Custom Cal Windows during a Guided Calibration

This VBScript program shows how to send commands that allow you to view specific 'custom' windows, and sweep specific channels, during a UI (Cal Wizard) or remote calibration.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as CalWindow.vbs. Learn how to setup and run the macro.

These commands are used to show and sweep specific windows and channels:

- AllowChannelToSweepDuringCalAcquisition Method
- DisplayNAWindowDuringCalAcquisition Method
- DisplayOnlyCalWindowDuringCalAcquisition Method
- SweepOnlyCalChannelDuringCalAcquisition Method

The following command sweeps the Cal Windows before remote acquisition:

- SetupMeasurementsForStep Method

See Other COM Example Programs

```vbs
Set pna = CreateObject("AgilentPNA835x.Application")
pna.Preset
' get a handle to the preset channel 1 so that we can later cal it
set meas=pna.ActiveMeasurement
' Creates a new S21 measurement in channel 2 and New window(2)
' this will be the channel and window to show during cal
pna.CreateSParameterEx 2,2,1,2,2
Set calMgr = pna.GetCalManager
Set guidedCal = calMgr.GuidedCalibration
' show window 2 during cal
calMgr.DisplayNAWindowDuringCalAcquisition 2,True
' sweep channel 2 during calibration of chan 1
calMgr.AllowChannelToSweepDuringCalAcquisition 1,2,True
' make Channel1 the active channel
' activating the measurement also activates the channel
meas.Activate
```
```vba
guidedCal.Initialize 1, True
' Do 2-port cal
' Select the connectors
guidedCal.ConnectorType(1) = "APC 3.5 female"
guidedCal.ConnectorType(2) = "APC 3.5 male"
' Select the Cal Kit for each port being calibrated.
guidedCal.CalKitType(1) = "85052D"
guidedCal.CalKitType(2) = "85052D"
' Initiate the calibration and query the number of steps
numSteps = guidedCal.GenerateSteps
' Measure the standards, compute and apply the cal
value = MsgBox("Number of steps is " + CStr(numSteps))
' Measure the standards
For i = 1 to NumSteps
    step = "Step " + CStr(i) + " of " + CStr(numSteps)
    strPrompt = guidedCal.GetStepDescription(i)
    ' Sweep the Cal window prior to standard acquisition
    guidedCal.SetupMeasurementsForStep i
    ' prompt to connect standard
    value = MsgBox(strPrompt, vbOKOnly, step)
    ' measure standard
    guidedCal.AcquireStep i
Next
' Conclude the calibration
guidedCal.GenerateErrorTerms
MsgBox ("Cal is complete!")
' clear the Cal window and channel flags
calMgr.DisplayOnlyCalWindowDuringCalAcquisition
calMgr.SweepOnlyCalChannelDuringCalAcquisition
```
COM Events Example

This Visual Basic program shows how to monitor the end of sweep. The program will set sweep time to various amounts and BEEPs when sweep is completed. This method allows other processes to continue while waiting for end-of-sweep. This program stops after 10 loops.

Note: To avoid Permission Denied problems, this should be run on the PNA and not a PC. To run it from a PC both units must be "trusted" and on the same domain/workgroup.

```vbnet
Option Explicit
Dim na As AgilentPNA835x.Application
Dim WithEvents naEvnt As AgilentPNA835x.Application
Dim ch As AgilentPNA835x.Channel
Dim sweepComplete As Boolean

Private Sub Form_Load()

Dim N As Integer
Set na = CreateObject("AgilentPNA835x.application")
n.a.preset
Set ch = na.ActiveChannel
na.DisallowAllEvents ' Turn off all events
Set naEvnt = na ' Enable event interrupts
Do
N = N + 1 ' Loop counter
ch.sweepTime = 1 + (Rnd * 9) ' Set random sweep-time from 1-10 sec
sweepComplete = False
ch.Single False ' Trigger sweep
naEvnt.AllowEventCategory naEventCategory_CHANNEL, True ' Enable Channel event
Do
DoEvents ' Allows other processes to continue
Loop Until sweepComplete = True
naEvnt.AllowEventCategory naEventCategory_CHANNEL, False ' Disable event until ready for next one
Beep ' Do end-of-sweep processing here;
Loop Until N > 10
End

End Sub

Private Sub naEvnt_OnChannelEvent(ByVal eventID As Variant, ByVal chNumber As Variant)
' In this example we don't care about the channel info
If eventID = naEventID_CHANNEL_TRIGGER_COMPLETE Then sweepComplete = True
End Sub
```
Upload a Segment Table using C++

This example program shows the Variant method for uploading a segment sweep to the PNA using the `SetAllSegments` method.

```cpp
#include "stdafx.h"
#include <stdio.h>
#include "atlbase.h"
#include "objbase.h"

// import the PNA type library
#include "C:/Program Files/Common Files/Agilent/PNA/835x.tlb" no_namespace, named_guids

for (int j = 0; j < val; j++)
{
    // Write value... the xVals array is offset by 1 in each data point since the return data is 16 bytes and each double is 8.
    printf("%.3lf GHz, %.4f/n", xVals[2*j+1]/1e9, pScalarData[j]);
}
}
else
{
    printf("Programmed failed to connect to the PNA.");
}
}
CoUninitialize();

system("PAUSE");
return 0;
Using C#

The following are common C# examples:

**Connecting to a specific PNA via DCOM:**

```csharp
public AgilentPNA835x.Application Connect(string hostname)
{
    AgilentPNA835x.Application pna = null;
    try
    {
        Type t = Type.GetTypeFromProgID("AgilentPNA835x.Application", hostname, true);
        pna = (AgilentPNA835x.Application) Activator.CreateInstance(t);
    }
    catch (Exception e)
    {
        HandleExceptions(e);
    }
    return pna;
}
```

**Using the GetData Interface**

```csharp
AgilentPNA835x.IMeasurement meas = app.ActiveMeasurement;
    object[] dataArrayAsObj;
    dataArrayAsObj = (object[])meas.getData(AgilentPNA835x.NADataStore.naMeasResult,
    AgilentPNA835x.NADataFormat.naDataFormat_LogMag);
    float[] dataArray = new float[dataArrayAsObj.Length];
    for (int j = 0; j < dataArrayAsObj.Length; j++)
    {
        dataArray[j] = (float)dataArrayAsObj[j];
    }
```

**2-dimensional GetData**

2201
AgilentPNA835x.IMeasurement meas = app.ActiveMeasurement;
    app.ActiveChannel.Single(true);
    object[,] dataArrayAsObj;
    dataArrayAsObj = (object[,])meas.getData(AgilentPNA835x.NADataStore.naRawData,
    AgilentPNA835x.NADataFormat.naDataFormat_Smith);
    float[,] dataArray = new float[dataArrayAsObj.Length,2];
    for (int j = 0; j < dataArrayAsObj.Length; j++)
    {
        dataArray[j,0] = (float)dataArrayAsObj[j,0];
        dataArray[j,1] = (float)dataArrayAsObj[j,1];
    }

15-Sep-2009 Modified GetData example
Configure for COM-DCOM Programming

Before developing or running a COM program, you should first establish communication between your PC and the analyzer. This process is referred to as gaining Access to the analyzer. You should then register the PNA type library on your PC.

DCOM (Distributed Component Object Model) refers to accessing the PNA from a remote PC. COM refers to accessing the PNA application from the analyzer PC.

- **Access Concepts**
- **Access Procedures**
- **Register the PNA Type Library on Your PC**
- **Problems?**

**Note:** After performing a Firmware Upgrade you must copy the new type library to your development PC to get access to new COM commands. See Register the analyzer on your PC.

**Other Topics about COM Concepts**

For detailed information on this subject, see [http://na.tm.agilent.com/pna/DCOMSecurity.html](http://na.tm.agilent.com/pna/DCOMSecurity.html)

**Note:** ONLY 32-bit compiler option is supported (64-bit is NOT supported).

**Access Concepts**

PNAs are shipped from the factory such that Everyone has permission to launch and access the PNA application via COM/DCOM. The term **Everyone** refers to a different range of users depending on whether the PNA is a member of a **Domain** or **Workgroup** (it must be one or the other; not both). By default, the PNA is configured as members of a workgroup. Therefore, **Everyone** includes only those users who have been given logon accounts on the PNA.

**Workgroup**

A workgroup is established by the **PNA administrator** declaring the workgroup name and declaring the PNA as a member of the workgroup. A workgroup does not require a network administrator to create it or control membership.

**Everyone** includes only those users who have been given logon accounts on the PNA.

By default, the PNA is configured as members of a workgroup named WORKGROUP.

**Note:** To setup a logon account for a new user, see Additional Users.

The easiest method of gaining DCOM access, is to make the user's account name and password on the PNA to EXACTLY match their PC logon account name and password.

**Domain**

A domain is typically a large organizational group of computers. Network administrators maintain the domain and
control which machines have membership in it. **Everyone** includes those people who have membership in the domain. In addition, those with logon accounts can also access the analyzer.

**Summary**

- A **Workgroup** requires no maintenance, but allows DCOM access to only those users with a log-on account for the PNA.

- A **Domain** requires an administrator, but all members of the domain and those with logons to the analyzer are allowed DCOM access to the PNA.

The following section "Access Procedures" provides a tighter level of security allowing only selected (not **Everyone**) domain and workgroup users DCOM **Access** and **Launch** capability of the PNA.

**Access Procedures**

Perform this procedure for the following reasons:

- To allow only selected users (not everyone) remote Access and remote Launch capability to the PNA. Launch capability is starting the PNA application if it is not already open.
- To verify that you have DCOM access to the analyzer.

**Note:** Before doing this procedure, you must first have a logon account on the PNA. See [PNA User Accounts](#)

The following procedure grants specific users DCOM access and launch capability of the PNA application: To perform this procedure, you must first minimize the PNA application.

**How do I know which Operating System I have?**

<table>
<thead>
<tr>
<th>Windows 2000</th>
<th>Windows XP</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the PNA, click the Windows <strong>Start</strong> button</td>
<td>On the PNA, click the Windows <strong>Start</strong> button</td>
</tr>
<tr>
<td>Click <strong>Run</strong></td>
<td>Click <strong>Run</strong></td>
</tr>
<tr>
<td>In the <strong>Open:</strong> box, type <strong>dcomcnfg</strong></td>
<td>In the <strong>Open:</strong> box, type <strong>dcomcnfg</strong></td>
</tr>
<tr>
<td>Click <strong>OK</strong></td>
<td>Click <strong>OK</strong></td>
</tr>
</tbody>
</table>
| In the Distributed COM Configuration Properties window, Click on **Agilent PNA Series** in the Applications list. Then click **Properties**... | Open the following folder sequence:  
Component Services Window  
Component Services  
Computers  
My Computer  
DCOM Config |
Right click **Agilent PNA Series**

| Click the **Security** tab | Click the **Security** tab |
| Click **Use custom access permissions** then click **Edit** | Under **Access Permissions**, click **Customize**, then **click Edit** |
| **In Registry Value Permissions**, select **Everyone**, then click **Remove** | Select **Everyone**, then click **Remove** |
| **Click Add** | **Click Add** |
| You could either select one or more of these groups to have access to the PNA, or specific users. To give specific users access, click **Show users** or **Members**, then select the name from the list. | Type a group name or user account name |
| **Click Add**, then **click OK** | **Click OK** |

**Launch Permission**

| Click **Use custom launch permissions**, then click **Edit** | Under **Launch Permissions**, click **Customize**, then **click Edit** |
| **In Registry Value Permissions**, select **Everyone** then click **Remove** | Select **Everyone**, then click **Remove** |
| **Click Add** | **Click Add** |
| You could either select one or more of these groups to have launch permission of the PNA, or specific users. |
|  - To give groups launch permission, select the group from the list. |
|  - To give specific users launch permission, click **Show users** or **Members**, then select the name from the list. | Type a group name or user account name |
| **Click Add**, then **click OK** | **Click OK** |

**Register the PNA Type Library on Your PC**

The type library contains the PNA object model. On your PC, there is a Registry file that keeps track of where object models are located. Therefore, you must register the type library on the PC that will be used to develop code and run the program. It is much more efficient to have the type library registered at design time (BEFORE running your COM program).

Do the following two items before proceeding:
1. Connect your PC and the PNA to LAN.

2. Either map a drive to the analyzer or copy the type library files on a floppy disk or other media. See Drive Mapping.

**Note:** To register the type library on your PC, you must be logged on as an administrator of your PC. Learn about User Accounts.

This procedure will do the following:

- Register the Network Analyzer application on your PC.
- Copy and register the proxystub (835xps.DLL) onto the PC.
- Copy and register the PNA type library (835x.tlb) onto the PC.
- Copy and register the FCA type library (fca.tlb) onto the PC.

1. Using Windows Explorer on your PC, find the Analyzer's C: drive. The drive will not be named "C:" on your PC, but a letter you assigned when mapping the drive.

2. Navigate to Program Files / Agilent / Network Analyzer / Automation

3. Double-click pnaproxy.exe and follow the prompts to Install PNA Proxy. If the installation offers a choice of Modify, Repair, or Remove, then select Remove. Then double-click on pnaproxy.exe again.

4. When prompted, type the Computer name of the PNA (Learn how to find this).

5. After the install program runs, the PNA and FCA type library should be registered on your PC.

6. Your programming environment may require you to set a reference to the PNA type library now located on your PC. In Visual Basic, click Project, References. Then browse to C:/Program Files/Common Files/Agilent/PNA Select 835x.tlb

**Problems?**

- These procedures will fail if there are any programs using the PNA type library (for example: Visual basic, VEE, Visual Studio, or any other application program that may communicate with the PNA).

- Perform the following procedure if the previous procedure did not return an error, but you cannot connect to the PNA.

- If you received an error, check that both the account name and password used on both the PNA and PC match EXACTLY.

- If you still get errors, see http://na.tm.agilent.com/pna/DCOMSecurity.html.

1. Map a drive from your remote PC to the PNA. Note the drive letter your PC assigns to the PNA. Substitute this drive letter for PNA in the following procedure.
2. On your PC, go to a DOS prompt c:>

3. Type **PNA:** (for example o:)

4. Type `cd program files/agilent/network analyzer/automation`

5. Type `copy 835xps.dll c:/program files/common files/agilent/pna`

6. Type `copy 835x.tlb c:/program files/common files/agilent/pna`

   If you will NOT be using **FCA commands**, skip steps 7.,8, and 9.

7. Type `cd..`

8. Type `cd extensions/fca`

9. Type `copy fca.tlb c:/program files/common files/agilent/pna`

10. If it is not already there, copy `reglib.exe` from PNA:/WINNT to your C:/<windows>/system32 directory
    (<windows> is OS-dependent- it is either windows or WINNT)

11. Type `reglib C:/program files/common files/agilent/pna/835x.tlb`

12. Type `regsvr32 C:/program files/common files/agilent/pna/835xps.dll`

13. Type `reglib C:/program files/common files/agilent/pna/fca.tlb`

   Perform the **Access Procedure** after doing these steps.
COM Fundamentals

The following terms are discussed in this topic:

- Objects
- Interfaces
- Collections
- Methods
- Properties
- Events
- Visual Basic Syntax

Note: The information contained in this topic is intended to help an experienced SCPI programmer transition to COM programming. This is NOT a comprehensive tutorial on COM programming.

Other Topics about COM Concepts

Visual Basic Syntax

The examples in PNA Help use Visual Basic as the programming environment for COM, which uses 'dot' notation.

To set a property, follow the object reference with:

- a period (.)
- property or method
- an equal sign (=)
- the new value

For example:

```
object.property = value
```

To read a property, a variable to contain the returned value is followed with:

- an equal sign (=)
- an object, or reference to an object
- a period (.)
- property

For example:
variable = object.property

To execute a method, an object, or reference to an object is followed with:

- a period (.)
- the method
- a blank space
- any required parameters

For example:
object.method parameters

Some methods return values, such as methods that return data. To return data from a method, a variable to contain the returned data is followed with:

- an equal sign (=)
- an object, or reference to an object
- a period (.)
- the method
- any required parameters enclosed in parenthesis

variable = object.method (parameters)

Objects
The objects of the Network Analyzer (Application) are arranged in a hierarchical order. The PNA object model lists the objects and their relationship to one another.

In SCPI programming, you must first select a measurement before making settings. With COM, you first get a handle to the object (or collection) and refer to that object in order to change or read settings (properties).

For more information on working with objects, see Getting a Handle to an Object.

Interfaces
A COM Interface is the connection to an object. When you get a handle to an object, you are actually using an interface to an object. This is important if you are developing PNA code that will run on multiple code versions. For more information, see PNA Interfaces.

Collections
A collection is an object that contains several other objects of the same type. For example, the Channels collection contains all of the channel objects.

Note: In the following examples, the collections are referred to as a variable. Before using a collection object, you must first get an instance of that object. For more information, see Getting a Handle to an Object

Generally, items in a collection can be identified by number or by name. The order for objects in a collection cannot be assumed. They are always unordered and begin with 1. For example, in the following procedure, chans(1) is used to set averaging on the first channel in the Channels collection (not necessarily channel 1).
Sub SetAveraging()
    chans(1).AveragingFactor = 10
End Sub

The following procedure uses the measurement string name to set the display format for a measurement in the measurements collection.

meass("CH1_S11_1").Format = 1

You can also manipulate an entire collection of objects if the objects share common methods. For example, the following procedure sets the dwell time on all of the segments in the collection.

Sub setDwell()
    For Each seg In segs
        segs.DwellTime = 0.03
    Next
End Sub

Methods
A method is an action that is performed on an object. For example, CreateSParameter is a method on the Application object. The following procedure uses that method to create a new S21 measurement in channel 1 in a new window.

Sub CreateMeas
    app.CreateSParameter 1,2,1,1
End Sub

Properties
A property is an attribute of an object that defines one of the object's characteristics, such as size, color, or screen location. A property can also change an aspect of the object's behavior, such as whether the object is visible. In either case, to change the characteristics of an object, you change the values of its properties.

For example, the following statement sets the IF Bandwidth of a channel to 1 KHz.

Chan.IFBandwidth = 1e3

You can also read the current value of a property. The following statement reads the current IF Bandwidth of a channel into the variable Ifbw.

Ifbw = Chan.IFBandwidth

Some properties cannot be set and some cannot be read. The Help topic for each property indicates if you can:

- Set and read the property (Write/Read)
- Only read the property (Read-only)
- Only set the property (Write-only)

Events
A COM event is an action recognized by an object, such as clicking the mouse or pressing a key. Using events, your program can respond to a user action, program code, or triggered by the analyzer.

The SCPI equivalent of an event is a Service Request (SRQ).

For example:

OnChannelEvent
For more information, see Working with the Analyzer's Events.
Getting a Handle to an Object

The following are discussed in this topic:

- **What Is a Handle**
- **Declaring an Object Variable**
- **Assigning an Object Variable**
- **Navigating the Object Hierarchy**
- **Getting a Handle to a Collection**

### Other Topics about COM Concepts

### What Is a Handle

In SCPI programming, you must first select a measurement before changing or reading settings. With COM, you first get a handle to the object (or collection) and refer to that object to change or read its settings. The following analogy illustrates this:

A CAR could be called an object. More precisely, CAR is a class of objects. For example, one of the properties of the CAR class is "**Color**". You can read (by looking) or set (by painting) the color property of a car object. In other words, you can only read or set properties of a specific car object; not the entire car class. Therefore, to read or set a property, you need to get "a handle", or an instance of the object.

This process is also called "accessing an object", "getting an instance of an object", "returning an object", or "referring to an object". You can have handles to many instances of an object at the same time.

### Accessing PNA Objects

The PNA Application object is the highest object in the PNA object model hierarchy. Because of that, it is the only object that must be 'created' before it, or any other objects, can be accessed and used. During the creation process, the application object assigned to a variable name, or handle. Throughout your program, that object is used by referring to that variable. All PNA objects can be assigned to a variable, and subsequently referred to, in this same manner.

The following example shows how to create the PNA Application object, as well as illustrate the general steps of get a handle to an object.

There are two steps in the process of getting a handle to analyzer objects:

1. Declaring a Variable
2. Assigning an Object to the Variable

### Declaring a Variable

**Note:** The examples in these topics use the Visual Basic Programming Language. See the short section regarding Visual Basic syntax.

Use the Dim statement or one of the other declaration statements (Public, Private, or Static) to declare a variable.
The type of variable that refers to an object must be a Variant, an Object, or a specific type of object. Some programming languages, such as VBScript and Agilent VEE, do not allow you to specify variable types. The following examples ALL declare the variable `pna`. Each subsequent statement is more specific than the previous:

- `Dim pna 'Variant data type.`
- `Dim pna As Object 'Object data type.`
- `Dim pna As AgilentPNA835x.Application 'Specific Application type`
- `Dim pna As AgilentPNA835x.IApplication 'Interface type`

1. If you use a variable without declaring it first, the data type of the variable is Variant. If you don't care about using automatic type checking, and willing to run code less efficiently, this method is very safe and is useable on all programming environments.

2. If you know the specific object type, and your programming environment allows it, you can declare the variable as an object.

3. Declaring a specific object type provides automatic type checking (Intellisense), faster code, and improved readability.

4. Declaring the interface is the most specific way and is beneficial when developing code for multiple firmware revisions. Learn more about Interfaces.

### 2. Assigning an Object to a Variable

To assign an object instance to a variable, use the `Set` keyword before the object variable that was declared previously. In the following line of code, we SET the current AgilentPNA835x Application to “pna”.

```
Set pna = AgilentPNA835x.Application
```

As mentioned earlier, the AgilentPNA835x object is unique because it is the highest level of object in the PNA object model hierarchy. Therefore, we must use the `CreateObject` keyword with the `(classname,server name)` parameters.

- The `classname` for the analyzer object is always "AgilentPNA835x.Application".
- To find your analyzer's `server name`, see View or change full computer name

The following statements create an instance of the Analyzer object.

```
Dim pna AS AgilentPNA835x.Application
Set pna = CreateObject("AgilentPNA835x.Application", "Analyzer46")
```

**Note:** These statements will start the PNA application if it is not already running on your instrument.

### Navigating the Object Hierarchy

Once an instance of the PNA Application is "created", you access all of the PNA objects by navigating the object hierarchy. Navigating the object model hierarchy can be tricky. In addition, you also need to know how to refer to a specific instance of that object. For example, if you have three measurements present on the PNA, how do you refer to the channel 1 measurement? Each object on the PNA Object Model image is linked to an object page. At
the top of each object page is a Description section and another called "Accessing the ... Object". These sections together explain how to navigate the PNA hierarchy to access a specific instance of that object.

From the previous discussion, you may think that you must always declare and assign variables to an object before setting or reading its properties. While this method is best for objects that you will continue to reuse, such as a measurement, it is not always necessary. You can also refer to an object directly.

The TriggerSetup object, which is a child of the Application object. Because we will only need to refer to this object once to set a couple of properties, and it is easy to access, we will refer to it directly. From the previous example, we already have a handle to the Application object in the variable pna. The following example uses Visual basic 'dot' notation to refer to the TriggerSetup object, and then the Scope property.

```
Dim trig As Object
Set trig = pna.TriggerSetup
```

By referring to the TriggerSetup object directly, we must type the same path whenever we refer to properties on the TriggerSetup object. The following method assigns the pna.TriggerSetup object to a variable that can be reused.

```
trig.Scope = naChannelTrigger
trig.Source = naTriggerSourceInternal
```

Getting a Handle to a Collection

The analyzer has several collections of objects which provide a convenient way of setting or reading all of the objects in the collection with a single procedure. Also, there are objects (limit lines for example) that can only be accessed through the collection.

To get a handle to an item in a collection, you can refer to the object by item number or sometimes by name. However, you first have to get a handle to the collection. To assign the collection to a variable, use the same two step process (1. declare the variable, 2. assign the variable using ‘Set’).

```
Dim meass As Measurements
Dim meas As Measurement
```

You can then iterate through the entire collection of measurements to read or set properties.

```
Sub setFormat()
    For Each meas In meass
        meas.Format = naDataFormat_LinMag
    Next
End Sub
```

Or you can read or set a property on an individual object in the collection:

```
meass(1).Format = naLinMag
```

Note: Each object and collection has its own unique way of dealing with item names, and numbers. Refer to the Analyzer Object Model for details.
Collections in the Analyzer

Collections are a gathering of similar objects. They are a convenience item used primarily to iterate through the like objects in order to change their settings. Collections generally provide the following generic methods and properties:

<table>
<thead>
<tr>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item(n)</td>
</tr>
<tr>
<td>Count</td>
</tr>
<tr>
<td>Add(n)</td>
</tr>
<tr>
<td>Remove(n)</td>
</tr>
</tbody>
</table>

where (n) represents the number of the item in the collection. Some collections may have unique capabilities pertinent to the objects they collect.

Other Topics about COM Concepts

Collections are Dynamic

A collection does not exist until you ask for it. When you request a Channels object (see Getting a Handle to an Object / Collection), handles to each of the channel objects are gathered and placed in an array.

For example, if channels 2 and 4 are the only channels that exist, then the array will contain only 2 items. The command 'channels.Count' will return the number 2, and:

- Channels(1) will contain the channel 2 object.
- Channels(2) will contain the channel 4 object.

The ordering of objects within the collection should not be assumed. If you add a channel to the previous example, as in:

```pna.Channels.Add(3)```

'channels.Count' will now return 3 and:

- Channels(1) will contain the channel 2 object.
- Channels(2) will contain the channel 3 object.
- Channels(3) will contain the channel 4 object.

Primarily, collections are useful for making this type of iteration possible:

```Dim ch as Channel
For each ch in pna.Channels
    Print ch.Number
    Print ch.StartFrequency
    Print ch.StopFrequency
Next ch```

As soon as this for-each block has been executed, the Channels object goes out of scope.
**COM Data Types**

The PNA uses several data types to communicate with the host computer. Before using a variable, it is best to declare the variable as the type of data it will store. It saves memory and is usually faster to access. The following are the most common data types:

- **Long Integer**
- **Single Precision (Real)**
- **Double Precision (Real)**
- **Boolean**
- **String**
- **Object**
- **Enumeration**
- **Variant**

**Other Topics about COM Concepts**

**Long** (long integer) variables are stored as signed 32-bit (4-byte) numbers ranging in value from -2,147,483,648 to 2,147,483,647.

**Double** (double-precision floating-point) variables are stored as IEEE 64-bit (8-byte) floating-point numbers ranging in value from \(-1.79769313486232E308\) to \(-4.94065645841247E-324\) for negative values and from \(4.94065645841247E-324\) to \(1.79769313486232E308\) for positive values.

**Single** (single-precision floating-point) variables are stored as IEEE 32-bit (4-byte) floating-point numbers, ranging in value from \(-3.402823E38\) to \(-1.401298E-45\) for negative values and from \(1.401298E-45\) to \(3.402823E38\) for positive values.

**Boolean** variables are stored as 16-bit (2-byte) numbers, but they can only be True or False. Use the keywords True and False to assign one of the two states to Boolean variables.

When other numeric types are converted to Boolean values, 0 becomes False and all other values become True. When Boolean values are converted to other data types, False becomes 0 and True becomes -1.

In PNA release 5.26, the following properties were changed to return True rather than 1 to conform with this definition. This change may affect the functionality of your COM program:

- **Bandwidth Tracking Property**
- **ErrorCorrection Property**
- **IFGateEnable Property**
String variables hold character information. A String variable can contain approximately 65,535 bytes (64K), is either fixed-length or variable-length, and contains one character per byte. Fixed-length strings are declared to be a specific length. Variable-length strings can be any length up to 64K, less a small amount of storage overhead.

Object variables are stored as 32-bit (4-byte) addresses that refer to objects within the analyzer or within some other application. A variable declared as Object is one that can subsequently be assigned (using the Set statement) to refer to any actual analyzer object.

Enumerations (Enum) are a set of named constant values. They allow the programmer to refer to a constant value by name instead of by number. For example:

```plaintext
Enum DaysOfWeek
    Sunday = 0
    Monday = 1
    Tuesday = 2
    Wednesday = 3
    Thursday = 4
    Friday = 5
    Saturday = 6
End Enum
```

Given this set of enumerations, the programmer can then pass a constant value as follows:

```plaintext
SetTheDay(Monday)
```
rather than

```plaintext
SetTheDay(1)
```
where the reader of the code has no idea what the value 1 refers to.

However, the analyzer RETURNS a long integer, not the text.

```plaintext
Day = DaysofWeek(today) 'Day = 1
```

Variant - If you don't declare a data type ("typed" data) the variable is given the Variant data type. The Variant data type is like a chameleon - it can represent many different data types in different situations.

The PNA provides and receives Variant data because there are programming languages that cannot send or receive "typed" data. Variant data transfers at a slower rate than "typed" data.
PNA Interfaces

A COM interface is the connection to an object. When you get a handle to an object, you are actually using an interface to an object. This subtle distinction is relevant to the COM programmer for the following two reasons:

- **Interface Inheritance (Coding for Multiple PNA Versions)**
- **Custom Interfaces**

### Other Topics about COM Concepts

#### Interface Inheritance (Coding for Multiple PNA Versions)

The PNA continues to evolve and release new firmware/software versions that provide more functionality and features. New commands are added to existing objects, and with them new interfaces are added to support those commands. For example, new commands were added to the Measurement object in PNA release 3.0. These commands are accessible from the new IMeasurement2 interface. This can be important if you develop code using the type library in release 3.0, and run the code on a PNA with an older release, such as 2.0.

When you use a command that was new with release 3.0, and you run that code on a PNA with release 2.0 firmware, errors will occur because that PNA does not recognize the new commands. However, even if you do NOT utilize new commands, errors can still occur. The following example shows how this occurs and how to avoid it.

The following Visual Basic statement dimensions the `meas` variable as an object.

```vbnet
Dim meas As Measurement
```

When the program compiles, Visual Basic figures out what interface to use to access that object. When dimensioning as an object, VB will use the default interface. As new interfaces are added to an object, they become the default interface. If this program was developed and compiled using the PNA 3.0 type library, the default Interface of the Measurement Object was IMeasurement2. However, if this program is run on an instrument with PNA 2.0 firmware, there was no IMeasurement2 Interface, and an E_NOINTERFACE error will occur.

Therefore, the more robust approach would be to specify the interface instead of the object when declaring a variable.

```vbnet
Dim meas As IMeasurement
```

This code will ONLY use the IMeasurement interface; not the default interface.

However, regardless of how you declare a variable, errors will always occur if you use new commands, and run the code on an older instrument.

#### Custom Interfaces

The PNA object model contains three "custom" interfaces use "typed" variables, which is more efficient than using variant type variables. However, these interfaces are only usable from VB6, C, & C++. All other programming languages must use the other standard interfaces.

The custom interfaces are:

- **IArrayTransfer** - Measurement object
- **ICalData** - Calibrator object
- **ISourcePowerCalData** - Channel object
Working with Events

- What are Events?
- Using the Analyzer's Events
- Event ID's
- Filtering Events
- List of Events
- Out of Range Errors
- Troubleshooting Problems with Events

See Also

- Events Example
- Errors and the SCPIStringParser Object

### Other Topics about COM Concepts

### What are Events?

Windows applications work from user-initiated events such as mouse moves and mouse clicks. A mouse-click produces an event that the programmer can either ignore or "handle" by providing an appropriate subroutine like this:

```vbscript
Sub DoThis_onClick
    Perform something
End Sub
```

If this subroutine were in your program and the mouse-click event occurs on your PC, it would generate a "Callback" to the client and interrupt whatever it was doing and handle the event.

A more practical example of an event in the analyzer is Limit test. If limit test is on and the measurement fails, the analyzer produces a "Limit-failed" event. If the measurement passed, the analyzer produces a "Limit-succeeded" event.

The Analyzer has a very sophisticated Event structure. Your program **CAN** be notified when one or more events occur. However, it may not be necessary.

For example, the analyzer has an event that will notify your program when a sweep is complete. A simpler alternative is to use a synchronous command which waits for the sweep to complete.

```vbscript
sync = True
app.ManualTrigger sync
chan.StartFrequency = 4.5E6
```

This would **NOT** work if you want the controller to do other things while waiting, like setup a power meter or sort some data. In this case you would like a "callback" from the analyzer to let your program know that the sweep has completed. For an example of this see [Events Example](#).
Another reason to use events is when you want to be notified of several conditions when they occur, such as errors or source unlock conditions. It would not be practical to routinely poll these conditions while executing your program.

**Using Events**

If you decide to use the COM events to get a callback, your program must do two things:

1. **Subscribe to events:**

   All events in the analyzer are a child of the Application object through the INetworkAnalyzerEvents Interface. You must tell the Application object that you are interested in receiving event callbacks. This process is called subscription.

   In Visual Basic, this is done by including " WithEvents " in the declaration statement. The declaration below dimensions an Application object (myPNA) and subscribes to the events produced by the Application.

   ```vba
   Dim WithEvents myPNA as AgilentPNA835x.Application
   ```

   In C++, this is a bit more involved. You must queryInterface for the IconnectionPointContainer interface, locate the INetworkAnalyzerEvents interface via a call to FindConnectionPoint and call Advise().

2. **Implement the Event Handler**

   When an event occurs, the Application object will "callback" to the client through the INetworkAnalyzerEvents interface.

   In VB, click on the object window (upper left pane). Find the Application object and click it. The event interfaces will appear in the upper right pane. As you click on them, VB supplies the first line of code. You fill in the rest of the handler routine to service the event. The following is an example of a event handler subroutine.

   **Note:** In C++, you must type the callback.

   ```vba
   Private Sub OnChannelEvent( eventID as Variant, channelNumber as Variant)
   Select Case (eventID)
   Case naEventID_CHANNEL_TRIGGER_COMPLETE:
     GetData( channelNumber )
   Case naEventID_CHANNEL_TRIGGER_ABORTED:
     MsgBox( "Hey don't touch the front panel!")
   End Select
   End Sub
   ```

   When the trigger is complete, the application object "fires" the event by making a callback to the event handler Sub OnChannelEvent() .

**Event IDs**

<table>
<thead>
<tr>
<th>Sev</th>
<th>C</th>
<th>R</th>
<th>Facility</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>3</td>
<td>2</td>
<td>2 2 2 2 2 2 2 2 1 1 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0</td>
<td></td>
</tr>
<tr>
<td>1  0</td>
<td>9</td>
<td>8 7 6 5 4 3 2 1 0 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Filtering Events**

There are over 140 different events that you subscribe to when you “Dim WithEvents...” (or the equivalent in your programming language). Monitoring all of these conditions slows the speed of the analyzer significantly. The following methods allow you to filter the events so that you only monitor specific conditions.
- **AllowEventMessage** - monitor a specific event
- **AllowAllEvents** - monitor ALL events
- **DisallowAllEvents** - monitor NO events
- **AllowEventCategory** - monitor specific event categories (discussed later)
- **AllowEventSeverity** - monitor events having one or more of the following severity levels associated with them.

### Severity Enumeration

<table>
<thead>
<tr>
<th>Code</th>
<th>Enumeration</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>naEventSeveritySUCCESS</td>
</tr>
<tr>
<td>01</td>
<td>naEventSeverityINFORMATIONAL</td>
</tr>
<tr>
<td>10</td>
<td>naEventSeverityWARNING</td>
</tr>
<tr>
<td>11</td>
<td>naEventSeverityERROR</td>
</tr>
</tbody>
</table>

**Code** | **Severity Enumeration**
---|---
00 | naEventSeveritySUCCESS - the operation completed successfully
01 | naEventSeverityINFORMATIONAL - events that occur without impact on the measurement integrity
10 | naEventSeverityWARNING - events that occur with potential impact on measurement integrity
11 | naEventSeverityERROR - events that occur with serious impact on measurement integrity

### List of Events

The following is a list of categories and the general types of events they include. Click the link view the event details.

<table>
<thead>
<tr>
<th>Category Enumerations</th>
<th>Callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>naEventCategory_PARSER</td>

<td>OnUserEvent</td>
</tr>
<tr>
<td>naEventCategory_DISPLAY</td>
<td>OnDisplayEvent</td>
</tr>
<tr>
<td>naEventCategory_GENERAL</td>
<td>OnSystemEvent</td>
</tr>
</tbody>
</table>

**Note:** Use the [MessageText](#) Method to get a text message describing the event.

### Out of Range Errors

When you attempt to set a value on an active function that is beyond the range (min or max) of the allowable values, the analyzer limits that value to an appropriate value (min or max) and sets the function to the limited value. From the front panel controls this is visually evident by the limited value in the edit box or by the annotation on the display. An example would be attempting to set the start frequency below 300kHz. The edit control doesn't allow the number to fall below 300kHz.

When the automation user programs a setting (such as start frequency below the allowable limits) the same behavior takes place. The analyzer accepts the limited value. However, in order to learn what setting took place, you have to read the HRESULT.
All automation calls return HRESULTs. By default the HRESULT returned when an overlimit occurs is S_NA_LIMIT_OUTOF RANGE. This value is a success code, meaning that bit 31 in this 32 value is 0. Programmers should check the return code from all automation calls to determine success or failure.

Some C++ macros (like SUCCEEDED(hr) or FAILED(hr) ) only check bit 31. So if you are interested in trapping this outOfRange error you will have to check for S_NA_LIMIT_OUTOF RANGE explicitly.

Alternatively, you can configure the analyzer to report outOfRange conditions with an error code. Use the method: App.SetFailOnOverRange (true). With this method set TRUE, any overrange error will return E_NA_LIMIT_OUTOF RANGE_ERROR.

This method is provided for the benefit of VB clients. VB users can't detect specific success codes because the VB runtime strips off the HRESULT and only raises a run time error if bit 31 is set, indicating a fail code.

**Troubleshooting Problems with Callbacks**

When you do callbacks, the client PC becomes the server and the analyzer (server) becomes the client. Callbacks can only take place when both server and client are in the same workgroup or in the same domain. See Configure for COM.
Read and Write Calibration Data using COM

Calibration data in the PNA is stored in Cal Sets. Learn more about Cal Sets.

You can read or write two types of Calibration data:

- **Error Terms** - calculated data using standard measurement data and the algorithms for the specified cal type.

- **Standard Measurement data** - raw data resulting from the measurement of a calibration standard.

Each of these data are available in the PNA in either variant data or typed data. Learn more about variant and typed data.

---

Other Topics about COM Concepts

Calibration / Cal Set Interfaces

There are several interfaces associated with Calibration.

**ICalibrator**

This interface is the original interface provided with the first version of the PNA. It provides remote access to the "Unguided" Calibration wizard. This interface can perform 1 and 2 port calibrations as well as response cals.

This interface can also read and write error terms from/to a Cal Set. However, ICalibrator is NOT recommended for this purpose. The ICalSet2 Interface is better suited for reading and writing error terms.

See a vbscript example of how to perform a 2-port Cal and read the cal data.

**IGuidedCalibration**

This interface provides the methods and properties used by the Guided Calibration wizard. With this interface you can perform multi-port calibrations (1 to 4 port cals), but no response cals.

**ICalSet2 and ICalData3**

These interfaces provide access to the Cal Set contents. You can read and write error terms with both of these interfaces.

- ICalSet2 uses Variant data, which means it is usable from vbscript.

- ICalData3 uses "typed" data, which means it can be used from any automation engine that can read the type library (VEE, VB, C++, etc.). Typed arguments (such as float or single) are more efficient than variants, so use the ICalData3 interface where better performance is needed.

See a vbscript example of how to read Cal Set data.

**ICalSet3**

This interface provides access to the stimulus attributes of the Cal data: frequency, power, number of points. These are the stimulus conditions under which the Cal Set was created.
Programming the PNA with C++

The programming information contained in this Help system is aimed at the Visual Basic programmer. VB does a lot of work for the programmer when it comes to managing and accessing components. Using a lower level language like C++ requires a more thorough understanding of the underlying tenets of COM. It is not the intent of this section to teach COM programming. The following is intended to acquaint you with some of the basic concepts you need to know in order to program against COM.

- Initializing COM
- Importing the Type Library
- Creating the Application Object
- Errors
- Events
- Additional Reading
- Example

**Note:** The information in this section assumes development on a Windows OS using Microsoft tools.

**Other Topics about COM Concepts**

Initializing COM

The first thing you must do before performing any COM transactions is to initialize the COM library. You can do this in a number of ways. The most basic of these is a call to `CoInitialize( )` or `CoInitializeEx( )`. Alternatively you can use the MFC (Microsoft Foundation Classes) `AfxOleInit( )`.

Conversely, before your program exits you must uninitialize COM. You can accomplish this with `CoUninitialize( )` or the MFC routine `AfxOleTerm( )`.

Importing the Type Library

To make a component available to the client, the server exports what is called the type library. For the PNA, this file is 835x.tlb. It is located on the PNA's hard drive at `C:/Program Files/ Agilent/ Network Analyzer/ Automation`. See [Configure for COM-DCOM Programming](#).

The type library can be read and deciphered using another COM interface called ITypeLib. VB uses this interface to present, for example, its object browser. Visual C++ can also read type libraries. This is done by importing the type library into your project with a compiler directive:

```cpp
#import "C:/Program Files/Common Files/Agilent/Pna/835x.tlb", named_guids
```

When you compile your program with this statement in it, the compiler creates two other files: `835x.tlh` and `835x.tli`. The first is a header file that contains the type definitions for the PNA's COM interfaces and their methods. The second file contains inline functions that wrap the PNA's interface methods. The wrappers are beneficial in that they contain error reporting for each of the method calls.

The .tlh file defines a smart pointer which you can use to access the PNA's objects. The smart pointer definition
A smart pointer is a term used for a C++ object that encapsulates a pointer used to refer to a COM object. All COM objects derive from the interface IUnknown. This interface has three methods: QueryInterface(), AddRef(), and Release(). The function of the AddRef and Release methods is to maintain a reference count on the object and thus control the object's lifetime. Anytime you copy or create a reference to a COM object, you are responsible for incrementing its reference count. And likewise, when you are finished using that reference, it is your responsibility to Release it. Smart pointers do this work for you, as shown in the example program. In addition, smart pointers will also perform the QueryInterface call when required. QueryInterface is a method that requests a specific interface from an object. In the example program we gain access to the IArrayTransfer interface of the Measurement object. In the ReadMethod routine, we see this:

PTransferData = pMeas;

The assignment operator is overloaded for the smart pointer and in reality, this simple statement does this:

HRESULT hr = pMeas->QueryInterface( IID_IArrayTransfer, (void**)&pTransferData);

Using the existing interface pointer (pMeas) to the object, this call asks the object if it supports the IArrayTransfer interface, and if so to return a pointer to it in pTransferData. Smart pointer makes life easier for the C++ programmer. Read more about smart pointers in Microsoft Developer's Network Library (MSDN).

Creating the Application Object

The only createable object exported by the PNA is the Application object. Typically this would be done with a call to CoCreateInstance:

STDAP IC oCreateInstance(
    CLSID__IApplication, //Class identifier (CLSID) of the object
    NULL, //Pointer to controlling IUnknown
    CLSCTX_SERVER, //Context for running executable code
    IID_IApplication, //Reference to the IID of the interface
    (void**)&pNA //Address of output variable that receives
    //the interface pointer requested in riid
);

With the smart pointer, this is taken care of with the following call:

IApplicationPtr pNA; // declare the smart pointer
pNA = IApplicationPtr("AgilentPNA835x.Application.1");

Errors

All COM method calls are required to return an HRESULT. This is 32 bit long with a specific format.

- The most significant bit indicates success(0) or failure(1).
- The lower 16 bits indicate the specific failure.

Visual Basic strips off the returned HRESULT and raises an error object for non-successful returns. The C++ programmer must himself be diligent about handling errors. You must check the return value of each COM call to ensure its success.

Events
The Application object sources the INetworkAnalyzerEvents interface. This object is the source for all events. To use events in C++, you must do two things:

1. Implement the INetworkAnalyzerEvents interface - derive an object from INetworkAnalyzerEvents and implement the methods described there.
2. Subscribe to the IConnectionPoint interface of the Application object. - obtain a pointer to the IConnectionPointContainer interface of the Application object and making the following request:

   ```
   FindConnectionPoint( IID_InetworkAnalyzerEvents, &pConnection );
   ```

   A successful call to this interface will return a valid pointer in pConnection. Use this pointer to subscribe to the Application object:

   ```
   pConnect->Advise( IUnknown* punk, DWORD dwCookie);
   ```

   This call provides the server object with a callback address. The IUnknown pointer in this call is the IUnknown pointer of the object that implements the INetworkAnalyzerEvents interface. This is the event sink. The application object needs a pointer to this object in order to call your interface when an event occurs. The `dwCookie` is your subscription key. Use it to unsubscribe (see Unadvise( )).

"Learning DCOM", by Thuan L. Thai, published by O'Reilly(1999)

"Understanding ActiveX and OLE", by David Chappell, also published by Microsoft Press (1996)

**Example**

The example uses the smart pointer created by Microsoft Visual Studio. The calls to CoInitialize and CoUninitialize open and close the COM libraries. In the example, notice that the pointers local to the main routine are explicitly released. When smart pointers go out of scope, they will perform this duty implicitly. However, we are calling CoUninitialize before they have the chance to be destroyed, so we are obliged to release them.

See the example program.
Using COM from .NET

To communicate with the PNA from Microsoft .NET enabled languages such as C# and Visual Basic.NET perform the following steps:

1. Configure your PC and PNA for COM-DCOM Programming.

2. Reference the type library within the development environment (see the following exception for managed C++ projects.) In the process of referencing the type library, a .NET assembly is created that wraps the PNA type library with a .NET friendly interface. This .NET assembly is called an Interop Assembly.

Note: ONLY 32-bit compiler option is supported (64-bit is NOT supported).

Exception for managed C++ projects: To generate the Interop Assembly for managed C++ projects, you must use the tlbimp.exe utility. This utility is described in the MSDN documentation. On your PC, click Start then Run then type: tlbimp.exe 835x.tlb and click OK. After doing this you can use the #using directive to include the Interop Assembly on managed C++ projects.

Example: Creating a .NET object from C#

The following is an example that shows how to create a .NET object that connects to the PNA over DCOM. In this example, machineName is either the DNS name or the IP address of the PNA to connect with.

```csharp
Type pna = Type.GetTypeFromProgID("AgilentPNA835x.Application", machineName);
AgilentPNA835x.IApplication app = (AgilentPNA835x.IApplication)Activator.CreateInstance(pna);
```

See C# Example Programs:

Perform a Guided Cal with C#

Using C#

Registering the PNA Primary Interop Assembly (PIA) (OPTIONAL)

The PIA is NOT necessary to communicate with the PNA. The following procedure is useful only when there are two .NET programs that want to share the same PNA interface definitions. Without the PIA, each .NET application would use its own Interop Assembly.

To register the PIA on a machine, you need to have the common language runtime (CLR) installed. This is included with Visual Studio.NET. Then perform the following steps:

Note: In the following steps, replace <local directory> with the full path name of the specified file on your PC.

1. Run the PNAProxy.exe program as described in Configure for COM-DCOM Programming.

2. On the PNA, copy C:/Program Files/Agilent/Network Analyzer/Automation/AgilentPNA835x.dll to a local directory on your PC. Make a note of this directory.

3. On your PC, click Start, then Run, then type: regasm <local directory>/AgilentPNA835x.dll and click OK to register the dll.

4. Again, click Start, then Run, then type: gacutil /i <local directory>/AgilentPNA835x.dll and click OK to add the assembly to the Global Assembly Cache (GAC).
To Uninstall the PIA, perform the following:

1. On your PC, click Start, then Run, then type: `gacutil /u <local directory> /AgilentPNA835x.exe` and click OK to remove the assembly from the GAC.

2. On your PC, click Start, then Run, then type: `regasm /unregister <local directory> /agilentpna835x.dll` and click OK to unregister the assembly.

3. To uninstall PNA Proxy.exe use the Add/Remove Programs utility in the control panel.

- 23-Feb-2010 Added CALC:GDElay and LXI (A.09.20)
- 30-Jul-2009 Added syst:conf:evev and Calc:X?
- 16-Jan-2009 Moved class
IEEE 488.2 Common Commands

*CLS - Clear Status
Clears the instrument status byte by emptying the error queue and clearing all event registers. Also cancels any preceding *OPC command or query. See Status Commands and Reading the Analyzer's Status Registers.

*ESE - Event Status Enable
Sets bits in the standard event status enable register. See Status Commands and Reading the Analyzer's Status Registers.

*ESE? - Event Status Enable Query
Returns the results of the standard event enable register. The register is cleared after reading it. See Status Commands and Reading the Analyzer's Status Registers.

*ESR - Event Status Enable Register
Reads and clears event status enable register. See Status Commands and Reading the Analyzer's Status Registers.

See Also
- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree
**IDN? - Identify**

Returns a string that uniquely identifies the analyzer. The string is of the form "Agilent Technologies",<model number>,<serial "number>,<software revision>".

**Note:** Beginning with Rev 6.01, this command now returns the software revision with 6 digits instead of 4. For example, A.06.01.02.

---

**OPC - Operation complete command**

Generates the OPC message in the standard event status register when all pending overlapped operations have been completed (for example, a sweep, or a Default). See Understanding Command Synchronization.

---

**OPC? - Operation complete query**

Returns an ASCII "+1" when all pending overlapped operations have been completed. See Understanding Command Synchronization

---

**OPT? - Identify Options Query**

Returns a string identifying the analyzer option configuration.

---

**RST - Reset**

Executes a device reset and cancels any pending *OPC command or query, exactly the same as a SYSTem:PRESet with one exception: Syst:Preset does NOT reset Calc:FORMAT to ASCII. The contents of the analyzer’s non-volatile memory are not affected by this command.

---

**SRE - Service Request Enable**

Before reading a status register, bits must be enabled. This command enables bits in the service request register. The current setting is saved in non-volatile memory. See Status Commands and Reading the Analyzer’s Status Registers.

---

**SRE? - Service Request Enable Query**

Reads the current state of the service request enable register. The register is cleared after reading it. The return value can be decoded using the table in Status Commands. See also Reading the Analyzer's Status Registers.

---

**STB? - Status Byte Query**

Reads the value of the instrument status byte. The register is cleared only when the registers feeding it are cleared. See Status Commands and Reading the Analyzer's Status Registers.

---

**TST? - Result of Self-test Query**

Returns the result of a query of the analyzer hardward status. An 0 indicates no failures found. Any other value indicates one or more of the following conditions exist. The value returned is the Weight (or sum of the Weights) of the existing conditions. For example:

- If 4 is returned from *TST?, an Overpower condition exists.
If 6 is returned, both Unleveled and Overpower conditions exists.

<table>
<thead>
<tr>

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

```
CALCulate<cnum>:CORRection:EDELay:DISTance <num>
```
(Read-Write) Sets the electrical delay in physical length (distance) for the selected measurement.

**See Critical Note**

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** Electrical delay in distance.

First Specify units using CALC:CORR:EDEL:UNIT

Use SENS:CORR:RVEL:COAX <num> to set Velocity factor.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**

```
CALC1:CORR:EDEL:DIST 5
```
```
calculate2:correction:distance .003
```

**Query Syntax**

CALCulate<cnum>:CORRection:EDELay:DISTance?

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:CORRection:EDELay:MEDium <char>**

(Read-Write) Sets the media used when calculating the electrical delay.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1.
- **<num>** Choose from: **COAX** for coaxial medium, **WAVE**guide for waveguide medium.

**Examples**

```
CALC:CORR:EDEL:MED COAX
```
```
calc3:corr:edelay:medium waveguide
```

**Query Syntax**

CALCulate<cnum>:CORRection:EDELay:MEDium?

**Return Type**

Character

**Default**

COAX

---

**CALCulate<cnum>:CORRection:EDELay:UNIT <char>**
(Read-Write) Sets and returns the units for specifying electrical delay in physical length (distance).

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Units for delay in distance. Choose from:
  - METer
  - FEET
  - INCH

**Examples**

```
CALC:CORR:EDEL:UNIT MET
calc3:corr:edelay:unit inch
```

**Query Syntax**

```
CALCulate<cnum>:CORRection:EDELay:UNIT?
```

**Return Type** Character

**Default** METer

---

**CALCulate<cnum>:CORRection:EDELay[:TIME] <num>**

(Read-Write) Sets the electrical delay for the selected measurement.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Electrical delay in seconds. Choose any number between:
  - **-10.00** and **10.00**
  - Use **SENS:CORR:RVEL:COAX** `<num>` to set Velocity factor.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**

```
CALC1:CORR:EDEL:TIME 1NS
calculate2:correction:time 0.5e-12
```

**Query Syntax**

```
CALCulate:CORRection:EDELay[:TIME]?
```

**Return Type** Numeric

**Default** 0 seconds
**CALCulate\(\text{cnum}\):CORRection:EDELay:WGcutoff \(<\text{num}\)**

(Read-Write) Sets the waveguide cutoff frequency used when the electrical delay media is set to WAVEguide. (See **CALCulate:CORRection:EDELay:ME Di um \(<\text{char}\>\).**)

**Parameters**

- \(<\text{cnum}\>\): Any existing channel number. If unspecified, value is set to 1.
- \(<\text{num}\>\): Waveguide cutoff frequency used with the electrical delay calculation.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**

- **CALC:CORR:EDEL:WGC 18.067 GHz**
- **calculate3:correction:edelay:wgcutoff 14.047 ghz**

**Query Syntax**

**CALCulate\(\text{cnum}\):CORRection:EDELay:WGcutoff?**

**Return Type**

Numeric

**Default**

45 MHz

---

**CALCulate\(\text{cnum}\):CORRection[:STATE] \(<\text{bool}\>)**

(Read-Write) Turns error correction ON or OFF for the selected measurement on the specified channel.

To turn error correction ON or OFF for a channel, use **SENS:CORR:STATe**.

**See Critical Note**

**Parameters**

- \(<\text{cnum}\>\): Any existing channel number. If unspecified, value is set to 1
- \(<\text{bool}\>\): Correction state. Choose from:
  - 0 - Correction OFF
  - 1 - Correction ON

**Examples**

- **CALC:CORR ON**
- **calculate:correction:state off**

**Query Syntax**

**CALCulate\(\text{cnum}\):CORRection:STATe?**

**Return Type**

Boolean

**Default**

Not Applicable
CALCulate<cnum>:CORRection[:STATE]:INDicator?
(Read-only) Returns the error correction state for the selected measurement on the specified channel.
To turn error correction ON or OFF for a channel, use SENS:CORR:STATe.

See Critical Note

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:CORR:IND?</td>
<td></td>
</tr>
<tr>
<td>calculate2:correction:state:indicator?</td>
<td></td>
</tr>
</tbody>
</table>

Return Type Character

- NONE - No error correction
- MAST (Master) - Original error correction terms
- INT - Error terms are interpolated. Learn more.
- DELT - Delta Match calibration terms. Learn more.
- INV - Error terms are not valid

Default NONE

CALCulate<cnum>:CORRection:TYPE <string>
(Read-Write) Sets the Cal Type for the selected measurement on the specified channel. This is used when a Cal Set is applied. Learn more about applying Cal Types.

- Use SENS:CORR:TYPE:CAT? to list the Cal Types in the PNA.
- Use SENS:CORR:CSET:TYPE:CAT? to list the Cal Types contained in the active Cal Set for the channel.
- Use SENS:CORR:COLL:METH to set the Cal type to perform a new calibration,

See Critical Note

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <string> (String) Cal type. Case sensitive. Use one of the following:

  For Full Calibrations:
This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full n Port(x,y,z...)"

where

\[ n = \text{the number of ports to calibrate} \]
\[ x,y,z = \text{the port numbers to calibrate} \]

For example:

"Full 7 Port(2,3,4,5,6,7,8)"

**For Response Calibrations:**

"Response(param)" OR

"ResponseAndIsolation(param)"

Where param =

- S-parameter. For example"

  "Response(S21)"

  "ResponseAndIsolation(A/R)"

- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:

  "Response(A)"

  "ResponseAndIsolation(a3/b4)"

**For FCA Calibrations:**

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.

- "SMCRsp+IN" No Output match. All four sweeps required.

- "SMCRsp+OUT" No Output match. All four sweeps required.

- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.
For Gain Compression Cal

where r = receive port; s = source port

- "GCA 2P (r,s)" - full 2-port cal
- “GCA Enh Resp (r,s)” - Enhanced Response Cal

**Examples**

```
CALC:CORR:TYPE "Scalar Mixer Cal"
```

**Query Syntax**

```
CALCulate<cnum>:CORRection:TYPE?
```

**Return Type**

String

**Default**

Not Applicable

---

**CALCulate<cnum>:CORRection:OFFSet[:MAGNitude] <num> Superseded**

*Note:* This command is replaced with `SENS:CORR:RPOWer:OFFSet[:AMPLitude]`.

To set data trace magnitude offset, use `CALC:OFFS:MAGN`.

This command does NOT function for FCA measurements.

See an example of a [Receiver Power Calibration](#).

*Read-Write*

**For Receiver Power Calibration**, specifies the power level to which the selected (unratioed) measurement data is to be adjusted. This command applies only when the selected measurement is of unratiored power.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Cal power level in dBm. No limits are enforced on this value, but the PNA receivers themselves have maximum and minimum power specifications (that may differ between PNA models) which this value must comply with for a valid receiver power cal.

**Examples**

```
CALC:CORR:OFFS 10DBM
```

```
CALCulate1:correction:offset:magnitude maximum
```

**Query Syntax**

```
CALCulate<cnum>:CORRection:OFFSet[:MAGNitude]?
```

**Return Type**

Numeric

**Default**

0dBm
CALCulate<cnum>:CORRection:OFFSet:PHASe <num>[<char>]  Superseded

Note: This command is replaced with CALC:OFFS:PHASE

(Read-Write) Sets the phase offset for the selected measurement.

Parameters

<cnum>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num>  Offset phase value. Choose any number between: -360 and 360

<char>  Units for phase. OPTIONAL. Choose either:
  DEG - Degrees (default)
  RAD - Radians

Examples

CALC:CORR:OFFS:PHAS 10  
calculate:correction:offset:phase 20rad

Query Syntax  CALCulate:CORRection:OFFSet:PHASe?

ReturnType  Numeric, returned value always in degrees

Default  0 degrees

Last modified:

19-Jul-2010  Added Calc:Corr:Indicator
22-Sep-2009  Removed VMC from Corr:Type
6-Feb-2009  Added two commands
12-Feb-2008  Fixed typo
9/12/06  MQ Modified Calc:Corr for multiport.
**Calculate:Custom Commands**

Creates and modifies application measurements:

```
CALCulate:CUStom:
    DEFine
    MODify
```

---

**CALCulate<cnum>:CUStom:DEFine <Mname>, <type> [,param]**

*(Write-only)* Creates a custom measurement. The custom measurement is not automatically displayed. You must also do the following:

- Use `DISP:WIND:STATE` to create a window if it doesn't already exist.
- Use `DISP:WIND:TRAC:FEED` to display the measurement
- Select the measurement (`CALC:PAR:SEL`) before making additional settings.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<Mname>` Name of the measurement. Any non-empty, unique string, enclosed in quotes.
- `<type>` String. The type of custom measurement. Click each to see an example program. Choose from:
  - "Vector Mixer/Converter"
  - "Scalar Mixer/Converter"
  - "Noise Figure Cold Source"
  - "Noise Figure Converters"
  - "Gain Compression"
  - "Gain Compression Converters"
  - "Swept IMD"
  - "IM Spectrum"
- "Swept IMD Converters"
- "IM Spectrum Converters"

[param] String. Optional parameter specifies the measurement to create:

Swept IMD

There are over 150 possible Swept IMD parameters, too many to list here.

Build the parameters with the [Swept IMD Parameter](#) dialog, then copy the parameter name to the remote command.

The following are a few example parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;PwrMainLo&quot;</td>
<td>Absolute power of the Low tone at the DUT output.</td>
</tr>
<tr>
<td>&quot;IM3&quot;</td>
<td>Power of the third product relative to the average power of the f1 and f2 tones measured at the DUT output.</td>
</tr>
<tr>
<td>&quot;OIP3&quot;</td>
<td>Theoretical power level at which the third product will be the same power level as the average of the main tones at the output of the DUT.</td>
</tr>
</tbody>
</table>

View signals OUT of the 2249
<table>
<thead>
<tr>
<th>IM Spectrum</th>
<th>&quot;Output&quot;</th>
<th>DUT and into PNA port 2 (B receiver).</th>
</tr>
</thead>
<tbody>
<tr>
<td>IM Spectrum Converters</td>
<td>&quot;Input&quot;</td>
<td>View signals IN to the DUT (R1 receiver).</td>
</tr>
<tr>
<td></td>
<td>&quot;Reflection&quot;</td>
<td>View signals reflected off the DUT input and back into PNA port 1 (A receiver)</td>
</tr>
</tbody>
</table>

**Examples**

```
calc2:cust:define 'MyNF', 'NoiseFigure', 'NF'
calc2:cust:define 'My VC21', 'Vector Mixer/Converter', 'S22'
```

**Query Syntax**

Not applicable

**Overlapped?**

No

**Default**

Not applicable

**CALCulate<cnum>:CUSTom:MODify <param>**

*(Write-only)* Changes the selected custom measurement to a different parameter.

See an example using this command for a VMC and SMC measurement

**Parameters**

- `<cnum>`: Channel of the custom measurement to be changed. First, select the measurement using `CALC:PAR:SEL`.
- `<param>`: Parameter to change the custom measurement to. Select a parameter that is valid for the type of measurement. Choose from the same arguments as `Calc:Cust:Def`.

**Examples**

```
syst:pres
calc2:cust:define 'My VC21', 'Vector Mixer/Converter'
calc:par:sel 'My VC21'
calc2:cust:mod 'S22'
```

**Query Syntax**

Not applicable

**Overlapped?**

No

**Default**

Calculate:Data Commands

Controls writing and reading PNA measurement data.

| CALCulate:DATA | CUSTom | CATalog? | SNP? | PORTs? | SAVE |

Click on a blue keyword to view the command details.

Red is a superseded command.

See Also

- Example Programs
- Data Access Map
- Synchronizing the PNA and Controller
- To read receiver data, use CALC:RDATA?
- To read error terms, use SENS:CORR:CSET:DATA
- To read SnP measurement data, use CALC:DATA:SNP?
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

(Write) CALCulate<cnum>:DATA <char>,<data>

(Read) CALCulate<cnum>:DATA? <char>

Reads or writes Measurement data, Memory data, or Normalization Divisor data from the Data Access Map location.

- For Measurement data, use FDATA or SDATA
- For Memory data, use FMEM or SMEM. When querying memory, you must first store a trace into memory
using `CALC:MATH:MEMorize`.

- For Normalization Divisor (Receiver Power Cal error term) data, use `SDIV`.
- For write operations, data type depends on `FORM:DATA` command.

**Equation Editor** Notes:

- When equation editor is active on a trace in a standard S-parameter channel, Calc:Data returns the data from the parameter on the trace that was measured last. For example, for the equation “S22 + S33 + S11”, then S33 is the last measured parameter because it uses source port 3.

- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.

- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

**Note:** The Calc:Data SCORR command to read / write error terms is **Superseded** with `SENS:CORR:CSET:DATA`. SCORR commands do NOT accommodate greater than 12 error terms.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` **FDATA** Formatted measurement data to or from Data Access Map location `Display` (access point 2).
  - Corrected data is returned when correction is ON.
  - Uncorrected data is returned when correction is OFF.
  - Returns TWO numbers per data point for Polar and Smith Chart format.
  - Returns one number per data point for all other formats.
  - Format of the read data is same as the displayed format.

- **SDATA** Complex measurement data.
  - Writes data to Data Access Map location `Raw Measurement` (access point 0).
    - When writing corrected data, and correction is ON, it will be corrected again, resulting in meaningless data.
  - Reads data from `Apply Error Terms` (access point 1).
- Returns TWO numbers per data point.
- Corrected data is returned when correction is ON.
- Uncorrected data is returned when correction is OFF.

**FMEM** Formatted memory data to or from Data Access Map location Memory result (access point 4).

- Returns TWO numbers per data point for Polar and Smith Chart format.
- Returns one number per data point for all other formats.
- Format of the read data is same as the displayed format.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.

**SMEM** Complex measurement data to or from Data Access Map location Memory (access point 3).

- Returns TWO numbers per data point.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.

**SDIV** Complex data from Data Access Map location Normalization (5).

- Returns TWO numbers per data point.
- If normalization interpolation is ON and the number of points changes after the initial normalization, the divisor data will then be interpolated.
- When querying the normalization divisor, you must first store a divisor trace using CALC:NORMALize[:IMMediate].

The following Calc:Data SCORR command to read / write error terms is **Superseded** with SENS:CORR:CSET:DATA. These SCORR commands do NOT accommodate greater than 12 error terms.
For 2-Port SOLT and TRL calibrations

Specify this `<char>` to get or put this Error Term...

**Return Type**

Depends on Form:Data

**Default**

Not Applicable

---

**CALCulate<cnum>:DATA:CUSTom:CATalog?** Superseded

**Note:** This command has been replaced by `CALC:DATA:CAT` which can now be used with all PNA applications.

(Read-only) Reads the list of buffer names (comma separated list of string values) available from the selected parameter. Specify the measurement using `CALCulate:PARameter:SELect`.

See Critical Note

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;cnum&gt;</strong> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>

</tbody>
</table>

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:DATA:CUST:CAT?</code></td>
<td></td>
</tr>
<tr>
<td><code>calculate:data:custom:catalog?</code></td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**

String

**Default**

Not Applicable
**CALCulate<cnum>:DATA:SNP? <n> Superseded**

**Note:** This command has been replaced by `CALC:DATA:SNP:PORTs?` (Read-only) Reads SnP data from the selected measurement. Learn more about SnP data.

**Note:** This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

See Critical Note

### Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<n>** Amount of data to return. If unspecified, <n> is set to 2. The number you specify must be less than or equal to the number of available ports on the PNA.

Choose from:

- **1 (S1P)** returns data for the active measurement.
- **2 (S2P)** returns data for the 2 port parameters associated with the current measurement. Default.
- **3 (S3P)** returns data for the 3 port parameters associated with the current measurement.
- **4 (S4P)** returns data for the 4 port parameters associated with the current measurement.

SnP data can be output using several data formatting options. See `MMEM:STOR<file>.<snp>.

See also `MMEM:STOR <file>.<snp>`

### Examples

```
CALC:PAR:DEF MyMeasurement, S11
CALC:PAR:SEL MyMeasurement
CALC:DATA:SNP? 1
```

### Return Type

- **Default** Not Applicable

---

**CALCulate<cnum>:DATA:SNP:PORTs? <"x,y,z".>**
Note: This command replaces \texttt{CALC\textasciitilde DATA\textasciitilde SNP}\textdollar. This command is more explicit regarding the data to be returned, and works for PNAs with multiport test sets.

(Read-only) Reads SNP data from the selected measurement for the specified ports. Learn more about SNP data.

Note: This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

\textbf{See Critical Note}

\textbf{Parameters}

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<"x,y,z">` Comma or space delimited port numbers for which data is requested, enclosed in quotes.

SnP data can be output using several data formatting options. See \texttt{MMEM\textasciitilde STORE\textasciitilde TRACe\textasciitilde FORMat\textasciitilde SNP}.

\textbf{Examples} \texttt{CALC\textasciitilde DATA\textasciitilde SNP\textasciitilde PORTs? "1,2,4,5,7"} 'read data for these ports

\textbf{Return Type} Depends on \texttt{FORMat\textasciitilde DATA}

\textbf{Default} Not Applicable

\texttt{CALCulate<cnum>-DATA\textasciitilde SNP\textasciitilde PORTs\textasciitilde SAVE <"x,y,z">,<filename>}

Note: This command replaces \texttt{MMEM\textasciitilde STORE\textasciitilde sNp}. This command is more explicit regarding the data to be saved, and works for PNAs with multiport test sets.

(Write-only) Saves sNp data from the selected measurement for the specified ports.

Learn more about SNP data.

\textbf{See Critical Note}

\textbf{Parameters}

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<"x,y,z">` \textbf{String} Comma or space delimited port numbers for which data is requested, enclosed in quotes.
<filename> String Path, filename, and suffix of location to store the sNp data. The suffix is not checked for accuracy. If saving 2 ports, specify "filename.s2p"; If saving 4 ports, specify "filename.s4p.", and so forth.

SnP data can be output using several data formatting options. See MMEM:STORe:TRACe:FORMat:SNP.

Examples

CALC:DATA:SNP:PORTs:Save '1,2,4', 'C:/Program Files/Agilent/Network Analyzer/Documents/MyData.s3p'

Return Type Depends on FORMat:DATA

Default Not Applicable

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using CALC:Par:Select.

CALCulate<cnum>:EQUation:LIBRary:FUNCtions <string>

(Read-only) Returns the functions in the specified DLL.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <string> Full path and filename of the *.dll to be read.

Examples

functions = CALC:EQU:LIBR:FUNC "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"

Query Syntax

CALCulate<cnum>:EQUation:LIBRary:FUNCtions?
**Return Type**  Comma delimited string of function names.

**Default**  Not Applicable

---

**CALCulate\(\text{cnum}\):EQUation:LIBRary:IMPort \(<\text{string}>\)**

**(Read-Write)** Imports the functions in the specified DLL and returns whether the functions have been imported into the PNA.

See Critical Note

**Parameters**

- **\(<\text{cnum}>\)**  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

- **\(<\text{string}>\)**  Full path and filename of the \*.dll.

**Examples**

<table>
<thead>
<tr>
<th>Write - Imports functions</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:EQU:LIBR:IMPort &quot;C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll&quot;</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Read if Imported</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>functions = CALC:EQU:LIBR:IMPort &quot;C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll&quot;</code></td>
</tr>
</tbody>
</table>

**Query Syntax**  CALCulate\(\text{cnum}\):EQUation:LIBRary:IMPort?

Returns the following:

- 1 - Imported
- 0 - NOT imported

**Return Type**  Boolean

**Default**  Not Applicable

---

**CALCulate\(\text{cnum}\):EQUation:LIBRary:REMove \(<\text{string}>\)**
(Write-only) Removes an imported an Equation Editor DLL from the PNA.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<string>` Full path and filename of the *.dll.

Examples

```
CALC:EQU:LIBR:REM "C:/Program Files/Agilent/Network Analyzer/UserFunctions/Expansion.dll"
```

Query Syntax Not Applicable

Default Not Applicable

CALCulate<cnum>:EQUation[:STATe] <bool>

(Read-Write) Turns ON and OFF the equation on selected measurement for the specified channel. If the equation is not valid, then processing is not performed. Use `CALC:EQUation:VALid?` to ensure that the equation is valid.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<bool>`
  - **ON** (or 1) - turns equation ON.
  - **OFF** (or 0) - turns equation OFF.

Examples

```
CALC:EQU 1
calculate2:equation:state 0
```

Query Syntax CALCulate<cnum>:EQUation[:STATe]?

Return Type Boolean

Default OFF (0)

CALCulate<cnum>:EQUation:TEXT <string>
Specifies an equation or expression to be used on the selected measurement for the specified channel.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<string>` Any valid equation or expression. See Equation Editor.

Examples

```
'Equation (includes '=')
CALC:EQU:TEXT "foo=S11/S21"

'Expression
calculate2:equation:text "S11/S21"
```

Query Syntax

```
CALCulate<cnum>:EQUation:TEXT?
```

Return Type

String

Default Not Applicable

---

**CALCulate<cnum>:EQUation:VALid?**

(Read-Write) Returns a boolean value to indicate if the current equation on the selected measurement for the specified channel is valid. For equation processing to occur, the equation must be valid and ON (CALC:EQU:STAT 1).

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

Examples

```
CALC:EQU:VAL?
calculate2:equation:valid?
```

Return Type

Boolean

1 - equation is valid
0 - equation is NOT valid

Default Not Applicable
Calculate: Filter Commands

Controls the gating function used in time domain measurements. The gated range is specified with either (start / stop) or (center / span) commands.

```
CALCulate:FILTER[:GATE]
```

COUPLE

TIME

CENTEr   SPAN   STATe   [TYPE]

PARameters   SHApe   START   STOP

Click on a blue keyword to view the command details.

**see Also**

- [Example Programs](#)
- [Learn about Gating](#)
- [Synchronizing the PNA and Controller](#)
- [SCPI Command Tree](#)

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:Select`

```
CALCulate<cnum>:FILTER:GATE1:COUPLE:PARameters <num>
```
CALCulate<cnum>:FILTer[:GATE]:COUPle:PARameters

Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To enable Trace Coupling, use SENS:COUP:PAR
- To specify Transform parameters to couple, use CALC:TRAN:COUP:PAR

Learn more about Time Domain Trace Coupling

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` (Numeric) Parameters to couple. To specify more than one parameter, add the numbers.
  - 1 - Gating Stimulus (Start, Stop, Center, and Span TIME settings.)
  - 2 - Gating State (ON / OFF)
  - 4 - Gating Shape (Minimum, Normal, Wide, and Maximum)
  - 8 - Gating Type (Bandpass and Notch)

Examples

- 'To couple all parameters:
  
  CALC:FILT:COUP:PAR 15

- 'To couple Stimulus and Type:
  
  calculate2:filter:gate:couple:parameters 9

Query Syntax

CALCulate<cnum>:FILTer:<GATE>:COUPle:PARameters?

Return Type

Numeric

Default

13 (All parameters except 2 - Gating State)
(Read-Write) Sets the gate filter center time.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Center time in seconds; Choose any number between:
  \[ \pm \left(\frac{\text{number of points}-1}{\text{frequency span}}\right) \]

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
calculate2:filter:time:shape normal
```

**Query Syntax**

```
CALCulate<cnum>:FILTer[:GATE]:TIME:CENTer?
```

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:FILTer[:GATE]:TIME:SHAPe <char>**

(Read-Write) Sets the gating filter shape when in time domain.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from
  - MAXimum - the widest gate filter available
  - WIDE -
  - NORMal -
  - MINimum - the narrowest gate filter available

**Examples**

```
CALC:FILT:GATE:TIME:SHAPE MAX
```

**Query Syntax**

```
CALCulate<cnum>:FILTer[:GATE]:TIME:SHAPe?
```

**Return Type**

Character

**Default**

NORMal
CALCulate<cnum>:FILTER[:GATE]:TIME:SPAN <num>

(Read-Write) Sets the gate filter span time.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Time span in seconds; Choose any number between: 0 and 2* [(number of points-1) / frequency span]

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

CALC:FILT:GATE:TIME:SPAN 5 ns
calculate2:filter:time:span maximum

Query Syntax

CALCulate<cnum>:FILTER[:GATE]:TIME:SPAN?

Return Type

Numeric

Default 20 ns

CALCulate<cnum>:FILTER[:GATE]:TIME:STATE <boolean>

(Read-Write) Turns gating state ON or OFF.

See Critical Note

Note: Sweep type must be set to LInear Frequency in order to use Transform Gating.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<boolean> ON (or 1) - turns gating ON.
OFF (or 0) - turns gating OFF.

Examples

CALC:FILT:TIME:STAT ON
calculate2:filter:gate:time:state off

Query Syntax

CALCulate<cnum>:FILTER[:GATE]:TIME:STATE?

Return Type

Boolean (1 = ON, 0 = OFF)

Default OFF
CALCulate<cnum>:FILTer[:GATE]:TIME:STARt <num>

(Read-Write) Sets the gate filter start time.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** Start time in seconds; any number between:
  \[\pm \frac{(number\ of\ points-1)}{frequency\ span}\]

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- `CALC:FILT:TIME:STAR 1e-8`
- `calculate2:filter:gate:time:start minimum`

Query Syntax

CALCulate<cnum>:FILTer[:GATE]:TIME:STARt?

Return Type

Numeric

Default

10 ns

CALCulate<cnum>:FILTer[:GATE]:TIME:STOP <num>

(Read-Write) Sets the gate filter stop time.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** Stop time in seconds; any number between:
  \[\pm \frac{(number\ of\ points-1)}{frequency\ span}\]

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- `CALC:FILT:TIME:STOP -1 ns`
- `calculate2:filter:gate:time:stop maximum`

Query Syntax

CALCulate<cnum>:FILTer[:GATE]:TIME:STOP?

Return Type

Numeric

Default

10 ns
CALCulate<cnum>:FILTer[:GATE]:TIME[:TYPE] <char>

(Read-Write) Sets the type of gate filter used.

See Critical Note

Parameters

- <cnum>: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <char>: Choose from:
  - BPASs - Includes (passes) the range between the start and stop times.
  - NOTCh - Excludes (attenuates) the range between the start and stop times.

Examples

- CALC:FILT:TIME BPAS
- calculate2:filter:gate:time:type notch

Query Syntax

CALCulate<cnum>:FILTer[:GATE]:TIME[:TYPE]?

Return Type

Character

Default

BPAS
Calculate:Format Commands

CALCulate:
  FORMat
  UNIT

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

See Also

- Example using this command.
- Learn About Data Format
- Synchronizing the PNA and Controller

CALCulate<cnum>:FORMat <char>

(Read-Write) Sets the display format for the measurement.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <char> Choose from:
  - MLINear
  - MLOGarithmic
  - PHASE
  - UPHase 'Unwrapped phase
  - IMAGinary
  - REAL
  - POLar
  - SMITH
  - SADMittance 'Smith Admittance
  - SWR
  - GDElay 'Group Delay
Examples

```
CALC:FORM MLIN
calculate2:format polar
```

Query Syntax

```
CALCulate<cnum>:FORMat?
```

Return Type

Character

**Default**

MLINear

---

**CALCulate<cnum>:FORMat:UNIT <dataFormat>, <units>**

*(Read-Write)* Sets and returns the units for the specified data format. Measurements with display formats other than those specified are not affected.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<dataFormat>` Choose MLOG.
- `<units>` For unratioed measurements, choose from:
  - **DBM** Units are displayed in dBm. 0 dBm = 0.001 watt
  - **DBMV** Units are displayed in dBmV. 0 dBmV = 0.001 volt

Examples

```
CALC:FORM MLOG, DBM
calculate2:format mlog, dbmv
```

Query Syntax

```
CALCulate<cnum>:FORMat:UNIT? <dataFormat>
```

Return Type

Character

**Default**

DBM

---

**CALCulate<cnum>:FSIMulator:SNP:EXTRapolate <bool>**

*(Read-Write)*  Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding. [Learn more.](#)

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- **<cnum>**  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<bool>**  Choose from:
  - **ON or 1** - Turns Extrapolation ON
  - **OFF or 0** - Turns Extrapolation OFF

**Examples**

```plaintext
CALC:FSIM:SNP:EXTR 1
calculate2:fsimulator:snp:extrapolate 0
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:SNP:EXTRapolate?

**Return Type**  Boolean

**Default**  OFF
CALCulate<cnum>:FSIMulator:STATe <bool>

(Read-Write) Turns all three fixturing functions (de-embedding, port matching, impedance conversion) ON or OFF for all ports on the specified channel. Does not affect port extensions.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<bool>** Choose from:
  - **ON or 1 -** Turns Fixturing ON
  - **OFF or 0 -** Turns Fixturing OFF

**Examples**

```
CALC:FSIM:STAT 1
calculate2:fsimulator:state 0
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:STATe?
```

**Return Type**

Boolean

**Default**

OFF

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

**CALCulate<cnun>:FUNCTION:DATA?**

(Read-only) Returns the trace statistic data for the selected statistic type for the specified channel. Select the type of statistic with CALC:FUNC:TYPE.

**See Critical Note**

**Parameters**

- `<cnun>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnun>` is set to 1.

**Return Type** Depends on FORM:DATA

**Example** CALCulate2:FUNCTION:DATA?

**Default** Not applicable

**CALCulate<cnun>:FUNCTION:DOMain:USER[:RANGE] <range>**
(Read-Write) Sets the range used to calculate trace statistics. Each channel has 16 user ranges. The x-axis range is specified with the CALC:FUNC:DOM:USER:START and STOP commands.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<range>` Range number. Choose from: 0 to 16
  - 0 is Full Span of the current x-axis range
  - 1 to 16 are user-specified ranges

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FUNC:DOM:USER 4</td>
<td>Numeric</td>
<td>0 - Full Span</td>
</tr>
<tr>
<td>calculate2:function:domain:user:range 0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:FUNCtion:DOMain:USER:STARt <range>, <start>**

(Read-Write) Sets the start of the specified user-domain range.

To apply this range, use CALC:FUNC:DOM:USER

To set the stop of the range, use CALC:FUNC:DOM:USER:STOP.

See Critical Note

Note: This command does the same as CALC:MARK:FUNC:DOM:USER:STAR

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<range>` Range number that will receive the start value. Choose an integer between 1 and 16
- `<start>` Start value of the specified range. Choose a real number between: the analyzer's Minimum and Maximum x-axis value.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FUNC:DOM:USER:STAR 1,1e9</td>
<td></td>
<td></td>
</tr>
<tr>
<td>calculate2:function:domain:user:start 2,2e9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Query Syntax**
CALCulate<cnum>:FUNCtion:DOMain:USER:STARt? <range>

**Return Type**
Numeric

**Default**
The analyzer's Minimum x-axis value

---

CALCulate<cnum>:FUNCtion:DOMain:USER:STOP <range>, <stop>

(Read-Write) Sets the stop value of the specified user-domain range.

To apply this range, use CALC:FUNC:DOM:USER.

To set the start of the range, use CALC:FUNC:DOM:USER:START

**See Critical Note**

**Note:** This command does the same as CALC:MARK:FUNC:DOM:USER:STOP

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<range>` Range number that will receive the stop value. Choose an integer between 1 and 16
- `<stop>` Stop value of the specified range. Choose a real number between: the analyzer's Minimum and Maximum x-axis value.

**Examples**
CALC:FUNC:DOM:USER:STOP 4,5e9  
calculate2:func:domain:user:stop 3,8e9

**Query Syntax**
CALCulate<cnum>:FUNCtion:DOMain:USER:STOP? <range>

**Return Type**
Numeric

**Default**
The analyzer's Maximum x-axis value

---

CALCulate<cnum>:FUNCtion:EXECute
(Write-only) For the active trace of specified channel, executes the statistical analysis specified by the
**CALC:FUNC:TYPE** command.

**See Critical Note**

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

  **Examples**
  
  ```
  CALC:FUNC:EXEC
  calculate2:function:execute
  ```

  **Query Syntax** Not Applicable

  **Default** Not Applicable

**CALCulate<cnum>:FUNCTION:STATistics[:STATE] <ON|OFF>**

(Read-Write) Displays and hides the trace statistics (peak-to-peak, mean, standard deviation) on the screen.

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

**See Critical Note**

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<ON|OFF>** ON - Displays trace statistics

  OFF - Hides trace statistics

  **Examples**
  
  ```
  CALC:FUNC:STAT ON
  calculate2:function:statistics:state off
  ```

  **Query Syntax** CALCulate<cnum>:FUNCTION:STATistics[:STATE]?

  **Return Type** Boolean (1 = ON, 0 = OFF)

  **Default** OFF (0)

**CALCulate<cnum>:FUNCTION:TYPE <char>**
(Read-Write) Sets statistic TYPE that you can then query using \texttt{CALC:FUNCtion:DATA?}.

**Note:** In PNA releases 4.2 and prior, this command applied the statistic type to all measurements. Now, this command affects only the selected measurement on the specified channel.

\begin{itemize}
\item **See Critical Note**
\item **Parameters**
\begin{itemize}
\item \texttt{<cnum>} Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \texttt{<cnum>} is set to 1.
\item \texttt{<char>} Choose from:
\begin{itemize}
\item \texttt{PTPeak} - the difference between the max and min data points on the trace.
\item \texttt{STDEV} - standard deviation of all data points on the trace
\item \texttt{MEAN} - mean (average) of all data points on the trace
\item \texttt{MIN} - lowest data point on the trace
\item \texttt{MAX} - highest data point on the trace
\end{itemize}
\end{itemize}
\item **Examples**
\begin{itemize}
\item \texttt{CALC:FUNC:TYPE PTP}
\item \texttt{calculate2:function:type stdev}
\end{itemize}
\item **Query Syntax** \texttt{CALCulate\textless cnum\textgreater :FUNCtion:TYPE?}
\item **Return Type** Character
\item **Default** \texttt{PTPeak}
\end{itemize}

Other Gain Compression commands

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- **CALC:CUSTom:DEFINE** - creates a gain compression measurement.
- **SENS:GCSetup** - Most Gain Compression settings.
- **CALC:GCMeas:ANAL** - Gain Compression Analysis settings
- Gain compression data can also be saved to a *.csv file. Learn how.

- **SCPI Command Tree**

CALCulate<ch>:GCData:DATA? <param>
Returns measurement data at all frequency and power data points for GCA SMART sweeps and 2D sweeps.

- When using SMART sweep, ALL data is returned including ALL background iteration sweeps.
- When using 2D sweeps, ALL data is returned.

Use Calc:Data? to return just the displayed data results (not the background sweeps).

A compression parameter must be present. Learn more.

The format of the data is the same as the format of the measurement that you select using Calc:Par:Select. If the measurement is scalar, than one number is returned per sweep per data point. If complex (such as Smith Chart format) than both real and imaginary numbers are returned.

If correction is on, corrected data are returned. Otherwise, raw data are returned.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<param>` (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed or selected. However, a compression parameter must be present. Learn more.

Choose from:

- "pin" - (CompIn21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

Learn more about GCA parameters.

**Examples**

```
data = CALC:GCD:DATA? "pin"
data = calculate:gcdata:data? "pout"
```

**Return Type**

Array of data

**Default**

Not Applicable
CALCulate<ch>:GCData:IMAG? <char>, <dpoint>, <param>

(Read-Only) Returns the imaginary part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1
- **<char>** Choose from:
  - **FREQuency** - for the specified frequency data point, returns all of the measured data for each power stimulus.
  - **POWer** - for the specified power data point, returns all of the measured data for each frequency stimulus.
- **<dPoint>** Data point (FREQ or POWer) for which data is returned.
- **<param>** (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.
  - "pin" - (CompIn21) Input power at the compression point.
  - "pout" - (CompOut21) Output power at the compression point.
  - "gain" - (CompGain21) Device gain (S21) at the compression point.
  - "inputmatch" - (CompS11) Input match at the compression point.
  - "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
  - "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Examples**

For the fifth frequency data point, returns 'Power Output' imaginary (phase) data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```plaintext
data = CALC:GCD:IMAG? FREQ,5,"pout"
```

For the 30th stimulus power data point, returns 'Power Output' imaginary (phase) data from all frequency stimulus values. If there are 201 power sweep points, 201 values are returned.

```plaintext
data = calculate:gcdata:imag? power,30,"pout"
```
CALCulate<cnum>:GCData:ITERations?

(Read-only) Returns the number of iterations made in a SMART sweep. Returns number of power points for a 2D sweep.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples CALC:GCD:ITER?

Return Type Numeric

Default Not Applicable

CALCulate<ch>:GCData:REAL? <char>, <dPoint>, <param>

(Read-Only) Returns the real part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<char> Choose from:

- FREQuency - for the specified frequency data point, returns all of the measured data for each power stimulus.
- POWer - for the specified power data point, returns all of the measured data for each frequency stimulus.

<dPoint> Data point (FREQ or POWer) for which data is returned.

<param> (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.

- "pin" - (Compln21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Examples**

For the fifth frequency data point, returns 'Power Output' real data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```
data = CALC:GCD:REAL? FREQ,5,"pout"
```

For the 30th stimulus power data point, returns 'Power Output' real data from all frequency stimulus values. If there are 201 power sweep points, 201 values are returned.

```
data = calculate:gcdata:real? power,30,"pout"
```

**Return Type** Array of data

**Default** Not Applicable

---

**CALCulate<cnum>:GCMeas:ANALysis:ENABle <bool>**
(Read-Write) Enables and disables a compression analysis trace.

**Parameters**

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>` **ON** (or 1) - Enable compression analysis.
  **OFF** (or 0) - Disable compression analysis.

**Examples**

```
CALC:GCM:ANAL:ENAB ON
```

```
calculate2:gcmeas:analysis:enable off
```

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:ENABle?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

----

**CALCulate<cnum>:GCMeas:ANALysis:CWFRequency <num>**

(Read-Write) Set and return the CW frequency for a compression analysis trace.

**Parameters**

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<num>` CW frequency in Hz. Choose a frequency within the range of the gain compression channel.

**Examples**

```
CALC:GCM:ANAL:CWFR 1e9
```

```
calculate2:gcmeas:analysis:cwfrequency 1e10
```

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:CWFRequency?`

**Return Type**

Numeric

**Default**

Not Applicable

----

**CALCulate<cnum>:GCMeas:ANALysis:ISDisfrequency <bool>**
(Read-Write) Sets and returns whether the CW frequency for the compression analysis trace can be set to only the discrete frequencies or provides interpolation.

**Parameters**

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>` **ON** (or 1) - Discrete data points only.
  **OFF** (or 0) - Interpolated data points.

**Examples**

```
CALC:GCM:ANAL:ISD ON
calculate2:gcmeas:analysis:isdisfrequency off
```

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:ISDisfrequency?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

**CALCulate<cnum>:GCMeas:ANALysis:XAXis <char>**

(Read-Write) Sets and returns the type of data to display on the x-axis of a compression analysis trace.

**Parameters**

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>` Data to display on X-axis. Choose from:

  - **PIN** - Input power to the DUT.
  - **PSOsource** - power from the source.

**Examples**

```
CALC:GCM:ANAL:XAX PIN
calculate2:gcmeas:analysis:xaxis psource
```

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:XAXis?`

**Return Type**

Character

**Default**

PIN
Group Delay Aperture Commands

Controls the Aperture setting used to make Group Delay measurements.

```
CALCulate:GDELay
  FREQuency
  PERCent
  POINts
```

Click on a blue keyword to view the command details.

See Also

- Learn about Group Delay Aperture
- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

CALCulate<cnum>:GDELay:FREQuency <value>

(Read-Write) Sets group delay aperture using a fixed frequency range.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>` Frequency range (in Hz) to use for the aperture setting. Choose between the equivalent of two data points and the channel frequency span.

Examples

```
CALC:GDEL:FREQ 1E6
```

Query Syntax

CALCulate<cnum>:GDELay:FREQuency?

Return Type

Numeric

Default

Frequency range that equates to 11 points. This can be changed to two points with a preference setting.

CALCulate<cnum>:GDELay:PERCent <value>
(Read-Write) Sets group delay aperture using a percent of the channel frequency span.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<value>** Percent of frequency span to use for the aperture setting. Choose between the equivalent of two data points and 100 percent of the channel frequency span.

**Examples**

'set to 25 percent of the channel frequency span

```
CALC:GDEL:PERC 25
```

**Query Syntax**

CALCulate<cnun>:GDELay:PERCent?

**Return Type**

Numeric

**Default**

Percent of frequency span that equates to 11 points. This can be changed to two points with a preference setting.

---

**CALCulate<cnun>:GDELay:POINts <value>**

(Read-Write) Sets group delay aperture using a fixed number of data points.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<value>** Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.

**Examples**

'set to 25 data points

```
CALC:GDEL:POIN 25
```

**Query Syntax**

CALCulate<cnun>:GDELay:POINts?

**Return Type**

Numeric

**Default**

11 points. This can be changed to two points with a preference setting.
Calc:Limit Commands

Controls the limit segments used for pass / fail testing.

- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one
measurement for each channel using `CalcPar:Select`

CALCulate<cnum>:LIMit:DATA <block>

(Read-Write) Sets data for limit segments.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement for which limit lines are to be set. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<block>` Data for all limit segments in REAL, 64 format. The following is the data format for 1 segment:

  `Type,BegStim, EndStim, BegResp,EndResp`

  - **Type** Type of limit segment. Choose from
    - 0 - Off
    - 1 - Max
    - 2 - Min
  - **BegStim** Start of X-axis value (freq, power, time)
  - **EndStim** End of X-axis value
  - **BegResp** Y-axis value that corresponds with Start of X-axis value
  - **EndResp** Y-axis value that corresponds with End of X-axis value

Examples

The following writes three max limit segments for a bandpass filter.

```
CALC:LIM:DATA 1,3e5,4e9,−60,0,1,4e9,7.5e9,0,0,1,7.5e9,9e9,0,−30
```

Query Syntax

`CALCulate<cnum>:LIMit:DATA?`

Return Type

Depends on `FORM:DATA` - All 100 predefined limit segments are returned.

Default

100 limit segments - all values set to 0

---

CALCulate<cnum>:LIMit:DATA:DELeTe
(Write-only) Deletes all limit line data for the selected measurement on the specified channel.

**See Critical Note**

<td>ON</td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:LIMit:FAIL?**
(Read-only) Returns the Pass / Fail status of the limit line test. Returns 1 (Fail) if any data point fails for any limit segment.

Limit display (CALC:LIM:DISP) does NOT have to be ON.

See Critical Note

Parameters

<cn> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cn> is set to 1.

Examples

CALC:LIM:FAIL?

Return Type

Boolean

- 0 is returned when Pass
- 1 is returned when Fail

Default Not Applicable

CALCulate<cn>:LIMit:SEGment<s>:AMPLitude:STARt <num>

(Read-Write) Sets the start (beginning) of the Y-axis amplitude (response) value.

See Critical Note

Parameters

<cn> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cn> is set to 1.

<s> Segment number; if unspecified, value is set to 1.

<num> Choose any number between -500 and 500

Display value is limited to the Maximum and Minimum displayed Y-axis values.

Examples

CALC:LIM:SEG1:AMPL:STAR 10
calculate2:limit:segment2:amplitude:start 10

Query Syntax

CALCulate<cn>:LIMit:SEGment<s>:AMPLitude:STARt?

Return Type

Numeric

Default 0
CALCulate<cnum>:LIMit:SEGMen<snum>:AMPLitude:STOP <num>
(Read-Write) Sets the stop (end) of the Y-axis amplitude (response) value.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<snum> Segment number; if unspecified, value is set to 1.
<num> Choose any number between: -500 and 500

Display value is limited to the Maximum and Minimum displayed Y-axis values.

Examples
CALC:LIM:SEG1:AMPL:STOP 10
calculate2:limit:segment2:amplitude:stop 10

Query Syntax
CALCulate<cnum>:LIMit:SEGMen<snum>AMPLitude:STOP?

Return Type Numeric

Default 0

CALCulate<cnum>:LIMit:SEGMen<snum>:STIMulus:STARt <num>
(Read-Write) Sets the start (beginning) of the X-axis stimulus value.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<snum> Segment number; if unspecified, value is set to 1.
<num> Choose any number within the X-axis span of the analyzer.

Examples
CALC:LIM:SEM1:STIM:STAR 10
calculate2:limit:segment2:stimulus:start 10

Query Syntax
CALCulate<cnum>:LIMit:SEGMen<snum>STIMulus:STARt?

Return Type Numeric

Default 0

CALCulate<cnum>:LIMit:SEGMen<snum>:STIMulus:STOP <num>
(Read-Write) Sets the stop (end) of the X-axis stimulus value.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>`: Segment number; if unspecified, value is set to 1.
- `<num>`: Choose any number within the X-axis span of the analyzer.

Examples:

```
CALC:LIM:SEGM1:AMPL:STOP 10
CALC:limit:segment2:stimulus:stop 10
```

Query Syntax:
```
CALCulate<cnum>:LIMit:SEGment<snum>:STIMulus:STOP?
```

Return Type: Numeric

Default: 0

CALCulate<cnum>:LIMit:SEGment<snum>:TYPE <char>

(Read-Write) Sets the type of limit segment.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>`: Segment number. Choose any number between: 1 and 100
  If unspecified, value is set to 1.
- `<char>`: Choose from:
  - `LMAX`: a MAX limit segment. Any response data exceeding the MAX value will fail.
  - `LMIN`: a MIN limit segment. Any response data below the MIN value will fail.
  - `OFF`: the limit segment (display and testing) is turned OFF.

Examples:

```
CALC:LIM:SEGM:TYPE LMIN
CALC:limit:segment3:type lmax
```

Query Syntax:
```
CALCulate<cnum>:LIMit:SEGment<snum>:TYPE?
```
CALCulate<cnum>:LIMit:SOUNd[:STATe] <ON | OFF>

(Read-Write) Turns limit testing fail sound ON or OFF.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`
  - ON (or 1) - turns sound ON.
  - OFF (or 0) - turns sound OFF.

Examples

```
CALC:LIM:SOUN ON
calculate2:limit:sound:state off
```

Query Syntax

CALCulate<cnum>:LIMit:SOUNd[:STATe]?

Return Type

- Boolean (1 = ON, 0 = OFF)
- Default: OFF

CALCulate<cnum>:LIMit[:STATe] <ON | OFF>

(Read-Write) Turns limit segment testing ON or OFF.

- Use CALC:LIM:DISP to turn ON and OFF the display of limit segments.
- If using Global Pass/Fail status, trigger the PNA AFTER turning Limit testing ON.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`
  - ON (or 1) - turns limit testing ON.
  - OFF (or 0) - turns limit testing OFF.

Examples

```
CALC:LIM:STAT ON
calculate2:limit:state off
```

Query Syntax

CALCulate<cnum>:LIMit[:STATe]?
**Return Type**  Boolean (1 = ON, 0 = OFF)

**Default**  OFF

- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

Note: The Reference Marker is Marker Number 10

---

CALCulate<cnum>:MARKer:AOFF
(Write-only) Turns all markers off for selected measurement.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

Examples

- `CALC:MARK:AOFF`
- `calculate2:marker:aoff`

Query Syntax Not applicable

Default Not applicable

CALCulate<cnum>:MARKer:BWIDth <num>

(Read-Write) Turns on and sets markers 1 through 4 to calculate filter bandwidth. The `<num>` parameter sets the value below the maximum bandwidth peak that establishes the bandwidth of a filter. For example, if you want to determine the filter bandwidth 3 db below the bandpass peak value, set `<num>` to -3.

To turn off the Bandwidth markers, either turn them off individually or turn them All Off.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To search a User Range with the bandwidth search, first activate marker 1 and set the desired User Range. Then send the CALC:MARK:BWID command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Target value below filter peak. Choose any number between : -500 and 500

Examples

- `CALC:MARK:BWID -3`
- `calculate2:marker:bwidth -2.513`

Query Syntax

- `CALCulate<cnum>:MARKer:BWIDth?` Returns the results of bandwidth search:

  Return Type Numeric - Four Character values separated by commas: bandwidth, center Frequency, Q, loss.
**CALCulate\(<\text{cnum}\>):MARKer\(<\text{mkr}\>\):COMPression:LEVel \(<\text{num}\>**

(Read-Write) Set and read the marker compression level. A compression marker must already exist. Use `CALC:MARK ON` and `CALC:MARK:FUNC COMP` to create compression markers.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`: Any existing marker number from 1 to 10; if unspecified, value is set to 1.
- `<num>`: Compression level. Choose any number between: -500 dB to 500 dB

Standard gain compression values are positive.

**Examples**

```
CALC:MARK:COMP:LEV 1
calculate2:marker:compression:level 1.5
```

**Query Syntax**

`CALCulate\(<\text{cnum}\>):MARKer\(<\text{mkr}\>\):COMPression:LEVel?`

**Return Type**

Numeric

**Default**

+1

---

**CALCulate\(<\text{cnum}\>):MARKer\(<\text{mkr}\>\):COMPression:PIN?**

(Read-only) Reads the input power at the marker compression level. First send `CALC:MARK:FUNC:EXEC COMP` or `CALC:MARK:FUNC:TRAC ON`.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`: Any existing marker number from 1 to 10; if unspecified, value is set to 1.

**Examples**

```
CALC:MARK:COMP:PIN?
calculate2:marker:compression:pin?
```

**Return Type**

Numeric

**Default**

Not applicable
CALCulate<cnm>:MARKer<mrk>:COMPression:POUT?

(Read-only) Reads the output power at the marker compression level. First send CALC:MARK:FUNC:EXEC COMP or CALC:MARK:FUNC:TRAC ON

See Critical Note

Parameters

<cnm> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnm> is set to 1.

<mrk> Any existing marker number from 1 to 10; if unspecified, value is set to 1.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calculate2:marker:compression:pout?</td>
<td></td>
</tr>
</tbody>
</table>

Return Type Numeric

Default Not applicable

CALCulate<cnm>:MARKer<mrk>:COUPling[:STATe]<ON|OFF>

(Read-Write) Sets and reads the state of Coupled Markers (ON and OFF).

See Critical Note

Parameters

<cnm> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnm> is set to 1.

<mrk> Any existing marker number from 1 to 10; if unspecified, value is set to 1.

<ON|OFF> OFF (0) - Turns Coupled Markers OFF. ON (1) - Turns Coupled Markers ON

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MARK:COUP ON</td>
<td>For measurement calculation.</td>
</tr>
<tr>
<td>calculate2:marker8:coupling off</td>
<td></td>
</tr>
</tbody>
</table>

Query Syntax CALCulate<cnm>:MARKer<mrk>:COUPling[:STATe]<ON|OFF>

Return Type Boolean (1 = ON, 0 = OFF)

Default OFF

CALCulate<cnm>:MARKer<mrk>:DELTa <ON|OFF>
**CALCulate<cnum>:MARKer<mkr>:DELTa <ON|OFF>**

*(Read-Write)* Specifies whether marker is relative to the Reference marker or absolute.

**Note:** The reference marker must already be turned ON with CALC:MARK:REF:STATE.

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<mkr>** Any existing marker number from 1 to 10; if unspecified, value is set to 1.
- **<ON|OFF>**
  - ON (or 1) - Specified marker is a Delta marker
  - OFF (or 0) - Specified marker is an ABSOLUTE marker

**Examples**

```
CALC:MARK:DELT ON
calculate2:marker8:delta off
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:DELTa?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**CALCulate<cnum>:MARKer<mkr>:DISCrete <ON|OFF>**

*(Read-Write)* Makes the specified marker display either a calculated value between data points (interpolated data) or the actual data points (discrete data).

**See Critical Note**

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<mkr>** Any existing marker number from 1 to 10; if unspecified, value is set to 1.
- **<ON|OFF>**
  - ON (or 1) - Specified marker displays the actual data points
  - OFF (or 0) - Specified marker displays calculated data between the actual data points.

**Examples**

```
CALC:MARK:DISC ON
calculate2:marker8:discrete off
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:DISCrete?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF
CALCulate<cnum>:MARKer<mkr>:DISTance <num>

(Read-Write) Set or query marker distance on a time domain trace.

The Write command moves the marker to the specified distance value. Once moved, you can read the Y axis value or read the X-axis time value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`: Any existing marker number from 1 to 10; if unspecified, value is set to 1.
- `<num>`: Marker distance in the unit of measure specified with `CALC:TRAN:TIME:MARK:UNIT`

Examples

```
CALC:MARK:DIST .1
calculate2:marker8:distance 5
```

Query Syntax

`CALCulate<cnum>:MARKer<mkr>:DISTance?`

Return Type

Numeric

Default

Not Applicable

---

CALCulate<cnum>:MARKer<mkr>:FORMAT <char>

(Read-Write) Sets the format of the data that will be returned in a marker data query `CALC:MARK:Y?` and the displayed value of the marker readout. The selection does not have to be the same as the measurement's display format.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`: Any marker number from 1 to 10; if unspecified, value is set to 1
- `<char>`: Choose from:
  - `DEFAULT` - The format of the selected measurement
| **MLINear** | Linear magnitude |
| **MLOGarithmic** | Logarithmic magnitude |
| **IMPedance** | (R+jX) |
| **ADMittance** | (G+jB) |
| **PHASE** | Phase |
| **IMAGinary** | Imaginary part (Im) |
| **REAL** | Real part (Re) |
| **POLar** | (Re, Im) |
| **GDELay** | Group Delay |
| **LINPhase** | Linear Magnitude and Phase |
| **LOGPhase** | Log Magnitude and Phase |
| **KELVin** | temperature |
| **FAHRENheit** | temperature |
| **CELSius** | temperature |

**Examples**

```
CALC:MARK:FORMat MLIN
calculate2:marker8:format Character
```

**Query Syntax**

```
CALCulate<cnum>:MARKer<mkr>:FORMat?
```

**Return Type**

Character

**Default**

DEFault

**Calculates**

```
CALCulate<cnum>:MARKer<mkr>:FUNCTION:APEak:EXCursion <num>
```
(Read-Write) Sets amplitude peak excursion for the specified marker. The Excursion value determines what is considered a "peak". This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

See Critical Note

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;mkr&gt;</td>
<td>Any existing marker number from 1 to 10; if unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Excursion value. Choose any number between -500 and 500.</td>
</tr>
</tbody>
</table>

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
cALC:MARK:FUNC:APE:EXC 10
```

Query Syntax

```
CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:EXCursion?
```

Return Type

Numeric

Default

3

CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:THReshold <num>

(Read-Write) Sets peak threshold for the specified marker. If a peak (using the criteria set with :EXCursion) is below this reference value, it will not be considered when searching for peaks. This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

See Critical Note

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;mkr&gt;</td>
<td>Any marker number from 1 to 10; if unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Threshold value. Choose any number between -500 and 500.</td>
</tr>
</tbody>
</table>

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
CALC:MARK:FUNC:APE:THR -40
```

```
calculate2:marker8:function:apeak:threshold -55
```
Query Syntax  | CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:THreshold?
Return Type   | Numeric
Default       | -100

**CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER[:RANGe] <range>**

*(Read-Write)* Assigns the specified marker to a range number. The x-axis travel of the marker is constrained to the range's span. The span is specified with the **CALC:MARK:FUNC:DOM:USER:START** and **STOP** commands, unless range 0 is specified which is the full span of the analyzer.

Each channel has 16 user ranges. (Trace statistics use the same ranges.) More than one marker can use a domain range.

*See Critical Note*

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1
- `<span>` User span. Choose any Integer from 0 to 16
  - 0 is Full Span of the analyzer
  - 1 to 16 are available for user-defined x-axis span

**Examples**

```
CALC:MARK:FUNC:DOM:USER 1
calculate2:marker8:function:domain:USER:range 1
```

**Query Syntax**  | CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER[:RANGe]?

Returns the user span number that the specified marker is assigned to.

**Return Type**  | Numeric
**Default**      | 0 - Full Span

**CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STARt <start>**
(Read-Write) Sets the start of the span that the specified marker's x-axis span will be constrained to.

Use `CALC:MARK:FUNC:DOM:USER<range>` to set range number

**Note:** If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

**Note:** This command does the same as `CALC:FUNC:DOM:USER:STAR`

See Critical Note

### Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1
- `<start>` The analyzer's Minimum x-axis value

### Examples

```
```

### Query Syntax

`CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STARt?`

### Return Type

Numeric

**Default** The analyzer's Minimum x-axis value

---

`CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STOP <stop>`

(Read-Write) Sets the stop of the span that the marker's x-axis travel will be constrained to.

Use `CALC:MARK:FUNC:DOM:USER<range>` to set range number

Use `CALC:MARK:FUNC:DOM:USER:STARt` to set the stop value.

**Note:** If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

**Note:** This command does the same as `CALC:FUNC:DOM:USER:STOP`

See Critical Note

### Parameters
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

Any marker number from 1 to 10; if unspecified, value is set to 1.

Stop value of x-axis span; Choose any number between the analyzer's MINimum and MAXimum x-axis value.

Examples

```
`calcule2:marker8:function:domain1:USER:stop 1e12
```

Query Syntax

```
CALCulate<\text{cnum}>:MARKer<\text{mkr}}:FUNCtion:DOMain:USER:STOP?
```

Return Type

Numeric

**Default**

The analyzer's MAXimum x-axis value.

---

CALCulate<\text{cnum}>:MARKer<\text{mkr}>:FUNCtion:EXECute <\text{func}>

(Write-only) Immediately executes (performs) the specified search function.

Learn more about Marker Search

See Critical Note

Parameters

- \(<\text{cnum}>\): Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.
- \(<\text{mkr}>\): Any marker number from 1 to 10; if unspecified, value is set to 1.
- \(<\text{func}>\): The function to be performed. Choose from:
  - MAXimum - finds the highest value
  - MINimum - finds the lowest value
  - RPEak - finds the next valid peak to the right
  - LPEak - finds the next valid peak to the left
  - NPEak - finds the next highest value among the valid peaks
  - TARGet - finds the target value to the right, wraps around to the left
  - LTARget - finds the next target value to the left of the marker
  - RTARget - finds the next target value to the right of the marker
- **COMPression** - finds the compression level on a Power Swept S21 trace.

**Examples**

```
CALC:MARK:FUNC:EXEC MAX
calculate2:marker2:function:execute maximum
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**CALCulate<cnum>:MARKer<mkr>:FUNCTION[:SELect] <char>**

(Read-Write) Sets the search function that the specified marker will perform when executed. Use **CALC:MARK:FUNC:TRAC ON** to automatically execute the search every sweep.

Learn more about Marker Search

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1.
- `<char>` Marker function. Choose from:
  - **MAXimum** - finds the highest value
  - **MINimum** - finds the lowest value
  - **RPEak** - finds the next valid peak to the right
  - **LPEak** - finds the next valid peak to the left
  - **NPEak** - finds the next highest value among the valid peaks
  - **TARGet** - finds the target value to the right, wraps around to the left
  - **LTARget** - finds the next target value to the left of the marker
  - **RTARget** - finds the next target value to the right of the marker
  - **COMPression** - finds the compression level on a power-swept S21 trace.

**Examples**

```
CALC:MARK:FUNC MAX
calculate2:marker8:function:select ltarget
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:FUNCTION[:SELect]?

**Return Type**

Character
CALCulate<cnum>:MARKer<mkr>:TARGet[:VALue] <num>

(Read-Write) Sets the target value for the specified marker when doing Target Searches with CALC:MARK:FUNC:SEL <TARGet | RTARget | LTARget>

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1.
- `<num>` Target value to search for; Units are NOT allowed.

Examples

```
CALC:MARK:TARG 2.5
calculate2:marker8:target:value -10.3
```

Query Syntax

CALCulate<cnum>:MARKer<mkr>:TARGet[:VALue]?

Return Type

Numeric

Default

0

CALCulate<cnum>:MARKer<mkr>:FUNCtion:TRACKing <ON | OFF>

(Read-Write) Sets the tracking capability for the specified marker. The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as doing a CALC:MARK:FUNC:EXECute command every sweep.

Learn more about Marker Search

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1.
- `<ON | OFF>` ON (or 1) - The specified marker will "Track" (find) the selected function every sweep.
  
  OFF (or 0) - The specified marker will find the selected function only when
the CALC:MARK:FUNC:EXECute command is sent.

**Examples**
```
CALC:MARK:FUNC:TRAC ON
calculate2:marker8:function:tracking off
```

**Query Syntax**
```
CALCulate<cnum>:MARKer<mkr>:FUNCtion:TRACking?
```

**Return Type**
Boolean (1 = ON, 0 = OFF)

**Default**
OFF

---

**CALCulate<cnum>:MARKer:REFerence[:STATE] <ON | OFF>**

(Read-Write) Turns the reference marker (marker 10) ON or OFF. When turned OFF, existing Delta markers revert to absolute markers.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`:  
  - **ON** (or 1) - turns reference marker ON
  - **OFF** (or 0) - turns reference marker ON

**Examples**
```
CALC:MARK:REF ON
calculate2:marker:reference:state OFF
```

**Query Syntax**
```
CALCulate<cnum>:MARKer:REFerence[:STATE]?
```

**Return Type**
Boolean (1 = ON, 0 = OFF)

**Default**
OFF

---

**CALCulate<cnum>:MARKer:REFerence:X <num>**
(Read-Write) Sets and returns the absolute x-axis value of the reference marker (marker 10).

See Critical Note

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>X-axis value. Choose any number within the operating domain of the reference marker.</td>
</tr>
</tbody>
</table>

Examples

```
CALC:MARK:REF:X 1e9
```

```
calculate2:marker:reference:x 1e6
```

Query Syntax

CALCulate<cnum>:MARKer:REFerence:X?

Return Type

Numeric

Default

If the first Marker, turns ON in the middle of the X-axis span. If not, turns ON at the position of the active marker.

---

CALCulate<cnum>:MARKer:REFerence:Y?

(Read-only) Returns the absolute Y-axis value of the reference marker.

See Critical Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>

Examples

```
CALC:MARK:REF:Y?
```

```
calculate2:marker:reference:y?
```

Return Type

Character

Default

Not applicable

---

CALCulate<cnum>:MARKer<mkr>:SET <char>
(Write-only) Sets the selected instrument setting to assume the value of the specified marker.

Marker Functions CENT, SPAN, STARt, and STOP do not work with channels that are in CW or Segment Sweep mode.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1
- `<char>` Choose from:
  - CENTer - changes center frequency to the value of the marker
  - SPAN - changes the sweep span to the span that is defined by the delta marker and the marker that it references. Unavailable if there is no delta marker.
  - START - changes the start frequency to the value of the marker
  - STOP - changes the stop frequency to the value of the marker
  - RLEVel - changes the reference level to the value of the marker
  - DELay - changes the line length at the receiver input to the phase slope at the active marker stimulus position.
  - CWFReq - Sets the CW frequency to the frequency of the active marker. Does NOT change sweep type. NOT available in CW or Power Sweep. Use this argument to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep:Type to POWer or CW.

Examples:

```plaintext
CALC:MARK:SET CENT
calculate2:marker8:set span
```

Query Syntax

Not Applicable

Default

Not Applicable

```
CALCulate<cnum>:MARKe<clk>:[:STATE] <ON|OFF>
```
(Read-Write) Turns the specified marker ON or OFF. **Marker 10 is the Reference Marker.** To turn all markers off, use CALC:MARK:AOFF.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1.
- `<ON|OFF>` **ON** (or 1) - turns marker ON.  
  **OFF** (or 0) - turns marker OFF.

**Examples**

```
CALC:MARK ON
calculate2:marker8 on
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

Off

---

**CALCulate<cnum>:MARKer<mkr>:TYPE <char>**

(Read-Write) Sets the type of the specified marker.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1
- `<char>` Choose from:
  - **NORMal** - a marker that stays on the assigned X-axis position unless moved or searching.
  - **FIXed** - a marker that will not leave the assigned X or current Y-axis position.

**Examples**

```
CALC:MARK:TYPE NORM
calculate2:marker2:type fixed
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:TYPE?

**Return Type**

Character

**Default**

NORMal
**CALCulate<cnum>:MARKer<mkr>:X <num>**

*(Read-Write)* Sets the marker's X-axis value (frequency, power, or time). If the marker is set as delta, the SET and QUERY data is relative to the reference marker.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 10; if unspecified, value is set to 1.
- `<num>` Any X-axis position within the measurement span of the marker.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
calc:mark:X 100Mhz
calculate2:marker8:x maximum
```

**Query Syntax**

`CALCulate<cnum>:MARKer<mkr>:X?`

**Return Type** Numeric

**Default** First Marker turns ON in the middle of the X-axis span. Subsequent markers turn ON at the position of the active marker.

**CALCulate<cnum>:MARKer<mkr>:Y?**

*(Read-only)* Reads the marker's Y-axis value. The format of the value depends on the current CALC:MARKER:FORMAT setting. If the marker is set as delta, the data is relative to the reference marker. The query always returns two numbers:

- Smith and Polar formats - (Real, Imaginary)
- LINPhase and LOGPhase - (Real, Imaginary)
- All other formats - (Value,0)

**Note:** To accurately read the marker Y-axis value with trace smoothing applied, the requested format must match the displayed format. Otherwise, the returned value is un-smoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

**See Critical Note**
Parameters

<cnum>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<mkr>   Any marker number from 1 to 10; if unspecified, value is set to 1.

Examples

CALC:MARK:Y?
calculate2:marker3:y?

Query Syntax

CALCulate<cnum>:MARKer<mkr>:Y?

Return Type

Numeric

Default

Not applicable

**CALCulate<ch>:MIXer:XAXis <char>**

(Read-Write) Sets or returns the swept parameter to display on the X-axis for the selected FCA and GCX measurement.

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Parameter to display on the X-axis. Choose from:
  - **INPUT** - Input frequency span
  - **OUTPUT** - Output frequency span
  - **LO_1** - First LO frequency span
  - **LO_2** - Second LO frequency span

**Examples**

```
CALC:MIX:XAX INPUT
calc2:mixer:xaxis output
```

See an example that creates, selects, and calibrates an SMC and VMC measurement using SCPI.

**Query Syntax**

CALCulate<ch>:MIXer:XAXis?

**Return Type**

Character

**Default**

OUTPUT

---

Last Modified:

9-Sep-2010   Edit for GCX
**Calculate:Normalize Commands**

Specifies the normalization features used for a receiver power calibration.

These commands are **Superseded** (Sept 2004).

See the replacement commands in a new [Receiver Power Cal example](#).

```
CALCulate:NORMalize

[IMMediate]  STATe  INTerpolation

[STATe]
```

Click on a blue keyword to view the command details.

See Also

- [Example Programs](#)
- [Learn about Receiver Cal](#)
- [SCPI Command Tree](#)

Save and recall your receiver power calibration (which use .CST file commands):

- `SENS:CORR:CSET:SAVE`
- `SENS:CORR:CSET[:SEL]`

Or use these two commands and specify either .STA or .CST file extensions:

- `MMEM:LOAD`
- `MMEM:STOR`

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:Select`

```
CALCulate<cnum>:NORMalize[:IMMediate]  Superseded
```
Note: This command is replaced with SENS:CORR COLL:METH RPOWER and SENS:CORR COLL[:ACQ] POWer

See an example of a Receiver Power Calibration.

(Write only) Stores the selected measurement’s data to that measurement’s “divisor” buffer for use by the Normalization data processing algorithm. This command is not compatible with ratioed measurements such as S-parameters. It is intended for receiver power calibration when the selected measurement is of an unratioed power type.

See Critical Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:NORM
calculate1:normalize:immediate
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**CALCulate<cnum>:NORMalize:STATe <ON | OFF> Superseded**

Note: This command is replaced with SENS:CORR[:STATe] ON|OFF

(Read-Write) Specifies whether or not normalization is applied to the measurement. Normalization is enabled only for measurements of unratioed power where it serves as a receiver power calibration.

See Critical Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;ON</td>
<td>OFF&gt;</td>
</tr>
<tr>
<td></td>
<td>OFF (or 0) – normalization is NOT applied to the measurement.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:NORM:STAT ON
calculate2:normalize:state off
```

**Query Syntax**

CALCulate<cnum>:NORMalize:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF
(Read-Write) Turns normalization interpolation ON or OFF. Normalization is enabled only for measurements of unratioed power, where it serves as a receiver power calibration.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>` **ON (or 1)** – turns interpolation ON.
  
  **OFF (or 0)** – turns interpolation OFF.

Examples

- `CALC:NORM:INT ON`
- `calculate2:normalize:interpolate:state off`

Query Syntax

- `CALCulate<cnum>:NORMalize:INTerpolate[:STATe]?`

Return Type

- Boolean (1 = ON, 0 = OFF)
- **Default** ON
Calculate:Offset Commands

Allows the data trace magnitude and phase to be offset.

CALCulate:OFFSet

MAGNitude PHASE

SLOPe

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Learn about Magnitude Offset
- Learn about Phase Offset
- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

CALCulate<cnum>::OFFSet:MAGNitude <num>
(Read-Write) Offsets the data trace magnitude by the specified value.
To offset the data trace magnitude to a slope value that changes with frequency, use
**CALC:OFFS:MAGN:SLOP**

See Critical Note

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>`: Offset value in dB.

**Examples**

```
CALC:OFFS:MAGN:4
calculate1:offset:magnitude -2
```

**Query Syntax**

`CALCulate<cnum>:OFFSet:MAGNitude?`

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:OFFSet:MAGNitude:SLOPe <num>**

(Read-Write) Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.

See Critical Note

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>`: Offset slope value in dB/1GHz.

**Examples**

```
CALC:OFFS:MAGN:SLOP 1 'Offset slope set to 1dB/GHz
calculate1:offset:magnitude:slope -2 'Offset slope set to -2dB/GHz
```

**Query Syntax**

`CALCulate<cnum>:OFFSet:MAGNitude:SLOPe?`

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:OFFSet:PHASe <num>[<char>]**
(Read-Write) Sets the phase offset for the selected measurement.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.

<num> Offset phase value. Choose any number between: -360 and 360

<char> Units for phase. OPTIONAL. Choose either:
        DEG - Degrees (default)
        RAD - Radians

Examples

CALC:OFFS:PHAS 10
calculate:offset:phase 20rad

Query Syntax

CALCulate:OFFSet:PHASe?

Return Type

Numeric, returned value always in degrees

Default

0 degrees
Calculate:Parameter Commands

Lists, creates, selects, and deletes measurements.

```
CALCulate:PARameter:
   CATalog
      | EXTended
   DEFine
      | EXTended
   DELete
      | ALL
   MNUMber
      | [SElect]
   MODify
      | EXTended
   SELect
   TNUMber?
   WNUMber?
```

Click on a blue keyword to view the command details.

Red commands are superseded.

See Also

- Example Programs
- Learn about Measurement Parameters
- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

```
CALCulate<cnum>:PARameter:CATalog? Superseded
```
Note: This command is replaced with **CALC:PAR:CAT:EXTended?** which lists parameters with "_" instead of ",," allowing the list to be parsed easily. This command will continue to work.

*(Read-only)* Returns the names and parameters of existing measurements for the specified channel.

**Note:** For Balanced Measurements: **CALC:PAR:CAT?** may have an unexpected behavior. Learn more.

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurements to be listed. If unspecified, <cnum> is set to 1.

**Examples**

```
CALC:PAR:CAT?
calculate2:parameter:catalog?
```

**Return Type** String - "<measurement name>,<parameter>,[<measurement name>,<parameter>...]"

**Default** "CH1_S11_1,S11"

---

**CALCulate<cnum>:PARameter:CATalog:EXTended?**

*(Read-only)* Returns the names and parameters of existing measurements for the specified channel. This command lists receiver parameters with "_" such that R1,1 is reported as R1_1. This makes the returned string a true "comma-delimited" list all the time.

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurements to be listed. If unspecified, <cnum> is set to 1.

**Examples**

```
CALC:PAR:CAT:EXT?
calculate2:parameter:catalog:extended?
```

**Return Type** String - "<measurement name>,<parameter>,[<measurement name>,<parameter>...]"

**Default** "CH1_S11_1,S11"

---

**CALCulate<cnum>:PARameter[:DEFine] <Mname>,<param>[,.port]** Superseded

**Note:** This command is replaced with **CALC:PAR:DEFine:EXTended**. This command will continue to work for up to 4 port parameters.
(Write-only) Creates a measurement but does NOT display it.

There is no limit to the number of measurements that can be created. However, there is a limit to the number of measurements that can be displayed. See Traces, Channels, and Windows on the PNA.

- Use `DISP:WIND:STATe` to create a window if it doesn't already exist.
- Use `DISP:WIND<wnum>:TRAC<tnum>:FEED <Mname>` to display the measurement.

For FCA Measurements see `CALC:CUST:DEF`

You must select the measurement (CALC<cnump>:PAR:SEL <mname>) before making additional settings.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the new measurement. If unspecified, value is set to 1.
- `<Mname>` Name of the measurement. Any non-empty, unique string, enclosed in quotes.
- `<param>` For S-parameters:
  
  Any S-parameter available in the PNA

  For ratioed measurements:
  
  Any two receivers that are available in the PNA. (See the block diagram showing the receivers in YOUR PNA.)

  For example: AR1 (this means A/R1)

  For non-ratioed measurements:
  
  Any receiver that is available in the PNA. (See the block diagram showing the receivers in YOUR PNA.)

  For example: A

  For Balanced Measurements:
  
  First create an S-parameter measurement, then change the measurement using `CALC:FSIM:BAL` commands. See an example.

  For Applications see `CALC:CUST:DEF`.

  [port] Optional argument;
For multi-port reflection S-parameter measurements: specifies the PNA port which will provide the load for the calibration. This argument is ignored if a transmission S-parameter is specified.

For all non S-parameter measurements: specifies the source port for the measurement.

**Examples**

```
CALC4:PAR 'ch4_S33',S33,2 'Defines an S33 measurement with a load on port2 of the analyzer.'
```

```
calculate2:parameter:define 'ch1_a', a, 1 'unratioed meas'
calculate2:parameter:define 'ch1_a', ar1,1 'ratioed meas'
```

**Query Syntax**

Not Applicable; see Calc:Par:Cat?

**Default**

Not Applicable

---

**CALCulate<cnum>:PARameter[:DEFine]:EXTended <Mname>,<param>**

**Note:** This command replaces CALC:PAR:DEF as it allows the creating of measurements using external multiport testsets.

*(Write-only)* Creates a measurement but does NOT display it.

There is no limit to the number of measurements that can be created. However, there is a limit to the number of measurements that can be displayed. See Traces, Channels, and Windows on the PNA.

- Use DISP:WIND:STATe to create a window if it doesn't already exist.
- Use DISP:WIND<wnum>:TRAC<tnum>:FEED <Mname> to display the measurement.

You must select the measurement (CALC<cnum>:PAR:SEL <mname>) before making additional settings.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the new measurement. If unspecified, value is set to 1.
- `<Mname>` *(String)* Name of the measurement. Any non-empty, unique string, enclosed in quotes.
- `<param>` *(String)* Measurement Parameter to create. Case sensitive.

**For S-parameters:**

Any S-parameter available in the PNA
Single-digit port numbers CAN be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For **ratioed measurements:**

Any two PNA physical receivers separated by forward slash '/' followed by comma and source port.

For example: "A/R1, 3"

[Learn more about ratioed measurements](#)

See a [block diagram](#) showing the receivers in YOUR PNA.

For **non-ratioed measurements:**

Any PNA physical receiver followed by comma and source port.

For example: "A, 4"

[Learn more about unratioed measurements](#)

See the [block diagram](#) showing the receivers in YOUR PNA.

With PNA Rev 6.2, **Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the PNA. You do not need to know which physical receiver is used for each test port. [Learn more](#).

For **ADC measurements:**

Any ADC receiver in the PNA followed by a comma, then the source port.

For example: "AI1,2" indicates the Analog Input1 with source port of 2.

[Learn more about ADC receiver measurements](#)

For **Balanced Measurements:**

First create an S-parameter measurement, then change the measurement using `CALC:FSIM:BAL "define" commands. [See an example](#).
receiver notation for unratioed meas of test port 9 receiver with
source port 1.

calculate2:parameter:define:extended 'ch1_a', 'b9/a10,1' 'logical
receiver notation for ratioed meas of test port 9 receiver divided
by the reference receiver for port 10 using source port 1

**Query Syntax**  
Not Applicable; see Calc:Par:Cat?

**Default**  
Not Applicable

---

**CALCulate<cnum>:PARameter:DELete[:NAME] <Mname>**

(Write-only) Deletes the specified measurement.

**See Critical Note**

**Parameters**

- `<cnum>`  
  Channel number of the measurement. There must be a selected measurement
  on that channel. If unspecified, `<cnum>` is set to 1.

- `<Mname>`  
  String - Name of the measurement

**Examples**

CALC:PAR:DEL 'TEST'
calculate2:parameter:delete 'test'

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

---

**CALCulate:PARameter:DELete:ALL**

(Write-only) Deletes all measurements on the PNA.

**See Critical Note**

**Parameters**

**Examples**

CALC:PAR:DEL:ALL

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

---

**CALCulate<cnum>:PARameter:MNUMber[:SELetc] <n>**
(Read-Write) Sets and returns the selected measurement for the channel. Most CALC: commands require that this, or CALC:PAR:SEL, be sent before a setting change is made to that measurement. Each channel can have one selected measurement.

These are the same numbers you see in the “Tr1”, “Tr2” annotation next to the parameter name on the PNA screen.

**Parameters**
- `<cnum>` Channel number of the measurement to be selected. If unspecified, `<cnum>` is set to 1.
- `<n>` Numeric - Measurement number.

**Examples**
- `CALC:PAR:MNUM 2`
- `calculate2:parameter:mnumber:select 3`

**Query Syntax**
`CALCulate:PARameter:MNUMber[:SELect]?

**Return Type**
String

**Default** Not Applicable

---

**CALCulate<cnum>**:PARameter:MODify <param>  Superseded

**Note:** This command is replaced with `CALC:PAR:MOD:EXT`. This command will continue to work for up to 4 port parameters.

(Write-only) Modifies a standard measurement using the same arguments as `CALC:PAR:DEF`. To modify an FCA measurement, use `CALC:CUST:MOD`.

**See Critical Note**

**Parameters**
- `<cnum>` Channel number of the measurement. The selected measurement on that channel will be changed. If unspecified, `<cnum>` is set to 1.
- `<param>` Measurement parameter to change to. Use the same `<param>` arguments as `CALC:PAR:DEF`.

**Examples**
- `SYST:PRESET`
- `CALC:PAR:DEF "MyMeas", S11`
- `CALC:PAR:SEL "MyMeas"`
- `CALC:PAR:MOD AR1 'changes the selected S11 measurement to an A/R1 measurement`
CALCulate<cnum>:PARameter:MODify:EXTended <param>

**Note:** This command replaces CALC:PAR:MOD as it allows modification of measurements using external multiport testsets.

(Write-only) Modifies a standard measurement using the same arguments as CALC:PAR:DEF:EXT. To modify an FCA measurement, use CALC: Cust:MOD.

**See Critical Note**

**Parameters**
- `<cnum>` Channel number of the measurement. The selected measurement on that channel will be changed. If unspecified, `<cnum>` is set to 1.
- `<param>` (String) New measurement parameter. Use the same `<param>` arguments as CALC:PAR:DEF:EXT.

**Examples**

```
SYST:PRESET
```

```
CALC:PAR:DEF:EXT "MyMeas", "S10_1"
```

```
CALC:PAR:SEL "MyMeas"
```

```
CALC:PAR:MOD:EXT "a4b4,1" 'changes the selected S10_1 measurement to an a4/b4 measurement with source port 1
```

**Query Syntax** Not Applicable

**Default** Not Applicable

CALCulate<cnum>:PARameter:SELect <Mname>
(Read-Write) Sets the selected measurement. Most CALC: commands require that this command be sent before a setting change is made. One measurement on each channel can be selected at the same time. To obtain a list of currently named measurements, use CALC:PAR:CAT?

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement to be selected. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;Mname&gt;</td>
<td>String - Name of the measurement. (Do NOT include the parameter name.)</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
CALC:PAR:SEL 'TEST'
calculate2:parameter:select 'test'
```

**Query Syntax**

CALCulate:PARameter:SELect?

**Return Type**

String

**Default**

Not Applicable

---

**CALCulate<cnum>:PARameter:TNUMber?**

(Read-only) Returns the trace number of the selected trace. Select a trace using Calc:Par:Select.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the trace. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
CALC:PAR:TNUM?
calculate2:parameter:tnumber?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**CALCulate<cnum>:PARameter:WNUMber?**

(Read-only) Returns the window number of the selected trace. Select a trace using Calc:Par:Select.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the selected trace. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
CALC:PAR:WNUM?
calculate2:parameter:wnumber?
```

**Return Type**

Numeric

**Default**

Not Applicable
Last modified:

26-May-2011   Added TNUM and WNUM
10-Feb-2011    Removed defaults from MNUM and CPS
31-Oct-2008    Added Mnum select (8.33)
19-Apr-2007    Added ADC meas
    9/12/06    New Extended commands.
**Calculate:RData? Command**

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

**CALCulate<cnum>:RDATA? <char>**

(Read-only) Returns receiver data for the selected measurement. To query measurement data, see CALC:DATA?

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from any physical receiver in the PNA.

For example: "A"

Also, **REF** returns data for either R1 or R2 data depending on the source port of the selected measurement.

See the [block diagram](#) showing the receivers in YOUR PNA.

**Note:** Logical receiver notation is NOT allowed with this command. [Learn more](#).

**Example**

```
GPIB.Write "INITiate:CONTinuous OFF"
GPIB.Write "INITiate:IMMediate:*wai"
GPIB.Write "CALCulate:RDATA? A"
```

GPIB.Write "CALCulate:RDATA? REF"

**Return Type**  Depends on FORM:DATA - Two numbers per data point

**Default**  Not Applicable

**Notes:**

Generally when you query the analyzer for data, you expect that the number of data values returned will be consistent with the number of points in the sweep.

However, if you query receiver data while the instrument is sweeping, the returned values may contain zeros. For example, if your request for receiver data is handled on the 45th point of a 201 point sweep, the first 45 values will be valid data, and the remainder will contain complex zero.

This can be avoided by synchronizing this request with the end of a sweep or putting the channel in hold mode.
Learn about Unratioed Measurements
Calculate:Smoothing Commands

Controls point-to-point smoothing. Smoothing is a noise reduction technique that averages adjacent data points in a measurement trace. Choose the amount of smoothing by specifying either the number of points or the aperture. Smoothing is not the same as CALC:AVERage which averages each data point over a number of sweeps.

CALCulate:SMOothing

APERture  POINTs  [STATe]

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Learn about Smoothing
- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

CALCulate<cnum>:SMOothing:APERture <num>

(Read-Write) Sets the amount of smoothing as a percentage of the number of data points in the channel.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num> Percentage value. Choose any number between:
  1 and 25

Examples

CALC:Smo:APER 2
calculate2:smoothing:aperture 20.7

Query Syntax

CALCulate<cnum>:SMOothing:APERture?

Return Type

Numeric
CALCulate<cnum>:SMOothing:POINts <num>

(Read-Write) Sets the number of adjacent data points to average.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Number of points from 1 point to maximum of 25% of data points in the channel. For example: if number of points in a data trace = 401, the maximum value for points = 100. The points value is always rounded to the closest odd number.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:SMO:POIN 50</td>
</tr>
<tr>
<td>calculate2:smoothing:points 21</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:SMOothing:POINts?

Return Type

Numeric

Default

3

CALCulate<cnum>:SMOothing[:STATe] <ON | OFF>

(Read-Write) Turns data smoothing ON or OFF.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`
  - **ON** (or 1) - turns smoothing ON.
  - **OFF** (or 0) - turns smoothing OFF.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:SMO ON</td>
</tr>
<tr>
<td>calculate2:smoothing:state off</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:SMOothing[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF
Calculate:Transform Commands

Specifies the settings for time domain transform.

CALCulate:TRANSform

COUPLE

TIME

CENTER KBESsel MARKer SPAN STATE STOP

[TYPE]

PARameters IMpulse MODE UNIT START STEP STIMulus

WDTh LPFRequency RTIme

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Learn about Time Domain
- Synchronizing the PNA and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

CALCulate<cnum>:TRANSform:COUPle:PARameters <num>

(Read-Write) Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To turn coupling ON and OFF, use SENS:COUP:PAR
- To specify Gating parameters to couple, use CALC:FILT:COUP:PAR

Learn more about Time Domain Trace Coupling

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num> (Numeric) Parameters to couple. To specify more than one parameter, add the
numbers.

1 - Transform Stimulus (Start, Stop, Center, and Span TIME settings.)

2 - Transform State (ON / OFF)

4 - Transform Window (Kaiser Beta / Impulse Width)

8 - Transform Mode (Low Pass Impulse, Low Pass Step, Band Pass)

16 - Transform Distance Marker Units

Examples

'To couple all parameters:

CALC:TRAN:COUP:PAR 31

'To couple Stimulus and Mode:

calculate2:transform:couple:parameters 9

Query Syntax

CALCulate<cnum>:TRANsform:COUPle:PARameters?

Return Type

Numeric

Default

29 (All parameters except 2 - Transform State)

CALCulate<cnum>:TRANsform:TIME:CENTer <num>

(Read-Write) Sets the center time for time domain measurements.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Center time in seconds; any number between:
± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

CALC:TRAN:TIME:CENT 1e-8
calculate2:transform:time:center 15 ps

Query Syntax

CALCulate<cnum>:TRANsform:TIME:CENTer?

Return Type

Numeric

Default

0
CALCulate<cnum>:TRAnSform:TIME:IMPulse:WIDTh <num>

(Read-Write) Sets the impulse width for the transform window.

See Critical Note

Parameters

<table>
  <tr><td><cnum></td><td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.</td></tr>
  <tr><td><num></td><td>Impulse width in seconds; Choose any number between: \( .6 / \text{frequency span} \) and \( 1.39 / \text{frequency span} \)</td></tr>
</table>

Examples

- CALC:TRAN:TIME:IMP:WIDTh 10
- calculate2:transform:time:impulse:width 13

Query Syntax

CALCulate<cnum>:TRAnSform:TIME:IMPulse:WIDTh?

Return Type

Numeric

Default

.98 / Default Span

CALCulate<cnum>:TRAnSform:TIME:KBESsel <num>

(Read-Write) Sets the parametric window for the Kaiser Bessel window.

See Critical Note

Parameters

<table>
  <tr><td><cnum></td><td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.</td></tr>
  <tr><td><num></td><td>Window width for Kaiser Bessel in seconds; Choose any number between: 0.0 and 13.0</td></tr>
</table>

Examples

- CALC:TRAN:TIME:KBES 10
- calculate2:transform:time:kbessel 13

Query Syntax

CALCulate<cnum>:TRAnSform:TIME:KBESsel?

Return Type

Numeric

Default

6

CALCulate<cnum>:TRAnSform:TIME:LPFREQuency
(Write-only) Sets the start frequencies in LowPass Mode.

See Critical Note

Parameters

<n> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <n> is set to 1.

Examples

CALC:TRAN:TIME:LPFR
calculate2:transform:time:lpfrequency

Query Syntax

Not applicable

Default

Not applicable

CALCulate<n>:TRANsform:TIME:MARKer:MODE <char>

(Read-Write) Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratioed measurements.

This setting affects the display of ALL markers for only the ACTIVE measurement.

Learn more about Distance Markers.

See Critical Note

Parameters

<n> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <n> is set to 1.

<char> Choose from:

AUTO If the active measurement is an S-Parameter, automatically chooses reflection or transmission. If non S-Parameter measurements, reflection is chosen.

REFLaction Displays the distance from the source to the receiver divided by two (to compensate for the return trip.)

TRANsmission Displays the distance from the source to the receiver.

Examples

CALC:TRAN:TIME:MARKer:MODE REFL
calculate2:transform:time:marker:mode auto

Query Syntax

CALCulate<n>:TRANsform:TIME:MARKer:MODE?
CALCulate<cnum>:TRANsform:TIME:MARKer:UNIT <char>

(Read-Write) Specifies the unit of measure for the display of marker distance values. This setting affects the display of all markers for only the active measurement (unless Distance Maker Units are coupled using CALC:TRAN:COUP:PAR).

Learn more about Distance Markers.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<char>** Choose from:
  - METRs
  - FEET
  - INCHes

Examples

- CALC:TRAN:TIME:MARK:UNIT INCH
- calculate2:transform:time:marker:unit feet

Query Syntax

CALCulate<cnum>:TRANsform:TIME:MARKer:UNIT?

Return Type: Character

Default: METRs

CALCulate<cnum>:TRANsform:TIME:SPAN <num>
(Read-Write) Sets the span time for time domain measurements.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<num>` Span time in seconds; any number between: 0 and 2*[(number of points-1) / frequency span]

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:TRAN:TIME:SPAN 1e-8</code></td>
<td>calculate2:transform:time:span maximum</td>
</tr>
</tbody>
</table>

**Query Syntax**

`CALCulate<cnum>:TRANsform:TIME:SPAN?`

**Return Type**

Numeric

**Default**

20 ns

---

**CALCulate<cnum>:TRANsform:TIME:STARt <num>**

(Read-Write) Sets the start time for time domain measurements.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<num>` Start time in seconds; any number between: ±(number of points-1) / frequency span

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

`CALCulate<cnum>:TRANsform:TIME:STARt?`

**Return Type**

Numeric

**Default**

-10 ns
CALCulate<cnum>:=TRANsform:TIME:STATe <ON | OFF>

(Read-Write) Turns the time domain transform capability ON or OFF.

See Critical Note

Note: Sweep type must be set to Linear Frequency in order to use Time Domain Transform.

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <ON|OFF> ON (or 1) - turns time domain ON.
  OFF (or 0) - turns time domain OFF.

Examples

- CALC:TRAN:TIME:STAT ON
- calculate2:transform:time:state off

Query Syntax
CALCulate<cnum>:TRANsform:TIME:STATe?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

CALCulate<cnum>:=TRANsform:TIME:STOP <num>

(Read-Write) Sets the stop time for time domain measurements.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num> Stop time in seconds; any number between:
  ± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- CALC:TRAN:TIME:STOP 1e-8
- calculate2:transform:time:stop maximum

Query Syntax
CALCulate<cnum>:=TRANsform:TIME:STOP?

Return Type
Numeric

Default
10 ns
CALCulate<cnum>:TRANsform:TIME:STEP:RTIMe <num>

(Read-Write) Sets the step rise time for the transform window.

See Critical Note

Parameters

(cnun) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Rise time in seconds; Choose any number between: 
0.45 / frequency span and 1.48 / frequency span

Examples
CALC:TRAN:TIME:STEP:RTIM 1e-8
calculate2:transform:time:step:rtime 15 ps

Query Syntax
CALCulate<cnum>:TRANsform:TIME:STEP:RTIMe?

Return Type
Numeric

Default
.99 / Default Span

CALCulate<cnum>:TRANsform:TIME:STIMulus <char>

(Read-Write) Sets the type of simulated stimulus that will be incident on the DUT.

See Critical Note

Parameters

(cnun) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<char> Choose from:
STEP - simulates a step DUT stimulus
IMPulse - simulates a pulse DUT stimulus

STEP can ONLY be used when CALC:TRAN:TIME:TYPE is set to LPAs (Lowpass). (STEP cannot be used with TYPE = BPAs.)

:STIM STEP will set :TYPE to LPAs

:TYPE BPAs will set :STIM to IMPulse

Examples
CALC:TRAN:TIME:STIM STEP
calculate2:transform:time:stimulus impulse

Query Syntax
CALCulate<cnum>:TRANsform:TIME:STIMulus?

Return Type
Character
CALCulate<cnum>:TRANsform:TIME[:TYPE] <char>

(Read-Write) Sets the type of time domain measurement.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<char> Type of measurement. Choose from:
- **LPASs** - Lowpass; Must also send CALC:TRAN:TIME:LPFRequency before calibrating.
- **BPASs** - Bandpass;

BPASs can only be used when CALC:TRAN:TIME:STIM is set to IMPulse. (BPASs cannot be used with :STIM = STEP)

:STIM STEP will set :TYPE to LPASs

:TYPE BPASs will set :STIM to IMPulse

Examples

| CALC:TRAN:TIME LPAS |
| calculate2:transform:time:type bpas |

Query Syntax

CALCulate<cnum>:TRANsform:TIME[:TYPE]?

Return Type

Character

**Default** BPAS
**X Values Command**

**CALCulate\(<cnum>:X[:VALues]\)?**

*(Read-only)* Returns the stimulus values for the selected measurement in the current units. You can select one measurement for each channel using `Calc:Par:Select`. This command can be used for all Measurement Classes.

**Parameters**

\(<cnum>\)  
Any existing channel number; if unspecified, value is set to 1.

**Examples**

1. `Calc:Par:Sel "MyGCATrace"`
2. `CALC:X?`

**Return Type**  
Depends on `FORM:DATA` command

**Default**  
Not applicable

- Auxilliary IO connector
- External Test Set IO connector
- Material Handler IO connector

**CONTrol:CALPod:COMMand <string>**

*(Write-only)* Sends commands that control a Calpod module.

See all Calpod commands.

Learn more about Calpod.

**Parameters**

<string> Calpod command. See ALL Calpod commands that can be used in this string.

**Examples**

```
'CONT:CALP:COMM 'CALP:INIT:ACT'

Enclose all strings in SINGLE quotes (NOT double quotes)
```

**Query Syntax**

CONTrol:CALPod:COMMand? <string>

Relevant only for query strings.

**Return Type** String

**Default** Not Applicable

**CONTrol:CHANnel:INTerface:CONTrol:CONFig:RECall[:STATE] <string>**
(Write-only) Recalls an Interface Control configuration file. Learn more about Interface Control.

**Parameters**

<string> File name and extension (.xml) of the configuration file to recall. Files are typically stored in the default folder "C:/Program Files/Agilent/Network Analyzer/Documents". To recall from a different folder, specify the full path name.

**Examples**

CONT:CHAN:INT:CONT:CONF:REC 'MyConfigFile.xml'

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**CONTrol:CHANnel:INTERface:CONtroL[:STATe] <bool>**

(Read-Write) Enables and disables ALL Interface Control settings. To send data, the individual interfaces must also be enabled. Learn more about Interface Control.

**Parameters**

<bool> Boolean

OFF (0) - Interface Control is disabled; NO control data is sent.

ON (1) - Interface Control is enabled.

**Examples**

CONT:CHAN:INT:CONT 1

control:channel:interface:control:state 0

**Query Syntax** CONTrol:CHANnel:INTERface:CONtroL[:STATe]?

**Return Type** Boolean

**Default** OFF (0)

---

**CONTrol:ECAL:MODule<num>:PATH:COUNt? <name>**

(Read-only) Returns the number of unique states that exist for the specified path name on the selected ECal module.

This command performs exactly the same function as SENS:CORR:CKIT:ECAL:PATH:COUNt?

Use the CONT:ECAL:MOD:PATH:STAT command to set the module into one of those states.
Use `SENS:CORR:CKIT:ECAL:PATH:DATA?` to read the data for a state.

**Parameters**

[num] Optional argument. USB number of the ECal module. If unspecified (only one ECal module is connected to the USB), `<num>` is set to 1. If two or more modules are connected, use `SENS:CORR:CKIT:ECAL:LIST?` to determine how many, and `SENS:CORR:CKIT:ECAL:INF?` to verify their identities.

<name> Name of the path for which to read number of states. Choose from:

**Reflection paths**

- A
- B
- C (4-port modules)
- D (4-port modules)

**Transmission paths**

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

Note: For each transmission path, the first of the available states is the through state, the second is the confidence (attenuator) state.

**Examples**

```
CONT:ECAL:MOD:PATH:COUNt? A
control:ecal:module2:path:count? cd
```

See example program

**Return Type** Integer

**Default** Not Applicable

```
CONTro1:ECAL:MODule<num>:PATH:STATe <path>, <stateNum>
```
(Write-only) Sets the internal state of the selected ECAL module. This command supersedes CONT:ECAL:MOD:STAT.

- Use CONT:ECAL:MOD:PATH:COUN? to read the number of unique states that exist for the specified path name on the module.
- Use SENS:CORR:CKIT:ECAL:PATH:DATA? to read the data for a state (from the module memory) corresponding to the stimulus values of a channel.

**Parameters**

[num]  Optional argument. USB number of the ECAL module. If unspecified (only one ECAL module is connected to the USB), <num> is set to 1. If two or more modules are connected, use SENS:CORR:CKIT:ECAL:LIST? to determine how many, and SENS:CORR:CKIT:ECAL:INF? to verify their identities.

<path>  Path name for which to set a state.

**Note:** The impedance paths are not independent. For example, changing the impedance presented on path A will cause a change to the impedance on path B.

Choose from:

**Reflection paths**

- A
- B
- C (4-port modules)
- D (4-port modules)

**Transmission paths**

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

<stateNum>  Number of the state to set. Refer to the following table to associate the
<stateNum> with a state in your ECal module.

In addition, CONT:ECAL:MOD:PATH:COUNt? returns the number of states in the specified ECal module.

<table>
<thead>
<tr>

** The following modules have only FOUR Impedance states (1, 2, 3, 4): N4690B, N4691B, N4692A, N4696B.

Examples

```
control:ecal:module2:state BC,1
```

See example program

Query Syntax Not Applicable

Default Not Applicable

CONTrol:ECAL:MODule<num>:STATe <value> Superseded
This command is replaced with `CONT:ECAL:MOD:PATH:STATe`.

*(Write-only)* Sets the internal state of the selected ECAL module.

**Parameters**

[**num**] Optional argument. USB number of the ECal module. If unspecified (only one ECal module is connected to the USB), `<num>` is set to 1. If two or more modules are connected, use `SENS:CORR:COLL:CKIT:INF?` to verify their identity.

<**value**> Integer code for switching the module. The following are codes for Agilent ECal modules.

CONT:ECAL:MOD:STAT 36
control:ecal:module2:state 38

**Query Syntax**

<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
</table>

**CONTrol:NOISe:SOURce[:STATe] <bool>**
(Read-Write) Set and read the noise source (28V) ON and OFF.

**Parameters**

<bool> Boolean  

**OFF (0)** - Noise Source OFF  

**ON (1)** - Noise Source ON

**Examples**

CONT:NOIS:SOUR 1  

control:noise:source:state 0

**Query Syntax**

CONTrol:NOISe:SOURce[:STATe]?

**Return Type**

Boolean

**Default**

For PNA models with a Noise Figure option (028/029/H29), the 28V line is ON at application start and after a preset. The ON/OFF state is also available from a PNA softkey menu.

For PNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF at application start and its state is not affected by a preset. The ON/OFF state is NOT available from a PNA softkey menu.

---

**CONTrol:SIGNal <conn>,<char>**

(Read-Write) Configures external triggering in the PNA.

- To control BNC1 and BNC2 with this command, then you **MUST** have TRIG:PREF:AIGLoabl = **ON**. [Learn more](#)
- **Trigger:Sequence:Source** is automatically set to External when CONTrol:SIGNal is sent.
- Edge triggering is only available on some Microwave PNA models.
- For more information, see External Triggering in the PNA.

**Parameters**

<conn> Rear Panel connector to send or receive trigger signals. Choose from:

**BNC1** Trigger IN from rear-panel Trigger IN BNC connector

**AUXT** Trigger IN from AUX IO connector Pin 19

**Note:** Only one of the input connectors is active at a time. When a command is sent to one, the PNA automatically makes the other INACTIVE.
BNC2  Trigger OUT to rear-panel Trigger OUT BNC connector.

MATHtrigger - Trigger IN from rear-panel Material Handler connector Pin 18

RDY - Ready for trigger OUT. (Not available on E836x models)

- PNA-X:  Meas Trig RDY
- PNA-L: AUX I/O p18, Handler I/O p21 (Some models)

**INACTIVE** - Disables the specified connector <conn>.

Choose from ONLY the following when <conn> is set to BNC1 or AUX1 or MATHtrigger:

- **TIENEGATIVE** - (Trigger In Edge Negative) - Triggers the PNA when receiving a negative going signal
- **TIEPOSITIVE** - (Trigger In Edge Positive) - Triggers the PNA when receiving a positive going signal
- **TILLOW** - (Trigger In Level Low) - Triggers the PNA when receiving a low level signal
- **TILHIGH** - (Trigger In Level High) - Triggers the PNA when receiving a High-level signal

Choose from ONLY the following when <conn> is set to BNC2:

Use **CONTrl:SIGNal:TRIGger:OUTP** to enable the BNC2 output.

The following selections send a positive or negative pulse before or after each trigger acquisition. This normally occurs each sweep unless a channel is in point trigger mode.

- **TOPPAFTER** - (Trigger Out Pulse Positive After) - Sends a POSITIVE going TTL pulse at the END of each trigger acquisition.
- **TOPPBEFORE** - (Trigger Out Pulse Positive Before) - Sends a POSITIVE going TTL pulse at the START of each trigger acquisition.
- **TOPNAFTER** - (Trigger Out Pulse Negative After) - Sends a NEGATIVE going TTL pulse at the END of each trigger acquisition.
- **TOPNBEFORE** - (Trigger Out Pulse Negative Before) - Sends a NEGATIVE going TTL pulse at the START of each trigger acquisition.

Choose from ONLY the following when <conn> is set to RDY:
• **LOW** Outputs a TTL low when the PNA is ready for trigger. (Default setting)

• **HIGH** Outputs a TTL high when the PNA is ready for trigger.

### Examples

```plaintext
CONT:SIGN BNC1, TIENEGATIVE
control:signal bnc2, toppbefore
CONT:SIGN RDY, LOW
```

### Query Syntax

`CONTrol:SIGNal? <conn>`

In addition to the arguments listed above, the following is also a possible returned value:

**NAVAILABLE** - This feature is not available on this PNA

### Return Type

Character

**Default** At Preset:

- BNC1 = INACTIVE
- BNC2 = INACTIVE
- AUXT = TILHIGH

When **Output is enabled**:

- BNC1 = INACTIVE
- BNC2 = TOPPAFTER
- AUXT = TILHIGH

---

**CONTrol:SIGNal:TRIGger:ATBA <bool>**

*(Read-Write)* **Accept Trigger Before Armed** Determines what happens to an EDGE trigger signal if it occurs before the PNA is ready to be triggered. (LEVEL trigger signals are always ignored.) For more information, see [External triggering](#).

#### Parameters

- `<bool>` Boolean

  **OFF (0)** - A trigger signal is ignored if it occurs before the PNA is ready to be triggered.

  **ON (1)** - A trigger signal is remembered and then used when the PNA becomes armed (ready to be triggered). The PNA remembers only one trigger signal.

### Examples

```plaintext
CONT:SIGN:TRIG:ATBA 0
control:signal:trigger:atba ON
```
**Query Syntax**  
CONTrol:SIGNal:TRIGger:ATBA?

**Return Type**  
Boolean

**Default**  
OFF

---

**CONTroll:SIGNal:TRIGger:OUTP <bool>**

(Read-Write) **Output Enabled**  
The PNA can be enabled to send trigger signals out the rear-panel TRIGGER OUT BNC connector. Use CONTrol:SIGNal to configure for output triggers.

For more information, see [External triggering](#).

**Parameters**

<bool>  
Boolean

OFF (0) - PNA does NOT output trigger signals.

ON (1) - PNA DOES output trigger signals.

**Examples**

CONT:SIGN:TRIG:OUTP 1

control:signal:trigger:outp OFF

---

**Query Syntax**  
CONTrol:SIGNal:TRIGger:OUTP?

**Return Type**  
Boolean

**Default**  
OFF

---

**Last Modified:**

- 7-Jan-2011  
  Added Calpod

- 3-Nov-2010  
  Noise source on/off for all models

- 24-Feb-2009  
  Replaced True/False

- 14-Mar-2008  
  Added RDY argument to CONT:SIGN

- 25-Feb-2008  
  Clarified CONT:SIGN

- 30-Jan-2008  
  Added ECal states note

- 22-Aug-2007  
  Added noise command (8.0)

- 18-Jan-2007  
  Fixed count? example
CSET:Fixture Commands

Manages several aspects of Cal Sets.

CSET:

| EXISts? |
| FIXTure: |
| DEEMbed |
| EMBed |

Click on a blue keyword to view the command details.

Note: There is no user-interface equivalent for these commands.

See Also

- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree

CSET:EXISts? <string>

(Read-only) Returns whether or not the specified Cal Set exists on the PNA.

**Parameters**

| <string> | Name or GUID of the Cal Set enclosed in quotes. |

**Examples**

```plaintext
dim check

check = CSET:EXISts? "MyCalSet"

check = CSET:EXISts? "7C4EEA5E-40D2-4D70-A048-33BFFE704163"
```

**Return Type** Boolean

- **ON** or **1** - Cal Set exists.
- **OFF** or **0** - Cal Set does NOT exist.

**Default** Not Applicable
CSET:FIXTure:DEEMbed <cs1>,<cs2>,<s2p>,<port>, <compPwr>[,extrap]

(Write-only) De-embeds a fixture from an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the fixture removed.

When the new Cal Set is applied to a channel, the effects of fixturing are removed from the measurement data. Do NOT enable fixturing. The effects of the fixture are removed when the new Cal Set is selected and correction is turned ON.

**Parameters**

- `<cs1>` (String) Name of an existing Cal Set which resides on the PNA.
- `<cs2>` (String) Name of new Cal Set which contains updated error terms with fixture de-embedded.
- `<s2p>` (String) Name of the S2P file which characterizes the adapter(fixture).
- `<port>` (Numeric) Port number from which fixture will be de-embedded.
- `<compPwr>` (Boolean) 
  - **ON (1)** - When the Cal Set contains a power correction array for the fixture port, that array will be compensated for the fixture loss.
  - **OFF (0)** - Do not compensate for loss in source power through the fixture.
- `[extrap]` (Boolean) Optional argument.
  - **ON (1)** - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.
  - **OFF (0)** - Extrapolation is NOT performed (default setting).

**Examples**

```plaintext
CSET:FIXT:DEEM "MyCalSet","MyNewCalSet","Fixture.s2p",1,1
```

```plaintext
iset:fixture:deembed
"MyCalSet","MyNewCalSet","Fixture.s2p",1,1,1 'extrapolation is performed if the s2p frequency range is narrower than that of the Cal Set.
```

**Query Syntax**  Not Applicable

**Default**  Not Applicable
CSET:FIXTure:EMBed <cs1>,<cs2>,<s2p>,<port>, <compPwr>[,extrap]

(Write-only) Embeds a fixture (usually a matching network) into an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the matching network included in the correction data.

When the new Cal Set is applied to a channel, the effects of the fixture are included in the measurement data. Do NOT enable fixturing. The effects of the matching network are included when the new Cal Set is selected and correction is turned ON.

Parameters

<cs1> (String) Name of an existing Cal Set which resides on the PNA.
<cs2> (String) Name of new Cal Set which contains updated error terms with fixture embedded.
<s2p> (String) Name of the S2P file which characterizes the fixture / matching network.
<port> (Numeric) Port number to which fixture will be added.
<compPwr> (Boolean)

ON (1) - Increase the source power to compensate for the loss through the fixture. The result is that the specified power level will be correct at the DUT input.

Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.

OFF (0) - Do not compensate for loss in source power through the matching network.

[extrap] (Boolean) Optional argument.

ON (1) - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.

OFF (0) - Extrapolation is NOT performed (default setting).

Examples

CSET:FIXT:DEEM "MyCalSet","MyNewCalSet","Fixture.s2p",1,1

cset:fixture:deembed
"MyCalSet","MyNewCalSet","Fixture.s2p",1,1,1 'extrapolation is performed if the s2p frequency range is narrower than that of the Cal Set.'

**DISPlay:ANNotation:FREQuency[:STATe] <ON | OFF>**

*(Read-Write)* Turns frequency information on the display title bar ON or OFF for all windows.

**Parameters**

- `<ON | OFF>`
  - **ON** (or 1) - turns frequency annotation ON.
  - **OFF** (or 0) - turns frequency annotation OFF.

**Examples**

```
DISP:ANN:FREQ ON
display:annotation:frequency:state off
```

**Query Syntax**

`DISPlay:ANNotation:FREQuency[:STATe]?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON (1)
**DISPlay:ANAnnotation:MESSage:STATe <ON | OFF>**

(Read-Write) Enables and disables error pop-up messages on the display.

**Parameters**

<ON | OFF>  
ON (or 1) - enables error pop-up messages  
OFF (or 0) - disables error pop-up messages

**Examples**

```
DISP:ANN:MESS:STAT ON  
display:annotation:message:state off
```

**Query Syntax**  
DISPlay:ANAnnotation:MESSage:STATe?

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
ON (1)

---

**DISPlay:ANAnnotation[:STATus] <ON | OFF>**

(Read-Write) Turns the status bar at the bottom of the screen ON or OFF. The status bar displays information for the active window.

**Parameters**

<ON | OFF>  
ON (or 1) - turns status bar ON  
OFF (or 0) - turns status bar OFF

**Examples**

```
DISP:ANN ON  
display:annotation:status off
```

**Query Syntax**  
DISPlay:ANAnnotation[:STATus]?

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
Last state that was set

---

**DISPlay:ARRange <char>**
(Write-only) Places EXISTING measurements into pre- configured window arrangements. Overlay, Stack(2), Split(3), and Quad(4) creates new windows. To learn more, see Arrange Existing Measurements.

**Parameters**

<char> Window arrangement. Choose from:

- TILE - tiles existing windows
- CASCade - overlaps existing windows
- OVERlay - all traces placed in 1 window
- STACk - 2 windows
- SPLit - 3 windows
- QUAD - 4 windows

**Examples**

```
DISP:ARR CASC
display:arrange cascade
```

**Query Syntax**

Not Applicable

**Default**

TILE

**DISPlay:CATalog?**

(Read-only) Returns the existing Window numbers.

To read the window number of the selected trace, use Calc:Par:WNUM.

**Return Type**

String of Character values, separated by commas

**Example**

Two windows with numbers 1 and 2 returns: "1,2"

**Default**

Not applicable

**DISPlay:ENABLE <ON | OFF>**
(Read-Write) Specifies whether to disable or enable all analyzer display information in all windows in the analyzer application. Marker data is not updated. More CPU time is spent making measurements instead of updating the display.

**Parameters**

- **<ON | OFF>**
  - **ON** (or 1) - turns the display ON.
  - **OFF** (or 0) - turns the display OFF.

**Examples**

- `DISP:ENAB ON`
- `display:enable off`

**Query Syntax**

- `DISP:ENABle?`

**Return Type**

- Boolean (1 = ON, 0 = OFF)

**Default**

- ON

---

**DISPlay:FSIGn <ON | OFF>**

(Read-Write) Shows or hides the window which displays global pass/fail results.

**Parameters**

- **<ON | OFF>**
  - **ON** (or 1) - displays the pass/fail dialog
  - **OFF** (or 0) - hides the pass/fail dialog

**Examples**

- `DISP:FSIG ON`
- `display:fsign off`

**Query Syntax**

- `DISP:FSIGn?`

**Return Type**

- Boolean (1 = ON, 0 = OFF)

**Default**

- OFF

---

**DISPlay:TMAX <bool>**
(Read-Write) Maximizes (isolates) or restores the active trace in the active window. When turned ON, the active trace is the ONLY trace on the display. All other traces are hidden. Learn more.

**Parameters**

- **<bool> ON (or 1) - Maximize / isolates the active trace.**
- **OFF (or 0) - Restores other traces to the normal window setting.**

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:TMAX ON</td>
<td></td>
</tr>
<tr>
<td>display:tmax 0</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**

`DISPlay:TMAX?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**DISPlay[:TILE] - Superseded**

This command is replaced by **DISP:ARRange**

(Write-only) Tiles the windows on the screen.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP</td>
<td></td>
</tr>
<tr>
<td>display:tile</td>
<td></td>
</tr>
</tbody>
</table>

**Default**

Not Applicable

---

**DISPlay:WINDow<wnum>:ANNotation:MARKer:NUMBer <num>**

This command replaces **DISP:WIND:ANN:MARK:SINGle**

(Read-Write) Sets the number of marker readouts to display per trace. Display up to 20 marker readouts per window.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- **<wnum> Any existing window number. If unspecified, value is set to 1.**
- **<num> Number of marker readouts to display. Choose a value between 1 and 10.**

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:ANN:MARK:NUMB 7</td>
<td></td>
</tr>
<tr>
<td>display:window:annotation:marker:number 2</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**

`DISPlay:WINDow:ANNotation:MARKer:NUMBer?`

**Return Type**

Numeric
**DISPlay:WINDoW<wnum>:ANNotation:MARKer:RESolution:STIMulus <num>**

(Read-Write) For the X-axis (stimulus), sets the number digits to display after the decimal point in marker readouts.

See other SCPI Marker commands. Learn more about Marker readout.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;wnum&gt;</td>
<td>Any existing window number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Number of digits to display. Choose a value between 2 and 6.</td>
</tr>
</tbody>
</table>

**Examples**

```
DISP:WIN:ANN:MARK:RES:STIM 2
display:window:annotation:marker:resolution:stimulus 4
```

**Query Syntax**

```
DISPlay:WINDoW:ANNotation:MARKer:RESolution:STIMulus?
```

**Return Type**

Numeric

**Default**

3

**DISPlay:WINDoW<wnum>:ANNotation:MARKer:RESolution:RESPonse <num>**

(Read-Write) For the Y-axis (response), sets the number digits to display after the decimal point in marker readouts.

See other SCPI Marker commands. Learn more about Marker readout.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;wnum&gt;</td>
<td>Any existing window number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Number of digits to display. Choose a value between 1 and 4.</td>
</tr>
</tbody>
</table>

**Examples**

```
DISP:WIN:ANN:MARK:RES:RESP 1
display:window:annotation:marker:resolution:stimulus 2
```

**Query Syntax**

```
DISPlay:WINDoW:ANNotation:MARKer:RESolution:RESPonse?
```

**Return Type**

Numeric

**Default**

2

**DISPlay:WINDoW<wnum>:ANNotation:MARKer:SINGle[:STATe] <bool> - Superseded**
Note: This command is replaced by **DISP:WIND:ANN:MARK:NUMB**

(Read-Write) Either shows marker readout of only the active trace or other traces simultaneously.

See other SCPI Mark commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<bool>` **ON** (or 1) - Shows the readout of only the active marker for each trace.
  **OFF** (or 0) - Shows up to 5 marker readouts per trace, up to 20 total readouts.

**Examples**

```plaintext
DISP:WIND:ANN:MARK:SING ON
display:window:annotation:marker:single off
```

**Query Syntax**

`DISP:WIND:ANN:MARK:SINGLE?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default** OFF

**DISPlay:WINDow<wnum>:ANNotation:MARKer:SIZE <char>**

(Read-Write) Specifies the size of the marker readout text. See other SCPI Mark commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<char>` Readout text size. Choose from: NORMal | LARGe

**Examples**

```plaintext
DISP:WIND:ANN:MARK:SIZE LARG
display:window:annotation:marker:size normal
```

**Query Syntax**

`DISP:WIND:ANN:MARK:SIZE?`

**Return Type**

Character

**Default** NORMal

**DISPlay:WINDow<wnum>:ANNotation:MARKer[:STATe] <ON | OFF>**
Specifies whether to show or hide the Marker readout (when markers are ON) on the selected window. See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<ON | OFF>` ON (or 1) - turns marker readout ON.

**Examples**

```plaintext
DISP:WIND:ANN:MARK ON
display:window:annotation:marker:state off
```

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

**DISPlay:WINDow<wnum>:ANNotation:MARKer:SYMBol <char>**

(Read-Write) Sets the symbol to display for marker position.

See other SCPI Marker commands.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<char>` Marker symbol. Choose from:
  - TRIangle
  - FLAG
  - LINE

**Examples**

```plaintext
DISP:WIND:ANN:MARK:SYMB TRI
display:window:annotation:marker:symbol line
```

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer:SYMBol?

**Return Type**

Character

**Default**

TRIangle

**DISPlay:WINDow<wnum>:ANNotation:MARKer:XPOSition <num>**
(Read-Write) Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` X-axis position. Choose a value between 1 (far left) and 10 (far right).

Examples

```
DISP:WIND:ANN:MARK:XPOS 1.5
display:window:annotation:marker:xposition 5
```

Query Syntax

```
DISPlay:WINDow:ANNotation:MARKer:XPOSition?
```

Return Type

Numeric

Default

10

-----

DISPlay:WINDow<wnum>:ANNotation:MARKer:YPOSition <num>

(Read-Write) Sets the Y-axis position of marker readouts. Readouts are top-justified at the specified position.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` Y-axis position. Choose a value between 1 (bottom) and 10 (top).

Examples

```
DISP:WIND:ANN:MARK:YPOS 1.5
display:window:annotation:marker:yposition 5
```

Query Syntax

```
DISPlay:WINDow:ANNotation:MARKer:YPOSition?
```

Return Type

Numeric

Default

10

-----

DISPlay:WINDow<wnum>:ANNotation[:TRACE][:STATe] <ON | OFF>
(Read-Write) Specifies whether to show or hide the Trace Status buttons on the left of the display.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<ON | OFF>` **ON** (or 1) - turns the buttons ON. **OFF** (or 0) - turns the buttons OFF.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:ANN ON</td>
<td>Display:window:annotation:trace:state on</td>
</tr>
<tr>
<td>display:window:annotation:trace:state off</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**

`DISPlay:WINDow<wnum>:ANNotation[:TRACe][:STATe]?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

`DISPlay:WINDow<wnum>:CATalog?`

(Read-only) Returns the trace numbers for the specified window.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.

**Example**

Window 1 with four traces:

`DISPlay:WINDow1:CATalog?`  
Returns:  
"1, 2, 3, 4"

**Return Type**

String of Character values separated by commas

**Default**

Not applicable

---

`DISPlay:WINDow<wnum>:ENABle <ON | OFF>`
(Read-Write) Specifies whether to disable or enable all analyzer display information in the specified window. Marker data is not updated. More CPU time is spent making measurements instead of updating the display.

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1.
- **<ON | OFF>**
  - **ON** (or 1) - turns the display ON.
  - **OFF** (or 0) - turns the display OFF.

**Examples**

```plaintext
DISP:WIND:ENABLE ON
display:window1:enable off
```

**Query Syntax**

```
DISP:WINDow<wnum>:ENABLE?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**DISPlay:WINDow<wnum>:SIZE <char>**

(Read-Write) Sets or returns the window setting of Maximized, Minimized, or Normal. To arrange all of the windows, use **DISP:ARR**.

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1
- **<char>** Window size. Choose from:
  - **MIN | MAX | NORM**

**Examples**

```plaintext
DISP:WIND:SIZE MAX
display:window:size norm
```

**Query Syntax**

```
DISP:WINDow:SIZE?
```

**Default**

Not Applicable

---

**DISPlay:WINDow<wnum>[::STATe] <ON | OFF>**
(Read-Write) Write to create or delete a window on the screen or Read whether a window is present.

**Parameters**

- `<wnum>`  Window number to create; choose any integer between 1 and the maximum number of windows allowed in the PNA.
- `<ON | OFF>`  ON (or 1) - The window `<wnum>` is created.  
  OFF (or 0) - The window `<wnum>` is deleted.

**Examples**

```
DISP:WIND ON
display:window2:state off
```

**Query Syntax**

`DISPlay:WINDow<wnum>[:STATe]?`

**Return Type**  Boolean (1 = ON, 0 = OFF)

**Default**  Window number "1" ON

---

**DISPlay:WINDow<wnum>:TABLe <char>**

(Read-Write) Write to show the specified table at the bottom of the analyzer screen or Read to determine what table is visible.

**Parameters**

- `<wnum>`  Any existing window number. If unspecified, value is set to 1
- `<char>`  Table to show. Choose from:
  - OFF | MARKer | LIMit | SEGMent

**Examples**

```
DISP:WIND:TABLE SEGm
display:window:table off
```

**Query Syntax**

`DISPlay:WINDow:TABLE?`

**Default**  OFF

---

**DISPlay:WINDow<wnum>:TITLe:DATA <string>**
(Read-Write) Sets data in the window title area. The title is turned ON and OFF with DISP:WIND:TITL:STAT OFF.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.
<string> Title to be displayed. Any characters, enclosed with quotes. If the title string exceeds 50 characters, an error will be generated and the title not accepted. Newer entries replace (not append) older entries.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:TITL:DATA 'hello'</td>
<td>Display title 'hello'</td>
</tr>
<tr>
<td>display:window2:title:data 'hello'</td>
<td>Display title 'hello'</td>
</tr>
</tbody>
</table>

Query Syntax

DISPlay:WINDow<wnum>:TITLe:DATA?

Return Type

String

Default

NA

DISPlay:WINDow<wnum>:TITLe[:STATe] <ON | OFF>

(Read-Write) Turns display of the title string ON or OFF. When OFF, the string remains, ready to be redisplayed when turned back ON.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1
<ON | OFF> ON (or 1) - turns the title string ON.
OFF (or 0) - turns the title string OFF.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:TITL ON</td>
<td>Display title ON</td>
</tr>
<tr>
<td>Display:window1:title:state off</td>
<td>Display title OFF</td>
</tr>
</tbody>
</table>

Query Syntax

DISPlay:WINDow<wnum>:TITLe[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

DISPlay:WINDow<wnum>:TRACe<tnum>:DELeTe
(Write-only) Deletes the specified trace from the specified window. The measurement parameter associated with the trace is not deleted.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` The number of the trace to be deleted; if unspecified, value is set to 1.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:TRAC:DEL</td>
</tr>
<tr>
<td>display:window2:trace2:delete</td>
</tr>
</tbody>
</table>

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:FEED <name>**

(Write-only) Creates a new trace `<tnum>` and associates (feeds) a measurement `<name>` to the specified window `<wnum>`. This command should be executed immediately after creating a new measurement with CALC:PAR:DEF `<name>,<parameter>`.

To feed the same measurement to multiple traces, create another measurement with the same `<name>,<parameter>` using the CALC:PAR:DEF command. The analyzer will collect the data only once.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Trace number to be created. Choose any Integer between 1 and the PNA maximum number of traces per window allowed.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<name>` Name of the measurement that was defined with CALC:PAR:DEF `<name>,<parameter>`

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:TRAC:FEED 'test'</td>
</tr>
<tr>
<td>display:window2:trace2:feed 'test'</td>
</tr>
</tbody>
</table>

**Query Syntax** Not applicable

**Default** "CH1_S11"
**DISPlay:WINDow:TRACe:GRATicule:GRID:LTYPE** `<value>`

(Read-Write) Sets and returns the grid line type (solid | dotted) for all open windows. Grid is returned to solid when the PNA is Preset. Learn more.

**Parameters**

- `<value>`: Line type. Choose from:
  - `SOLid` - solid lines
  - `DOTTed` - dotted lines

**Examples**

`DISP:WIND:TRAC:GREAT:GRID:LTYPE SOL`  
`display:window:trace:graticule:grid:ltype dotted`

**Query Syntax**

`DISPlay:WINDow:TRACe:GRATicule:GRID:LTYPE?`

**Return Type** Character

**Default** `SOLID`

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:MEMory[:STATe]** `<ON | OFF>`

(Read-Write) Turns the memory trace ON or OFF.

**Parameters**

- `<wnum>`: Any existing window number. If unspecified, value is set to 1.
- `<tnum>`: Any existing trace number; if unspecified, value is set to 1.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<ON | OFF>`:
  - `ON` (or 1) - turns the memory trace ON.
  - `OFF` (or 0) - turns the memory trace OFF.

**Examples**

`DISP:WIND:TRAC:MEM ON`  
`display:window2:trace2:memory:state off`

**Query Syntax**

`DISPlay:WIND<wnum>:TRACe<tnum>:MEMory[:STATe]?`

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** `OFF`

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:SELect**
(Write-only) Activates the specified trace in the specified window for front panel use.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

**Examples**

```
DISP:WIND:TRAC:SEL
display:window2:trace2:select
```

**Query Syntax**

Not applicable

**Default**

NA

---

**DISPlay:WINDow<wnum>:TRACe<tnum>[:STATe] <ON | OFF>**

(Read-Write) Turns the display of the specified trace in the specified window ON or OFF. When OFF, the measurement behind the trace is still active.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<ON | OFF>`  
  - **ON** (or 1) - turns the trace ON.  
  - **OFF** (or 0) - turns the trace OFF.

**Examples**

```
DISP:WIND:TRAC ON
display:window2:trace2:state off
```

**Query Syntax**

DISPlay:WIND<wnum>:TRACe<tnum>[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe:DATA <string>**
(Read-Write) Writes and read data to the trace title area. The trace title is embedded in the trace status field. Learn more.

Newer entries replace (not append) older entries. The title is turned ON and OFF with DISP:WIND:TRAC:TITL:STAT.

**Parameters**

<wnum> Any existing window number. If unspecified, value is set to 1.
<tnum> Trace number of the specified window. If unspecified, value is set to 1. Use Display:Cat? to read the window numbers. Use Disp:Window:Cat? to read the trace numbers of the specified window.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

<string> Title to be displayed. Any characters (not spaces) enclosed with quotes.

**Examples**

DISP:WIND:TRAC:TITL:DATA 'MyNewMeas'
display:window2:trace3:title:data 'hello'

**Query Syntax**

DISPlay:WINDow<wnum>:TRACe<tnum>TITLe:DATA?

**Return Type** String

**Default** Not Applicable

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe[:STATe] <bool>**

(Read-Write) Turns display of the Trace Title ON or OFF. When turned OFF, the previous trace title returns. Set a new trace title using DISP:WIND:TRAC:TITL:DATA.

Learn more about Trace Titles

**Parameters**

<wnum> Any existing window number. If unspecified, value is set to 1
<tnum> Trace number of the specified window. If unspecified, value is set to 1. Use Display:Cat? to read the window numbers. Use Disp:Window:Cat? to read the trace numbers of the specified window.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.
<bool> **ON** (or 1) - turns the title ON.

**OFF** (or 0) - turns the title OFF.

**Examples**

```plaintext
DISP:WIND:TRAC:TITL ON
Display:window2:trace3:title:state off
```

**Query Syntax**

```
DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe[:STATe]?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:AUTO**

(Write-only) Performs an Autoscale on the specified trace in the specified window, providing the best fit display.

Autoscale is performed only when the command is sent; it does NOT keep the trace autoscaled indefinitely.

Autoscale behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. Learn more.

See Also, **DISPlay:WINDow:Y:AUTO** which performs an Autoscale All.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

**Examples**

```
DISP:WIND:TRAC:Y:AUTO
display:window2:trace2:y:scale:auto
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**DISPlay:WINDow:TRACe:Y[:SCALe]:COUPle:METHod <char>**
(Read-Write) Sets and returns the method of scale coupling. Learn more about Scale coupling.

**Parameters**

- `<char>` **OFF** - NO scale coupling for any windows.
- **WINDoW** - Scale settings are coupled for traces in each window.
- **ALL** - Scale settings are coupled for traces in ALL selected windows.

Enable the selected windows using `DISP:WIND:TRAC:Y:COUP ON`

**Examples**

```bash
```

```bash
Display:window2:trace:y:scale:method window
```

**Query Syntax**

`DISP:WIND:TRAC:Y[:SCALE]:COUPle:METHod?`

**Return Type**

Character

**Default**

OFF

---

`DISP:WIND<wnum>:TRACe<tnum>:Y[:SCALE]:PDIVision <num>`

(Read-Write) Enables and disables scale coupling for the specified window. Learn more about Scale coupling.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1
- `<bool>` **ON** (or 1) - Scale coupling enabled for specified window.
- **OFF** (or 0) - Scale coupling disabled for specified window.

**Examples**

```bash
DISP:WIND<wnum>:TRACe<tnum>:Y:COUP ON
```

```bash
Display:window2:trace:y:scale:couple:state off
```

**Query Syntax**

`DISP:WIND<wnum>:TRACe<tnum>:Y[:SCALE]:COUPle[:STATE] ?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

`DISP:WIND<wnum>:TRACe<tnum>:Y[:SCALE]:PDIVision <num>`
(Read-Write) Sets the Y axis **Per Division** value of the specified trace in the specified window.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<num>` Units / division value. The range of acceptable values is dependent on format and domain.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
DISP:WIND:TRAC:Y:PDIV 1
display:window2:trace2:y:scale:pdivision maximum
```

**Query Syntax**

```
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:PDIVision?
```

**Return Type**

Numeric

**Default**

10

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RLEVel <num>**

(Read-Write) Sets the Y axis Reference Level of the specified trace in the specified window.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<num>` Reference level value. The range of acceptable values is dependent on format and domain.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
DISP:WIND:TRAC:Y:RLEV 0
display:window2:trace2:y:scale:rlevel minimum
```

**Query Syntax**

```
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RLEVel?
```
**Return Type**  Numeric  
**Default**  Not Applicable

**DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RPOSition <num>**

(Read-Write) Sets the **Reference Position** of the specified trace in the specified window

**Parameters**

- `<wnum>`  Any existing window number. If unspecified, value is set to 1.
- `<tnum>`  Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the **Tr annotation** on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<num>`  Reference position on the screen measured in horizontal graticules from the bottom. The range of acceptable values is dependent on format and domain.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

- DISP:WIND:TRAC:Y:RPOS 0
- display:window2:trace2:y:rposition maximum

**Query Syntax**  
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RPOSition?

**Return Type**  Numeric  
**Default**  5

**DISPlay:VISible <ON | OFF>**
(Read-Write) Makes the PNA application visible or not visible. In the Not Visible state, the analyzer cycle time for making measurements, and especially data transfer, can be significantly faster because the display does not process data.

**Parameters**

<ON | OFF>  
ON (or 1) - PNA app is visible  
OFF (or 0) - PNA app is NOT visible  

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:VIS ON</td>
<td>ON (or 1) - PNA app is visible</td>
</tr>
<tr>
<td>display:visible off</td>
<td>OFF (or 0) - PNA app is NOT visible</td>
</tr>
</tbody>
</table>

**Query Syntax**

DISPlay:VISible?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**DISPlay:WINDow<wnum>:Y:AUTO**

(Write-only) Scales ALL of the traces to fit in the same window. This is equivalent to "Autoscale All" from the front panel.

Autoscale behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. [Learn more.](#)

Autoscale is performed only when the command is sent; it does NOT keep the trace autoscaled indefinitely.

See Also, **DISPlay:WINDow:TRACe:Y:AUTO** which Autoscales only the specified trace.

**Parameters**

<wnum>  
Any existing window number. If unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:WIND:y:AUTO</td>
<td>Autoscales ALL traces</td>
</tr>
<tr>
<td>display:window2:y:auto</td>
<td>Autoscales only window 2</td>
</tr>
</tbody>
</table>

**Query Syntax**

Not applicable

**Default**

Not applicable

---

Last modified:
11-Jan-2011  Minor edits
15-Sep-2010  Added autoscale all and scale coupling note.
  6-Aug-2010  Added marker readout (A.09.30)
  16-Mar-2010  Added grid line (9.2)
  23-Mar-2009  Added <tnum> note
  26-Aug-2008  Added TraceMax
  12-Sep-2006  Modified for number of windows.
Format Commands

Specifies the way that data will be transferred when moving large amounts of data.

```
FORMat

BORDer [DATA]
```

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree

**FORMat:BORDer <char>**

*(Read-Write)* Set the byte order used for GPIB data transfer. Some computers read data from the analyzer in the reverse order. This command is only implemented if FORMAT:DATA is set to :REAL.

If FORMAT:DATA is set to :ASCII, the swapped command is ignored.

**Parameters**

- `<char>` Choose from:
  - **NORMal** - Use when your controller is anything other than an IBM compatible computers.
  - **SWAPped** - for IBM compatible computers.

**Note:** Use NORMal if you are using VEE, LabView, or T&M Tool kit.

**Examples**

```
FORM:BORD SWAP
format:border normal
```

**Query Syntax**

```
FORMat:BORDer?
```

**Return Type**

Character

**Default** Normal

**FORMat[:DATA] <char>**
(Read-Write) Sets the data format for data transfers.

- To transfer measurement data, use **CALC:DATA**.
- To transfer Cal Set data, use **SENS:CORR:CSET:DATA**
- To transfer Source Power correction data, use:
  - **SOURce:POWer:CORRection:COLLect:TABLE:DATA**
  - **SOURce:POWer:CORRection:COLLect:TABLE:FREQuency**
  - **SOURce:POWer:CORRection:DATA**

**Parameters**

<char> Choose from:

- **REAL,32** - (default value for REAL) Best for transferring large amounts of measurement data.
- **REAL,64** - Slower but has more significant digits than REAL,32. Use REAL,64 if you have a computer that doesn't support REAL,32.
- **ASCii,0** - The easiest to implement, but very slow. Use when you have small amounts of data to transfer.

**Notes:**

- The higher frequencies used on PNA can exceed the maximum value that can be represented by a 32-bit floating point number.
- The **REAL,32** and **REAL,64** arguments transfer data in block format as explained in Transferring Measurement Data.

**Examples**

```
FORM REAL, 64
format: data ascii
```

**Query Syntax**  FORMat:DATA?

**Return Type**  Character,Character

**Default**  ASCii,0

Syst:Preset does NOT reset this command.
However, *RST does reset this command to ASCII,0

---

Last Modified:
18-May-2009  Added Real 64 note
17-Sep-2008  Added *RST vs Syst:Pres note.
Hardcopy Command

Controls printing of the PNA screen and optional data to a printer or a file.

HCOPY:
  DPRinter
  FILE
  [IMMediate]

ITEM

PRINters?

Click on a blue keyword to view the command details.

Red commands are superseded or obsolete.

See Also

- Learn more about PNA Printing
- Example Programs
### HCOPy:DPRinter <string>

*(Read-Write)* Sets the default printer and selects as the current printer. Use HCOPy:PRINters? to return a list of locally installed printers.

This setting survives instrument preset and PNA application restart.

**Parameters**

- `<string>`: Name of the printer to become the default.

**Examples**

- HCOP: DPR "MyPrinter"
- hcopy: dprinter "YourPrinter"

**Query Syntax**

HCOPy:DPRinter?

**Return Type**

String

**Default**

Not Applicable

---

### HCOPy:FILE <filename>

*(Write-only)* Saves the screen image to a file. The image does NOT include the optional print data invoked by many HCOPy commands.

**Parameters**

- `<filename>`: Name of the file to save the screen to. The file is saved to the current working directory unless a valid full path name is specified.

Use one of the following suffixes:

- .bmp - not recommended due to large file size
- .jpg - not recommended due to poor quality
- .png - recommended

**Examples**

- HCOPY:FILE "myFile.png"
- hcopy:file "c:/data/myfile.png"

**Query Syntax**

Not Applicable

**Default**

Not Applicable
HCOPy[:IMMediate]

(Write-only) Prints the screen to the default printer.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOP</td>
</tr>
<tr>
<td>hcopy:immediate</td>
</tr>
</tbody>
</table>

**Query Syntax**

Not applicable

**Default**

Not Applicable

HCOPy:ITEM:AWINdow[:STATe] <bool>

(Read-Write) When ON, prints only the Active window. When OFF, prints all windows.

This setting survives instrument preset and PNA application restart.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;bool&gt;</td>
</tr>
<tr>
<td>Active window state. Chose from:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF or (0) - Print ALL windows.</td>
</tr>
<tr>
<td>ON or (1) - Print Active window only.</td>
</tr>
</tbody>
</table>

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOP</td>
</tr>
<tr>
<td>hcopy:item:awindow:state off</td>
</tr>
</tbody>
</table>

**Query Syntax**

HCOPy:ITEM:AWINdow[:STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

HCOPy:ITEM:CTABLE[:STATe] <bool>
(Read-Write) When ON, prints the channel settings table.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Channel table print state. Chose from:

- **OFF** or (0) - Does NOT print the channel settings table.
- **ON** or (1) - Prints channel settings table.

**Examples**

```
HCOP:ITEM:CTAB 1
hcopy:item:ctable:state off
```

**Query Syntax**

```
HCOPy:ITEM:CTABle[:STATe]
```

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:ITEM:GPFail[:STATe] <bool>**

(Read-Write) When ON, prints the **Global Pass/Fail** status in the page header.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Pass / Fail print state. Chose from:

- **OFF** or (0) - Does NOT print Pass / Fail status.
- **ON** or (1) - Print Pass / Fail status

**Examples**

```
HCOP:ITEM:GPF 1
hcop:item:gpfail:state off
```

**Query Syntax**

```
HCOPy:ITEM:GPFail[:STATe]
```

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:ITEM:LOGO[:STATe] <bool>**
When ON, prints the Agilent Technologies logo in the page header.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Agilent logo print state. Chose from:

- **OFF** or (0) - Prints the Agilent logo.
- **ON** or (1) - Does NOT print the Agilent logo.

**Examples**

```
HCOP:ITEM:LOGO 1
hcop:item:logo:state off
```

**Query Syntax**

```
HCOPy:ITEM:LOGO[:STATe]?
```

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:ITEM:MKRData[:STATe] <bool>**

(Read-Write) When ON, includes marker data as part of the [trace attributes table](#).

To print marker data, **HCOP:ITEM:TTABle** must also be set to ON.

This setting does not affect the limited [marker readout data](#) that can be displayed in the measurement window.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Marker data print state. Chose from:

- **OFF** or (0) - Does NOT print Marker data.
- **ON** or (1) - Print Marker data.

**Examples**

```
HCOP:ITEM:MKRD 1
hcop:item:mkrdata:state off
```

**Query Syntax**

```
HCOPy:ITEM:MKRData[:STATe]?
```

**Return Type**

Boolean

**Default**

OFF (0)
HCOPy:ITEM:PNUMber[:STATE] <bool>

(Read-Write) When ON, prints page numbers (1 of n) in the header at the top of each page.

This setting survives instrument preset and PNA application restart.

Parameters

<bool> Page number print state. Chose from:

  OFF or (0) - Does NOT print page numbers.

  ON or (1) - Print page numbers.

Examples

HCOP:ITEM:PNUM 1
hc:copy:item:pnumber:state off

Query Syntax

HCOPy:ITEM:PNUMber[:STATE]

Return Type

Boolean

Default

OFF (0)

HCOPy:ITEM:SEGData[:STATE] <bool> - Obsolete

Note: This command no longer works beginning with A.09.40

(Read-Write) When ON, includes ALL segment data as part of the channel settings table.

To print ALL segment data, HCOP:ITEM:CTAB must also be set to ON.

This setting survives instrument preset and PNA application restart.

Parameters

<bool> Expanded segment data print state. Chose from:

  OFF or (0) - Does NOT print expanded segment data, but summary data is printed.

  ON or (1) - Print expanded segment data.

Examples

HCOP:ITEM:SEG 1
hc:copy:item:segdata:state off

Query Syntax

HCOPy:ITEM:SEGData[:STATE]

Return Type

Boolean

Default

OFF (0)
HCOPY:ITEM:SWINdow[:STATe] <bool>

(Read-Write) When ON, prints a single measurement window per page. When OFF, prints up to four measurement windows per page.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Single window print state. Chose from:

OFF or (0) - Print up to four windows per page.

ON or (1) - Print only one window per page.

**Examples**

HCOP:ITEM:SWIN 1
hcop:item:swindow:state off

**Query Syntax**

HCOPY:ITEM:SWIN[:STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

HCOPY:ITEM:TIME[:STATe] <bool>

(Read-Write) When ON, prints the PNA computer date and time in the header.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Time stamp print state. Chose from:

OFF or (0) - Does NOT print time stamp.

ON or (1) - Print time stamp.

**Examples**

HCOP:ITEM:TIME 1
hcop:item:time:state off

**Query Syntax**

HCOPY:ITEM:TIME:[STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

HCOPY:ITEM:TTABle[:STATe] <bool>
(Read-Write) When ON, prints the trace attributes table.

This setting survives instrument preset and PNA application restart.

**Parameters**

<bool> Trace attributes table print state. Chose from:

- **OFF** or (0) - Does NOT print the trace attributes table.
- **ON** or (1) - Print the trace attributes table.

**Examples**

```
HCOP:ITEM:TTABle 1
hcopen:ITEM:ttable:state off
```

**Query Syntax**

```
HCOPY:ITEM:TTABle[:STATe]?
```

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPY:ITEM:WFRaction <value>**

(Read-Write) Sets the vertical amount of a page that is filled by the measurement windows.

This setting survives instrument preset and PNA application restart.

**Parameters**

<value> Window size as a fraction of the page. Chose a value from .4 (40%) to 1.0 (100%)

**Examples**

```
HCOP:ITEM:WFR .8
hcopen:ITEM:wfraction .5
```

**Query Syntax**

```
HCOPY:ITEM:WFRaction?
```

**Return Type**

Numeric

**Default**

.4

---

**HCOPY:ITEM:WINDows[:STATe] <bool>**
(Read-Write) When ON, prints measurement windows.

Use `HCOPy:ITEM:AWIn Dow` to specify all windows or only the active window.

This setting survives instrument preset and PNA application restart.

**Parameters**

- `<bool>` Windows print state. Choose from:
  - **OFF** or (0) - Does not print measurement windows.
  - **ON** or (1) - Print measurement windows.

**Examples**

- `HCOP:ITEM:WIND 1`
- `hcopy:item:windows:state off`

**Query Syntax**

`HCOPy:ITEM:WINDows[:STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:PAGE:DIMensions:LLEFt <left, lower>**

(Read-Write) Sets the left and lower page margins.

This setting survives instrument preset and PNA application restart.

**Parameters**

- `<left>` Left page margin as a percentage of entire page width. Value must be between 0 and 1.
- `<lower>` Lower page margin as a percentage of entire page length. Value must be between 0 and 1.

**Examples**

- `HCOP:PAGE:DIM:LLEF .10,.10`
- `hcopy:page:dimensions:lleft .5,.7`

**Query Syntax**

`HCOPy:PAGE:DIMensions:LLEFt?`

**Return Type**

Numeric, Numeric

**Default**

Depends on selected page size

---

**HCOPy:PAGE:DIMensions:URIGht <right, upper>**
(Read-Write) Sets the right and upper page margins.

This setting survives instrument preset and PNA application restart.

**Parameters**

- **<right>** Right page margin as a percentage of entire page width. Value must be between 0 and 1.
- **<upper>** Upper page margin as a percentage of entire page length. Value must be between 0 and 1.

**Examples**

```
HCOP:PAGE:DIM:URIG .10,.10
hcopy:page:dimensions:uright .5,.7
```

**Query Syntax**

```
HCOPy:PAGE:DI Mensions:URIGht?
```

**Return Type** Numeric, Numeric

**Default** Depends on selected page size

---

**HCOPy:PAGE:ORIentation <char>**

(Read-Write) Sets the page orientation.

This setting survives instrument preset and PNA application restart.

**Parameters**

- **<char>** Choose from:
  - PORTrait
  - LANDscape

**Examples**

```
HCOP:PAGE:ORI PORT
hcopy:page:orientation landscape
```

**Query Syntax**

```
HCOPy:PAGE:ORIentation?
```

**Return Type** Character

**Default** PORTrait

---

**HCOPy:PAGE:SIZE <int>**
(Read-Write) Sets the paper type, which implies the page size.

This setting survives instrument preset and PNA application restart.

**Parameters**

Choose from:

<table>
<thead>
<tr>
<th>Integer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Letter 8 1/2 x 11 in</td>
</tr>
<tr>
<td>2</td>
<td>Letter Small 8 1/2 x 11 in</td>
</tr>
<tr>
<td>3</td>
<td>Tabloid 11 x 17 in</td>
</tr>
<tr>
<td>4</td>
<td>Ledger 17 x 11 in</td>
</tr>
<tr>
<td>5</td>
<td>Legal 8 1/2 x 14 in</td>
</tr>
<tr>
<td>6</td>
<td>Statement 5 1/2 x 8 1/2 in</td>
</tr>
<tr>
<td>7</td>
<td>Executive 7 1/4 x 10 1/2 in</td>
</tr>
<tr>
<td>8</td>
<td>A3 297 x 420 mm</td>
</tr>
<tr>
<td>9</td>
<td>A4 210 x 297 mm</td>
</tr>
<tr>
<td>10</td>
<td>A4 Small 210 x 297 mm</td>
</tr>
<tr>
<td>11</td>
<td>A5 148 x 210 mm</td>
</tr>
<tr>
<td>12</td>
<td>B4 (JIS) 250 x 354</td>
</tr>
<tr>
<td>13</td>
<td>B5 (JIS) 182 x 257 mm</td>
</tr>
</tbody>
</table>

For more paper type choices, see Microsoft's "wingdi.h" file, which can be downloaded as part of the Platform SDK.

**Examples**

HCOP:PAGE:SIZE 2
hcop:page:size 5

**Query Syntax**

HCOPy:PAGE:SIZE?

**Return Type**

Integer

**Default**

1
Returns the display image in a definite-length arbitrary binary block. The format of the data is PNG by default. Use `HCOP:SDUMp:DATA:FORMat` to change the format.

This command is equivalent to saving an image to the PNA (`HCOPy:FILE`) and then using `MMEM:TRAN` to transfer the file to the computer.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>A definite-length arbitrary binary block</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**Examples**

```
HCOP : SDUM?
hcopy : sdump?
```

**HCOPy:SDUMp:DATA:FORMat <char>**

(Read-Write) Sets the graphic format for `HCOPy:SDUMp:DATA`?

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;char&gt;</code></td>
</tr>
</tbody>
</table>

Choose from: JPG | BMP | PNG

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOP : SDUMP : DATA : FORMAT BMP</td>
</tr>
</tbody>
</table>

**Query Syntax**

HCOPy:SDUMp:DATA:FORMat?

**Return Type**

Character

**Default**

PNG

**HCOPy:PRINters?**

(Read-only) Returns a comma-separated list of printers installed on the PNA. Select a printer using `HCOPy:DPRinter`.

This setting survives instrument preset and PNA application restart.

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOPy:PRINters?</td>
</tr>
</tbody>
</table>

**Return Type**

String

**Default**

Not Applicable

### Initiate Commands

Controls triggering signals

---

**INITiate**

**CONTinuous** [IMMediate]

Click on a blue keyword to view the command details.

**See Also**

- Example [Triggering the PNA](#)
- [Learn about Triggering](#)
- [Synchronizing the PNA and Controller](#)
- [SCPI Command Tree](#)

---

**INITiate:CONTinuous <boolean>**

*(Read-Write)* Specifies whether the PNA trigger source is set to Internal (continuous) or Manual.

This command is a subset of [TRIG:SEQ:SOURce](#), which can also set the trigger source to External.

To set how a channel responds to trigger signals, use [SENS:SWE:MODE](#).

See a map of user interface to SCPI triggering commands.

For more information on triggering, see the [PNA Trigger Model](#).

**See the Example program:** [Triggering the PNA using SCPI](#)

**Parameters**

- **<boolean>**
  - **ON** (or 1) - Internal (continuous) trigger.
  - **OFF** (or 0) - Manual sweep. Use [INIT:IMMediate](#) to send a trigger signal

**Examples**

- **INIT:CONT ON**
- **initiate:continuous off**

**Query Syntax**

INITiate:CONTinuous?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON
INITiate<cnum>[:IMMediate]

(Write-only) Stops the current sweeps and immediately sends a trigger. (Same as Trigger! on the PNA front panel).

See the Example program: Triggering the PNA using SCPI

**Note:** An SMC Fixed Output measurement cannot be triggered using this command. For more information, see the example program.

This command requires Trigger:Source to be set to Manual. This causes ONE trigger signal to be sent each time INIT:IMM is issued.

Sens<ch>:Sweep:Mode sets the number of trigger signals each channel will accept (Continuous - unlimited, Groups - a specific number, or HOLD - none.)

**To trigger ALL channels in turn:**

Set ALL channels to Sens<ch>:Sweep:Mode Continuous. The <ch> argument in INIT<ch>:IMM is ignored.

Then…

- TRIG:SCOP ALL triggers ALL channels (in sequence) each time Init:Imm is sent.
- TRIG:SCOP CURRent triggers ONLY the NEXT channel each time Init:Imm is sent.

**To trigger ONLY a specified channel:**

1. Set ALL channels to Sens<ch>:Sweep:Mode HOLD
2. Send TRIG:SCOP CURRent
3. Send Init<ch>:Imm where <ch> is the channel to be triggered.

**Advanced** Situations that require some channels to be in CONT and others in HOLD are rare. The following describes the behavior of the Init:Imm command in these situations:

**When Trigger:Scope = Global:**

- If the SPECIFIED <cnum> channel is in hold mode, it is put in single trigger (accepts 1 trigger signal) and goes to the end of the queue of channels to be triggered. The other 'non-hold' channels are triggered. The next Init:Imm triggers the specified channel first.

  For example: ch1 is in Hold, ch2 and ch3 are in CONT and we send INIT1:IMM
On the first INIT:IMM, ch2 and ch3 is triggered.

next INIT:IMM, ch1, ch2, ch3 is triggered.

next INIT:IMM, ch2 and ch3 is triggered.

next INIT:IMM, ch1, ch2, ch3 is triggered, and so forth.

**When Trigger:Scope = Channel**

- Only ONE channel is triggered for each issued INIT<ch>:IMM command.

- If the specified channel is in hold, it is put in single trigger (accepts 1 trigger signal) and goes the end of the queue of channels to be triggered as in the 'Global' example.

This is one of the PNA overlapped commands. [Learn more.](#)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;chnum&gt;</code></td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>
</tbody>
</table>

**Examples**

```
INIT
initiate2:immediate
```

**Query Syntax**

- Not applicable

**Default**

- Not applicable

Last modified:

April 23, 2007    Updated Init:Imm
The memory commands control saving and loading instrument states and measurement trace data to the hard drive. To read and write trace data in GPIB format, see CALC:DATA.

Click on a blue keyword to view the command details.

Red commands are superseded.

Specifying Path Names

The MMEM commands use the following rules to specify path names:

- The default folder is "C:/Program Files/Agilent/Network Analyzer/Documents"
- You can change the active directory using MMEMory:CDIRectory.
- Specify only the file name if using the active directory.
- You can also use an absolute path name to specify the folder and file.

**MMEMory:CATalog[:<char>]? [<folder>]**

(Read-only) Returns a comma-separated string of file names that are in the specified folder. If there are no files of the specified type, "NO CATALOG" is returned. [Learn about File Types](#)

**Parameters**

- **<char>** The type of files to list. Choose from:
  - **STATe** - Instrument states (.sta)
  - **CORRection** - Calibration Data (.cal)
  - **CSARchive** - Instrument state and calibration data (.csa)
  - **CSTate** - Instrument state and link to Calibration data (.cst)

  If unspecified then ALL file types (even unknown types) are listed.

- **<folder>** String - Any existing folder name. See [Specifying Path Names](#)

**Examples**

- `MMEM:CAT?` 'lists all files from the current folder
- `mmemory:catalog:correction?` 'C:/Program Files/Agilent/Network Analyzer/Documents' 'lists .cal files from the specified folder

**Default** Not applicable

**MMEMory:CDIRectory <folder>**
(Read-Write) Changes the folder name.

**Parameters**

- `<folder>`: Any drive and folder name that already exists. If the same level as "C:/Program Files/Agilent/Network Analyzer/Documents", then no punctuation is required.

**MMEM:CDIR Service**

If the new folder is at a different level than "C:/Program Files/Agilent/Network Analyzer/Documents", use a slash (/) before the folder name and enclose in quotes.

```mmemory:cdirectory '/automation' 'changes default directory up one level.'```

You can use an absolute path to specify the new folder.

```mmemory:cdirectory 'c:/automation/service'```

**Query Syntax**

`MMEMory:CDIRectory?` Returns the current folder name

**Return Type**

String

**Default**

'C:/Program Files/Agilent/Network Analyzer/Documents'

---

**MMEMory:COPY <file1>,<file2>**

(Write-only) Copies file1 to file2. Extensions must be specified.

**Parameters**

- `<file1>`: String - Name of the file to be copied. See [Specifying Path Names](#).
- `<file2>`: String - Name of the file to be created from file1.

**Examples**

```MMEM:COPY 'MyFile.cst','YourFile.cst'```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**MMEMory:DELete <file>**
(Write-only) Deletes file. Extensions must be specified.

**Parameters**

<file> String - Name of the file to be deleted. See [Specifying Path Names](#)

**Examples**

MMEM:DEL 'MyFile.cst'

**Query Syntax** Not applicable

**Default** Not applicable

---

**MMEMory:LOAD[:<char>] <file>**

(Write-only) Loads the specified file. [Learn about File Types](#)

**Parameters**

<char> The type of file to load. Choose from:

- **STATe** - Instrument states (.sta)
- **CORRection** - Calibration Data (.cal)
- **CSARchive** - Instrument state and calibration data (.csa)
- **CSTate** - Instrument state and link to Calibration data (.cst)
- **ENR** - Excess Noise Source data ([Noise Figure App only](#))

  - When <char> is **ENR**, then include **CAL**, - See example below.

  - "*.sNp files CAN be recalled to the PNA although no <char> is used. See example below.

If <char> is unspecified, the extension must be included in the filename.

If an extension is specified in <file> that does not agree with <char> then no action is taken.

<file> String - Name of the file to be loaded. See [Specifying Path Names](#)

**Examples**

MMEM:LOAD 'MyFile.cst'

mmemory:load:state 'MyInstState'

MMEM:LOAD:ENR CAL, C:/data/calset/346C_16500.enr"

MMEM:LOAD "MyFile.s2p"

**Query Syntax** Not applicable

**Default** Not applicable
**MMEMory:MDIRectory** <folder>

(Write-only) Makes a folder.

**Parameters**

- `<folder>` String - Name of the folder to make. See [Specifying Path Names](#).

**Examples**

- `MMEM:MDIR 'MyFolder'
- `mmemory:mdirectory 'c:/NewFolder'

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**MMEMory:MOVE** <file1>,<file2>

(Write-only) Renames `<file1>` to `<file2>`. File extensions must be specified.

**Parameters**

- `<file1>` String - Name of the file to be renamed. See [Specifying Path Names](#).
- `<file2>` String - Name of the new file.

**Examples**

- `MMEM:MOVE 'MyFile.cst','YourFile.cst'

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**MMEMory:RDIrectory** <folder>

(Write-only) Removes the specified folder.

**Parameters**

- `<folder>` String - Name of the folder to remove. See [Specifying Path Names](#).

**Examples**

- `MMEM:RDIR 'MyFolder'

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**MMEMory:STORe[:<char>]** <file>

---

2418
(Write-only) Saves instrument / calibration state files.

To save data files, use `MMEM:STOR:DATA`.

To save ENR files, use `MMEMory:STORe:ENR`

**Parameters**

<char> Optional argument. The type of file to store. Choose from:

- **STATE** - Instrument states (.sta)
- **CORRection** - Calibration Data (.cal)
- **CSARchive** - Instrument state and calibration data (.csa)
- **CSTate** - Instrument state and link to Calibration data (.cst)

Include either <char> or the file extension. If both <char> and the extension are specified, they must agree or an error is returned and no action is taken. See examples below.

**Learn about File Types**

=file> String - Name of any valid file that does not already exist. See [Specifying Path Names](#).

**Examples**

```
MMEM:STOR:STAT 'myState'
mmemory:store 'c:/bin/myState.sta'
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

`MMEMory:STORe:CITifile:DATA <filename>` - Superseded
This command is replaced with `MMEMory:STORe:DATA`.

(Write only) Saves UNFORMATTED trace data to .cti file. Learn more.

**Parameters**

*<filename>* Any drive and folder name that already exists.
If the same level as "C:/Program Files/Agilent/Network Analyzer/Documents", then no punctuation is required

```
MMEM:STOR:CIT:DATA MYCTIFile
```

If the new folder is at a different level than "C:/Program Files/Agilent/Network Analyzer/Documents", use a slash (/) before the folder name and enclose in quotes.

```
memory:cdirectory '/automation' 'changes default directory up one level.'
```

You can use an absolute path to specify the new folder.

```
memory:cdirectory 'c:/automation/service'
```

**Query Syntax** Not Applicable

**Default** C:/Program Files/Agilent/Network Analyzer/Documents'

---

This command is replaced with `MMEMory:STORe:DATA`.

(Write only) Saves FORMATTED trace data to .cti file. Learn more.

**Parameters**

*<filename>* Any drive and folder name that already exists.
If the same level as "C:/Program Files/Agilent/Network Analyzer/Documents", then no punctuation is required

```
MMEM:STOR:CIT:DATA MYFile
```

If the new folder is at a different level than "C:/Program Files/Agilent/Network Analyzer/Documents", use a slash (/) before the folder name and enclose in quotes.

```
memory:cdirectory '/automation' 'changes default directory up one level.'
```

You can use an absolute path to specify the new folder.
**MMEMory:STORe:DATA <filename>,<type>,<scope>,<format>,<selector>**

*(Write-only)* Stores trace data to the following file types: *.prn, *.cti, *.csv, *.mdf

To save SNP files, use **Calc:Data:SNP:PORTs:SAVE**

To save state and calibration files, use **MMEM:STORe**

This command replaces the following:

- **MMEMory:STORe:CITifile:DATA**
- **MMEMory:STORe:CITifile:FORMat**
- **MMEMory:STORe:TRACe:FORMat:CITifile**
- **MMEMory:STORe:TRACe:CONTent:CITifile**

**Parameters**

- <filename>  (String) Name of the file in which data will be saved.  
  
  See rules for specifying a filename.

Choose from the following valid parameter combinations for ALL measurement classes:

<table>
<thead>
<tr>
<th>Type of file to save</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;type&gt; (String)</td>
</tr>
<tr>
<td>* .prn</td>
<td>&quot;PRN Trace Data&quot;</td>
</tr>
<tr>
<td>* .cti</td>
<td>&quot;Citifile Data&quot;</td>
</tr>
</tbody>
</table>

Example: MMEMory:STORe:DATA "myData.prn","PRN Trace Data","Trace","Displayed",2
Example: MMEMory:STORe:DATA "myData.cti","Citifile Data Data","AUTO","RI",3

<table>
<thead>
<tr>
<th>*.cti (unformatted)</th>
<th>&quot;Citifile Data Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot;</th>
<th>-1</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.cti","Citifile Data Data","AUTO","RI",3

<table>
<thead>
<tr>
<th>*.cti (formatted)</th>
<th>&quot;Citifile Formatted Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>*(formatted)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example: MMEMory:STORe:DATA "myData.cti","Citifile Formatted Data","AUTO","MA",3

<table>
<thead>
<tr>
<th>*.cti (formatted)</th>
<th>&quot;Citifile Formatted Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.cti","Citifile Formatted Data","DISPLAYED","MA",-1

<table>
<thead>
<tr>
<th>*.csv</th>
<th>&quot;CSV Formatted Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.csv","CSV Formatted Data","Trace","DB",3

<table>
<thead>
<tr>
<th>*.csv</th>
<th>&quot;CSV Formatted Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.csv","CSV Formatted Data","displayed","RI",-1

<table>
<thead>
<tr>
<th>*.mdf</th>
<th>&quot;MDIF Data&quot;</th>
<th>&quot;Trace&quot; or &quot;Auto&quot;</th>
<th>&quot;RI&quot; or &quot;Displayed&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.mdf","MDIF Data","trace","displayed",1

<table>
<thead>
<tr>
<th>*.mdf</th>
<th>&quot;MDIF Data&quot;</th>
<th>&quot;Displayed&quot;</th>
<th>&quot;RI&quot; or &quot;Displayed&quot;</th>
<th>Measurement number</th>
</tr>
</thead>
</table>

Example: MMEMory:STORe:DATA "myData.mdf","MDIF Data","displayed","displayed",-1

Notes (for above file types)

Use Calc:Par:MNUM? to read the measurement number of the selected trace.

Scope:

"Trace" - specified measurement number only.

"Displayed" - all displayed measurements.

"Auto" - for all Standard Meas Class (S-parameter) channels:
When correction is OFF, saves the specified trace

When correction is ON, saves all corrected parameters associated with the calibrated ports in the Cal Set.

"Auto" - for all other channels:

When correction is OFF or ON, saves the specified trace

The following parameter combinations save *.csv files in specific formats for GCA and Swept IMD classes:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>&lt;type&gt; (String)</th>
<th>&lt;scope&gt; (String)</th>
<th>&lt;format&gt; (String)</th>
<th>&lt;selector&gt; (Numeric)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GCA channels ONLY:</td>
<td>&quot;GCA Sweep Data&quot;</td>
<td>&quot;Auto&quot;</td>
<td>&quot;DB&quot;</td>
<td>GCA channel number</td>
</tr>
</tbody>
</table>

**Learn more**

Example: MMEMory:STORe:DATA "myData.csv", "GCA Sweep Data", "Auto", "db", 1

<table>
<thead>
<tr>
<th>Swept IMD channels ONLY:</th>
<th>&quot;IMD Sweep Data&quot;</th>
<th>&quot;Auto&quot;</th>
<th>&quot;DB&quot;</th>
<th>Swept IMD channel number</th>
</tr>
</thead>
</table>

**Learn more**

Example: MMEMory:STORe:DATA "myData.csv", "IMD Sweep Data", "Auto", "db", 1

**Query Syntax** Not applicable

**Default** Not applicable

**MMEMory:STORe:ENR CAL, <file>**

*(Write-only)* Stores an ENR (Excess Noise Source) data *(Noise Figure App only)*

**Parameters**

<file> String - Name of any valid file that is not already in existence. See **Specifying Path Names**

**Examples**

```
MMEM:STOR:ENR CAL, C:/data/calset/346C_16500.enr
```

**Query Syntax** Not applicable

**Default** Not applicable
**MMEMory:STORe:TRACe:FORMat:CITifile <char> - Superseded**

This command is replaced with MMEMory:STORe:DATA.

(Read-Write) Specifies the format of subsequent citifile save statements.

**Parameters**

- `<char>` Format in which the citifile will be saved with subsequent MMEMory:STORe:CIT:FORMat statements. Choose from:
  - **MA** - Linear Magnitude / degrees
  - **DB** - Log Magnitude / degrees
  - **RI** - Real / Imaginary
  - **AUTO** - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.
  - **DISP** - Displayed format.

**Examples**

```
MMEM:STOR:TRAC:FORM:CIT MA
```

**Query Syntax** MMEMory:STORe:TRACe:FORMat:CITifile?

**Return Type** Character

**Default** Auto

---

**MMEMory:STORe:TRACe:CONTents:CITifile <char> - Superseded**

This command is replaced with MMEMory:STORe:DATA.

(Read-Write) Specifies the contents of subsequent citifile save statements. (See Data Define Saves)

**Parameters**

- `<char>` Choose from:
  - **SING** - Single trace
  - **DISP** - All displayed traces
  - **AUTO** - All displayed traces

**Examples**

```
MMEM:STOR:TRAC:CONT:CIT SING
```

**Query Syntax** MMEMory:STORe:TRACe:CONTents?

**Return Type** Character
**MMEMory:STORe:TRACe:FORMat:SNP <char>**

*(Read-Write)* Specifies the format of subsequent .s1p, .s2p, .s3p; s4p save statements. Learn more.

To save SNP data, use **CALC:DATA:SNP:PORTs:SAVE**

**Parameters**

- **<char>** Choose from:
  - **MA** - Linear Magnitude / degrees
  - **DB** - Log Magnitude / degrees
  - **RI** - Real / Imaginary
  - **AUTO** - data is output in currently selected trace format. If other than LogMag, LinMag, or Real/Imag, then output is in Real/Imag.

**Examples**

```
MMEM:STOR:TRAC:FORM:SNP MA
```

**Query Syntax**

`MMEMory:STORe:TRACe:FORMat:SNP?`

**Return Type**

Character

**Default** Auto

---

**MMEMory:TRANsfer <fileName>,<dataBlock>**

*(Read-Write)* Transfers data between the PNA and an external controller. Other MMEM commands transfer data between the PNA application and the PNA hard drive. If `<fileName>` already exists, it will be overwritten. The file must be no larger than 20MB.

To read **trace data** from the PNA in block format, use **CALC:DATA**.

**Parameters**

- **<fileName>** String - File name. See Specifying Path Names
- **<dataBlock>** Block Data - The contents of the file.

The data block is a block of binary data. Use the following syntax:

```
#<num digits><byte count><data bytes><NL><END>
```

where:
<num_digits> specifies how many digits are contained in <byte_count>

<byte_count> specifies how many data bytes will follow in <data bytes>

Example  See example program

Query Syntax  MMEMory:TRANsfer? <fileName>

               Reads block data from the specified file location.

Default  Not applicable

Last modified:

2-Mar-2010   Updated for csv and mdif formats (9.2)
30-Oct-2008  Fixed noise keywords for load and store.
30-Jul-2007  Added noise keywords to load and store.
9/12/06      MQ Store command has reference to PORTS Snp.
Output Commands

Controls two output functions: RF power and Noise Source.

```
OUTPut:
  | MANual:NOISe[:STATe]
  | [:STATe]
```

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree

**OUTPut:MANual:NOISe[:STATe] <bool>**

*(Read-Write)* Sets and reads the noise source *(28V)* ON or OFF.

**Parameters**

<bool>  
  ON (1) - Noise source ON  
  OFF (0) - Noise source OFF

**Examples**

```
OUTP:MAN:NOIS 0
output:manual:noise:state 1
```

**Query Syntax**

OUTPut:MANual:NOISe[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

For PNA models with a Noise Figure option (028/029/H29), the 28V line is always ON. The ON/OFF state is also available from a PNA softkey menu.

For PNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF by default and survives a preset. The ON/OFF state is NOT available from a PNA softkey menu.

**OUTPut[:STATe] <ON | OFF>**
(Read-Write) Turns RF power from the source ON or OFF.

See note about source power state with instrument state save and recall.

**Parameters**

<ON | OFF>  
- **ON** (or 1) - turns RF power ON  
- **OFF** (or 0) - turns RF power OFF

**Examples**

- OUTP ON  
- output:state off

**Query Syntax**

OUTPut[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

SCPI Command Tree

**ROUTe<cnum>:PATH:LOOP[:R1] <char>**

*(Read-Write)*  Throws internal switch to reference receiver when the specified channel is measured.  
This feature is available on PNA models with [Option 081](#) (external reference switch) and ALL PNA-X models.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<char>`  Position of the switch. Choose from:
  - **INTernal** - bypass R1 Loop. Connects the port 1 source directly to the R1 receiver.
  - **EXTernal** - flow through R1 Loop. Allows direct access to the R1 receiver through the Reference 1 front-panel connectors.

**Examples**

```
ROUTe:PATH:LOOP INT
route2:PATH:LOOP:R1 external
```

**Query Syntax**  
`ROUTe<cnum>:PATH:LOOP:R1?`

**Return Type**  Character

**Default**  INTernal

Last Modified:  
30-Apr-2009  Added PNA-X
Sense: Average Commands

Sets sweep-to-sweep averaging parameters. Averaging is a noise reduction technique that averages each data point over a user-specified number of sweeps. Averaging affects all of the measurements in the channel.

<table>
<thead>
<tr>
<th>SENSE:AVERAGE</th>
</tr>
</thead>

- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe<cnun>:AVERAGE:CLEar

(Write-only) Clears and restarts averaging of the measurement data. Does NOT apply to point averaging.

**Parameters**

<cnun> Any existing channel number; if unspecified, value is set to 1.

**Examples**

SENSE:AVER:CLE
sense2:average:clear

**Query Syntax** Not applicable

**Default** Not applicable

SENSe<cnun>:AVERAGE:COUNt <num>
(Read-Write) Sets the number of measurements to combine for an average. Must also set SENS:AVER[:STATE] ON

Parameters
<cnm> Any existing channel number; if unspecified, value is set to 1.
<num> Number of measurements to average. Choose any number between 1 and 65536 (2^16).

Examples
SENS:AVER:COUN 999
sense2:average:count 73

Query Syntax
SENS<cnm>:AVERage:COUNt?

Return Type
Numeric

Default
1

SENSe<cnm>:AVERage:MODE <char>
(Read-Write) Sets the type of averaging to perform: Point or Sweep.

Parameters
<cnm> Any existing channel number; if unspecified, value is set to 1.
<num> Averaging Type. Choose from:

POINT - Averaging measurements are made on each data point before stepping to the next data point. (Not available on 'C' models).

SWEEP - Averaging measurements are made on subsequent sweeps until the required number of averaging sweeps are performed.

Examples
SENS:AVER:MODE POIN
sense2:average:mode sweep

Query Syntax
SENS<cnm>:AVERage:MODE?

Return Type
Character

Default
Sweep

SENSe<cnm>:AVERage[:STATE] <ON | OFF>
(Read-Write) Turns trace averaging ON or OFF.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<ON | OFF>`
  - **ON** (or 1) - turns averaging ON.
  - **OFF** (or 0) - turns averaging OFF.

**Examples**

```plaintext
SENS:AVER ON
sense2:average:state off
```

**Query Syntax**
SENSe<cnum>:AVERage[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** Off
**Sense:Bandwidth Commands**

SENSe:BANDwidth:
  
  RESolution <num>
  TRACk <bool>

See Also

- Example Programs
- Learn about IF Bandwidth
- Synchronizing the PNA and Controller
- SCPI Command Tree

---

**SENSe<cnum>:BANDwidth | BWIDth[:RESolution] <num>**

*(Read-Write)* Sets the bandwidth of the digital IF filter to be used in the measurement. (Use either *Sense:Bandwidth* or *Sense:Width*)

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. *(Click to see the lists.)* If an invalid number is specified, the analyzer will round up to the closest valid number.

  This parameter supports MIN and MAX as arguments. [Learn more.](#)

**Examples**

```
SENS:BWID 1KHZ
sense2:bandwidth:resolution 1000
```

**Query Syntax**

SENSe<cnum>:BANDwidth | BWIDth[:RESolution]?

**Return Type**

Numeric

**Default**

See [Preset IFBW](#) for your PNA model.

---

**SENSe<cnum>:BANDwidth | BWIDth:TRACk <bool>**
(Read-Write) Sets and returns the state of the Reduce IF BW at Low Frequencies feature. (Use either Sense:Bandwidth:Track or Sense:Bwidth:Track).

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: Choose from:
  - ON or 1 - Reduce IF BW at Low Frequencies is set ON
  - OFF or 0 - Reduce IF BW at Low Frequencies is set OFF

Examples

- SENS:BWID:TRAC OFF
- sense2:bandwidth:track 1

Query Syntax

SENSe<cnum>:CLASs:NAME?

(Read-only) Returns the measurement class name of the specified channel. Use Calc:Custom commands to create measurements from classes other than standard S-Parameters. Use Cal:Par:Define:Ext to create standard measurements.

Parameters

| <cnum> | Any existing channel number; if unspecified, value is set to 1. |

Examples

SENs:CLAS:NAME?
sense2:classe:name?

For a standard S-Parameter channel, returns...
"Standard"

Sense:Correction Commands

Performs and applies calibration and other error correction features.

- To perform a Guided Calibration, use ONLY the Sens:Corr Coll:GUIDed commands.
- To perform an Unguided Calibration, do NOT use the Sens:Corr:Coll:Guided commands.
- See the "Unguided example programs" for clarification.

SENSe<cnum>:CORRection:CCHeck[:ACQuire] <mod>[,char]

(Write-only) Reads the 'confidence data' associated with the specified ECal module and puts it into memory. The measurement is selected using SENS:CORR:CCH:PAR. This command is compatible with *OPC.

Note: A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1.
<mod> ECal Module that contains the confidence data. Choose from:

ECAL1
..through..

ECAL8

[char] Optional argument. Specifies which characterization within the ECal module that the confidence data will be read from.

CHAR0 Factory characterization (data that was stored in the ECal module by Agilent). Default if not specified.

CHAR1 User characterization #1

CHAR2 User characterization #2

...and so forth up to:

CHAR12 User characterization #12

Examples SENS:CORR:CCHCheck ECAL

sense2:correction:ccheck:acquire ecal1,char1

Query Syntax Not applicable
**SENSe<cnum>:CORRection:CCHeck:DONE**

(Write-only) Concludes the Confidence Check and sets the ECal module back into the idle state.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1

**Examples**

- `SENSe:CORRection:CCHeck: DONE`
- `sense2:correction:ccheck:done`

**Query Syntax**

- **Default**: Not applicable

---

**SENSe<cnum>:CORRection:CCHeck:PARameter <Mname>**

(Read-Write) Specifies an existing measurement to be used for the Confidence Check.

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<Mname>`: Name of the measurement you are selecting for the confidence check. The measurement must already exist.

**Examples**

- `SENSe:CORRection:CCHeck:PAR 'TEST'`
  - 'selects the measurement "test" on channel 1 for the confidence check'
- `sense2:correction:ccheck:parameter 'test'`
  - 'selects the measurement "test" on channel 2 for the confidence check'

**Query Syntax**

- `SENSe<cnum>:CORRection:CCHeck:PARameter?`
  - Returns the name of the selected measurement on channel `<cnum>`.

**Return Type**

- **String**

**Default**

- Not applicable
For UNGUIDED calibration, measures the specified standards from the selected calibration kit. The calibration kit is selected using the `Sense:Correction:Collect:CKIT` command. For using two sets of standards, see `SENS:CORR:TST`.

**Note:** Before using this command you must select two items:
1. Select a calibration method using `SENS:CORR:COLL:METH`
2. Select a measurement using `CALC:PAR:SEL`. You can select one measurement for each channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<class>` **Measures the standards associated with these class labels.** Choose from:

<table>
<thead>
<tr>
<th>Label</th>
<th>Forward</th>
<th>Reverse</th>
</tr>
</thead>
<tbody>

</table>

**RESPonse** Same as `Normalize` selection in Unguided Cal. (subclass is ignored)

**POWER** Take a receiver power cal sweep and turn correction ON

**SLSET** Sets 'sliding load type', and increments the "number of slides" count. The total number of slides is critical to the correct calculation of the sliding load algorithm. See a sliding load cal example.

**SLDONE** Computes the sliding load using a circle fit algorithm.

[subclass] Optional argument. For mechanical calibration kits, choose from the following to specify the standard to be acquired from the `SENS:CORR:COLL:CKIT:ORDer` list. If not specified, subclass is set to `SST1`. 
SST1  First standard in the order list
SST2  Second standard in the order list
SST3  Third standard in the order list
SST4  Fourth standard in the order list
SST5  Fifth standard in the order list
SST6  Sixth standard in the order list
SST7  Seventh standard in the order list

If an ECAL module (1 through 8) is specified for <class>, choose one of the following for specifying which characterization within the ECal module will be used for the acquire. If not specified, the default is CHAR0.

  CHAR0  Factory characterization (data that was stored in the ECal module by Agilent)
  CHAR1  User characterization #1
  CHAR2  User characterization #2

...and so forth up to:

  CHAR12 User characterization #12

[sync] Optional argument. Choose from:

  SYNChronous - blocks SCPI commands during standard measurement (default behavior)
  ASYNchronous - does NOT block SCPI commands during standard measurement.

Learn more.

Examples

SENS:CORR:COLL STAN1

'If SENS:CORR:COLL:CKIT:ORDer2 5,3,7 was specified, the following command measures standard 3 (the second in the order list)
sense1:correction:collect:acquire stan3,sst2

SENS:CORR:COLL ECAL4,ASYN; *OPC?
sense2:correction:collect:acquire ecal2,char1

Query Syntax

  Default  Not applicable

  Not applicable
SENSe<cnun>:CORRection:COLLect:APPLy

(Write-only) Applies error terms to the measurement that is selected using Calc:Par:Select.

Note: Before using this command you must select a measurement using CALC:PAR:SEL. You can select one measurement for each channel.

Note: This command is only necessary if you need to modify error terms. If you do not need to modify error terms, SENSe<cnun>:CORRection:COLLect:SAVE calculates and then automatically applies error terms after you use SENS:CORR:COLL:ACQuire to measure cal standards.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1

Example

1. CALCulate2:PARameter:SELect S21_2 'select the measurement to apply terms to
2. SENSe2:CORRection:COLLect:METHod SPARSOLT 'set type of cal method.
3. CALCulate2:DATA? SCORR1 'download the error term of interest
4. 'Modify the error term here
5. CALCulate2:DATA SCORR1 'upload the error term of interest
6. SENSe2:CORRection:COLLect:APPLy 'applies the error terms to the measurement

SENSe:CORRection:COLLect:DISPlay:WINDow:AOFF

(Write-only) Clears the flags for windows to be shown during calibrations. To flag a window to be shown see SENS:CORR:COLL:DISP:WIN.

Examples

SENSe:CORRection:COLLect:DISP:WIN:AOFF

sense:correction:collect:display:window:aoff

See an example using this command.

Query Syntax

Not Applicable

Default

Not Applicable

SENSe:CORRection:COLLect:DISPlay:WINDow<wNum>[:STATE] <bool>
(Write-only) Set the 'show' state of the window to be displayed during a calibration. Learn more.

When this command is sent, the specified window is 'flagged' to be shown during calibration. The flag is cleared when the window is closed. A Preset or Instrument State Recall also closes the window. If the same window number is reopened, this command must be sent again to show the window during a calibration. The flag is NOT saved with an instrument state.

Send this command for each additional window to show during a calibration.

**Parameters**

- `<wNum>` Window number to show during a calibration. The calibration window will also be shown with this window.
  
The window must already be created.
  
  Use `DISPlay:CATalog?` to read all existing window numbers.
- `<bool>` Window state. Choose from:
  
  **ON** (or 1) - Show the specified window during calibration.
  
  **OFF** (or 0) - Do NOT show the specified window during calibration.

**Examples**

```
SENS:CORR:COLL:DISP:WIND1 1
sense:correction:collect:display:window2:state off
```

See an example using this command.

**Query Syntax** Not Applicable

**Default** OFF

**SENSe:CORRection:COLLect:ISOLation:AVERage:INCRement <num>**
(Read-Write) Specifies amount to increment (increase) the channel averaging factor during isolation measurement of the ECal module during an unguided ECal calibration.

**Note:** if the channel currently has averaging turned OFF and `<num>` is greater than 1, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to `<num>`.

**Parameters**

- `<num>`: Incremental Averaging factor. The maximum averaging factor is 65536 (2^16).

**Examples**

- `SENS:CORR:COLL:ISOL:AVER:INCR 16`
- `sense:correction:collect:isolation:average:increment 0`

**Query Syntax**

SENS:CORRection:COLLect:ISOLation:AVERage:INCRement?

**Return Type**

Numeric

**Default**

8 - If this command is NOT sent, but ECal isolation is measured, then averaging will be turned ON with factor set to 8 during the isolation measurement.

---

**SENSe<cnum>:CORRection:COLLect:ISOLation:ECAL[:STATe] <bool>**

(Read-Write) Specifies whether or not the isolation state of the ECal module will be measured as part of an unguided ECal calibration.

An unguided calibration is performed using the SENS:CORR:COLL:METH and SENS:CORR:COLL:ACQ commands.

**Note:** The inherent isolation of the PNA is better than that attained with this command. ONLY use this command when using an external test set, and ONLY using a 8509x ECal module.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: **ON** (or 1) - isolation is measured during the unguided ECal calibration.
  
  **OFF** (or 0) isolation is NOT measured during the unguided ECal calibration.

**Examples**

- `SENS1:CORR:COLL:ISOL:ECAL ON`
- `sense2:correction:collect:isolation:ecal:state 0`

**Query Syntax**

SENS:CORRection:COLLect:ISOLation:ECAL[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF
SENSe<nump>:CORRection:COLLect:METHod <char>

(Read-Write) For UNGUIDED calibration, sets the calibration method (also known as 'Calibration Type' on calibration dialog box.) To select a Cal Type from a Cal Set, use CALC:CORR:TYPE.

**Note:** Before using this command you must select a measurement using CALC:PAR:SEL. You can select one measurement for each channel.

**Parameters**

- `<nump>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:

  **Method** | **Description**
  --- | ---
  NONE | No Cal method
  REFL1OPEN | Response Open
  REFL1SHORT or | Response Short
  REFL1 |  
  REFL3 | Full 1 port
  RESPONSE | Same as Normalize selection in Unguided Cal.
  RPOWER | Receiver Power Cal - Used only with receiver measurements.
  TRAN1 | Response Thru - Requires a Thru standard.
  TRAN2 | Response Thru and Isolation - Requires a Thru standard.
  SPARSOLT | Full SOLT 2 port
  SPARTRL | TRL Cal (not available on all PNAs.)

**Examples**

```
SENS:COR:COLL:METH REFL1
sense2:correction:collect:method sparsolt
```

**Query Syntax**

SENSe<nump>:CORRection:COLLect:METHOD?

**Return Type**

Character

**Default** Not Applicable

---

(Read-Write) Set and read the state of ENR Adapter de-embedding. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ENR Adapter de-embed state. Choose from:
  - **OFF** or **0** - Do not force de-embedding.
  - **ON** or **1** - Force de-embedding.

**Examples**

```
SENSe:CORR:COLL:NOIs:ENR:ADAP:DEEM 0
```

**Query Syntax**

`SENSe:CORRection:COLLect:NOISe:ENR:ADAPter:DEEMbed:[STATe]?`

**Return Type**

Boolean

**Default**

O - OFF

---

**SENSe<ch>:CORRection:COLLect:NOISe:PSENsor:ADAPter:DEEMbed:[STATe] <bool>**

(Read-Write) Set and read the state of power sensor adapter de-embedding. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Power sensor adapter de-embed state. Choose from:
  - **OFF** or **0** - Do not force de-embedding.
  - **ON** or **1** - Force de-embedding.

**Examples**

```
SENSe:CORR:COLL:NOIs:PSEN:ADAP:DEEM 0
```

**Query Syntax**

`SENSe:CORRection:COLLect:NOISe:PSENsor:ADAPter:DEEMbed:[STATe]?`

**Return Type**

Boolean

**Default**

O - OFF

---

**SENSe<ch>:CORRection:COLLect:NOISe:LO<n>:PCAL[:STATe] <bool>**
(Read-Write) Enables and disables LO power calibration for NFX.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` LO Stage (number). Choose 1 for NFX.
- `<bool>` LO Power Cal state. Choose from:
  - **OFF** or **0** - Disable LO Power Cal
  - **ON** or **1** - Enable LO Power Cal

**Examples**

```
SENS:CORR:COLL:NOIS:LO1:PCAL 0
sense2:correction:collect:noise:lo1:pcal:state ON
```

**Query Syntax**

`SENSe:CORRection:COLLect:NOISe:LO<n>:PCAL:STATe?`

**Return Type**

Boolean

**Default**

O - OFF

---

**SENSe<cnum>:CORRection:COLLect:SAVE**

(Write-only) For UNGUIDED calibrations ONLY. This command does the following:

- calculates the error terms using the selected :METHod
- applies the error terms to the selected measurement (turns error correction ON.)
- saves the calibration error-terms to the channels Cal Register or a User Cal Set.

The Cal Register or User Cal Set is determined by the setting of the `SENS:CORR:PREFerence:CSET:SAVE` command.

Do NOT use this command during an ECAL. When performing an ECAL calibration using `SENS:CORR:COLL:ACQuire`, this SAVE operation is performed automatically before the completion of a successful ACQuire.

Before using this command you must select a measurement using `CALC:PAR:SEL`. You can select one measurement for each channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
SENSe:CORRection:COLLect:SWEep:CHANnel:AOFF

(Write-only) Clears ALL flags for channels to sweep during calibration. To flag a channel, see SENSe:CORR:COLL:SWE:CHAN.

Examples  
SENSe:CORRection:COLLect:SWEep:CHANnel:AOFF

sense:correction:collect:sweep:channel:aoff

See an example using this command.

Default  Not applicable

SENSe<cnum>:CORRection:COLLect:SWEep:CHANnel<cnum2>[[:STATe] <bool>]

(Write-only) Specifies the channel to sweep during a Calibration.

When this command is sent, the <cnum2> channel is 'flagged' to be swept during calibration.

The flag is cleared when the channel is deleted, if the Measurement Class is changed, or if all measurements are deleted from the channel.

If the same channel number is recreated, this command must be sent again to sweep the channel during a calibration. The flag is NOT saved with an instrument state.

A Preset or Instrument State Recall deletes the channel.

Parameters

<cnum>  The channel to be calibrated. If unspecified, value is set to 1.
<cnum2>  The channel to sweep when waiting to measure a standard.

This channel must already exist with at least one measurement in the channel. If this channel is in continuous sweep mode, it must have the same attenuator settings and path configuration (PNA-X only).
<bool> Channel sweep state. Choose from:

ON (or 1) - Sweep the channel during calibration.

OFF (or 0) - Do NOT sweep the channel during calibration.

Examples

SENSe:CORRection:COLL:SWE:CHAN2 1
sense2:correction:collect:sweep:channel3:state off

See an example using this command.

Query Syntax Not Applicable

Default OFF

SENSe:CORRection:ENR:CALibration:TABLE:DATA <freq, value, freq, value...>

(Read-Write) Set and read the ENR calibration data. All of the frequency and ENR data must be sent at the same time. Use MMEM:LOAD and MMEM:SAVE to load and save ENR table data from disk. Learn more about Noise Source ENR files.

Parameters

<freq, value> (Numeric) ENR data. Frequency value in Hz followed by a ENR noise value in dB. Enter as many pairs as necessary.

Examples

SENSe:CORRection:ENR:CALibration:TABLE:DATA 1.0E9,14.37,2.5E9,15.28
sense:correction:enr:calibration:table:data 1.0E9,14.37,2.5E9,15.28

Query Syntax SENSe:CORRection:ENR:CALibration:TABLE:DATA?

Return Type Comma separated numeric values

Default Not Applicable

SENSe:CORRection:ENR:CALibration:TABLE:ID:DATA <id>
(Read-Write) Sets and returns ID of ENR table. While this is for informational purposes only, it can be used to record the model of the noise source. Learn more about ENR files.

**Parameters**

- **<id>** (String) Identifier for the ENR table.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SENS:CORRection:ENR:CALibration:TABLe:ID:DATA?

**Return Type**

String

**Default**

Not Applicable

---

**SENS:CORRection:ENR:CALibration:TABLe:SERial:DATA <sn>**

(Read-Write) Sets and returns the serial number of noise source. This is for informational purposes only to identify the specific noise source for which the data pertains. Learn more about ENR files.

**Parameters**

- **<sn>** Serial number of the noise source for which the data applies, enclosed in quotes.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SENS:CORRection:ENR:CALibration:TABLe:SERial:DATA?

**Return Type**

String

**Default**

Not Applicable

---

**SENS<ch>:CORRection:GCSetup:POWer <num>**

(Read-Write) Set and read the power level at which to perform the Source Power Cal portion of a Gain Compression (Opt 086) Calibration. Learn more about this setting.

**Parameters**

- **<num>** Power level in dB. Choose a value from +30 to -30.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:GCS:POW 0</td>
<td>Sense:correction:gcsetup:power 5</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENS:CORRection:GCSetup:POWer?

**Return Type**

Numeric

**Default**

0
SENSe<ch>:CORRection:GCSetup:SENSor:CKIT <string>

(Read-Write) Set and read the cal kit to be used for calibrating at the port 1 reference plane when the power sensor connector is different from the DUT port 1. Learn more.

Parameters

Examples

```
SENS:CORR:GCS:SENS:CKIT "85052B"
```

Query Syntax

SENSe:CORRection:GCSetup:SENSor:CKIT?

Return Type

String

Default

Not Applicable

SENSe<ch>:CORRection:GCSetup:SENSor:CONNector<string>

(Read-Write) Set and read the power sensor connector type which is used to perform the Source Power Cal portion of a Gain Compression Calibration. Learn more.

Parameters

Examples

```
SENS:CORR:GCS:SENS:CKIT "3.5 mm (50) male"
```

Query Syntax

SENSe:CORRection:GCSetup:SENSor:CKIT?

Return Type

String

Default

Not Applicable

SENSe:CORRection:IMPedance:INPut:MAGNitude <num>
(Read-Write) Sets and returns the system impedance value for the analyzer.

**Parameters**

<num> System Impedance value in ohms. Choose any number between 0 and 1000 ohms.

**Examples**

SENS:CORR:IMP:INP:MAGN 75
sense:correction:impedance:input:magnitude 50.5

**Query Syntax**

SENSe:CORRection:IMPedance:INPut:MAGNitude?

**Return Type** Numeric

**Default** 50

**SENSe<ch>:CORRection:INTerpolate[:STATe] <ON | OFF>**

(Read-Write) Turns correction interpolation ON or OFF.

**Note:** Before using this command you must select a measurement using CALC:PAR:SEL. You can select one measurement for each channel.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<ON | OFF> ON (or 1) - turns interpolation ON.
OFF (or 0) - turns interpolation OFF.

**Examples**

SENS:CORR:INT ON
sense2:correction:interpolate:state off

**Query Syntax**

SENSe<cnum>:CORRection:INTerpolate[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** ON

**SENSe<ch>:CORRection:ISOLation[:STATe] <ON | OFF> OBSOLETE**
This command no longer works beginning in the PNA 5.2 release. To perform isolation as part of an unguided calibration, you must explicitly measure the isolation standard using **SENS:CORR:COLL:ACQ Stan5**. See Example program.

To measure isolation as part of an ECal, use **SENS:CORR:COLL:ISOL:ECAL**.

(Read-Write) Turns isolation cal ON or OFF during Full 2-port calibration. If this command is not sent, the default state is to **disable** Isolation.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>` **ON** (or 1) - turns isolation ON.  
  **OFF** (or 0) - turns isolation OFF.

**Examples**

```
SENS:CORR:ISOL ON
sense2:correction:isolation:state off
```

**Query Syntax**

```
SENSe<cnum>:CORRection:ISOLation[:STATe]?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF - (Isolation disabled)

**SENS<ch>:CORRection:METHods:MATCh <bool>**

(Read-Write) Turns match-correction ON or OFF. Use this command AFTER performing an Guided Power Cal. [Learn more.]

**Parameters**

- `<ch>` Channel number on which Guided Power Cal was performed. If unspecified, value is set to 1
- `<bool>` **ON** (or 1) - Turns match-correction ON  
  **OFF** (or 0) - Turns match-correction OFF.

**Examples**

```
SENS:CORR:METH:MATC 0
sense2:correction:methods:match off
```

**Query Syntax**

```
SENSe<cnum>:CORRection:METHods:MATCh?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

**SENS:CORRection:PREFerence:CALibration[:FOM]:RANGe <char>**
(Read-Write) Specifies the FOM frequency range to use when performing calibration.

**Parameters**

<char> Choose from:

- **PRIMary** - Used for calibrating at the mmWave frequencies when NOT using a test set. Learn more.

- **AUTO** - All other calibration situations.

**Examples**

```
SENS:CORR:PREF:CAL:RANG PRIM
sense:correction:preference:calibration:fom:range auto
```

**Query Syntax**

```
SENSe:CORRection:PREFerence:CALibration[:FOM]:RANGe?
```

**Return Type** Character

**Default** AUTO

---

**SENSe:CORRection:PREFerence:CSET:SAVE <char>**

**Important Notes:**

- This command replaces SENS:CORR:PREF:CSET:SAVU

- With 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets. To revert to the old behavior, send this command with the USER argument.

(Read-Write) Specifies the default manner in which calibrations that are performed using SCPI or COM are to be stored. Cal data is ALWAYS stored to the channel Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another execution of this command.

**Note:** Cal Set arguments used with commands such as SENS:CORR:COLL:GUID:INIT, SENS:CORR:COLL:GUID:SAVE and SENS:CORR:COLL:GUID:SAVE:CSET will override of any of these default preference settings.

Learn about Cal Registers and User Cal Sets.

**Parameters**

<char> **CALRegister** - Cal is saved ONLY to the channel Cal Register.

- **USER** - Cal is saved to a new User Cal Set file when performing a SCPI calibration. The Cal Set name is automatically generated. To change the name,
send `SENS:CORR:CSET:NAME` after the cal is complete. This reverts to pre-6.0 behavior.

**REUSE** - The cal is saved to the Cal Set that is currently selected on the specified channel, which could be the channel Cal Register. If the channel does not yet have a selected Cal Set, the cal will be saved to a new User Cal Set with an automatically-generated name.

**SENSe:CORRection:PREFerence:CSET:SAVUser <bool> Superseded**

This command is replace with `SENS:CORR:PREF:CSET:SAVE`.

**NOTE:** With 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets. To revert to the old behavior, send this command as ON (1). For UI and COM use, this can be done from the GPIB console.

(Read-Write) Specifies whether cal data is automatically saved to a User Cal Set file after performing a SCPI calibration. Cal data is always saved to a Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another execution of this command.

Learn about [Cal Registers and User Cal Sets](https://example.com/cal_registers_and_user_cal_sets).

**Parameters**

`<bool>`

- **ON** or **1** - Cal is automatically saved to a User Cal Set file when performing a SCPI calibration. The Cal Set name is automatically generated. To change the name, send `SENS:CORR:CSET:NAME` after the cal is complete. Reverts to pre-6.0 behavior.

- **OFF** or **0** - Cal is NOT automatically saved to a User Cal Set. To save a calibration to a User Cal Set, use `SENS:CORR:COLL:GUID:INIT`.

2455
SENSe:CORRection:PREFerence:ECAL:ORIentation[:STATe] <ON|OFF>

(Read-Write) Specifies whether or not the PNA should perform orientation of the ECal module during calibration. Orientation is a technique by which the PNA automatically determines which ports of the module are connected to which ports of the PNA. Orientation begins to fail at very low power levels or if there is much attenuation in the path between the PNA and the ECal module. If orientation is turned OFF, the SENS:CORR:PREF:ECAL:PMAP command must be used to specify the port connections before performing a cal.

**Note:** For 3-port or 4-port measurements, when orientation is OFF, you are not allowed to specify how the ECAL module is connected. Instead, the PNA determines the orientation. Use SENS:CORR:COLL:GUID:DESC? to query the orientation. The PNA does not verify that you made the connection properly.

This setting remains until the PNA is restarted or this command is sent again.

**Parameters**

<bool> ECAL orientation state. Choose from:

**ON** or 1 - PNA performs orientation of the ECal module.

**OFF** or 0 - PNA does NOT performs orientation of the ECal module.

**Examples**

SENS:CORR:PREF:ECAL:ORI OFF

SENSe:CORRection:PREFerence:ECAL:ORIentation[:STATe] ON

**Query Syntax**

SENSe:CORRection:PREFerence:ECAL:ORIentation[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON (1)

SENSe:CORRection:PREFerence:ECAL:PMAP <module>,<string>

(Read-Write) When ECal module orientation is turned OFF (SENS:CORR:PREF:ECAL:ORI), this command specifies the port mapping (which ports of the module are connected to which ports of the PNA) prior to performing ECal calibrations.

This setting remains until the PNA is restarted or this command is sent again.

**Parameters**

<module> Specifies which ECal module this port map is being applied to. Choose from:
Format this parameter in the following manner:

\[ A_w, B_x, C_y, D_z \]

where

- \( A, B, C, \) and \( D \) are literal ports on the ECAL module
- \( w, x, y, \) and \( z \) are substituted for PNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: \( A_2, B_3, D_1 \)

If either the receive port or source port (or load port for 2-port cal) of the CALC:PAR:SELeected measurement is not in this string and orientation is OFF, an attempt to perform an ECal calibration will fail.

**Examples**

```
SENSe:CORR:PREF:ECAL:PMAP ECAL2, 'A1,B2'
SENSe:CORR:PREF:ECAL:PMAP ECAL3, 'a2,b1,c3'
```

**Query Syntax**

SENSe:CORR:PREF:ECAL:PMAP? <module>

**Return Type**

String

**Default**

Null string ()
(Read-Write) Sets and returns a preference for the Unguided Cal behavior described below. This setting persists until it is changed.

This preference can also be set ON by executing the script on the PNA at C:/Program Files/Agilent/Network Analyzer/System/wincal32.reg.

Parameters

<bool> Boolean - Choose from:

0 - OFF - Reverts to new (preferred) behavior. An error is returned if standard data is not acquired before sending SENS:CORR:COLL:SAVE.

1 - ON - (WinCal compatible) Prevents SENS:CORR:COLL:SAVE from failing when standard data has not, and will not, be acquired.

Learn more about old and new behaviors.

Examples

SENS:CORR:PREF:SIMC 0
sense:correction:preference:simcal 1

Query Syntax
SENSe:CORRection:PREFerence:SIMCal?

Return Type
Boolean

Default
0

SENSe:CORRection:PREFerence:TRIG:FREE <char>, <bool>

(Read-Write) Sets and returns the preference for the trigger behavior during a calibration. This setting persists until it is changed.

Note: If TRIGger:SOURce = Manual, during a calibration the PNA ALWAYS switches to Internal for one trigger, then back to Manual, regardless of this preference command.

Parameters

<char> Character - Calibration type. Choose from:

GUIDed - preference setting pertains to a Guided calibration.

UNGuided - preference setting pertains to an Unguided calibration.

<bool> Boolean - Choose from:

0 - OFF - The trigger behavior during the specified calibration type DOES respect the setting of the TRIGger:SOURce command. For example, when Trigger source = External, the single trigger method will wait for the External
trigger signal and then allow only one sweep.

1 - ON - (Pre-6.0 behavior) The trigger behavior during the specified calibration type does NOT respect the setting of the TRIGger:SOURce command. For example, when Trigger source = External, during calibration the PNA switches to Internal sweep, responds to one trigger signal to measure the standard, then switches back to External.

**Examples**

<table>
<thead>
<tr>
<th>SENS:CORR:PREF:TRIG:FREE GUID,1</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense:correction:preference:trig:free unguided,0</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe:CORRection:PREFerence:TRIG:FREE? <char>

**Return Type**

Boolean

**Default**

OFF for both calibration types.

---

**SENSe<cnum>:CORRection:RPOWer:OFFSet[:AMPLitude] <num>**

(Read-Write) Adjusts a receiver power cal to account for components or adapters that are added between the source port and receiver while performing this cal. For more information, see Receiver Cal.

**Parameters**

- <cnum>: Any existing channel number. If unspecified, value is set to 1
- <num>: Offset Value in dB. Specify loss as a negative number; and gain as a positive number. Choose a number between -200 and 200.

**Examples**

<table>
<thead>
<tr>
<th>SENS:CORR:RPOW:OFFS .5</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense2:correction:rpower:offset:amplitude .-5</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:CORRection:RPOWer:OFFSet[:AMPLitude]?

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:CORRection:RVELocity:COAX <num>**
(Read-Write) Sets the velocity factor to be used with Electrical Delay and Port Extensions.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Velocity factor. Choose a number between 0 and 10

(0.66 polyethylene dielectric; .7 PTFE dielectric)

**Examples**

```
SENS:CORR:RVEL:COAX .66
sense2:correction:rvelocity:coax .70
```

**Query Syntax**

```
SENSe<cnum>:CORRection:RVELocity:COAX?
```

**Return Type** Numeric

**Default** 1

---

**SENSe<cnum>:CORRection:SFORward[:STATe] <boolean>**

(Read-Write) Sets the direction a calibration will be performed when only one set of standards is used.

Use `SENSe:CORRection:TSTandards[:STATe] OFF` to specify that only one set of standards will be used.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<boolean>` ON (1) - FORWARD direction of a 2-port calibration will be performed
  
  OFF (0) - REVERSE direction of a 2-port calibration will be performed

**Examples**

```
SENS:CORR:SFOR 1
sense2:correction:sforward:state 0
```

See an example using this command

**Query Syntax**

```
SENSe<cnum>:CORRection:SFORward[:STATe]?
```

**Return Type** Boolean

**Default** ON

---

**SENSe<cnum>:CORRection[:STATe] <ON | OFF>**
(Read-Write) Turns error correction ON and OFF for the specified channel.

**Note:** Before using this command you must select a measurement using `CALC:PAR:SEL`. You can select one measurement for each channel.

### Parameters

- `<cnum>`  
  Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`  
  - **ON** (or 1) - correction is applied to the channel.
  - **OFF** (or 0) - correction is NOT applied to the channel.

### Examples

```plaintext
SENS:CORR ON
sense2:correction:state off
```

### Query Syntax

```
SENSe<cnum>:CORRection[:STATe]?
```

To query the error correction state for a measurement, use `CALC:CORR:STATe?`

### Return Type

- **Boolean** (1 = ON, 0 = OFF)

### Default

OFF

---

**SENSe<cnum>:CORRRection:TCOLOd:USER:VALue <num>**

(Read-Write) Sets and returns the temperature of the noise source connector. Learn more about Noise Figure Calibration.

### Parameters

- `<cnum>`  
  Any existing channel number. If unspecified, value is set to 1.
- `<num>`  
  Noise source temperature in Kelvin.

### Examples

```plaintext
SENS:CORR:TCOL 295
sense2:correction:tcold 298
```

See an example using this command

### Query Syntax

```
SENSe<cnum>:CORRection:TCOLd:USER:VALue?
```

### Return Type

- **Numeric**

### Default

Not Applicable

---

**SENSe<cnum>:CORRRection:TSTandards[:STATe] <boolean>**
(Read-Write) Specifies the acquisition of calibration data using ONE or TWO sets of standards.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<boolean>`
  - **ON (1)** - TWO identical sets of standards will be used to simultaneously calibrate two ports (for both Forward and Reverse parameters).
  - **OFF (0)** - ONE set of standards will be used to perform a full 2-port calibration, one port at a time.

When specifying ON (use two sets), the `SENS:CORR:COLL:ACQuire` command uses the same standard index for each calibration class. To specify the calibration standard gender for each port, you must first ensure that the order of calibration class accurately reflects the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

**Examples**

```plaintext
SENS:CORR:TST 1
sense2:correction:tstandard:state 0
```

See an example using this command

**Query Syntax**

`SENSe<cnum>:CORRection:TSTandards[:STATe]?`

**Return Type**

Boolean

**Default**

ON

`SENSe:CORRection:TYPE:CATalog? <char>`
(Read-Write) Lists the Cal Types in the PNA by either GUID or registered name. Learn more about applying Cal Type using SCPI.

**Note:** Before using this command you must select a measurement using `CALC:PAR:SEL`. You can select one measurement for each channel.

**Parameters**

<char> Specifies the type of list. Choose from:

- **GUID** - the registered GUID of the Cal Type
- **NAME** - the registered name of the Cal Type

**Examples**

```
SENS:CORR:TYPE:CAT? GUID
```

**Query Syntax**

```
SENSe<cnum>:CORRection:TYPE:CATalog? <char>
```

**ReturnType**

Comma-separated string

**Default**

Not Applicable

---

**SENSe:CORRection:CKIT:ECAL<mod>:CLIS?**
(Read-only) Returns a list of characterizations stored in the specified ECal module.

**Parameters**

<mod> ECal module from which to read user characterization numbers. If unspecified, value is set to 1.

**Examples**

Module 1 contains User Characterizations 1 and 3.

SENSe:CORRection:CKIT:ECAL:CLIST?

Returns the following (0 always indicates the factory characterization):

0,1,3

**Return Type**

Numeric list, separated by commas.

**Default**

Not Applicable

---

SENSe:CORRection:CKIT:ECAL:DMEMory:CLEar <kitName>

(Write-only) Deletes user characterizations from PNA disk memory.

**Parameters**

<kitName> Optional String argument. ECal Model, User Characterization name + " ECal", and serial number of the ECal module, separated by spaces. See examples below.

If unspecified, ALL User Characterizations that are stored in PNA disk memory are deleted.

**Examples**

'These examples all use "MyUserChar" as the User characterization name.

'The "My User Char" characterization is deleted from disk memory.

'All User characterizations are deleted from disk memory.

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

SENSe:CORRection:CKIT:ECAL:DMEMory:IMPort <file>
After the PNA disk memory is Exported to a file, use this command to Import the file into PNA disk memory, which allows the User Characterization to be used with the PNA and ECal module.

**Note:** An ECal confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

**Parameters**

- `<file>` String. Full path and file name of file that was exported.

**Examples**

```plaintext
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

(SENSE:CORR:CKIT:ECAL:EXPort <kit>,<file>,<NewName>)

(Write-only) Saves an existing ECal characterization to a file. Use this command to archive the user characterization or to move the characterization to a different PNA for use with the specified ECal module. After exporting the user characterization, use **SENS:CORR:CKIT:ECAL:DMEM:IMPport** to make the user characterization available for use.

**Parameters**

- `<kit>` String. Not case sensitive. ECal Model, User char name + " ECal", and serial number of the ECal module used for the characterization, separated by spaces. See examples below.

  If the model and serial number of the module is not found, an error is returned.

- `<file>` Optional String argument. Path and filename of the user characterization. If not specified, the file is saved using characterization name + ".euc". If the path is not specified, it is stored in C:/Program Files/Agilent/Network Analyzer/ECal User Characterizations/. The extension ".euc" is appended if one is not specified.

- `<NewName>` Optional String argument. This allows you to change the name for the User Characterization. When specified, the new name is saved in the file with the characterization. If unspecified, the existing user characterization name is saved.

**Examples**

'**These examples all use "MyUserChar" as the User characterization name.**

'All parameters specified

(Read-only) This command is replaced with SENS:CORR:CKIT:ECAL:KNAM:INF?

Reads the user-characterization information from the specified ECal module. This command returns the same values as SENS:CORR:COLL:CKIT:INF?

**Parameters**

- **<mod>**  
  ECal module to read characterizations from. Choose from:
  
  1 through 8. If unspecified, value is set to 1.

- **<char>**  
  Optional argument. Specifies which characterization within the ECal module to read information from. If not specified, value is set to CHAR0.

Choose from:

- CHAR0  
  Factory characterization (data that was stored in the ECal module by Agilent)

- CHAR1  
  User characterization #1

- CHAR2  
  User characterization #2

- CHAR3  
  User characterization #3

- CHAR4  
  User characterization #4

- CHAR5  
  User characterization #5

Query Syntax  
**Default** Not Applicable
Examples

'Example return string:

ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002

Return Type Character
Default Not Applicable

SENSe:CORRection:CKIT:ECAL:KNAMe:INFormation? <kitName>
(Read-only) This command replaces SENS:CORR:COLL:CKIT:INF?

Reads the user-characterization information from the specified ECal module or PNA disk memory.

Learn more about User Characterization in PNA Disk Memory.

Parameters

<kitName> String. ECal kit name and user characterization to read information from.

Optionally include the serial number in the <kit name>. Include the serial number when two or more ECal modules with same model number are attached to the PNA, or the PNA may not be referencing the intended ECal module.

Examples

'For a factory characterization in module memory:

'For user characterization in module memory:

'For user characterization in disk memory:

'Example return string:

ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002

Return Type Character
Default Not Applicable
**SENSe:CORRection:CKIT:ECAL:LIST?**

(Read-only) Returns a list of index numbers to be used for referring to the ECal modules that are currently attached to the PNA.

**Examples**

```
SENS:CORR:CKIT:ECAL:LIST?

'If 2 modules are attached to the PNA
'then the returned list will be:

1,2
```

**Return Type** Numeric list, separated by commas.

**Default** Not Applicable

---

**SENSe<ch>:CORRection:CKIT:ECAL<n>:ORIent? <pnaPort>[,<charN>]**

(Read-only) Returns the ECal port that is connected to the specified PNA port. A calibration does not have to be in process.

- `<ch>` Channel number that contains the frequency range to be calibrated.
- `<n>` ECal module number. If unspecified (only one ECal module is connected to the USB), `<n>` is set to 1. If two or more modules are connected, use **SENS:CORR:CKIT:ECAL:LIST?** to determine how many, and **SENS:CORR:CKIT:ECAL:INF?** to verify their identities.
- `<pnaPort>` PNA port number.
- `<charN>` Optional argument. If unspecified, factory data (CHAR0) is used. User Characterization number that matches the physical adapters/fixtures that are on the ECal module. This aids in determining the orientation of the ECal module.

Choose from:

- **CHAR0** Factory characterization (data that was stored in the ECal module by Agilent)
- **CHAR1** User characterization #1
- **CHAR2** User characterization #2
  
  and so forth up to:

- **CHAR12** User characterization #12

Beginning with A.08.33, up to 12 User Characterizations can be stored in a single ECal module. Previous releases allowed up to 5. [Learn more](#).
Examples

SENSe:CORRection:CKIT:ECAL1:ORI? 2
sense2:correction:ckit,ecal1:orient? 2, char2

Return Type

The returned ECal port number is a 1-based number: 1 = Port A, 2 = Port B, 3 = Port C, 4 = Port D.

Zero (0) is returned when the auto-orientation routine is unable to resolve the orientation.

Default
Not Applicable

SENSe:CORRection:CKIT:ECAL<n>:PATH:COUNt? <path>

(Read-only) Returns the number of unique states that exist for the specified path name on the selected ECal module.

This command performs exactly the same function as CONT:ECAL:MOD:PATH:COUNt?

Use the CONT:ECAL:MOD:PATH:STAT command to set the module into one of those states.

Use SENS:CORR:CKIT:ECAL:PATH:DATA? to read the data for a state.

Parameters

<n> USB number of the ECal module. If unspecified (only one ECal module is connected to the USB), <n> is set to 1. If two or more modules are connected, use SENS:CORR:CKIT:ECAL:LIST? to determine how many, and SENS:CORR:CKIT:ECAL:INF? to verify their identities.

<path> Name of the path for which to read number of states. Choose from:

Reflection paths

- A
- B
- C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
Examples

```
CONT:ECAL:MOD:PATH:COUNT?
control:ecal:module2:path:count?
```

Return Type
Integer

Default
Not Applicable

**SENSe<ch>:CORRection:CKIT:ECAL<num>:PATH:DATA? <path>, <stateNum>[,<char>]**

(Read-only) Returns the data for a state from the memory of the selected ECAl module. The returned data is interpolated if necessary to have the same stimulus values as the specified channel `<ch>`.

- For a reflection path state, the data is reflection S-parameter data. The number of values equals the number of stimulus points on the channel multiplied by 2 (because they are complex numbers).
- For a transmission path state, the data is all 4 S-parameters of the state. The number of values returned is 4 times that of a reflection state.

The data is returned in the same format as **CALC:DATA:SNP?**

**Note:** This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<num>` Optional argument. USB number of the ECAl module. If unspecified (only one ECAl module is connected to the USB), `<num>` is set to 1. If two or more modules are connected, use **SENS:CORR:CKIT:ECAL:LIST?** to determine how many, and **SENS:CORR:CKIT:ECAL:INF?** to verify their identities.
- `<path>` Name of the path for which to read number of states. Choose from:

  Reflection paths
  
  - A
  - B
  - C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

<stateNum> Number of the state to set. Refer to the following table to associate the <stateNum> with a state in your ECal module.

In addition, **CONT:ECAL:MOD:PATH:COUNt?** returns the number of states in the specified ECal module.

<table>

Two-Port Transmission States

| 1          | Thru                      | Thru          | Thru           | Thru         |
** The following modules have only FOUR Impedance states (1, 2, 3, 4): N4690B, N4691B, N4692A, N4696B.

<char> Optional argument. Specifies which characterization within the ECal module to read information from. If not specified, value is set to CHAR0.

Choose from:

- **CHAR0** Factory characterization (data that was stored in the ECal module by Agilent)
- **CHAR1** User characterization #1
- **CHAR2** User characterization #2
- and so forth up to:

- **CHAR12** User characterization #12

**Examples**

```
```

**Return Type** S1P or S2P

**Default** Not Applicable

---

**SENSe:CORRRection:CKIT:EXPort <kit>[,<file>]**

(Write-only) Saves an existing cal kit definitions to a file. Use this command to archive or move a user-defined or modified cal kit to a different PNA. After exporting the cal kit, use **SENS:CORR:CKIT:IMPort** to make the cal kit available for use on the PNA. This command provides the same behavior as the Installed Kits - Save As button on the Edit PNA Cal Kits dialog.

**Parameters**

- **<kit>** String. Not case sensitive. Name of the cal kit to export, as seen in the Cal Kits field of the Select DUT Connectors and Cal Kits dialog of a SMART Cal.
- **<file>** Optional String argument. Path and filename to where the Cal Kit file is to be saved. If not specified, the file is saved using <kit> + ".ckt". If the path is not specified, it is stored in C:/Program Files/Agilent/Network Analyzer/PNACalKits/User.

**Examples**

- 'File unspecified
  **SENS:CORR:CKIT:EXP "MyCalKit"**
- 'Both parameters are specified
SENSe:CORRection:CKIT:IMPort <string>

(Write-only) Imports the specified cal kit (.ckt file) and appends the imported kit to the end of the list of kits.

Parameters

<string> Path and cal kit name.

Examples

SENSe:CORRection:CKIT:IMPort "C:/Program Files/Agilent/Network Analyzer/Documents/85033D.ckt"

SENSe:CORRection:CKIT:INITialize[:IMMediate] [ckit]

(Write-only) Restores default factory installed cal kits.

Note: This command can also delete all existing User-defined Cal Kits. However, if saved using Save As, these kits can be restored in the same manner as after a PNA firmware upgrade. Learn more about saving modified Cal Kits.

Parameters

[ckit] Optional String. Cal Kit to restore. If not specified, all PNA factory Cal kits are restored.

Examples

SENSe:CORRection:CKIT:INITialize

SENSe:CORRection:ckit:initialize:immediate "85052B"

SENSe:CORRection:CKIT:LOAD <string>
(Write-only) Loads the specified collection of cal kits from a .wks file. You can make your own collection of cal kits from the Advanced Modify Cal Kit menu.

**Parameters**

- `<string>` Path and file name of the cal kit collection.

**Examples**

```
sense:correction:ckit:load "C:/Program Files/Agilent/Network Analyzer/PnaCalKits/factory/wMyCalKits.wks"
```

**Query Syntax** Not Applicable

**Default** Not Applicable

Last modified:

- **11-Apr-2011** Edited Orient? command
- **15-Jun-2010** Updated for 12 User Chars
- **19-May-2009** Added [ckit] argument to clear and init
- **24-Mar-2009** Edited Path SNP
- **6-Mar-2009** Added ECal orient?
- **31-Oct-2008** Added Characterizations (8.33)
- **16-Jun-2008** Added CKIT:INIT note
- **10/16/06** Modified Ecal:Data to include `<ch>`
**Sense:Correction:Collect:Kit Commands**

Use to change the definitions of calibration kit standards.

Click on a **blue** keyword to view the command details.

**Red** keywords are superseded commands.

Most of these commands act on the currently selected standard from the currently selected calibration kit.

- To select a Calibration kit, use `SENS;CORR;COLL:CKIT:SEL`.
- To select a Calibration standard, use `SENS;CORR;COLL:CKIT:STAN:SEL`.
- See an **example** program that [CREATES a New Cal Kit](#).
- See an **example** program that [MODIFIES an Existing Cal Kit](#).
- Learn about Modifying Cal Kits.
- [Synchronizing the PNA and Controller](#)
- [SCPI Command Tree](#)

**Note:** You should provide data for every definition field - for every standard in your calibration kit. If a field is not set, the default value may not be what you expect.

For more information, read [Specifying Calibration Standards and Kits for Agilent Vector Network Analyzers (Application Note 1287-11)](#).

---

**SENSe:CORRection:COLLect:CKIT:CATalog?**
(Read-only) Returns the names of the first 50 mechanical cal kits in your PNA that can be used for unguided calibrations.

**Examples**
```
SENS:CORR:COLL:CKIT:CAT?
```

**Return Type**
A comma-separated string

**Default**
Not Applicable

---

**SENSe:CORRRection:COLLect:CKIT:CONNector:ADD**
```
<familiy>,<start>,<stop>,<z0>,<gender>,<media>,<cutoff>
```

(Write only) Creates a new connector. The connector is automatically added to the list of available connectors for the currently selected cal kit. If a connector includes both male and female connectors, each connector must be added separately.

**Parameters**
- `<family>` (String) Name of connector family. Limited to 50 characters.
- `<start>` Start frequency
- `<stop>` Stop frequency
- `<z0>` Characteristic Impedance of the connector in ohms.
- `<gender>` Connector gender. Choose from:
  - MALE
  - FEMALE
  - NONE
- `<media>` Media of the connector. Choose from:
  - COAX - coaxial
  - WAVE - waveguide
- `<cutoff>` Cutoff frequency of the connector (waveguide only).

**Examples**
```
SENS:CORR:COLL:CKIT:CONN:ADD "PSC 1.8 mm",0 HZ,999.9 GHZ,50,FEMALE,COAX,0.0
SENS:CORR:COLL:CKIT:CONN:ADD "PSC 1.8 mm",0 HZ,999.9 GHZ,50,MALE,COAX,0.0
```

**Query Syntax**
Not applicable

**Default**
Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CONNector:CATalog?**
(Read-only) Returns a comma-separated list of all connectors defined within the currently selected calibration kit. The returned string includes the connector family name followed by the connector gender, if any. Kits may include a primary connector family name and additional connector family names.

Connector family names are case sensitive. A connector family named "PSC 2.4" is different from a connector family named "psc 2.4".

Learn more about Connector Family Name

**Examples**

```
SENS:CORR:COLL:CKIT:CONN:CAT?

'Returned string

"Type-N (50) male, Type-N (50) female"
```

**Default** Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CONNector:DELete**

(Write-only) Deletes the primary connector family name from the selected kit. The PNA allows multiple connector families for each kit. If a kit includes multiple connector families, only the first listed (primary) connector family name is deleted.

Once the connector family is deleted, the connector may not be assigned to any new or existing standard within the kit.

The previously defined standards retain their association to the deleted connector name. To reassign standards to a new connector family name, use **SENS:CORR:COLL:CKIT:CONN:SNAMe**.

**Examples**

```
SENS:CORR:COLL:CKIT:CONN:DEL
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CONNector:FNAME <name>**
(Read-Write) Replaces the primary connector family name from the selected kit with a new connector family name. The connector family name is replaced in all standards in the kit that share that name. The PNA allows multiple connector families for each kit. If a kit includes multiple connector families, only the first listed (primary) connector family name is replaced. Use the query form of this command to return the name of the primary connector family.

**Parameters**

- `<name>` New connector family name. Limited to 50 characters.

**Examples**

```
SENS:CORR:COLL:CKIT:CONN:FNAME 'MYPSC35'
```

```
Sense:correction:collect:ckit:connector:name 'My Type N'
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:CONNector:FNAMe?
```

**Return Type**

String

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CONNector:SNAMe <family>,<gender>,<port>**

(Read-Write) Assigns a family name to the currently selected standard from the currently selected kit. Specify each port of a 2-port standard individually. Use the query form of this command to read the connector family name assigned to the current standard. The name is not assigned unless the connector family name is previously defined within the selected kit.

**Parameters**

- `<family>` String. Connector family name.
- `<gender>` Connector gender. Choose from:
  - MALE
  - FEMALE
  - NONE
- `<port>` Number of the connector port to be assigned the connector family name. 2-port standards such as a thru line must be assigned separately. It is not relevant which connector is port 1 or port 2.
  - 1 Specifies a 1-port standard or the first port of a 2-port standard.
  - 2 Specifies the second port of a 2-port standard.

**Examples**

```
SENS:CORR:COLL:CKIT:CONN:SNAME "Type-N (50)",MALE,1
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:CONNector:SNAME?
```

**Return Type**

String
SENSe:CORRection:COLLect:CKIT:DESCription <string>

(Read-Write) Modifies the cal kit description field of the selected kit. This description appears in the Edit PNA Cal Kit dialog box.

Parameters

<string> Description of the cal kit. Limited to 50 characters.

Examples

SENSe:CORRection:COLLect:CKIT:DESC "My New CalKit"

Query Syntax

SENSe:CORRection:COLLect:CKIT:DESCription?

Return Type

String

Default

Not Applicable

SENSe:CORRection:COLLect:CKIT:INFormation? <module>[,.char]

(Read Only) Reads characterization information from an ECal module.

Parameters

<string> Specifies which ECal module to read from. Choose from:

ECAL1

. through.

ECAL8

[char] Optional argument.

Specifies which characterization within the ECal module to read information from. If this argument is not used, the default is CHAR0. CHAR1 through CHAR5 are for user characterizations that may have been written to the module by the User Characterization feature on the PNA. Choose from:

CHAR0 Factory characterization (data that was stored in the ECal module by Agilent)

CHAR1 User characterization #1

CHAR2 User characterization #2

CHAR3 User characterization #3
SENSe:CORRection:COLLect:CKIT:NAME <name>

(Read-Write) Sets a name for the selected calibration kit.

Parameters

- `<name>` Calibration Kit name. Any string name, can include numerics, period, and spaces; any length (although the dialog box display is limited to about 30 characters).

Examples

SENSe:CORRection:COLLect:CKIT:NAME 'MYAPC35'
sense:correction:collect:ckit:name 'mytypen'

Query Syntax
SENSe:CORRection:COLLect:CKIT:NAME?

Return Type
String

Default
Not Applicable

SENSe:CORRection:COLLect:CKIT:OLABel<class> <name>

(Read-Write) Sets the label for the calibration class designated by `<class>`. The label is used in the prompts for connecting the calibration standards associated with that `<class>`.

Parameters

- `<class>` Number of the calibration class. Choose a number between: 1 and 18. The `<class>` numbers are associated with the following calibration Classes:
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>S11A Reflection standard</td>
</tr>
<tr>
<td>2</td>
<td>S11B Reflection standard</td>
</tr>
<tr>
<td>3</td>
<td>S11C Reflection standard</td>
</tr>
<tr>
<td>4</td>
<td>S21T Thru/Delay standard</td>
</tr>
<tr>
<td>5</td>
<td>S22A Reflection standard</td>
</tr>
<tr>
<td>6</td>
<td>S22B Reflection standard</td>
</tr>
<tr>
<td>7</td>
<td>S22C Reflection standard</td>
</tr>
<tr>
<td>8</td>
<td>S12T Thru/Delay standard</td>
</tr>
</tbody>
</table>

### 3-port analyzers only

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>S33A Reflection standard</td>
</tr>
<tr>
<td>10</td>
<td>S33B Reflection standard</td>
</tr>
<tr>
<td>11</td>
<td>S33C Reflection standard</td>
</tr>
<tr>
<td>12</td>
<td>S32T Thru/Delay standard</td>
</tr>
<tr>
<td>13</td>
<td>S23T Thru/Delay standard</td>
</tr>
<tr>
<td>14</td>
<td>S31T Thru/Delay standard</td>
</tr>
<tr>
<td>15</td>
<td>S13T Thru/Delay standard</td>
</tr>
</tbody>
</table>

### TRL Calibrations

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>TRL &quot;T&quot; Thru standard</td>
</tr>
<tr>
<td>17</td>
<td>TRL &quot;R&quot; Reflect standard</td>
</tr>
<tr>
<td>18</td>
<td>TRL &quot;L&quot; Line standard</td>
</tr>
</tbody>
</table>

<name> Label for the calibration class. Must be enclosed in quotes. Any string between 1 and 12 characters long. Cannot begin with a numeric.

Examples

```
SENS:CORR:COLL:CKIT:OLAB3 'LOADS'
sense:correction:collect:ckit:olabel4 'Thru'
```

**Return Type** String

**Default** Not Applicable

**SENSe:CORRection:COLLect:CKIT:OLIST[class]?**

*(Read-only)* Returns seven values of standards that are assigned to the specified class.

**Parameters**

<class> Number of the calibration class to be queried. The <class> numbers are associated with the following calibration Classes:
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>S11A Reflection standard</td>
</tr>
<tr>
<td>2</td>
<td>S11B Reflection standard</td>
</tr>
<tr>
<td>3</td>
<td>S11C Reflection standard</td>
</tr>
<tr>
<td>4</td>
<td>S21T Thru/Delay standard</td>
</tr>
<tr>
<td>5</td>
<td>S22A Reflection standard</td>
</tr>
<tr>
<td>6</td>
<td>S22B Reflection standard</td>
</tr>
<tr>
<td>7</td>
<td>S22C Reflection standard</td>
</tr>
<tr>
<td>8</td>
<td>S12T Thru/Delay standard</td>
</tr>
</tbody>
</table>

3-port analyzers ONLY

4-port analyzers use S11 and S22 classes *(see example program)*

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>S33A Reflection standard</td>
</tr>
<tr>
<td>10</td>
<td>S33B Reflection standard</td>
</tr>
<tr>
<td>11</td>
<td>S33C Reflection standard</td>
</tr>
<tr>
<td>12</td>
<td>S32T Thru/Delay standard</td>
</tr>
<tr>
<td>13</td>
<td>S23T Thru/Delay standard</td>
</tr>
<tr>
<td>14</td>
<td>S31T Thru/Delay standard</td>
</tr>
<tr>
<td>15</td>
<td>S13T Thru/Delay standard</td>
</tr>
</tbody>
</table>

**TRL Calibrations**

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>TRL &quot;T&quot; Thru standard</td>
</tr>
<tr>
<td>17</td>
<td>TRL &quot;R&quot; Reflect standard</td>
</tr>
<tr>
<td>18</td>
<td>TRL &quot;L&quot; Thru standard</td>
</tr>
</tbody>
</table>

**Examples**

<table>
<thead>
<tr>
<th>Examples</th>
<th>SENS:CORR:COLL:CKIT:OLIST8?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Always returns 7 standard numbers. Unassigned standards return 0</td>
</tr>
</tbody>
</table>

**Return Type**

Numeric; returns the `<class>` number of the selected standard.

**Default**

Not Applicable

(Read-Write) Sets a standard number to a calibration class. Does NOT set or dictate the order for measuring the standards. For more information, see Assigning Standards to a Calibration Class

Parameters

$class$ Number of the calibration class that is assigned to $<standard>$. Choose a number between: 1 and 18. The $<class>$ numbers are associated with the following calibration Classes:

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>S11A Reflection standard</td>
</tr>
<tr>
<td>2</td>
<td>S11B Reflection standard</td>
</tr>
<tr>
<td>3</td>
<td>S11C Reflection standard</td>
</tr>
<tr>
<td>4</td>
<td>S21T Thru/Delay standard</td>
</tr>
<tr>
<td>5</td>
<td>S22A Reflection standard</td>
</tr>
<tr>
<td>6</td>
<td>S22B Reflection standard</td>
</tr>
<tr>
<td>7</td>
<td>S22C Reflection standard</td>
</tr>
<tr>
<td>8</td>
<td>S12T Thru/Delay standard</td>
</tr>
</tbody>
</table>

3-port analyzers ONLY

4-port analyzers use S11 and S22 classes (see example program)

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>S33A Reflection standard</td>
</tr>
<tr>
<td>10</td>
<td>S33B Reflection standard</td>
</tr>
<tr>
<td>11</td>
<td>S33C Reflection standard</td>
</tr>
<tr>
<td>12</td>
<td>S32T Thru/Delay standard</td>
</tr>
<tr>
<td>13</td>
<td>S23T Thru/Delay standard</td>
</tr>
<tr>
<td>14</td>
<td>S31T Thru/Delay standard</td>
</tr>
<tr>
<td>15</td>
<td>S13T Thru/Delay standard</td>
</tr>
</tbody>
</table>

TRL Calibration

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>TRL &quot;T&quot; Thru standard</td>
</tr>
<tr>
<td>17</td>
<td>TRL &quot;R&quot; Reflect standard</td>
</tr>
<tr>
<td>18</td>
<td>TRL &quot;L&quot; Line standard</td>
</tr>
</tbody>
</table>
Standard number to be assigned to the class; Choose a standard between 1 and 8. One standard is mandatory; up to six additional standards are optional.

**Examples**
- Assigns standard 3 to S11A class:
  ```
  SENS:CORR:COLL:CKIT:ORD1 3
  ```
- Assigns standard 2 and 5 to S21T class class:
  ```
  sense:correction:collect:ckit:order4 2,5
  ```

**Query Syntax**
- `SENSe:CORRection:COLLect:CKIT:ORDer<class>?`
  - 'Returns only the first standard assigned to the specified class. To query the remaining standards, use `SENSe:CORRection:COLLect:CKIT:OLIST[1-15]`?

**Return Type**
- Numeric
- **Default** Not Applicable

---

**SENSe<cnum>:CORRection:COLLect:CKIT:PORT<n>[:SELect] <string>**

(Read-Write) Sets and returns the name of the Cal Kit to use for unguided cal.

**Parameters**
- `<cnum>` Currently not used. The unguided cal kit selection is for all ports on all channels.
- `<n>` Currently not used. The unguided cal kit selection is for all ports on all channels.
- `<string>` Cal Kit name enclosed in quotes. Use `SENS:CORR:COLL:CKIT:CAT?` to read a list of all available Cal Kits in the PNA.

**Examples**
- `SENS:CORR:COLL:CKIT:PORT "85052B"
- `sense2:correction:collect:ckit:port:select "85052D"

**Query Syntax**
- `SENSe<cnum>:CORRection:COLLect:CKIT:PORT<n>:SELECT?`
- **Return Type** String
- **Default** Last kit selected

---

**SENSe:CORRection:COLLect:CKIT:RESet <num>** - Superseded
This command is replaced by Sens:Corr:Ckit:Init.

(Write-only) Resets the selected calibration kit to factory default definition values.

**Parameters**

- `<num>` The number of the calibration kit to be reset. Choose any integer between 1 and 8.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:COLL:CKIT:RESet 1</td>
</tr>
<tr>
<td>sense:correction:collect:ckit:reset 4</td>
</tr>
</tbody>
</table>

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

---

**SENSe<cnum>:CORRection:COLLect:CKIT[:SELect] <num>**

(Read-Write) Selects (makes active) a calibration kit for performing an UNGUIDED calibration or for modifying standards. All subsequent "CKIT" commands that are sent apply to this selected calibration kit. Select a calibration standard using SENS:CORR:COLL:CKIT:STAN <num>. Kits 1 to approximately kit 37 are factory installed Cal Kits.

Use the Edit PNA Cal Kits dialog to see the name that is associated with each Kit ID <num>.

Another method is to iterate through the cal kits, select the kit using this command, then query the name using SENS:CORR:COLL:CKIT:NAME.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<num>` The number of the calibration kit. Choose from:

<table>
<thead>
<tr>
<th>Kit ID</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cal Kit 1</td>
</tr>
<tr>
<td>2</td>
<td>Cal Kit 2</td>
</tr>
<tr>
<td>3</td>
<td>Cal Kit 3</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>48</td>
<td>Cal Kit 48</td>
</tr>
<tr>
<td>49</td>
<td>Cal Kit 49</td>
</tr>
<tr>
<td>50</td>
<td>Cal Kit 50</td>
</tr>
</tbody>
</table>

Use SENS:CORRection:COLLect:CKIT:RESet to restore Cal Kits to default values.
**SEnSe:CORRection:COLLect:CKIT:STANdard:C0 <num>**

*(Read-Write)* Sets the C0 value (the first capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at [www.Agilent.com](http://www.Agilent.com).

**Parameters**

- `<num>` Value for C0 in femtofarads (1E-15)

**Examples**

The following commands set C0=15 femtofarads:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:C0?

**Return Type** Numeric

**Default** Not Applicable

---

**SEnSe:CORRection:COLLect:CKIT:STANdard:C1 <num>**

*(Read-Write)* Sets the C1 value (the second capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at [www.Agilent.com](http://www.Agilent.com).

**Parameters**

- `<num>` Value for C1.

**Examples**

The following two commands set C1=15:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:C1?

**Return Type** Numeric

**Default** Not Applicable
SENSe:CORRection:COLLect:CKIT:STANdard:C2 <num>

(Read-Write) Sets the C2 value (the third capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Agilent.com.

**Parameters**

- `<num>` Value for C2.

**Examples**
The following two commands set C2:

```
SENS:CORR:COLL:CKIT:STAN:C2 15
sense:correction:collect:ckit:standard:c2 15
```

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:C2?

**Return Type**
Numeric

**Default**
Not Applicable

---

SENSe:CORRection:COLLect:CKIT:STANdard:C3 <num>

(Read-Write) Sets the C3 value (the fourth capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Agilent.com.

**Parameters**

- `<num>` Value for C3.

**Examples**
The following two commands set C3:

```
SENS:CORR:COLL:CKIT:STAN:C3 15
sense:correction:collect:ckit:standard:c3 15
```

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:C3?

**Return Type**
Numeric

**Default**
Not Applicable

---

SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter <char>
(Read-Write) Sets the media type of the selected calibration standard.

**Parameters**

<char> Media type of the standard. Choose from:

- **Coax** - Coaxial Cable
- **Wave** - Waveguide

**Examples**

```
SENS:COR:COLL:CKIT:STAN:CHAR COAX
sense:correction:collect:ckit:standard:character wave
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter?
```

**Return Type** Numeric

**Default** Coax

---

**SENSe:CORRection:COLLect:CKIT:STANdard:DELay <num>**

(Read-Write) Sets the electrical delay value for the selected standard.

**Parameters**

<num> Electrical delay in picoseconds

**Examples**

```
The following two commands set delay to 50 picoseconds

SENS:CORR:COLL:CKIT:STAN:DEL 50e-12
sense2:correction:collect:ckit:standard:delay 50ps
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:DELay?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:FMAXimum <num>**
**SENSe:CORRection:COLLect:CKIT:STANdard:FMAXimum <num>**

(Read-Write) Sets the maximum frequency for the selected standard.

**Parameters**

<num>  Maximum frequency in Hertz.

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:FMAX 9e9  
sense:correction:collect:ckit:standard:fmaximum 9Ghz
```

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:FMAXimum?

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:FMINimum <num>**

(Read-Write) Sets the minimum frequency for the selected standard.

**Parameters**

<num>  Minimum frequency in Hertz.

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:FMIN 1e3  
sense:correction:collect:ckit:standard:fminimum 1khz
```

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:FMINimum?

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:IMPedance <num>**

(Read-Write) Sets the characteristic impedance for the selected standard.

**Parameters**

<num>  Impedance in Ohms

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:IMP 75  
sense:correction:collect:ckit:standard:impedance 50.3
```

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:IMPedance?

**Return Type**

Numeric

**Default**

50

---

**SENSe:CORRection:COLLect:CKIT:STANdard:L0 <num>**
**SENSe:CORRection:COLLect:CKIT:STANdard:L0**

*(Read-Write)* Sets the L0 value (the first inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at [www.Agilent.com](http://www.Agilent.com).

**Parameters**

- `<num>`: Value for L0 in femtohenries (1E-15)

**Examples**

The following two commands set L0=15 femtohenries:

```
SENS:CORR:COLL:CKIT:STAN:L0 15
sense:correction:collect:ckit:standard:l0 15
```

**Query Syntax**

`SENSe:CORRection:COLLect:CKIT:STANdard:L0?`

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:L1** `<num>`

*(Read-Write)* Sets the L1 value (the second inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at [www.Agilent.com](http://www.Agilent.com).

**Parameters**

- `<num>`: Value for L1.

**Examples**

The following two commands set L1=15:

```
SENS:CORR:COLL:CKIT:STAN:L1 15
sense:correction:collect:ckit:standard:l1 15
```

**Query Syntax**

`SENSe:CORRection:COLLect:CKIT:STANdard:L1?`

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:L2** `<num>`
(Read-Write) Sets the L2 value (the third inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Agilent.com.

**Parameters**

<num> Value for L2.

**Examples**
The following two commands set L2=15:

```
SENS:CORR:COLL:CKIT:STAN:L2 15
sense:correction:collect:ckit:standard:l2 15
```

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:L2?

**Return Type**
Numeric

**Default**
Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:L3 <num>**

(Read-Write) Sets the L3 value (the fourth inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Agilent.com.

**Parameters**

<num> Value for L3.

**Examples**
The following two commands set L3=15:

```
SENS:CORR:COLL:CKIT:STAN:L3 15
sense:correction:collect:ckit:standard:l3 15
```

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:L3?

**Return Type**
Numeric

**Default**
Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:LABel <name>**
(Read-Write) Sets the label for the selected standard. The label is used to prompt the user to connect the specified standard.

**Parameters**

- `<name>` Label for the standard; Must be enclosed in quotes. Any string between 1 and 12 characters long. Cannot begin with a numeric.

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:LAB 'OPEN'
sense:correction:collect:ckit:standard:label 'Short2'
```

**Query Syntax**

`SENSe:CORRection:COLLect:CKIT:STANdard:LABel?`

**Return Type**

String

**Default**

Not Applicable

---

`SENSe:CORRection:COLLect:CKIT:STANdard:LOSS <num>`

(Read-Write) Sets the insertion loss for the selected standard.

**Parameters**

- `<num>` Insertion loss in Gohms / sec. (GigaOhms per second of electrical delay)

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:LOSS 3.5e9
sense:correction:collect:ckit:standard:loss 3
```

**Query Syntax**

`SENSe:CORRection:COLLect:CKIT:STANdard:LOSS?`

**Return Type**

Numeric

**Default**

Not Applicable

---

`SENSe:CORRection:COLLect:CKIT:STANdard:REMove`

(Write only) Deletes the selected standard from the selected cal kit.

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:REMove
```

**Default**

Not Applicable

---

`SENSe:CORRection:COLLect:CKIT:STANdard:SDEscription <string>`
(Read-Write) Modifies the description of the selected standard of the selected kit. This description appears in the edit kit dialog box.

**Parameters**

<string> Description of the standard.

**Examples**

```
```

**Query Syntax**

```
SENS:CORR:COLL:CKIT:STAN:SDEScription?
```

**Return Type** String

**Default** Not Applicable

---

**SENS:CORR:COLL:CKIT:STANdard[:SELECT] <num>**

(Read-Write) Selects the calibration standard. All subsequent "CKIT" commands to modify a standard will apply to the selected standard. Select a calibration kit using SENS:CORR:COLL:CKIT:SEL

**Parameters**

<num> Number of the standard. Choose any number between: 1 and 30

**Examples**

```
SENS:CORR:COLL:CKIT:STAN 3
sense:correction:collect:ckit:standard:select 8
```

**Query Syntax**

```
SENS:CORR:COLL:CKIT:STANdard[:SELect]?
```

**Return Type** Numeric

**Default** 1

---

**SENS:CORR:COLL:CKIT:STANdard:TYPE <char>**
(Read-Write) Sets the type for the selected standard.

**Parameters**

<char> Choose from:
- OPEN
- SHORT
- LOAD
- SLOAD (sliding load)
- THRU (through)
- ARBI (arbitrary)

**Examples**

SENS:CORR:COLL:CKIT:STAN:TYPE LOAD
sense:correction:collect:ckit:standard:type short

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:TYPE?

**Return Type**

Character

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:TZReal <num>**

(Read-Write) Sets the TZReal component value of the Terminal Impedance for the selected standard.

**Note:** Only applicable when the Standard Type is set to **ARBI**

**Parameters**

<num> Value for TZReal in Ohms

**Examples**

The following commands set TZReal=15 Ohms:

SENS:CORR:COLL:CKIT:STAN:TZReal 15
sense:correction:collect:ckit:standard:TZReal 15

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:TZReal?

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard:TZImag <num>**
(Read-Write) Sets the TZImag component value of the Terminal Impedance for the selected standard.

**Note:** Only applicable when the Standard Type is set to **ARBI**

**Parameters**

<num> Value for TZImag in Ohms

**Examples**

The following two commands set TZImag=15 Ohms:

```
SENS:CORR:COLL:CKIT:STAN:TZImag 15
sense:correction:collect:ckit:standard:TZImag 15
```

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:TZImag?

**Return Type**

Numeric

**Default**

Not Applicable

---

SENSe<cnum>:CORRection:CSET:ACTivate <string>, <bool>

This command replaces SENS:CORR:CSET:GUID

(Read-Write) Selects and applies a Cal Set to the specified channel.

Use SENS:CORR:CSET:CAT? to list the Cal Sets.

Parameters

- **<cnum>**  Any existing channel number. If unspecified, value is set to 1
- **<string>**  Cal Set to make active. Specify the Cal Set by GUID or Name. Use SENS:CORR:CSET:CAT? to list the available Cal Sets in either format.
- **<bool>**  Should the Cal Set stimulus values be applied to the channel. Choose from:
  - **ON (1)**  Apply the Cal Set stimulus values to the channel.
  - **OFF (0)**  Do NOT apply the Cal Set stimulus values. If the Cal Set stimulus values do not match the channel stimulus values, then the following will occur:
    - If interpolation is ON, then interpolation will be attempted. This may fail if the channel frequency is outside the range of the Cal Set.
    - If interpolation is OFF, the selection will be abandoned and an error is returned:

Examples

```
SENS:CORR:CSET:ACT "My2Port",1
sense:correction:cset:activate? name
returns
"My2Port"
```

Query Syntax

SENSe<cnum>:CORRection:CSET:ACTivate? [GUID|NAME]

Returns the name of the Cal Set that is applied to the specified channel. Choose from GUID or NAME to specify which string is returned. If unspecified, the
GUID of the Cal Set is returned. If no Cal Set is applied to the specified channel, then "No Calset Selected" is returned.

<table>

</tbody>
</table>

**SENSe:CORRection:CSET:CATalog? [char]**

(Read-only) Returns a list of Cal Sets.

**Parameters**

- `<char>` Optional argument. The list is returned in one of the following formats. Both return comma-separated string lists.
  - **GUID** Cal Sets are listed by GUID (Default if unspecified).
  - **NAME** Cal Sets are listed by Name

**Examples**

```
SENS:CORR:CSET:CAT?

'Returns:
{FD6F863E-9719-11d5-8D6C-00108334AE96},{1B03B2CE-971A-11d5-8D6C-00108334AE96}

sense2:correction:cset:catalog? name
```

<table>
<thead>
<tr>
<th>Default</th>

</tr>
</thead>
</table>

**SENSe<cnum>:CORRection:CSET:COPY <string>**

(Write-only) Creates a new Cal Set and copies the current Cal Set data into it. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

**Parameters**

- `<cnum>` Channel number using the Cal Set to be copied. If unspecified, value is set to 1
- `<string>` Name of the new Cal Set.

**Examples**

```
SENS2:CORR:CSET:COPY 'My2Port'
```

**Query Syntax** Not Applicable

<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
</table>
SENSe<cnum>:CORRection:CSET:CREate [name]

(Write-only) Creates an empty Cal Set and attaches it to the specified channel. This command is ONLY necessary before remotely filling the Cal Set with error term data. (For Advanced Users).

A Cal Set is automatically created, applied to the channel, and saved at the completion of a guided cal according to the preference setting SENS:CORR:PREF:CSET:SAVE.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `[name]` Optional argument. Name of the Cal Set. Spaces or punctuation are NOT allowed. If unspecified, a unique name is chosen in the form "Calset_N" where N is a unique number.

**Examples**

SENSe:CORR:CSET:CRE 'My2Port'

**Query Syntax**

Not Applicable

**Default**

Not Applicable

SENSe<cnum>:CORRection:CSET:DATA <eterm, portA, portB,>[<param>,] <block>

(Read-Write) Read or Write a specific error term from/to the Cal Set currently attached to the specified channel. (For Advanced Users). The command can be used only for the error terms listed. See SENS:CORR:CSET:ETERM to get and put error term data using a string argument for all error terms.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<eterm, portA, portB>` Error Term, Port pair of the specified error term.
  - Although not all error terms use two port numbers, two are required by the PNA in all cases. Each port number must be between 1 and the number of ports on the PNA.
  - **EDIR** - directivity
    - portA: the port at which directivity is measured.
    - portB: Not used, but must be a valid PNA port number.
  - **ESRM** - source match
    - portA: the port at which source match is measured.
    - portB: Not used, but must be a valid PNA port number.
**ERFT** - reflection tracking

portA: the port at which reflection tracking is measured.

portB: Not used, but must be a valid PNA port number.

**ELDM** - load match

portA: the port at which load match is measured.

portB: the source port.

Load match is measured with a cable connected between the measured port (portA) and the source port (portB).

The cal system requires that the complete matrix of loadmatch arrays be filled. In most cases you can measure loadmatch once at a port, driven by any other port. Then use that data for all variations of the receive port. (The exception is the 3-port PNA models, which requires the loadmatch-measured port to be driven by every other port.)

For example: Measure the loadmatch at port2 while driving port1. Then upload this same data to the following arrays:

```
ELDM,2,1,<data>
ELDM,2,3,<data>
ELDM,2,4,<data>
```

**ETRT** - transmission tracking

portA: the receive port

portB: the source port for this measurement

**EXTLK** - crosstalk

portA: the receive port

portB: the source port for this measurement

**ERSPT** - response tracking.

portA: Not used, but must be a valid PNA port number.

portB: Not used, but must be a valid PNA port number.
ERSPI - response isolation.

portA: Not used, but must be a valid PNA port number.

portB: Not used, but must be a valid PNA port number.

<string> - required ONLY when Eterm is response tracking (ERSPT) or response isolation (ERSPI). Specify the S-parameter, ratio, or unratioed measurement for which the Eterm applies.

Logical receiver notation is allowed. Ratioed measurements do not require source port to be specified.

A full 4-port calibration requires the following terms be uploaded:

<table>
<thead>
<tr>

Reflection terms

Transmission terms

<Block> (Block). Error term data. A Real / Imaginary data pair for each data point.

Format is set using FORM:DATA command.

For REAL binary formats, refer to Getting Data from the Analyzer using SCPI
Example

'Set the directivity term with a cal set using 5 points

Query Syntax
SENSe<cnum>:CORRection:CSET:DATA? <eterm,portA, portB>

Return Type
Block data

Default
Not Applicable

SENSe:CORRection:CSET:DELete <string>
(Write-only) Deletes a Cal Set from the set of available Cal Sets. This method immediately updates the Cal Set file on the hard drive. If the Cal Set is currently being used by a channel or does not exist, this request will be denied and an error is returned.

Parameters

<string> Cal Set to be deleted. Specify the Cal Set by GUID or Name. Use SENSe:CORRection:CSET:CAT? to list the available Cal Sets in either format.

Examples
sense2:correction:cset:delete 'MyCalSet'

Query Syntax
Not Applicable

Default
Not Applicable

SENSe<cnum>:CORRection:CSET:DESCription <string>
(Read-Write) Sets or returns the descriptive string assigned to the selected Cal Set. Change this string so that you can easily identify each Cal Set. Apply and select the Cal Set using SENSe:CORRection:CSET:ACT.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1
<string> The descriptive string associated with the currently-selected Cal Set

Examples
SENSe:CORRection:CSET:DESC 'MyCalSet'
sense2:correction:cset:description 'thisCalSet'

Query Syntax
SENSe<cnum>:CORRection:CSET:DESCription?

Return Type
String

Default
Not Applicable
SENSe<cnump>:CORRection:CSET:ETERm <string>,<r, i [r,i]...>

(Read-Write) Sets or returns error term data for all PNA measurements.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <string> (String) Error term to read or write. The error term is specified using the EXACT case-sensitive string displayed in the Cal Set Viewer utility. See SENS:CORR:CSET:DATA for a description of port numbers.

The following Noise figure error terms are listed for convenience:

- **RcvNoiseCorr_m_n** Noise correlation matrix of the noise receiver (a 2x2 complex matrix). The row and column indices m and n range from 1 to 2.
- **RcvT_m_n** T-matrix of the noise receiver (a 2x2 complex matrix). The row and column indices m and n range from 1 to 2.
- **GammaTuner_n** Reflection coefficient for impedance state n of the embedded noise tuner (Ecal module) in the port 1 source path. For the Agilent 4691 family of Ecal modules, n can range from 1 to 7.
- **<r, i>** (Block) Error term data. A Real / Imaginary data pair for each data point.

Format is set using FORM:DATA command.

For REAL binary formats, refer to Getting Data from the Analyzer using SCPI

Examples

```
SENS:CORR:CSET:ETERm "Directivity(1,1)", 0.237,-1.422, 0.513, 0.895  ' set directivity(source error term for 2 points
SENS:CORR:CSET:ETERm? "Directivity(1,1)"  ' read
```

Query Syntax

SENSe<cnump>:CORRection:CSET:ETERm? <string>

Return Type

Block data

Default Not Applicable

---

SENSe<cnump>:CORRection:CSET:ETERm:CATalog? <setNum>,<string>
(Read-only) Returns a list of error terms names found in the Cal Set containing the specified prefix.

**Parameters**

- `<setNum>` Set number of the calset. There can be more than one set of error terms in a Cal Set.
  
  - setNumber 0 contains the original set of error terms for a Cal Set.
  
  - setNumbers > 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation.

To determine the Cal Set in use by a channel, see `SENS:CORR:CSET:NAME`?

- `<string>` (Optional argument) The string used to identify Cal Set data as belonging to a specific Cal Type. This string is used as a filter so that only the error term names of interest are returned. If the string is empty, all terms are returned.

**Examples**

```
SENS:CORR:CSET:ETER:CAT? 0,"Full 2 Port Cal (2,3)" 'Returns original error terms for a two port cal on ports 2 and 3
```

**Default** Not Applicable

---

**SENSe<cnum>:CORRection:CSET:FLATten <string>**

(Write-only) When a Cal Set that was produced by a calibration has been interpolated or otherwise modified (for example, by Fixturing operations) this command saves the modified Cal Set to the PNA hard drive so that it can be reused. There is no User Interface equivalent for this command.

**Background**

When a Cal Set is selected for use by a channel, the channel reads the Cal Set from disk (master Cal Set). If the channel aligns perfectly with the Cal Set, the master Cal Set is used directly. In this case, the active Cal Set is the master Cal Set.

When processing occurs on the error terms due to interpolation or modification due to the use of fixturing, the channel will generate a temporary "memory-resident" Cal Set. In this case, the active Cal Set is the memory-resident Cal Set. This FLATten command allows you to save the active Cal Set to disk.

Depending on the measurement conditions, this flattening of the Cal Set can improve performance, especially if the Cal Set is applied often (using multiple recall states) or used by many channels. Flattening a version of the Cal Set for each channel can avoid the interpolation or the fixturing processing that would otherwise occur when the Cal Set is selected or the instrument state is recalled.
You will have to manage the application of such a Cal Set as the PNA itself will have no way to
determine what processing had been done once the flatten command is used. For example, if fixture
de-embedding occurred prior to the flatten command, that Cal Set should then be applied WITHOUT
fixturing on, because fixturing is already embedded in that Cal Set. It is your responsibility to apply
the Cal Set properly.

If you want to repeatedly de-embed multiple networks (i.e. concatenate multiple 2-port de-embedding
files) you can use the flatten command to create a new master Cal Set after each de-embed, and
sequentially add additional de-embed networks.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number on which the modified Cal Set resides. If unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;string&gt;</td>
<td>Name of the new Cal Set. Spaces or punctuation NOT allowed.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:CORR:CSET:FLAT "MyCalSet"
```

**Query Syntax**

```
SENSe<cnum>:CORRection:CSET:GUID?
```

Returns the GUID of the currently-selected Cal Set for the specified channel.

---

**SENS{<cnum>}:CORR{ection}:CSET{GUID} <string> Superseded**

This command is replaced by `SENS:CORR:CSET:ACTivate`.

(Read-Write) Selects the Cal Set identified by the string parameter (GUID) and applies it to the
specified channel.

- A Cal Set cannot be selected for a channel which is not ON.
- If the stimulus settings of the selected Cal Set differ from those of the selected channel, the instrument will automatically change the channel's settings to match the Cal Set.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;string&gt;</td>
<td>GUID of the desired Cal Set. The curly brackets and hyphens must be included.</td>
</tr>
</tbody>
</table>

**Examples**

```
```

**Query Syntax**

```
SENSe<cnum>:CORRection:CSET:GUID?
```

Returns the GUID of the currently-selected Cal Set for the specified channel.
SENSe<cnum>:CORRection:CSET:NAME <string>

(Read-Write) Sets or queries the name of the Cal Set currently applied to the specified channel.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<string>`: Name of the Cal Set. Spaces or punctuation NOT allowed.

**Examples**
```
SENSe:CORR:CSET:NAME 'MyCalSet'
sense2:correction:cset:name 'thisCalSet'
```

**Query Syntax**
SENSe<cnum>:CORRection:CSET:NAME?

**Return Type** String

**Default** Not Applicable

---

SENSe<cnum>:CORRection:CSET[:SElect] <char>  **Superseded**

This command is replaced by **MMEM:LOAD**

(Read-Write) Recalls a *.cst file from memory. The file name is "CSETx.cst" where x is the user number assigned to `<char>`. Learn more about .cst files

For more information on the file naming syntax, see the **MMEMory** subsystem.

**Note:** This command does NOT select a Cal Set for a channel. To select a Cal Set, use **SENSe:CORR:CSET:ACTivate**

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: Choose from:
  - **DEF**: Presets the analyzer
  - **USER01**: Restores User01 calibration data
  - **USER02**: Restores User02 calibration data
  - through...
  - **USER10**: Restores User10 calibration data
**SENSe<cnum>:CORRection:CSET:SAVE <char>**

This command is NOT necessary after completion of a calibration. A Cal Set is automatically created, applied to the channel, and saved at the completion of a guided cal according to the preference setting `SENSe:CORR:PREF:CSET:SAVE`. (Read Write)

Saves the channel's Cal Set to the PNA hard drive. For example, use this command after writing data to a Cal Set using `SENSe:CORR:CSET:DATA` (For Advanced Users).

The file name is saved as "CSET:x.cst" where x is the user number assigned to <char>, and .cst specifies a Cal Set and instrument state. This is not the same syntax as a file saved through the default choices from the front panel, which is "at00x.cst". For more information on the file naming syntax, see the MMEMory subsystem. Learn more about Instrument/Cal States.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - USER01
  - USER02...
  - USER10

**Examples**

`SENSe:CORR:CSET:SAVE USER03`

`sense2:correction:cset:save user09`

**Query Syntax**

`SENSe<cnum>:CORRection:CSET:SAVE?`

Queries the last correction set saved.

**Return Type**

Character

**Default** Not applicable

**SENSe<cnum>:CORRection:CSET:STANdard <string>,<data>**
(Read-Write) Sets or returns standard data. Standard data is available for Unguided Cals ONLY.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<string>` (String) Cal standard to read or write. The standard is specified using the EXACT case-sensitive string displayed in the [Cal Set Viewer](#) utility. See [SENS:CORR:CSET:DATA](#) for a description of port numbers.
- `<data>` (Block). Acquisition data. A Real / Imaginary data pair for each data point.

Format is set using [FORM:DATA](#) command.

For REAL binary formats, refer to [Getting Data from the Analyzer using SCPI](#)

**Examples**

```plaintext
SENS:CORR:CSET:STAN 'S11C(1,1), 0.237,-1.422, 0.513, 0.895 '  
Set acquisition data for two points.

SENS:CORR:CSET:STAN? "S11C(1,1)"  
'Read data
```

**Query Syntax**

`SENSe<cnum>:CORRection:CSET:STANdard? (string)`

**Return Type**

Block data

**Default** Not Applicable

---

**SENSe<ch>:CORRection:CSET:STIMulus? [num]**

(Read-only) Returns the source or response stimulus values for the Cal Set that is currently used by channel `<ch>`. Values are returned in the format specified by [FORM:DATA](#) (Block or ASCII).

**Parameters**

- `<ch>` Channel number to query Cal Set stimulus values. If unspecified, value is set to 1
- `[num]` Optional argument. Range of frequencies to return. These values would be different when FOM (Opt 080) is enabled.
  - `0` - returns source frequencies. Default setting if not specified.
  - `1` - returns response frequencies.
  - `2` - returns primary frequencies.

**Examples**

```plaintext
SENSe:CORR:CSET:STIM?

sense:correction:cset:stimulus 1
```

**Return Type** Numeric
SENSe:CORRection:CSET:TSET:ALLPorts? <cset>

(Read-only) Reads the port mapping used for the specified Cal Set. The returned values are the physical ports. The POSITION of the returned values corresponds to the logical ports.

For example, with an N44xx test set, if the returned string is "PNA 1,TS 2,PNA 2, TS 4" this means:

- PNA 1 is assigned to logical port 1
- TS 2 is assigned to logical port 2
- PNA 2 is assigned to logical port 3
- TS 4 is assigned to logical port 4

**Parameters**

- **<cset>** (String) Name or GUID of the Cal Set. Use SENS:CORR:CSET:CAT? to read the list of available Cal Set names or GUIDs.

**Examples**

```
SENS:CORR:CSET:TSET:ALLP? "MyCalSet"
```

**Return Type** String

**Default** Not Applicable

---

SENSe:CORRection:CSET:TSET:TYPE? <cset>

(Read-only) Reads the test set type (model) used for the specified Cal Set.

**Parameters**

- **<cset>** (String) Name or GUID of the Cal Set. Use SENS:CORR:CSET:CAT? to read the list of available Cal Set names or GUIDs.

**Examples**

```
SENS:CORR:CSET:TSET:TYPE? "MyCalSet"
returns "N44xx"
```

**Return Type** String

**Default** Not Applicable
SENSe<ch>:CORRrection:CSET:TYPE:CATalog? [format]

(Read-only) Query the Cal Types available in the selected Cal Set. The output is a comma separated list of Guids or a Cal Type names. Learn more about applying Cal Types using SCPI.

Use CALC:CORR:TYPE to apply a Cal Type.

Parameters

[ch] Any existing channel number. If unspecified, value is set to 1
[format] (Optional) Format of the output of cal types. choose from:

NAME - (default) returns a list of cal type string names.

GUID - returns a list of cal type GUIDs

Examples

SENS:CORR:CSET:TYPE:CAT? NAME
SENS2:CORR:CSET:TYPE:CAT?

Return Type String

Default Not Applicable

Last modified:

9-Mar-2011 Added last paragraph to Flatten
4-Nov-2010 Added CSET:ETerm:CAT?
19-Nov-2009 Added Flatten command
28-Sep-2009 Added <block> desc to cset:Stan command
23-Mar-2009 Added <block> desc to cset:data command
12-Nov-2008 Added Stimulus? (8.33)
6-Mar-2008 Added CSET Delete by Name (8.0)
5-Mar-2008 Added Noise ETerm and Std commands (8.0)
9/12/06 Added TSET commands for multiport.
## Sense:Correction:Extension Commands

Performs and applies Port Extensions.

SENSe<cnum>:CORRection:EXTension:AUTO:CONFig <char>

(Read-Write) Sets the frequencies used to calculate Automatic Port Extension. Learn more about calculating Automatic Port Extension.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Frequencies to be used:
  - **CSPN** Use current frequency span.
  - **AMKR** - Use active marker frequency.

Examples

   SENS:CORR:EXT:CONF CSPN
   sense2:correction:extension:auto:config amkr

Query Syntax

SENSe<cnum>:CORRection:EXTension:AUTO:CONFig ?

Return Type

Character

Default

CSPN
SENSe<cnum>:CORRection:EXTension:AUTO:DCOFfset <bool>

(Read-Write) Specifies whether or not to include DC Offset as part of automatic port extension. Learn more about Automatic DC Offset. Only allowed when SENS:CORR:EXT:AUTO:LOSS is set to ON.

**Parameters**

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <bool> ON (or 1) - Includes DC Offset correction.
  
  **Examples**
  
  ```
  SENS:CORR:EXT:AUTO:DCOF 1
  sense2:correction:extension:auto:dcoffset off
  ```

**Query Syntax**

SENSe<cnum>:CORRection:EXTension:AUTO:DCOFfset?

**Return Type**

Boolean

**Default**

OFF (0)

SENSe<cnum>:CORRection:EXTension:AUTO:LOSS <bool>

(Read-Write) Specifies whether or not to include loss correction as part of automatic port extension. Learn more about Loss Compensation in port extension.

**Parameters**

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <bool> ON (or 1) - Includes Loss correction.
  
  **Examples**
  
  ```
  SENS:CORR:EXT:AUTO:LOSS 1
  sense2:correction:extension:auto:loss off
  ```

**Query Syntax**

SENSe<cnum>:CORRection:EXTension:AUTO:LOSS?

**Return Type**

Boolean

**Default**

OFF (0)

SENSe<cnum>:CORRection:EXTension:AUTO:MEASure <char>
(Write-only) Measures either an OPEN or SHORT standard. When this command is sent, the PNA acquires the measurement with which to set automatic port extensions. Learn more about which standard to measure.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Standard to be measured. Choose from:
  - **OPEN**: Measure OPEN standard
  - **SHORT**: Measure SHORT standard

**Examples**

- `SENS:CORR:EXT:AUTO:MEAS OPEN`
- `sense2:correction:extension:auto:measure short`

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<cnum>:CORRection:EXTension:AUTO:PORT<n> <bool>**

(Read-Write) Enables and disables automatic port extensions on the specified port.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<n>` PNA Port number to enable or disable for automatic port extensions.
- `<bool>` ON (or 1) - Enable
  - OFF (or 0) - Disable

**Examples**

- `SENS:CORR:EXT:AUTO:PORT2 0`
- `sense2:correction:extension:auto:port4 on`

**Query Syntax**

`SENSe<cnum>:CORRection:EXTension:AUTO:PORT<n>?`

**Return Type**

Boolean

**Default**

All ports ON (enabled)

---

**SENSe<cnum>:CORRection:EXTension:AUTO:RESet**
(Write-only) Clears old port extension delay and loss data in preparation for acquiring new data. Send this command prior to sending a new series of SENS:CORR:EXT:AUTO:MEAS. If acquiring both OPEN and SHORT standards, do not send this command between those acquisitions.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:CORR:EXT:AUTO:RES
sense2:correction:extension:auto:reset
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<cnm>:CORRection:EXTension:AUTO:STARt <value>**

(Read-Write) Set the start frequency for custom user span. [Learn more about User Span.](#)

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` User span start value. Must be within the frequency range of the active channel and less than the value set by SENS:CORR:EXT:AUTO:STOP.

**Examples**

```
SENS:CORR:EXT:AUTO:STAR 1E9
sense2:correction:extension:auto:start 200e6
```

**Query Syntax**

```
SENSe<cnm>:CORRection:EXTension:AUTO:STARt <value>?
```

**Return Type**

Numeric

**Default**

Start frequency of the current active channel.

---

**SENSe<cnm>:CORRection:EXTension:AUTO:STOP <value>**
**SENSe<cnum>:CORRection:EXTension:PORT<pnum>:DISTance <value>**

(Read-Write) Sets and returns the port extension delay in physical length (distance).

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the delay setting. If unspecified, value is set to 1.

**Examples**
- `SENSe:CORR:EXT:PORT1:DIST 12`
- `sense2:correction:extension:port2:distance .003`

**Query Syntax**
`SENSe<cnum>:CORRection:EXTension:PORT<pnum>:DISTance?`

**Return Type**
Numeric

**Default**
0

---

**SENSe<cnum>:CORRection:EXTension:PORT<pnum>:FREQuency<n> <value>**
avadoc

(Read-Write) Sets and returns the frequency for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the freq/loss settings. If unspecified, value is set to 1.
- `<n>`: Freq and Loss pair number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: Frequency value. Choose a frequency within the frequency span of the PNA.

**Examples**

```
SENS:CORR:EXT:PORT1:FREQ1 10E9
sense2:correction:extension:port2:freq2 2E10
```

**Query Syntax**

```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:FREQuency<n>?
```

**Return Type**

Numeric

**Default**

1 GHz

---

SENSe<cnum>:CORR:EXT:PORT<pnum>:INCLude<n>[;STATE] <bool>

(Read-Write) Sets and returns the ON/OFF state for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- `<n>`: Freq and Loss pair. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: State of Freq and Loss values for port extension.

0 or OFF Specified Freq and Loss values are OFF

1 or ON Specified Freq and Loss values are ON

**Examples**

```
SENS:CORR:EXT:PORT:INCL 0
sense2:correction:extension:port2:include2:state on
```
Query Syntax  
```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:INCLude[:STATe]?
```

Return Type  
Boolean

Default  
OFF

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:LDC <value>
(Read-Write) Sets and returns the Port Loss at DC value for the specified port number.

Learn about Loss Compensation values.

Note: This command affects ALL measurements on the specified channel.

Parameters
- `<cnum>`  
  Any existing channel number. If unspecified, value is set to 1
- `<pnum>`  
  Port number to receive Loss value. If unspecified, value is set to 1.
- `<value>`  
  Loss in dB. Choose a value between -90 and 90

Examples
```
SENSe:CORR:EXT:PORT:LDC 1.5
SENSe:CORR:EXT:PORT:LDC 1.5
sense2:correction:extension:port2:ldc .1
```

Query Syntax  
```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:LDC?
```

Return Type  
Numeric

Default  
0

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:LOSS<n> <value>
(Read-Write) Sets and returns the Loss value for the specified port number.

Learn about Loss Compensation values.

Note: This command affects ALL measurements on the specified channel.

Parameters
- `<cnum>`  
  Any existing channel number. If unspecified, value is set to 1
- `<pnum>`  
  Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- `<n>`  
  Loss "Use" number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`  
  Loss in dB. Choose a value between -90 and 90
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:MEDium <char>
(Read-Write) Sets and returns the media type of the added fixture or transmission line.

See also SENS:CORR:EXT:PORT:SYSMedia

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which media type is being set. If unspecified, value is set to 1.
- `<char>` Medium type. Choose from:
  - COAX
  - WAVEguide

**Examples**
SENSe:CORR:EXT:PORT:MEAd COAX
SENSe:CORR:EXT:PORT:MEAd waveguide

**Query Syntax**
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:MEDium?

**Return Type** Character

**Default** COAX
(Read-Write) Sets and returns the state of coupling with the system Media type. Learn more.

Note: This command potentially affects ALL measurements on the PNA.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which system Velocity Factor coupling is being set. If unspecified, value is set to 1.
- `<bool>` Coupling state. Choose from:
  - **ON** (or 1) - Media type is coupled with the system setting.
  - **OFF** (or 0) - Media type is NOT coupled with the system setting.

Examples

```
SENS:CORR:EXT:PORT:SYSM 1
sense2:correction:extension:port2:sysmedia off
```

Query Syntax

```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:SYSMedia?
```

Return Type

boolean

Default

1 or ON (Coupled)

---

**SENSe<cnum>:CORRection:EXTension:PORT<pnum>:SYSVelocity <bool>**

(Read-Write) Sets and returns the state of coupling with the system Velocity Factor value. Learn more.

Note: This command potentially affects ALL measurements on the PNA.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which system Velocity Factor coupling is being set. If unspecified, value is set to 1.
- `<bool>` Coupling state. Choose from:
  - **ON** (or 1) - Velocity Factor is coupled with the system setting.
  - **OFF** (or 0) - Velocity Factor is NOT coupled with the system setting.

Examples

```
SENS:CORR:EXT:PORT:SYSV 1
sense2:correction:extension:port2:sysvelocity off
```
### SENSe<cnum>:CORRection:EXTension:PORT<pnum>:SYSVelocity?

**Query Syntax**: SENSe<cnum>:CORRection:EXTension:PORT<pnum>:SYSVelocity?

**Return Type**: Boolean

**Default**: 1 or ON (Coupled)

---

### SENSe<cnum>:CORRection:EXTension:PORT<pnum>[:TIME] <num>

*(Read-Write)* Sets the extension delay value in time at the specified port. Must also set SENS:CORR:EXT ON.

**Note**: This command affects ALL measurements on the specified channel.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the extension. If unspecified, value is set to 1.
- `<num>`: The port extension in seconds; may include suffix. Choose a number between -1E18 and 1E18.

**Examples**
- SENS:CORR:EXT:PORT 2MS
- sense2:correction:extension:port2 .00025

### SENSe<cnum>:CORRection:EXTension:PORT:UNIT <char>

*(Read-Write)* Sets and returns the units for specifying port extension delay in physical length (distance).

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<char>`: Units for delay in distance. Choose from:
  - METer
  - FEET
  - INCH

**Examples**
- SENS:CORR:EXT:PORT:UNIT MET
- sense2:correction:extension:port:unit inch
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:VELFactor <value>

(Read-Write) Sets and returns the velocity factor of the fixture or added transmission line.

Parameters
- <cnum>  Any existing channel number. If unspecified, value is set to 1
- <pnum>  Port Number for which velocity factor is being set. If unspecified, value is set to 1.
- <value> Velocity Factor.

Set SENS:CORR:EXT:PORT:SYSV to use the system velocity factor.

Examples
SENSe<cnm>:CORRection:EXTension:PORT:VELF .6
sense2:correction:extension:port2:velfactor 1

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:WGCutoff <value>

(Read-Write) Sets and returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

Parameters
- <cnum>  Any existing channel number. If unspecified, value is set to 1
- <pnum>  Port Number for which media type is being set. If unspecified, value is set to 1.
- <value> Cutoff frequency in Hz.

This value is ignored when SENS:CORR:EXT:PORT:MED is set to COAX for the same port.

Examples
SENS:CORR:EXT:PORT:WGC 1e8
sense2:correction:extension:port2:wgcutoff 100Mhz

Query Syntax
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:VELFactor?

Return Type  Character
Default  METer
SENSe<cnm>:CORRection:EXTension:RECeiver<Rnum>[<TIME>] <num> OBSOLETE
(Read-Write) This command has NO replacement and no longer works.

Sets the extension value at the specified receiver. Must also set SENS:CORR:EXT ON.

**Note:** Before using this command you must select a measurement using CALC:PAR:SEL. You can select one measurement for each channel.

**Parameters**
- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<Rnum>` Number of the receiver that will receive the extension. If unspecified, value is set to 1
  - Choose from:
    - 1 for Receiver A
    - 2 for Receiver B
- `<num>` The electrical length in seconds; may include suffix. Choose a number between:
  - -10 and 10

**Examples**
- SENS:CORR:EXT:REC 2MS
- sense2:correction:extension:receiver2:time .00025

**Query Syntax**
SENSe<cnm>:CORRection:EXTension:RECeiver<Rnum>[<TIME>]?

**Return Type** Numeric
- **Default** 0

SENSe<cnm>:CORRection:EXTension[:STATe] <ON | OFF>
(Read-Write) Turns port extensions ON or OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>` **ON** (or 1) - turns port extensions ON.
  - **OFF** (or 0) - turns port extensions is OFF.

**Examples**

```
SENS:CORR:EXT ON
sense2:correction:extension:state off
```

**Query Syntax**

```
SENSe<cnum>:CORRection:EXTension[:STATe]?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default** OFF

---

Last Modified:

- 11-Jan-2011 Minor edits
- 28-Sep-2009 Fixed Port:Frequency command syntax
- 6-Feb-2009 Added new commands (A.08.50)
**Sense:Correction:Collect:Guided Commands**

Performs and applies a SmartCal (Guided) calibration and other error correction features.

To perform a **Guided Calibration**, use ONLY `Sens:Corr:Coll:Guided` commands. See the "Guided" example programs for clarification.

SENSe<ch>:CORRection:COLLect:GUIDed:ABORt

(Write-only) Aborts the acquiring of a guided calibration that has been INITialized but has not yet been concluded using the SAVE command. If at least one Cal standard has already been measured, and the Calibration Window is being displayed, this command also closes the Calibration Window and re-tiles the other measurement windows.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

Examples

SENs:CORr:COLL:GUID:ABOr
sense2:correction:collect:guided:abort

Query Syntax

Not Applicable

Default

Not Applicable
**SENSe:<ch>CORRection:COLLect:GUIDed[:ACQuire] <std>[,sync]**

*(Write-only)* Initiates the measurement of the specified calibration standard. Executing this command with an unnecessary standard has no affect.

The measured data is stored and used for subsequent calculations of error correction coefficients. All standards must be measured before a calibration can be completed. Any measurement can be repeated until the **SENS:CORR:COLL:GUID:SAVE** command is executed.

Query the user prompt description using **SENS:CORR:COLL:GUID:DESC**?

Query the required calibration steps using **SENS:CORR:COLL:GUID:STEP**?

**Parameters**

- `<ch>` Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- `<std>` Choose from: STAN1, STAN2, STAN3, through STAN40
- `[sync]` Optional argument. Choose from:
  - **SYNChronous** - blocks SCPI commands during standard measurement (default behavior).
  - **ASYNchrous** - does NOT block SCPI commands during standard measurement.

**Learn more.**

**Examples**

- **SENS:CORR:COLL:GUID STAN1**
- **sense2:correction:collect:guided:acquire stan1**

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter:CREate? <conn1>, <conn2>**
Specifies the use of a THRU adapter to be used during the Guided Cal Unknown THRU and Adapter Removal Cal. Returns an adapter index <n> which is used to refer to the adapter in several related commands. See Cal Thru Methods. While the choice of which end of the adapter is <conn1> and <conn2> is arbitrary, it is necessary to remember which will be used on each test port.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the ZERO command is sent.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<conn1>` Adapter port 1 connector type. Use SENS:CORR:COLL:GUID:CONN:CAT? to return a list of valid connector types.
- `<conn2>` Adapter port 2 connector type.

**Examples** See example using this command.

**Return Type** Numeric

**Default** Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter:COUNt?

(Read-Only) Returns the number of THRU adapters that have been created for this calibration using SENS:CORR:COLL:GUID:ADAP:CREate.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

**Examples** See example using this command.

**Return Type** Numeric

**Default** Not Applicable

SENSe<ch> CORRection:COLLect:GUIDed:ADAPter:COUNT:ZERO

2532
(Write-only) Removes all adapters that have been defined for calibrations on the specified channel using **SENS:CORR:COLL:GUID:ADAP:CREate**.

**Parameters**

- `<ch>` Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.

**Examples**

```
SENS:CORR:COLL:GUID:ADAP:COUNT:ZERO
```

```
SENSe:CORRection:COLLect:GUIDed:ADAPter<n>:DElay <coax>, [w phase, wdelay]
```

(Write-only) Specifies the adapter delay, and optionally waveguide delay and optional phase offset (degrees) of adapter `<n>`.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the **ZERO** command is sent.

**Parameters**

- `<ch>` Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- `<n>` Adapter index number that was returned from **SENS:CORR:COLL:GUID:ADAP:CREate?**
- `<coax>` Delay value of coax adapter `<n>` in seconds. If the adapter has no coax connector, enter 0.
- `<wphase>` Waveguide phase offset in degrees. If the adapter has no waveguide connector, do not enter a value.
- `<wdelay>` Waveguide delay in seconds. If the adapter has no waveguide connector, do not enter a value.

**Examples**

See example using this command.

**Default** Not Applicable

**SENS**<ch>:CORRection:COLLect:GUIDed:ADAPter<n>:DEscription <string>
(Write-only) Specifies the adapter description for use as the guided cal connection prompts.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the **ZERO** command is sent.

**Parameters**

- `<ch>` Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- `<n>` Adapter index number that was returned from **SENS:CORR:COLL:GUID:ADAP:CREate?**
- `<string>` Adapter description.

**Examples**

See example using this command.

**Query Syntax**

Not Applicable

**Default**

Not Applicable

**SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter<n>:PATHs <port pairs>**

(Write-only) Specifies the port pairs for which the adapter will be used for a THRU connection.

For example, for a 3-port cal on channel 1 using ports 1,2, and 3), to use adapter 1 between the ports (1 to 2) and (1 to 3) the following command is used: SENS1:CORR:COLL:GUID:ADAP1:PATH 1,2,1,3.

The adapter must have the same DUT connectors as the ports that are already specified for these ports.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the **ZERO** command is sent.

**Parameters**

- `<ch>` Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- `<n>` Adapter index number that was returned from **SENS:CORR:COLL:GUID:ADAP:CREate?**
- `<port pair>` Ports for which the adapter will be used. The orientation is not critical, as the PNA will align the connector types as necessary. The minimum number of Thru connections required is the number of ports to calibrated -1.

**Examples**

See example using this command.

**Query Syntax**

Not Applicable
**SENSe:CORRection:COLLect:GUIDed:CHANnel:MODE <bool>**

(Read-Write) Determines whether or not to honor the channel `<ch>` argument in guided calibration SCPI commands.

**Parameters**

- **<bool> OFF (0)**: Honor all `<ch>` arguments. This means the `<ch>` channel is calibrated regardless of which channel is currently active.

- **<bool> ON (1)**: Default (legacy) behavior. Behavior is specified by the following table:

<table>
<thead>
<tr>
<th><code>&lt;ch&gt;</code> channel type</th>
<th>Active channel type</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Std or App</td>
<td>Std or App</td>
<td></td>
</tr>
<tr>
<td>Std</td>
<td>Std</td>
<td>Active chan cal'd</td>
</tr>
<tr>
<td>Std</td>
<td>App</td>
<td>&quot;Channel not found&quot; error</td>
</tr>
<tr>
<td>App</td>
<td>Std</td>
<td><code>&lt;ch&gt;</code> chan cal'd</td>
</tr>
<tr>
<td>App</td>
<td>App</td>
<td><code>&lt;ch&gt;</code> chan cal'd</td>
</tr>
</tbody>
</table>

Learn about [Standard vs Application](#) channels.

**Examples**

SENSe:CORR:COLL:GUID:CHAN:MODE 0

sense:correction:collect:guided:channel:mode ON

**Query Syntax**

SENSe:CORRection:COLLect:GUIDed:CHANnel:MODE?

**Return Type**

Boolean

**Default**

ON (1)

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECAL modules currently connected to the PNA, and all user characterizations stored in PNA disk memory. For ECAL modules, the returned list includes the serial numbers. See ECAL User Characterization commands.

Use items in the list to select the kit to be used with the `SENS:CORR:COLL:GUID:CKIT:PORT` and `SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:CKIT` commands.

### Parameters

- **<conn>**
  

- **Examples**
  
  `SENSe:CORR:COLL:GUID:CKIT:CAT? "Type N (50) male"`

- **Return Type**
  
  String

- **Default**
  
  Not Applicable

---

(Read-only) This command is replaced by `SENS:CORR:COLL:GUID:CKIT:CAT?`.

Returns a comma-separated list of valid kits for the specified PNA port. In addition to mechanical calibration kits, this will include applicable characterizations found within ECAL modules currently connected to the PNA.

Use items in the list to select the kit to be used with the `SENS:CORR:COLL:GUID:CKIT:PORT` command.

**Note:** Beginning with PNA Rev 9.1, the serial number is returned for ALL ECAL modules that are connected with the connector type of the specified port. Previously, the returned list would include the serial numbers to distinguish the ECAL modules only when two or more identical ECAL models were connected to the PNA.

### Parameters

- **<pnum>**
  
  Any existing port number. If unspecified, value is set to 1

- **Examples**
  

  'When "Type N (50) male" is specified for connector type, returns:

  "85054D, 85032F"

  'When two identical ECAL modules are connected for the connector type,'

(Read-Write) Specifies the calibration kit (mechanical or ECal) for each port to be used during a guided calibration. An unused port does NOT need to have a specified Cal Kit.

**Note**: Sliding loads are not fully supported from Sens:Corr:Coll:Guided... The **Measure** button must be manually pressed.

1. Specify the connector type for the port with SENS:CORR:COLL:GUID:CONN:PORT.
2. Query the valid available kits for the connector on each port with SENS:CORR:COLL:GUID:CKIT:PORT:CAT?
3. Specify the kit using this command.
4. Perform a query of this command. If the <kit> parameter was incorrectly entered, an error will be returned.

**Parameters**

- **<ch>** Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- **<pnum>** Any existing port number. If unspecified, value is set to 1
- **<kit>** Calibration kit to be used for the specified port. **Case-sensitive.**

When using an ECal module, include the characterization name in the <kit> string. Use SENSE:CORR:COLL:GUID:CKIT:CAT? to read the list of characterizations available in the module and in PNA disk memory.

If two or more identical ECal modules are connected to the PNA, the serial number must be included to distinguish the ECal modules.

**Examples**

'Note: All of the following examples specify port 1 only

' Mechanical Cal kit

SENS:CORR:COLL:GUID:CKIT:PORT1 '85055A'

' Standard ECal modules

---

Return Type: String
Default: Not Applicable
Non-factory ECal characterizations are specified as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 User 1 ECal"

When two or more ECal modules with the same model number are connected, also specify the serial number as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 ECal 01234"

When Disk Memory ECal user characterizations are used, specify both the User char and the serial number as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 MyDskChar ECal 01234"

Return Type: String - If the <kit> parameter was incorrectly entered while writing, an error will be returned.

Default: Not Applicable

SENSe:CORRection:COLlECT:GUIDed:CONNector:CATalog?

(Read only) Returns a list of valid connectors based on the connector descriptions of the available cal kits. Use an item from the returned list to specify a connector for SENSE:CORR:COL:GUID:CONN:PORT

Here are the more common connector types:

- W-band waveguide
- V-band waveguide
- U-band waveguide
- R-band waveguide
- Q-band waveguide
- K-band waveguide
- P-band waveguide
- X-band waveguide
- 7-16 female

Type B: 1.00 mm female

Type A (50): 1.00 mm male

Type A (50): 1.85 mm male

Type F (75): 1.85 mm female

Type F (75): 2.92 mm female

Type N (75): 2.92 mm female

Type N (75): APC 2.4 female

Type N (50): APC 2.4 male

Type N (50): APC 3.5 female
Examples

```
SENS:CORR:COLL:GUID:CONN:CAT?
```

**Returns:**

Type N (50) female, Type N (50) male, APC 7 (50), 3.5 mm (50) male, 3.5 mm (50) female, User Connector A

**Return Type** Comma separated string values

**Default** Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:CONNECTor:PORT<pnum>[:SElect] <conn>

(Read-Write) Specifies a connector type for every port during the Guided Calibration procedure. Valid connector names are stored within calibration kits. Some cal kits may include both male and female connectors. Therefore, specifying connector gender may be required.

The PNA remembers previous Guided Cal settings. Therefore, for completeness, unused ports should be defined as "Not used". See Guided Cal examples.

- A single port with a valid <conn> name indicates a 1-Port calibration will be performed.
- Two ports with valid <conn> names indicate either a 2-Port SOLT or TRL calibration will be performed depending on the standards definition found within the cal kit and the capability of the PNA.
- Three ports with valid <conn> names indicate a 3-Port calibration will be performed, and so forth.

Follow these steps to ensure port connectors are specified correctly:

2. Set a connector type for each port using this command.
3. Perform a query of this command. If the connector type was incorrectly entered, an error will be returned.
4. Specify the cal kit to use for each port with SENS:CORR:COLL:GUID:CKIT:PORT.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
<pnum> Any existing port number. If unspecified, value is set to 1.
<conn> String - DUT connector type to connect with PNA port <pnum>. Case-sensitive.

**Examples**

'Specifying a 2-port cal (1 & 2) on a 4-port PNA

SENS:CORR:COLL:GUID:CONN:PORT1 'Type N (50) female'
SENS:CORR:COLL:GUID:CONN:PORT2 'Type N (50) male'
SENS:CORR:COLL:GUID:CONN:PORT3 'Not used'
SENS:CORR:COLL:GUID:CONN:PORT4 'Not used'

**Query Syntax**

SENSe:CORRection:COLLect:GUIDed:CONNector:PORT<pnum>[[:SELect]?]

**Return Type**

String

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:DESCription? <step>**

(Read-only) Returns the connection description for the specified calibration step.

**Parameters**

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<step> A number from 1 to the number of steps required to complete the calibration (Use SENS:CORR:COLL:GUID:STEP? to query the number of steps)

**Examples**

SENS:CORR:COLL:GUID:DESC? 10

'Returns:
Connect APC 7 Open to port3

**Return Type**

String

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:DMATch:APPLY[:IMMediate] [<CalSetGUID>]**
(Write-only) Specifies a Cal Set as a source of delta match correction.

If CalSetGUID is not specified, then the Global Delta Match Cal Set is assumed. An error is returned if the specified Cal Set does not meet the following Delta Match criteria. The Global Delta Match Cal can ALWAYS be applied.

- Must have been performed using ECal or as a guided mechanical cal (not Unguided).
- Must have the same start freq, stop freq, and number of points as the channel being calibrated.
- Must calibrate the ports that are required by the TRL or Unknown Thru cal as indicated by SENS:CORR:COLL:GUID:DMATch:APPLy:PORTs?.

Learn more about Delta match calibration.

See example of a complete Global Delta Match calibration.

See example where Delta Match is applied to a calibration.

**Parameters**

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<CalSetGUID> Optional. GUID of the Cal Set to use. If unspecified, the Global Delta Match Cal Set is used.

**Examples**

SENS:CORR:COLL:GUID:DMAT:APPL
sense:correction:collect:guided:dmatch:apply:immediate
"{2B893E7A-971A-11d5-8D6C-00108334AE96}"

**Query Syntax** Not Applicable

**Default** Not Applicable

`SENSe<ch>:CORRection:COLLect:GUIDed:DMATch:APPLy:PORTs?`
(Read-only) Returns the port numbers for which delta match correction is required. 0 (zero) is returned if the Cal does NOT require Delta Match correction for one of the following reasons:

- The Cal does NOT involve Unknown THRU or TRL. You specify this using `SENS:CORR:COLL:GUID:METH <UNKN | TRL>`.
- The Cal DOES involve Unknown THRU or TRL, but the delta match data can be calculated by the Unknown Thru or TRL Cal. Learn how this is possible. However, you can force the Cal to use the Delta Match data from a Cal Set.

Learn more about Delta match calibration.

See example of a complete Delta Match calibration.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ch&gt;</code></td>
<td>Channel being calibrated, depending on the <code>CHAN:MODE</code> setting. If unspecified, value is set to 1.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:CORR:COLL:GUID:APPL:PORT?
'Returns:
1, 2, 3
```

**Return Type** Numeric

**Default** Not Applicable

**SENS<ch>:CORRection:COLLect:GUIDed:DMATch[:INITiate] <conn>,<cKit>**

(Write-only) Initiates a global delta match calibration.

Learn more about Global Delta Match calibration.

See example of a complete Delta Match calibration.

**Parameters**

- `<ch>` Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `<conn>` **String**. Connector type for port 1. All other ports are set automatically.
- `<cKit>` **String** Cal Kit for all ports. If incorrectly entered while writing, an error is returned.

**Examples**

```
SENS:CORR:COLL:GUID:DMAT APC 3.5 female,"85052B"
```

**Query Syntax** Not Applicable

**Default** Not Applicable

(Write-only) Loads 1-port error terms from a Cal Set into the current Guided Cal sequence. When the Cal steps are recomputed, connection steps are removed due to the loading of the error terms.

See example of how to use this command.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<cset> String Name of User Cal Set in which the error terms reside.

<pnum> Integer Port number of the current cal to receive error terms.

[csPort] Integer Optional argument. Port number associated with the error terms in the Cal Set. If unspecified, the same port number as <calPort> is used.

Examples See example

Query Syntax Not Applicable

Default Not Applicable

---

SENSe<ch>:CORRection:COLLect:GUIDed:INITiate[:IMMediate] [string[, bool]]

(Write-only) Initiates a guided calibration.

- After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete a guided calibration.

Parameters

<ch> Channel to be calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

[string] Optional argument. Cal set name or GUID enclosed in quotes.

If specified, choose an existing Cal Set, either by name or by GUID.

If NOT specified, behavior depends on the SENS:CORR:PREFerence:CSET:SAVE setting.
By Cal Set name: include quotes.

By Calset GUID in the form: " {GUID} " ; including quotes and curly brackets.

Query all Cal Set GUIDs with SENS:CORR:CSET:CAT?

An error is reported if the Cal Set is not found.

The Cal Set is either supplemented or overwritten depending on the method, connectors, and ports selected. Learn more about Cal Sets.

[bool] Optional argument.

**OFF (0)** If Cal Set stimulus settings differ from the existing channel, do not change channel stimulus settings. The Cal Set is save to the current setting of the SENS:CORR:PREF:CSET:SAVE command. This is the default setting if not specified.

**ON (1)** If cal set stimulus settings differ from the existing channel, change the channel stimulus settings to match the Cal Set settings.

**Examples**

sense2:correction:collect:guided:initiate:immediate 'myCalSet'

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:ISOLation:AVERage:INCRement <num>**

*(Read-Write)* Specifies amount to increment (increase) the channels averaging factor during measurement of isolation standards in a guided calibration.

**Note:** If the channel has averaging turned OFF and the value of <num> is greater than 1, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to <num>.

**Parameters**

*<ch>* Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

*<num>* Amount to increment the averaging factor for the isolation measurement. The maximum averaging factor for the channel is 65536 ($2^{16}$).

**Examples**

'Measure isolation on all paths for the cal

SENS:CORR:COLL:GUID:ISOL ALL
Remove the port pairs 1-to-2 and 1-to-3 from the list of paths on which to measure isolation.

Query Syntax

Return Type
Numeric

Default
8 - If this command is NOT sent, but isolation is measured, then averaging will be turned ON with factor set to 8 during the isolation measurements.

SENSe<ch>:CORRection:COLLect:GUIDed:ISOLation[:PATHs] <char>[,<p1a, p1b, p2a, p2b]

(Read-Write) Specifies the paths (port pairs) to make isolation measurements on during a guided calibration.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<char> ALL Measure isolation on all pairings of the ports that are to be calibrated.

NONE Do not measure isolation on any pairing of the ports to be calibrated. (Default behavior).

ADD Add one or more specific pairings of ports to the list of port pairings for which isolation will be measured.

REMove Remove one or more specific pairings of ports from the list of port pairings for which isolation will be measured. If many paths are to be measured, it may be easier to first send ALL, then REMove and specify the paths to remove.

<p1a, p2a...> For use when <char> is ADD or REMove.

Specify Port numbers in pairs:

- For 3-port cals, specify up to 3 pairs.
- For 4-port cals, specify up to 6 pairs.

p1a, p1b (Path1 - port A and port B)

p2a, p2b (Path2 - port A and port B)

p3a, p3b (Path3 - port A and port B)
Examples

'Measure isolation on all paths for the cal
SENS:CORR:COLL:GUID:ISOL ALL

'Remove the port pairs 1-to-2 and 1-to-3 from the list of paths on which to measure isolation
sense:correction:collect:guided:isolation:paths REMove,1,2,1,3

Query Syntax
SENS<ch>:CORRection:COLLect:GUIDed:ISOLation:PATHs?

Note: if isolation is not be measured on any of the paths, the query returns 0

Return Type
Numeric

Default
0 - Isolation not measured on any paths.

SENSe:CORRection:COLLect:GUIDed:METHod <char> Superseded

(Read-Write) Selects from one of several algorithms available for performing the THRU portion of a guided calibration. Learn more about THRU methods.

Parameters

<char> DEFAULT - Informs guided calibrations to use the default algorithm when computing the number of needed standards acquisition steps. (default selection if omitted.)

ADAP - Use the adapter removal algorithm

FLUSH - Use with insertable devices.

UNKN - Use the Unknown THRU algorithm with calibrations for non-insertable devices.

DEFINED - Use the THRU definition that you stored in the cal kit file, or ECal module.

TRL - Select TRL Cal Type for guided cals. Valid for "TRL ready" Cal Kits with properly assigned TRL cal classes.

SOLT - Select SOLT Cal Type for guided cals. Valid for any kit with properly assigned SOLT cal classes.

Examples

SENS:CORR:COLL:GUID:METH ADAP
sense:correction:collect:guided:method unkn
SENSe<ch>:CORRection:COLLect:GUIDed:PACQuire <std>

(Read-Write) Show the Cal Window, and optionally one or more other specific windows before acquiring a Cal standard. This command will cause the Cal Window to display the specific measurements that are to be made for that particular Cal standard.

Parameters

- `<ch>`: Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<std>`: Choose from: STAN1, STAN2, STAN3, through STAN40.

Examples

```
SENS:CORR:COLL:GUID:PACEquire STAN2
sense:correction:collect:guided:pacquire STAN5
```

See an example that uses this command.

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PACQuire?

Return Type: Character

Default: Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:PATH:CMEThod <port1>,<port2>,<caltype1[,caltype2]>

Note: This command replaces SENS:CORR:COLL:GUID:METH.

(Read-Write) Specifies the calibration method for each port pair.

Note: Do NOT send this command to rely on SmartCal to determine the most accurate cal method for your connector settings and Cal Kits. You can send the query form of this command to learn the cal method determined by SmartCal.

Before sending this command, first do the following:

1. Set the connector types: SENS:CORR:COLL:GUID:CONN:PORTn
3. Set or query the thru path pairs: SENS:CORR:COLL:GUID:THRU:PORT

5. **Send this command** `(SENS:CORR:COLL:GUID:PATH:CMET)`

After sending this command, send the query form to be sure that the command was accepted. If not, then the chosen Cal method is not compatible with the specified Thru method. For example, if the specified Thru method is Unknown Thru, an attempt to set Enhanced Response Cal should be rejected.

Learn more about Thru Methods.

**Parameters**

- `<ch>` Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `<port1>` First port of the pair to be calibrated.
- `<port2>` Second port of the pair to be calibrated.
- `<caltype1[caltype2]>` (String) Cal types for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

  - **caltype1** Cal type for the pair if caltype2 is not specified. Otherwise, Cal type for port 1. Choose from:
    - TRL
    - SOLT
    - QSOLTN
    - EnhRespN

  For the last two arguments, replace N with the port to be used as the source port, which MUST be one of the port pair.

  - **caltype2** Optional argument. Use only when performing an adapter removal cal on the pair. This argument specifies the Cal type on the second port. Caltype1 then specifies the Cal type of the first port.

Examples

```
SENS:CORR:COLL:GUID:PATH:CMEThod 2,3,"QSOLTN"
```

```
sense:correction:collect:guided:path:cmethod 2,3,"solt,trl"
```
Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PATH:CMETHod?
<port1>,<port2>

If only one caltype is returned then its NOT adapter removal.

Return Type
String

Default
The most accurate Cal method for the current cal.

SENSe<ch>:CORRection:COLLect:GUIDed:PATH:TMETHod
<port1>,<port2>,<thruType1[,thruType2]>

Note: This command replaces SENS:CORR:COLL:GUID:METH.

(Read-Write) Specifies the calibration THRU method for each port pair.

Note: Do NOT send this command to rely on SmartCal to determine the most accurate cal for your connector settings and Cal Kits. You can send the query form of this command to learn the THRU method determined by SmartCal.

Before sending this command, first do the following:

1. Set the connector types: SENS:CORR:COLL:GUID:CONN:PORTn
3. Set or query the thru path pairs: SENS:CORR:COLL:GUID:THRU:PORT
4. Send this command (SENS:CORR:COLL:GUID:PATH:TMETHod)

To determine the default Thru method:

1. Set the connector types: SENS:CORR:COLL:GUID:CONN:PORTn
4. Read the proposed thru path pairs: SENS:CORR:COLL:GUID:THRU:PORT?
5. Read this command:(SENS:CORR:COLL:GUID:PATH:TMETHod)

After sending this command, set and query the Cal Type: SENS:CORR:COLL:GUID:PATH:CMETHod

Learn more about Thru methods.
Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<port1> First port of the port pair to be calibrated.

<port2> Second port of the port pair to be calibrated.

<thruType1,[thruType2]> (String) Thru methods for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

thruType1 Calibration thru method for the pair if thruType2 is not specified. Otherwise, thru method for port 1.

Choose from:

- **Defined Thru** A thru type for which there is a stored definition in the Cal Kit.
- **Zero Thru** Zero length thru, also known as flush-thru.
- **Undefined Thru** A thru type for which there is NOT a stored definition in the Cal Kit. Also known as Unknown Thru. Valid ONLY for SOLT cal type.
- **Undefined Thru using a Defined Thru** Using an ECal module, measure the internal thru using the "Undefined Thru" method.

thruType2 Optional argument. Use only when performing an adapter removal cal on the pair as determined by SENS:CORR:COLL:GUID:PATH:CMETHod.

The only valid arguments for ThruType1&2 (when specifying ThruType2) "Defined Thru, Defined Thru".

Examples

SENSe<ch>:CORRection:COLLect:GUIDed:PATH:TMEThod?

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PATH:TMEThod?

Always returns two parts:

If the second part of the string is empty, adapter removal is NOT being performed.

If the string is "Defined Thru, Defined Thru", adapter removal IS being performed.
Return Type  String

Default  The most accurate Thru method for the current cal.

SENSe<ch>:CORRection:COLLect:GUIDed:SAVE[:IMMediate] [bool]

(Write-only) Completes the guided cal by computing the error correction terms, turning Correction ON, and saving the calibration to a Cal Set.

If all of the required standards have not been measured, the calibration will not complete properly.

**Parameters**

- `<ch>` Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `[bool]` Optional argument. If unspecified, the default behavior is the current PNA preference setting of `SENSe:CORRection:PREFerence:CSET:SAVE

  **OFF** (0)  Save cal data ONLY to a Cal Register.

  **ON** (1)  Save cal data to a Cal Register and a User Cal Set. The filename is automatically generated.

**Examples**

```
SENS:CORR:COLL:GUID:SAVE
sense2:correction:collect:guided:save:immediate 0
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:SAVE:CSET <cal set name or guid>
(Write-only) Completes the guided cal by computing the error correction terms, turning Correction ON, and saving the calibration to the specified Cal Set. This command performs the same function as `SENSe:CORRection:COLLect:GUIDed:SAVE`, but this command allows the name or GUID of the Cal Set to be specified.

- Use this command instead of the optional name or GUID argument in `SENSe:CORR:COLL:GUID:INIT`.
- Use `SENSe:CORR:CSET` commands to get names or GUIDs of existing Cal Sets.
- The cal data is also saved to the channel Cal Register.
- If all of the required standards have not been measured, the calibration will not complete properly.

**Parameters**

- `<ch>` Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `<cal set name or guid>` String - Name or GUID of an existing Cal Set to be overwritten. If specifying a GUID, curly brackets must be included.

**Examples**

```
```

```
sense:correction:collect:guided:save:cset "MyCalSet"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:STEPs?**

(Read-only) Returns the number of measurement steps required to complete the current guided calibration. This command is sent after the `SENSe:CORR:COLL:GUID:INIT`, `SENSe:CORR:COLL:GUID:CONN:PORT` and `SENSe:CORR:COLL:GUID:CKIT:PORT` commands.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

```
SENS:CORR:COLL:GUID:STEP?
sense2:correction:collect:guided:steps?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:THRU:PORTs <t1a, t1b, t2a, t2b, t3a, t3b...>**
(Read-Write) For calibrating more than 2-ports ONLY. Specifies the port pairs for the thru connections of the calibration.

**Note:** Do NOT send this command to rely on SmartCal to determine the most accurate cal for your connector settings and Cal Kits. You can send the query form of this command to learn the Thru pairs determined by SmartCal.

**Parameters**

- **<ch>** Channel being calibrated, depending on the **CHAN:MODE** setting. If unspecified, value is set to 1.
- **<t1a,...>** Specify Port numbers in pairs:
  - For 3-port cals, specify two or three pairs.
  - For 4-port cals, specify from three up to six pairs.

  - t1a, t1b (Thru1 - port A and port B)
  - t2a, t2b (Thru2 - port A and port B)
  - t3a, t3b (Thru3 - port A and port B)

  ...and so forth up to six pairs.

**Examples**

```plaintext
SENS:CORR:COLL:GUID:THRU:PORT 1,2,1,3,1,4 '4-port measurement
SENSe:CORR:COL:GUID:THRU:PORTs 1,2,2,3 '3-port measurement
```

**Query Syntax**

`SENSe<ch>:CORRection:COLLect:GUIDed:THRU:PORTs?`

**Return Type**

Numeric

**Default**

Port pairings that were used in the previous cal.

SENSe<cnm>:CORRection:IMD:CALibration:FREQuencies <char>
(Read-Write) Sets and returns the frequencies at which an IMD source power cal is performed.

Parameters

<cnm> Any existing channel number; if unspecified, value is set to 1.
<char> Choose from:

- CENTer - Perform source power calibration at only the center frequencies, midway between the main tones.
- ALL - Perform source power calibration at all main tone frequencies.

Examples

SENS:CORR:IMD:CAL:FREQ ALL
sense2:correction:imd:calibration:frequencies center

Query Syntax
SENSe<cnm>:CORRection:IMD:CALibration:FREQuencies?

Return Type
Character

Default
CENTer

SENSe<cnm>:CORRection:IMD:CALibration:METHod <char>
(Read-Write) Sets and returns the method by which the match-correction portion of an IMD calibration is performed.

Parameters

<cnm> Any existing channel number; if unspecified, value is set to 1.
<char> Choose from:

- MATCH - Performs a full 2-port cal for full match-correction.
- RESPONSE - Performs only a response (normalization) cal instead of a full 2-port cal.

Examples

SENS:CORR:IMD:CAL:METH MATCH
sense2:correction:imd:calibration:method response

Query Syntax
SENSe<cnm>:CORRection:IMD:CALibration:METHod?

Return Type
Character

Default
MATCH

SENSe<cnm>:CORRection:IMD:LO<n>:PCAL[:STATe] <bool>
(Read-Write) Sets and returns whether or not the LO power cal step is included in the cal steps when an IMDX cal is performed. Learn more.

**Parameters**

- **<cnum>** Any existing channel number; if unspecified, value is set to 1.
- **<n>** LO Stage. Choose 1.
- **<char>** LO Power Cal state. Choose from:
  - O or OFF - Skips over the LO Power Cal when calibrating.
  - 1 or ON - Includes a step for LO Power Cal when calibrating

**Examples**

```
SENS:CORR:IMD:LO1:PCAL 0
sense2:correction:imd:lo1:pcal:state on
```

**Query Syntax**

SENSe<cnum>:CORRection:IMD:LO<n>:PCAL[:STATe]?

**Return Type**

Boolean

**Default**

PNA Rev. 9.1 and above: 0 or OFF

Before Rev 9.1: 1 or ON

---

**SENSe<cnum>:CORR:IMD:MPR <num>**

(Read-Write) Sets and returns the maximum intermod product frequencies to be calibrated. All lower product frequencies are also calibrated.

**Parameters**

- **<cnum>** Any existing channel number; if unspecified, value is set to 1.
- **<char>** Maximum IM products to calibrate. Choose from:
  - 2 - second order products
  - 3 - third order products
  - 5 - fifth order products
  - 7 - seventh order products
  - 9 - ninth order products

**Examples**

```
SENS:CORR:IMD:MPR 5
sense2:correction:imd:mproduct 9
```

2557
SENSe<cnum>::CORRection:IMD:POWer <num>

(Read-Write) Sets and returns the power level at which to perform the source power calibration using a power sensor.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<char>`: Power level. Choose a value between the min and max power level of the PNA.

**Examples**

```
SENS:CORR:IMD:POW -5
sense2:correction:imd:power 5
```

**Query Syntax**

SENSe<cnum>::CORRection:IMD:POWer?

**Return Type**

Numeric

**Default**

0

SENSe<cnum>::CORRection:IMD:SENSor:CKIT <string>

(Read-Write) Sets and returns the cal kit to be used for calibrating at the port 1 reference plane when the power sensor connector is different from the DUT port 1. This effectively removes the effects of an adapter that is used to connect the power sensor.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<string>`: Cal Kit enclosed in quotes. First set the DUT connector for port 1 and the connector of the power sensor. Then use SENS:CORR:COLL:GUID:CKIT:PORT1:CAT? to return a list of valid cal kits.

**Examples**

```
SENS:CORR:IMD:SENS:CKIT "85052B"
```

**Query Syntax**

SENSe<cnum>::CORRection:IMD:SENSor:CKIT?

**Return Type**

String

**Default**

Depends on the specified connectors
SENSe<cnum>::CORRection:IMD:SENSor:CONNector <string>

(Read-Write) Sets and returns the power sensor connector type which is used to perform the Source Power Cal portion of an IMD calibration.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

Select "Ignored" to NOT compensate for the adapter.

**Examples**

```
SENS:CORR:IMD:SENS:CONN "APC 3.5 male"
```

```
sense2:correction:imd:sensor:connector "Ignored"
```

**Query Syntax**

SENSe<cnum>::CORRection:IMD:SENSor:CONNector?

**Return Type** String

**Default** "Ignored"

---

SENSe<cnum>::CORRection:IMD:SORDer:INCLude <bool>

(Read-Write) Sets and returns whether to include the second order products in the calibration. These frequencies of these products can be far from the main tones.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<bool>` Choose from:

  - **ON** (or 1) - Include 2nd order products
  - **OFF** (or 0) - Do NOT include 2nd order products

**Examples**

```
SENS:CORR:IMD:SORD:INCL ON
```

**Query Syntax**

SENSe<cnum>::CORRection:IMD:SORDer:INCLude?

**Return Type** Boolean

**Default** OFF or 0

Last Modified:

- 11-Jan-2011 Minor edit
- 27-Mar-2009 Edited for IMDx
- 18-Sep-2008 MX New topic
Sense:Correction:Collect:Session Commands - Superseded

Note: These commands are replaced with Sense:Corr:Guided commands.

The commands in this topic are common to perform both SMC and VMC calibrations.

A calibration session is a term used to describe an instance of a SMC or VMC calibration. The session number is chosen in the SENS:CORR:COLL:SESS:INITiate command. All other commands refer to that session number. For more commands, see SESS:SMC and SESS:VMC.

Commands to read (STEP?) and describe (DESC?) each step are provided to facilitate a remote user interface.

Click on a blue keyword to view the command details.

See Also

- Learn about SMC and VMC calibrations
- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe<ch>:CORRection:COLLect:SESSion<n>:ACQuire <step>[,sync]
(Write only) Acquire a calibration measurement.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<n>`  Session number of the calibration.  
  Learn about Cal sessions.
- `<step>`  Step number to acquire. Use `SENS:CORR:COLL:SESS:STEPS?` to find the number of steps required for the calibration.
- `[sync]`  Optional argument. Choose from:  
  SYNChronous - blocks SCPI commands during standard measurement (default behavior).
  ASYNChronous - does NOT block SCPI commands during standard measurement.
  Learn more.

**Examples**

```
SENS2:CORR:COLL:SESS6:ACQ 5, ASYN; *OPC?
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:CKIT:PORT<p>:CATalog?**

(Read only) Returns a list of cal kits that are compatible with the connector on port `<p>`. The port connector type is set with `SENS:CORR:COLL:SESS:CONN:PORT`.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<n>`  Session number of the calibration.  
  Learn about Cal sessions.
- `<p>`  PNA port number connector to query for compatible cal kits.  
  For VMC, output port of the calibration mixer, specify 3 unless already used for the output of the mixer. Otherwise, specify 4.

**Examples**

```
```

**Return Type**  Comma separated string values

**Default**  Not Applicable

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:CKIT:PORT<p>[:SELect] <calkit>**
(Read-Write) Set or return the Cal Kit for the specified port. Use `SENS:CORR:COLL:SESS:CKIT:PORT:CAT?` to list compatible Cal Kits.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<p>` PNA port number connector for which to specify a cal kit.
  For VMC, output port of the calibration mixer, specify 3 unless already used for the output of the mixer. Otherwise, specify 4.
- `<calkit>` Cal Kit Name

**Examples**

```
SENS:CORR:COLL:SESS:CKIT:PORT:SEL 85091A
```

**Query Syntax**

**Return Type** String

**Default** Not Applicable

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:CONNector:PORT<p>[:SELect] <conn>**

(Read-Write) Set the connector type and sex for the specified port number. Catalog valid connector types using `SENS:CORR:COLL:GUID:CONN:CAT?`

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<p>` PNA port number connector for which to specify a connector type.
- `<conn>` Name of the connector type

**Examples**

```
SENS2:CORR:COLL:SESS6:CONN:PORT1:SEL "N Type"
```

**Query Syntax**

`SENSe<ch>:CORR:COLL:SESS<n>:CONN:PORT<p>[:SELect]?`

**Return Type** String

**Default** Not Applicable
SENSe<ch>:CORRection:COLLect:SESSion<n>:DESCription? <step>

(Read-only) Returns the connection prompt for the step. List the number of steps in the calibration using SENS:CORR:COLL:SESS:STEPS?.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration.
Learn about Cal sessions.
<step> Step number

Return Type Numeric
Default Not Applicable

SENSe<ch>:CORRection:COLLect:SESSion<n>:DONE

(Write only) Ends the calibration session. First use SAVE? to calculate error terms and save the CalSet.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration.
Learn about Cal sessions.

Examples SENS1:CORR:COLL:SESS6:SAVE?
SENS1:CORR:COLL:SESS6:DONE

Query Syntax Not Applicable
Default Not Applicable

SENSe<ch>:CORRection:COLLect:SESSion<n>:INITiate <string>
(Write only) Initiates an SMC or VMC calibration session. Use the session number for subsequent SMC or VMC commands.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number. Choose from 1 to the max number of channels. If the session number already exists it will be terminated and a new session initiated.
- `<string>` Name of the calibration. Choose from:
  - "VMC" or "VectorMixerCal.VMCTYPE"
  - "SMC" or "ScalarMixerCal.SMCType"

**Examples**

SENS1:CORR:COLL:SESS6:INITiate "VectorMixerCal.VMCTYPE"

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENS<ch>:CORR:COLL:SESS<n>:SAVE?**

(Read only) Finish the SMC or VMC calibration, compute error terms, populate and save the Cal Set, and return the GUID of the Cal Set.

*Note:* The destination (Cal Register or User Cal Set) is determined by the setting of the SENS:CORR:PREFERENCE:CSET:SAVE command.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

**Examples**

SENS1:CORR:COLL:SESS6:SAVE?

**Return Type**

String specifying the GUID of the Cal Set produced by this session.

**Default**

Not Applicable

---

**SENS<ch>:CORR:COLL:SESS<n>:STEPS?**
(Read-only) Returns the number of steps required by the Calibration.

To ensure this query always completes successfully, first send the write command:
SENS:CORR:COLL:SESS:STEP, then send the query.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

**NOTE:** To configure a power meter and sensor see SOURce:POWer: commands.

```plaintext
SENS<ch>:CORRection:COLLect:SESSION<n>:SMC:ECAL:CHARacteriza <mod>,<char> (Read-Write) Specifies the ECal module and characterization to be used for the SMC calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<mod>` 1 - Electronic Calibration Module
- `<char>` Specifies which characterization within the ECal module from which to read the confidence data.
  - 0  Factory characterization (data that was stored in the ECal module by Agilent). Default if not specified.
  - 1  User characterization #1
  - 2  User characterization #2
  - 3  User characterization #3
  - 4  User characterization #4
  - 5  User characterization #5

**Examples**

SENS:CORR:COLL:SESS:SMC:ECAL:CHAR 1, 2

**Query Syntax**

**Return Type** Numeric
```

(Read-Write) Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<p>` Apply network to input or output of mixer. Choose from:
  1 - Input of mixer
  2 - Output of mixer
- `<string>` Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

**Examples**

**Query Syntax**

**Return Type** String

**Default** Not Applicable

(Read-Write) Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<p>` Apply network to input or output of mixer. Choose from:
  1 - Input of mixer
  2 - Output of mixer
- `<char>` Choose from:
  - **NONE** - Do nothing with effects of S2P file.
  - **EMBed** - Add effects of S2P file from the measurement results.
  - **DEEMbed** - Remove effects of S2P file from the measurement results.

**Examples**

```
```

**Query Syntax**

```
SENS<ch>:CORRection:COLLect:SESSion<n>:SMC:IMPort <calName>, <dataset>
```

**Return Type** Character

**Default** NONE

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:IMPort <calName>, <dataset>
(Write-only) Imports existing Source Power Cal data into the SMC calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<calName>` (String) Name of existing Cal Set from which power meter data is imported.
- `<dataset>` (String) Name of the data set. Use POWER_STEP

**Examples**

**Query Syntax**

Not Applicable

**Default**

NONE

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:DELay <num>**

(Read-Write) Set and return the known delay through the calibration mixer. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<char>` Known delay through the calibration mixer in seconds.

**Examples**

**Query Syntax**

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:DELay?

**Return Type**

Numeric

**Default**

0 seconds

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:METHod <char>**
(Read-Write) Set and return the method of setting the delay through the calibration mixer. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<char>` Choose from:

  - **MIXer** - use the S2P file set with `SENS:CORR:COLL:SESS:SMC:PHAS:MIX`

**Examples**

```
```

**Query Syntax**

```
SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:METHod?
```

**Return Type** Character

**Default** FIXed

---

`SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:MIXer <string>`

(Write-only) Set the filename of the S2P file used to characterize the calibration mixer. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<string>` Calibration mixer filename. Use the following rules to specify path names:
  - The default folder is "C:/Program Files/Agilent/Network Analyzer/Documents"
  - You can change the active directory using `MMEMory:CDIRectory`
  - Specify only the file name if using the active directory.
  - You can also use an absolute path name to specify the folder and file.
SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PWRCal:SEParate <bool>

(Read-Write) Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration.

This command must be sent BEFORE the INITiate command and all the other calibration commands.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

<bool> OFF or 0 - Perform Cal with Thru standard.

ON or 1 - Do NOT use a Thru, but instead perform separate power cals on Input and Output reference planes.

Examples

SENS:CORR:COLL:SESS:INIT "SMC"
SENS:CORR:COLL:SESS:SMC:PWRC:SEP 1

Query Syntax

Return Type

Boolean

Default

0 or OFF

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PWRCal:SRCPort <string> Obsolete
Specifies which port to calibrate.

**Note:** Beginning with Rev 6.0, this command is no longer necessary. Because of improved calibration techniques, **Both** is always selected although a power meter measurement is performed only on port 1.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

*Learn about Cal sessions.*

- `<char>`
  - '1' Source port 1 (SMC forward direction)
  - '2' Source port 2 (SMC reverse direction)
  - 'BOTH' (both forward and reverse directions)

**Examples**

```
SENS:CORR:COLL:SESS:SMC:PWRC:SRCP 'both'
SENS2:CORRection:COLLection:SESSion6:SMC:PWRCal:SRCPort '2'
```

**Query Syntax**

**Return Type** String

**Default**

1

---

*(Read-Write)* Sets ECAL Auto-Orientation ON or OFF. If setting auto-orientation OFF, you must manually specify the orientation of the ECAL module with `SENS:CORR:COLL:SESS:SMC:TWOP:ECAL:PORTmap`.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

*Learn about Cal sessions.*

- `<bool>`
  - **OFF or 0** = Orientation OFF
  - **ON or 1** = Orientation ON

**Examples**

```
```

**Query Syntax**

**Return Type** Boolean
SENSe<ch>:CORRection:COLLect:SESSION<n>:SMC:TWOPort:ECAL:PORTmap <mod>,<string>

(Read-Write) Specifies the manual orientation (which ports of the module are connected to which ports of the PNA) when auto-orientation is OFF.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1
- **<n>** Session number of the calibration.
  
  Learn about Cal sessions.

- **<mod>** 1 - Electronic Calibration Module

- **<string>** Format in the following manner:

  Aw,Bx,Cy,Dz

  where

  - A, B, C, and D are literal ports on the ECAL module
  - w, x, y, and z are substituted for PNA port numbers to which the ECAL module port is connected.

  Ports of the module which are not used are omitted from the string.

**For example,** on a 4-port ECal module with

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: A2,B3,D1

If either the receive port or source port (or load port for 2-port cal) of the
CALC:PAR:SELelected measurement is not in this string and orientation is OFF, an attempt to perform an ECal calibration will fail.

**Examples**

**Query Syntax**

**Return Type**

String

**Default**

"A1,B2"

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:TWOPort:METHod <string>**

(Read-Write) Specifies the guided ECal method for performing the thru portion of the calibration.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

Learn about Cal sessions.

<string> ECAL Method: Choose from:

'DEFAULT' - Default

'ADAP' - Adapter removal

'FLUSH' - Flush Through

'UNKN' - Unknown Thru

**Examples**

SENS:CORR:COLL:SESS:SMC:TWOPort:METH 'default'

**Query Syntax**

**Return Type**

String

**Default**

DEFAULT

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:TWOPort:OMITisolat <bool>**
(Read-Write) Select to omit or perform the isolation portion of the ECAL.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.
- `<bool>` **ON or 1** - Omit isolation
  
  **OFF or 0** - Perform isolation

**Examples**

```
SENS:CORR:COLL:SESS:SMC:TWOPort:OMIT 1
```

**Query Syntax**

**Return Type** Boolean

**Default** 1

---

**SENSe<ch>:CORRection:COLLect:SESSion<n >:SMC:TWOPort:OPTion <string>**

(Read-Write) Sets the SMC calibration to ECAL or MEChanical

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.
- `<char>` Choose from:
  
  'ECAL' Electronic Calibration Module -
  
  **Note:** This selection assumes there is only one ECal module on the USB and so it selects the first enumerated module on the bus, and the factory characterization on that ECal module, to be used for the cal.
  
  'MECH' Mechanical Calibration Kit

**Examples**

```
SENS:CORR:COLL:SESS:SMC:TWOPort:OPTion 'ECAL'
```

**Query Syntax**

`SENS:CORR:COLL:SESS:SMC:TWOPort:OPTion?`

**Return Type** String

**Default** ECAL

**Sense:Correction:Collect:Session:VMC Commands - Superseded**

**Note:** Beginning with PNA release A..09.33, these commands (commonly known as "Session" commands) were replaced with Sens:Corr:Coll:Guid:VMC commands.

Performs a vector (VMC) calibration on a frequency converting device.

```
SENS:CORR:COLL:SESS:VMC
```

Click on a blue keyword to view the command details.

**See Also**

- Example Programs
- Learn about VMC Calibration
- Synchronizing the PNA and Controller

```
SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:FSIMulator:NETWork<x>:MODE <char>
```
(Read-Write) Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement. Learn more.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<x>` Apply network to input or output of mixer. Choose from:
  1 - Input of mixer
  2 - Output of mixer
- `<char>` Choose from:
  - NONE - Do nothing with effects of S2P file.
  - EMBED - Add effects of S2P file from the measurement results.
  - DEEMBED - Remove effects of S2P file from the measurement results.

Examples

```
```

Query Syntax

```
SENS<ch>:CORRection:COLLect:SESSion<n> :VMC:FSIMulator:NETWork<x>:MODE?
```

Return Type Character

Default NONE

---

**SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:FSIMulator:NETWork<x>:FILENAME <string>**

(Read-Write) Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement. Learn more.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<x>` Apply network to input or output of mixer. Choose from:
  1 - Input of mixer
  2 - Output of mixer

(Read-Write) Specifies the .S2P filename used for mixer characterization. Use the VMC:MIXer:CHARacterize:CAL:OPTion command to load the file for mixer characterization. Once loaded, use this command to query the current filename or set a new filename.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

Learn about Cal sessions.

<string> Filename of the S2P used for mixer characterization. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

Examples

Query Syntax

Return Type String

Default C:/Program Files/Agilent/Network Analyzer/Documents/default.s2p
(Read-Write) Sets the mixer characterization method to ECal, Mechanical, or read from a file.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<n>  Session number of the calibration.

Learn about Cal sessions.

<char>  ECAL - Electronic Calibration Module

MECH - Mechanical Calibration Kit

FILE, <filename> - Retrieve a mixer characterization file. Also specify the filename of the S2P used for mixer characterization. Use the full path name, file name, and .S2P suffix. Use the VMC:CHARacterize:CAL:FILENAME command to query the filename.

Examples

'or

Return Type  String

Default  MECH

(Read-Write) Specifies the direction in which to characterize the calibration mixer. Learn more about the calibration mixer.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<n>  Session number of the calibration.

Learn about Cal sessions.

<bool>  OFF (0) - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.

ON (1) - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.
**Examples**

**Query Syntax**

**Return Type**

Boolean

Default OFF

---

**SENSe<ch>:CORRection:COLLect:SESSion<n >:VMC:MIXer:ECAL:CHARacteriza <mod> ,<char>**

*(Read-Write)* Specifies the ECAL module and characterization to be used for the mixer characterization portion of the calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<char>` Characterization number in the specified ECAL module. Choose from:
  - 0 Factory characterization (data that was stored in the ECAL module by Agilent). Default if not specified.
  - 1 User characterization #1
  - 2 User characterization #2
  - 3 User characterization #3
  - 4 User characterization #4
  - 5 User characterization #5

**Examples**

SENS:CORR:COLL:SESS:VMC:MIX:ECAL:CHAR 1,0

**Query Syntax**

**Return Type**

Numeric

Default 1,0

---

**SENSe<ch>:CORRection:COLLect:SESSion<n >:VMC:MIXer:ECAL:PORTmap <mod>,<string>**
(Read-Write) Sets the port mapping for the mixer characterization with ECal. This command is required if SENS:CORR:COLL:SESS:VMC:MIX:CHAR:CAL:OPT ECAL is specified.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<string>` Choose from:
  - "A1" - ECAL module port A is connected to PNA port 1
  - "B1" - ECAL module port B is connected to PNA port 1

**Examples**

```
```

**Query Syntax**

**Return Type** String

**Default** "A1"

---

**SENSe<ch>:CORRection:COLLect:SESSion<n>:VMC:OPERation <string>**

(Read-Write) Perform either full VMC calibration or mixer characterization only.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<char>` 'CAL' - full calibration and mixer characterization
  - 'CHAR' - mixer characterization only (no reference mixer required) - Saves an .S2P file with the filename specified in SENS<ch>:CORR:COLL:SESSion<n>:VMC:CHARacterize:CAL:FILENAME <filename> . If none is specified, a filename is automatically generated and can be queried using the filename command.

**Examples**

```
SENS:CORR:COLL:SESS:VMC:OPER 'CAL'
```

**Query Syntax**

SENS:CORR:COLL:SESS:VMC:OPER?

(Read-Write) Specifies the ECAL module and characterization to be used for the VMC calibration.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<n>  Session number of the calibration.

<mod>  1 - Electronic Calibration Module

<char>  Characterization number in the specified ECAL module. Choose from:

0  Factory characterization (data that was stored in the ECAL module by Agilent). Default if not specified.
1  User characterization #1
2  User characterization #2
3  User characterization #3
4  User characterization #4
5  User characterization #5

Examples  SENS:CORR:COLL:SESSION:VMC:TWOP:ECAL:CHAR 1, 1

Return Type  Integer

Default  1,0
(Read-Write) Sets ECAL orientation for the VMC ECal.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  - Learn about Cal sessions.
- `<bool>` **ON or 1** - Perform orientation
  - **OFF or 0** - Do NOT perform orientation

**Examples**

```
```

**Query Syntax**

**Return Type** Integer

**Default** ON

---

SENS<ch>:CORRection:COLLect:SESSION<n>:VMC:TWOPort:ECAL:PORTmap <mod>,
<string>

(Read-Write) Specifies the manual orientation (which ports of the module are connected to which ports of the PNA) when orientation is turned off.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  - Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<string>` Port Map, formatted in the following manner:
  - Aw,Bx,Cy,Dz
  where:

  - A, B, C, and D are literal ports on the ECAL module.
  - w,x,y, z are substituted for PNA port numbers to which the ECAL module port is connected.
  - Ports of the module which are not used are omitted from the string.
For example, on a 4-port ECal module with:

- port A connected to PNA port 2
- port B connected to PNA port 3
- port C not connected
- port D connected to PNA port 1

the string would be: A2,B3,D1

If either the receive port or source port (or load port for 2-port cal) of the measurement is not in this string and orientation is OFF, an attempt to perform an ECal will fail.

**Examples**

```
```

**Query Syntax**

```
```

**Return Type** string

**Default** "A1,B2"

---

**SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:TWOPort:METHod <string>**

*(Read-Write)* Specifies the guided ECal method for performing the thru portion of the calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. [Learn about Cal sessions.](#)
- `<char>`  
  - `'DEFAULT'` - Default
  - `'ADAP'` - Adapter removal
  - `'FLUSH'` - Flush Through
  - `'UNKN'` - Unknown Thru

**Examples**

```
SENS:CORR:COLL:SESS:VMC:TWOP:METH 'ADAP'
SENSe2:CORR:COLL:SESSion6:VMC:TWOPort:METHod 'FLUSH'
```

**Query Syntax**

```
SENS:CORR:COLL:SESS:VMC:TWOP:METH?
```

**Return Type** String

**Default** DEFAULT
SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:TWOPort:OMITisolat <bool>

(Read-Write) Select to omit or perform the isolation portion of the ECAL.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

<bool> ON or 1 - omit isolation

OFF or 0 - perform isolation

Examples

SENS:CORR:COLL:SESS:VMC:TWOP:OMIT 1

Query Syntax

SENS:CORR:COLL:SESS:VMC:TWOP:OMIT?

Return Type Boolean

Default ON

SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:TWOPort:OPTion <string>

(Read-Write) Sets the 2-port calibration option to ECAL or MEChanical

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

<char> Choose from:

'ECAL' Electronic Calibration Module

'MECH' Mechanical Calibration Kit

Examples

SENS:CORR:COLL:SESS:VMC:TWOP:OPT 'MECH'

SENSe2:CORR:COLL:SESSion6:VMC:TWOPort:OPTion 'ECAL'

Query Syntax

SENS:CORR:COLL:SESS:VMC:TWOP:OPT?

Return Type String

Default "MECH"

Sense:Couple Commands

SENSe:COUPlE

| PARameter | [STATe] |

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe<cnum>:COUPlE <ALL | NONE>

(Read-Write) Sets the sweep mode as Chopped or Alternate.

Learn about Alternate Sweep

Parameters

< <cnum> > Any existing channel number; if unspecified, value is set to 1.
< <ALL | NONE> > ALL - Sweep mode set to Chopped - reflection and transmission measured on the same sweep.
NONE - Sweep mode set to Alternate - reflection and transmission measured on separate sweeps. Improves Mixer bounce and Isolation measurements.
Increases sweep time

Examples

SENSe:COUPlE ALL
sense2:couple none

Query Syntax

SENSe<cnum>:COUPlE?

Return Type

Character

Default

ALL

SENSe<cnum>:COUPlE:PARameter[::STATe] <bool>
(Read-Write) Turns ON and OFF Time Domain Trace Coupling. All of the measurements in the specified channel are coupled.

- To select Transform parameters to couple, use **CALC:TRAN:COUP:PAR**
- To select Gating parameters to couple, use **CALC:FILT:COUP:PAR**

Learn more about **Time Domain Trace Coupling**.

**Parameters**

- **<cnum>**  
  Any existing channel number; if unspecified, value is set to 1.
- **<bool>**  
  **ON (or 1)** - Turns ON Time Domain Trace Coupling.

  **OFF (or 0)** - Turns OFF Time Domain Trace Coupling.

**Examples**

```
SENS:COUP:PAR 0  
sense2:couple:parameter:state on
```

**Query Syntax**  
SENS<enum>:COUPE:PARame[ter[:STATe]]?

**Return Type**  
Boolean

**Default**  
ON (or 1)
**Sense:FOM (Frequency Offset) Commands**

Controls the frequency offset settings which cause stimulus and response frequencies to be different.

**Note:** These commands replace the previous FOM commands. Although the old commands will continue to work, they can NOT be mixed with these new commands.

Click on a **blue** keyword to view the command details.

**See Also**

- FOM Example Program
- Learn about Frequency Offset
- Synchronizing the PNA and Controller
- SCPI Command Tree

\[
\text{SENSe}<\text{cnum}>:\text{FOM[:STATe]} <\text{bool}>
\]
(Read-Write) Turns Frequency Offset ON and OFF. Frequency offset settings are not enabled until this setting is ON.

Send this command (FOM ON) AFTER sending other FOM settings to avoid 'out-of-range' errors.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<bool>` ON (or 1) - turns FOM ON.
  
  OFF (or 0) - turns FOM OFF.

**Examples**

```
SENS:FOM 1
sense2:fom:state on
```

**Query Syntax**

`SENSe<cnum>:FOM:STATe?`

**Return Type** Boolean

**Default** OFF

---

**SENSe<cnum>:FOM:CATalog?**

(Read-only) Returns a comma-separated list of available range names in the PNA.

Use `SENS:FOM:CAT?` to see a list of available range names.

Use `SENS:FOM:COUNT?` to see a list of available range numbers.

Use `SENS:FOM:RNUM?` to see the range number for a specific name.

Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.

External devices can appear in the list of range names. Learn more.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

**Examples**

```
SENS:FOM:CAT?
'returns
"Primary, Source, Receivers"
```

**Return Type** String

**Default** Not Applicable

---

**SENSe<cnum>:FOM:COUNT?**
(Read-only) Returns the number of valid range numbers in the PNA.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

**Examples**

```
SENS:FOM:COUN?
sense2:fom:count?
```

**Query Syntax**

SENSe<cnum>:FOM:COUNt?

**Return Type** Numeric

**Default** Not Applicable

### SENSe<cnum>:FOM:DISPlay:SELect <string>

(Read-Write) Select the range to be displayed on the PNA x-axis. All traces in the channel have this same x-axis scaling.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<string>` Range name. Case insensitive. Use SENSe:FOM:CAT? to see a list of available frequency range names.

**Examples**

```
SENS:FOM:DISPLAY:SELECT "source2"
sense2:fom:display:select "source"
```

**Query Syntax**

SENSe<cnum>:FOM:DISPlay:SELect?

**Return Type** String

**Default** Receivers

### SENSe<cnum>:FOM:RNUM? <string>
(Read-only) Returns the number of a specified range name.

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

Use SENS:FOM:CAT? to see a list of available range names.
Use SENS:FOM:COUNt? to see a list of available range numbers.
Use SENS:FOM:RANG:NAME? to see the range name for a specific number.

External devices can appear in the list of range names. Learn more.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<string>` Range name for which a number is being queried. Case insensitive.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:FOM:RNUM?</td>
<td>Returns the range number.</td>
</tr>
<tr>
<td>sense2:fom:rnum?</td>
<td>Returns the range number for a specific name.</td>
</tr>
</tbody>
</table>

Default Not Applicable

SENSe<cnum>:FOM:RANGE<n>:COUPled <bool>

(Read-Write) Sets and returns the state of coupling (ON or OFF) of the specified range to the primary range.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number to couple to primary range. An error is returned when attempting to couple to the Primary range (1).

Use SENS:FOM:CAT? to see a list of available range names.
Use SENS:FOM:COUNt? to see a list of available range numbers.
Use SENS:FOM:RNUM? to see the range number for a specific name.
Use SENS:FOM:RANG:NAME? to see the range name for a specific number.
<bool> ON (or 1) - Couple range to primary range.
OFF (or 0) - Do NOT couple to primary range.

Examples
SENS:FOM:RANG:COUP 1
sense2:fom:range2:coupled 0

Query Syntax SENSE<cnum>:FOM:RANGE<n>:COUPled?
Return Type Boolean

Default ON (or 1) Coupled

SENSe<cnum>:FOM:RANGe<n>:FREQuency:CW <num>

(Read-Write) Sets and returns the CW frequency.
This setting is valid for the primary range, or if the specified range is already uncoupled from the primary range and if the sweep type is CW.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.
Use SENS:FOM:CAT? to see a list of available range names.
Use SENS:FOM:COUNt? to see a list of available range numbers.
Use SENS:FOM:RNUM? to see the range number for a specific name.
Use SENS:FOM:RANG:NAME? to see the range name for a specific number.
<br>
<num> CW frequency value in Hz. Choose any frequency within the range of the PNA.

Examples SENS:FOM:RANG:FREQ:CW 1e9
sense2:fom:range2:frequency:cw 10000000

Query Syntax SENSE<cnum>:FOM:RANGE<n>:FREQuency:CW?
Return Type Numeric

Default Center frequency of the PNA.

SENSe<cnum>:FOM:RANGe<n>:FREQuency:DIVisor <num>
(Read-Write) Sets and returns the divisor value.
This setting is valid only if the specified range is coupled to the primary range.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.
Use SENS:FOM:CAT? to see a list of available range names.
Use SENS:FOM:COUNT? to see a list of available range numbers.
Use SENS:FOM:RNUM? to see the range number for a specific name.
Use SENS:FOM:RANG:NAME? to see the range name for a specific number.
<num> Divisor value (unitless).

Examples
SENS:FOM:RANG:FREQ:DIV 3
sense2:fom:range2:frequency:divisor 0

Query Syntax
SENSe<cnum>:FOM:RANGe<n>:FREQuency:DIVisor?

Return Type
Numeric

Default 1

SENSe<cnum>:FOM:RANGe<n>:FREQuency:MULTiplier <num>
(Read-Write) Sets and returns the multiplier value to be used when coupling this range to the primary range.
This setting is valid only if the specified range is coupled to the primary range.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.
Use SENS:FOM:CAT? to see a list of available range names.
Use SENS:FOM:COUNT? to see a list of available range numbers.
Use SENS:FOM:RNUM? to see the range number for a specific name.
Use SENS:FOM:RANG:NAME? to see the range name for a specific number.
<num> Multiplier value. (Unitless)

Examples
SENS:FOM:RANG:FREQ:MULT 1
sense2:fom:range2:frequency:multiplier 2
### Query Syntax

```
SENSe<cnum>:FOM:RANGe<n>:FREQuency:OFFSet <num>
```

(Read-Write) Sets and returns the offset value to be used when coupling this range to the primary range. Learn more about offset value.

This setting is valid only if the specified range is coupled to the primary range.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
  - Use `SENSe:FOM:CAT?` to see a list of available range names.
  - Use `SENSe:FOM:COUNT?` to see a list of available range numbers.
  - Use `SENSe:FOM:RNUM?` to see the range number for a specific name.
  - Use `SENSe:FOM:RANG:NAME?` to see the range name for a specific number.
- `<num>` Offset value. (Unitless)

**Examples**

```
SENSe:FOM:RANG:FREQ:OFFS 1E9
sense2:fom:range2:frequency:offset 10000000
```

### Query Syntax

```
SENSe<cnum>:FOM:RANGe<n>:FREQuency:STARt <num>
```

**Return Type** Numeric

**Default** 1

**Return Type** Numeric

**Default** 0
(Read-Write) Sets and returns the Start value of frequency range. Also specify Stop frequency.
This setting is valid for the primary range, or if the specified range is already uncoupled from the primary range and if the sweep type is LOG or LINear.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
  - Use `SENS:FOM:CAT?` to see a list of available range names.
  - Use `SENS:FOM:COUNt?` to see a list of available range numbers.
  - Use `SENS:FOM:RNUM?` to see the range number for a specific name.
  - Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.
- `<num>` Start value in Hz. Choose any frequency within the range of the PNA.

Examples

`SENS:FOM:RANG:FREQ:STAR 1GHz`
`sense2:fom:range2:frequency:start 100000000`

Query Syntax

`SENSe<cnum>:FOM:RANGe<n>:FREQuency:STARt?`

Return Type

Numeric

Default

Minimum frequency of the PNA.

---

`SENSe<cnum>:FOM:RANGe<n>:FREQuency:STOP <num>`

(Read-Write) Sets and returns the Stop value of frequency range. Also specify Start frequency.
This setting is valid for the primary range, or if the specified range is already uncoupled from the primary range and if the sweep type is LOG or LINear.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
  - Use `SENS:FOM:CAT?` to see a list of available range names.
  - Use `SENS:FOM:COUNt?` to see a list of available range numbers.
  - Use `SENS:FOM:RNUM?` to see the range number for a specific name.
  - Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.
- `<num>` Stop value in Hz. Choose any frequency within the range of the PNA.

**SENSe<cnum>:FOM:RANGe<n>:NAME?**

*Read-only* Returns the name of range<n>.
The FOM range items are typically named as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)

Use **SENSe:FOM:CAT?** to see a list of available range names.
Use **SENSe:FOM:COUNt?** to see a list of available range numbers.
Use **SENSe:FOM:RNUM?** to see the range number for a specific name.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

**Examples**

```sql
SENSe:FOM:RANG:NAME?
sense2:fom:range2:name?
```

**Return Type** String

**Default** Not Applicable

---

**SENSe<cnum>:FOM:RANGe<n>:SWEep:TYPE <char>**

---

2600
(Read-Write) Sets and returns the sweep type to be used with the specified range.
This setting is valid only if the specified range is already uncoupled from the primary range.
Learn about Unsupported Sweep Type combinations.

Parameters

- `<cnum>`  Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
  Use SENS:FOM:CAT? to see a list of available range names.
  Use SENS:FOM:COUNt? to see a list of available range numbers.
  Use SENS:FOM:RNUM? to see the range number for a specific name.
  Use SENS:FOM:RANG:NAME? to see the range name for a specific number.
- `<char>` Sweep type. Choose from:
  - CW - Also specify CW frequency.
  - LINear - Also specify frequency Start/Stop or Center/Span
  - LOG - Also specify frequency Start/Stop or Center/Span
  - PHASE - See all Phase sweep settings.
  - POWER - Also specify power Start/Stop or Center/Span
  - SEGMENT - Also specify segment sweep settings.

Examples

SENS:FOM:RANG:SWE:TYPE LOG
sense2:fom:range2:sweep:type linear:

Query Syntax
SENSe<cnum>:FOM:RANGe<n>:SWEep:TYPE?

Return Type
Character

Default
Linear

Last Modified:

5-Jul-2007 Fixed state link
8-Mar-2007 MQX New topic
**Sense:FOM:Range:Segment Commands**

Constructs a segment table for a specified **UNCOUpled** FOM range.

**Note:** Do NOT use **Sens:Segment** commands for FOM segment sweep.

Click on a blue keyword to view the command details.

**See Also**

- Other **SENSe:FOM Commands**
- **Example Programs**
- **Synchronizing the PNA and Controller**
- **SCPI Command Tree**

**SENSe<cnum>:FOM:RANGE<n>:SEGMENT<s>:ADD**
(Write-only) Adds a segment.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.
- `<s>`: Segment number to add. If unspecified, value is set to 1. Segment numbers must be sequential. If a new number is added where one currently exists, the existing segment and those following are incremented by one.

**Examples**

Two Segments exist (1 and 2). The following command will add a new segment (1). The existing (1 and 2) will become (2 and 3) respectively.

```
sense2:fom:range2:segment:add
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<cnum>:FOM:RANGe<n>:SEGment<s>:BWIDth[:RESolution] <num>**

(Read-Write) Sets the IF Bandwidth for the specified segment. First set

```
SENSe:FOM:RANGe:SEGm:BWIDth:CONTrol ON
```

All subsequent segments that are added assume the new IF Bandwidth value.

Valid either for Receiver range or for Primary range when coupled to Receiver.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.
- `<s>`: Segment number for which to set independent IF Bandwidth.
- `<num>`: IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. See the list of valid IFBW values. If an invalid number is specified, the analyzer will round up to the closest valid number.

**Examples**

```
SENSe:FOM:RANGe:SEGm:BWIDth 100
sense2:fom:range2:segment4:bwidth:resolution 1e3
```

**Query Syntax**

SENSe<cnum>:FOM:RANGe<n>:SEGment<s>:BWIDth[:RESolution]?

**Return Type**

Numeric

**Default**

See Preset IFBW for your PNA model.
SENSe<cnum>:FOM:RANGe<n>:SEGment:BWIDth[:RESolution]:CONTrol <bool>

(Read-Write) Specifies whether the IF Bandwidth resolution can be set independently for each segment. When set, each segment added after this will be set to ON automatically.

Valid either for Receiver range or for Primary range. Primary range value is ignored unless Receiver is coupled to Primary.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<bool>`
  - ON (or 1) - turns Bandwidth control ON. Bandwidth can be set for each segment
  - OFF (or 0) - turns Bandwidth control OFF. Use the channel IF bandwidth setting instead.

Examples

```
SENSe:FOM:RANG:SEG:BWIDth:CONT 0
sense2:fom:range2:segment:bwidth:resolution:control 1
```

Query Syntax

```
SENSe<cnum>:FOM:RANGe<n>:SEGMe nt:BWIDth[:RESolution]:CONTrol?
```

Return Type

Boolean

Default

OFF

SENSe<cnum>:FOM:RANGe<n>:SEGment:COUNt?

(Read-only) Returns the number of segments that exist for the specified range.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

Examples

```
SENSe:FOM:RANG:SEG:COUNT?
sense2:fom:range2:segment:count?
```

Return Type

Numeric

Default

Not Applicable

SENSe<cnum>:FOM:RANGe<n>:SEGment<s>:DELe te
(Write-only) Deletes the specified sweep segment.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.
<s> Number of the segment to delete. If unspecified, value is set to 1.

Examples

SENS:FOM:RANG:SEGM3:DEL
sense2:fom:range2:segment4:delete

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<cnum>:FOM:RANGe<n>:SEGMent:DELete:ALL

(Write-only) Deletes all sweep segments in the specified range.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.

Examples

SENS:FOM:RANG:SEGM:DEL:ALL
sense2:fom:range2:segment:delete:all

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:CENTer <num>
(Read-Write) Sets and returns the center frequency for the specified sweep segment. Also specify segment frequency span.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Center Frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Examples**

```
SENS: FOM: RANG: SEGM: FREQ: CENT 1GHz
sense2: fom: range2: segment4: frequency: center 1e9
```

**Query Syntax**

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:CENTer?
```

**Return Type** Numeric

**Default** Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.

---

SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:SPAN <num>

(Read-Write) Sets and returns the span frequency for the specified sweep segment. Also specify segment center frequency.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Frequency span in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Examples**

```
SENS: FOM: RANG: SEGM: FREQ: SPAN 1GHz
sense2: fom: range2: segment4: frequency: span 1e9
```

**Query Syntax**

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:SPAN?
```

**Return Type** Numeric
**SENSe\(<cnum>\):FOM:RANGe\(<n>\):SEGMent\(<s>\):FREQuency:STARt \(<num>\)**

*(Read-Write)* Sets and returns the start frequency for the specified sweep segment. Also specify segment stop frequency.

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

**Parameters**

- \(<cnum>\) Any existing channel number; if unspecified, value is set to 1.
- \(<n>\) Range number. If unspecified, value is set to 1.
- \(<s>\) Segment number to modify. Choose any existing segment number.
- \(<num>\) Start frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Examples**

```
SENS:FOM:RANG:SEGM:FREQ:STAR 1GHz
sense2:fom:range2:segment4:frequency:start 1e9
```

**Query Syntax**

SENSe\(<cnum>\):FOM:RANGe\(<n>\):SEGMent\(<s>\):FREQuency:STARt?

**Return Type** Numeric

**Default** If first segment, frequency span of the analyzer. Otherwise 0.

---

**SENSe\(<cnum>\):FOM:RANGe\(<n>\):SEGMent\(<s>\):FREQuency:STOP \(<num>\)**

Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.
Sets and returns the stop frequency for the specified sweep segment. Also specify segment start frequency.

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.
- `<s>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Stop frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Examples**

```
SENS:FOM:RANG:SEGM:FREQ:STOP 1GHz
sense2:fom:range2:segment4:frequency:stop 1e9
```

**Query Syntax**

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:STOP?
```

**Return Type**

Numeric

**Default**

Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.

---

Sets the Port Power level for the specified sweep segment. First set SENS:FOM:RANG:SEGM:POW:CONTrol ON.

When port power is Coupled, setting port power for one port will apply port power for all source ports.

All subsequent segments that are added assume the new Power Level value.

Valid either for Source ranges or for Primary range when coupled to the source.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.
- `<s>`: Segment number to modify. Choose any existing segment number.
- `<p>`: Port number of the source. If unspecified, value is set to 1.
- `<num>`: Power level in dBm.
Note: The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, send SOUR:POW? MAX and SOUR:POW? MIN. (SOUR:POW:ATT:AUTO must be set to ON).

Actual achievable leveled power depends on frequency.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:FOM:RANGe&lt;n&gt;:SEGMent&lt;s&gt;:POWer&lt;p&gt;[:LEVel]?</td>
<td>Numeric</td>
<td>0</td>
</tr>
</tbody>
</table>

SENSe<cnum>:FOM:RANGe<n>:SEGMent:POWer[:LEVel]:CONTrol <bool>

(Read-Write) Specifies whether Power Level is to be set independently for each segment.
Valid either for Source ranges or for Primary range. Primary range value is ignored unless Source is coupled to Primary.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<bool>` ON (or 1) - Power level will be set for each segment.
  OFF (or 0) - Use the channel power level setting.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:FOM:RANGe&lt;n&gt;:SEGMent:POWer[:LEVel]:CONTrol?</td>
<td>Boolean</td>
<td>OFF (or 0)</td>
</tr>
</tbody>
</table>

SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>[:STATe] <bool>
(Read-Write) Turns the specified sweep segment ON or OFF.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to be turned ON or OFF. Choose any existing segment number.
- `<bool>` ON (or 1) - turns segment ON.
  OFF (or 0) - turns segment OFF.

Examples

```plaintext
SENS:FOM:RANG:SEGM 0
sense2:fom:range2:segment4:state on
```

Query Syntax

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>[STATe]?
```

Return Type

Boolean

Default

OFF (or 0)

---

**SENS<cnue>:FOM:RANG<n>:SEGM<s>:SWEep:POINts <num>**

(Read-Write) Sets the number of data points for the specified sweep segment.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Number of points in the segment. The total number of points in all segments cannot exceed 20001. A segment can have as few as 1 point.

Examples

```plaintext
SENS:FOM:RANG:SEGM:SWE:POIN 101
sense2:fom:range2:segment4:sweep:points 201
```

Query Syntax

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:SWEep:POINts?
```

Return Type

Numeric

Default

21
SENSe\textless cnum\textgreater :FOM:RANGE\textless n\textgreater :SEGMENT\textless s\textgreater :SWEep:TIME \textless num\textgreater

\textit{(Read-Write)} Sets the time the PNA takes to sweep the specified segment.
Valid ONLY for receiver ranges.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{\textless cnum\textgreater} Any existing channel number; if unspecified, value is set to 1.
  \item \texttt{\textless n\textgreater} Range number. If unspecified, value is set to 1.
  \item \texttt{\textless s\textgreater} Segment number for which to set sweep time.
  \item \texttt{\textless num\textgreater} Sweep time in seconds. Choose a number between 0 and 100
\end{itemize}

\textbf{Examples}

\begin{verbatim}
SENS:FOM:RANGE:SEGMENT:SWE:TIME 1
sense2:fom:range2:segment3:sweep:time 1
\end{verbatim}

\textbf{Query Syntax}

SENSe\textless cnum\textgreater :FOM:RANGE\textless n\textgreater :SEGMENT\textless s\textgreater :SWEep:TIME?

\textbf{Return Type} Numeric

\textbf{Default} Not Applicable

SENSe\textless cnum\textgreater :FOM:RANGE\textless n\textgreater :SEGMENT:SWEep:TIME:CONTrol \textless bo\textgreater

\textit{(Read-Write)} Specifies whether Sweep Time can be set independently for each sweep segment.
Valid either for Receiver ranges or for Primary range. Primary range value is ignored unless Receiver is \texttt{coupled} to Primary.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{\textless cnum\textgreater} Any existing channel number; if unspecified, value is set to 1.
  \item \texttt{\textless n\textgreater} Range number. If unspecified, value is set to 1.
  \item \texttt{\textless bo\textgreater} \texttt{ON} (or 1) - Sweep time will be set for each segment.
  \texttt{OFF} (or 0) - Use the channel sweep time setting.
\end{itemize}

\textbf{Examples}

\begin{verbatim}
SENS:FOM:RANGE:SEGMENT:SWE:TIME:CONT 1
sense2:fom:range2:segment:sweep:time:control off
\end{verbatim}

\textbf{Query Syntax}

SENSe\textless cnum\textgreater :FOM:RANGE\textless n\textgreater :SEGMENT:SWEep:TIME:CONTrol?

\textbf{Return Type} Boolean
Last Modified:

21-Jun-2007 Increased max number of points
Sense:Frequency Commands

Sets the frequency sweep functions of the analyzer.

SENSe: FREQuency

CENTER  [CW | FIXED]  SPAN  START  STOP

Click on a blue keyword to view the command details.

See Also

- Example using some of these commands.
- Learn about Frequency Sweep
- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe<cnum>:FREQuency:CENTer <num>

(Read-Write) Sets the center frequency of the analyzer.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Center frequency. Choose any number between the minimum and maximum frequency limits of the analyzer. Units are Hz.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

`SENS:FREQ:CENT 1000000`

`sense2:frequency:center 1mhz`

`sense2:frequency:center 1e6`

**Query Syntax**

SENSe<cnum>:FREQuency:CENTer?

**Return Type**

Numeric

**Default**

Center of the analyzer's frequency span

SENSe<cnum>:FREQuency[:CW | :FIXed] <num>
(Read-Write) Sets the Continuous Wave (or Fixed) frequency. Must also send SENS:SWEEP:TYPE CW to put the analyzer into CW sweep mode.

### Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` CW frequency. Choose any number between the **minimum** and **maximum** frequency limits of the analyzer. Units are Hz.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

### Examples

```
SENS:FREQ 1000000
SENS:FREQ:CW MIN
sense2:frequency:fixed 1mhz
```

### Query Syntax

`SENSe<cnum>:FREQuency[:CW | :FIXed]?`

### Return Type

Numeric

**Default**

1 GHz

---

**SENSe<cnum>:FREQuency:SPAN <num>**

(Read-Write) Sets the frequency span of the analyzer.

### Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Frequency span in Hz. Choose any number between 0 (minimum) and the **maximum** frequency span of the analyzer.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

### Examples

```
SENS:FREQ:SPAN 1000000
sense2:frequency:span max
```

### Query Syntax

`SENSe<cnum>:FREQuency:SPAN?`

### Return Type

Numeric

**Default**

Maximum frequency span of the analyzer

---

**SENSe<cnum>:FREQuency:STARt <num>**
(Read-Write) Sets the start frequency of the analyzer.

**Parameters**

- `<cnun>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Start frequency. Choose any number between the **MIN** and **MAX** frequency limits of the analyzer. Units are Hz.

  If `FREQ:START` is set greater than `FREQ:STOP`, then `STOP` is set equal to `START`.

  This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENS:FREQ:STAR 1000000
sense2:frequency:start MIN
```

**Query Syntax**

`SENSe<cnun>:FREQuency:STARt?`

If **Sweep type is segment**, this query returns the start frequency of the first segment.

**Return Type** Numeric

**Default** Minimum frequency of the analyzer

---

**SENSe<cnun>:FREQuency:STOP <num>**

(Read-Write) Sets the stop frequency of the analyzer.

**Parameters**

- `<cnun>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Stop frequency. Choose any number between: the **minimum** and **maximum** frequency limits of the analyzer. Units are Hz.

  If `FREQ:STOP` is set less than `FREQ:START`, then `START` will be set equal to `STOP`.

  This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENS:FREQ:STOP 1000000
sense2:frequency:stop max
```

**Query Syntax**

`SENSe<cnun>:FREQuency:STOP?`

If **Sweep type is segment**, this query returns the stop frequency of the last segment.

**Return Type** Numeric

**Default** Maximum frequency of the analyzer

---

Other Gain Compression commands

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- **CALC:CUSTom:DEFine** - creates a gain compression measurement.
- **CALC:GCMeas:ANAL** - Gain Compression Analysis settings
- **GCA Calibration** uses the Guided Calibration commands, except for the following:
  - **Sens:Corr:GCS:Power** - sets power level for Source Power Cal

- **SCPI Command Tree**

**SENSe<ch>:GCSetup:AMODe <char>**
(Read-Write) Set and read the method by which gain compression data is acquired.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<char>` Choose from:
  - PFREQuency - 2D Power Per Frequency
  - FPOWer - 2D Frequency Per Power
  - SMARtsweep - Smart Sweep

**Examples**

```
SENS:GCS:AMOD SHAR
sense:gcsetup:amode pfrequency
```

**Query Syntax** `SENS<ch>:GCSetup:AMODe ?`

**Return Type** Character

**Default** SMARtsweep

---

**SENSe<ch>:GCSetup:COMPression:ALGorithm <char>**

(Read-Write) Set and read the algorithm method used to compute gain compression.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<char>` Algorithm method. Choose from:
  - CFLG - compression from linear gain
  - CFMG - compression from maximum gain
  - BACKoff - compression from BackOff
  - XYCOM - X/Y Compression
  - SAT - compression from saturation

**Examples**

```
SENS:GCS:COMP:ALG BACK
sense:gcsetup:compression:algorithm XYcom
```

**Query Syntax** `SENS<ch>:GCSetup:COMPression:ALGorithm?`

**Return Type** Character

**Default** CFLG
SENSe<ch>:GCSetup:COMPression:BACKoff:LEVel <num>
(Read-Write) Set and read value for the BackOff compression algorithm.

Parameters
- <ch> Any existing GCA channel. If unspecified, value is set to 1.
- <num> Backoff value in dB. Choose from 30 to (-30)

Examples
- SENS:GCS:COMP:BACK:LEV 10
- sense:gcsetup:compression:backoff:level 5

Query Syntax
SENSe<ch>:GCSetup:COMPression:BACKoff:LEVel?

Return Type Numeric

Default 10

SENSe<ch>:GCSetup:COMPression:DELTa:X <num>
(Read-Write) Set and read the 'X'' value in the delta X/Y compression algorithm.

Parameters
- <ch> Any existing GCA channel. If unspecified, value is set to 1.
- <num> X value in dB. Choose from 30 to (-30)

Examples
- SENS:GCS:COMP:DELT:X 9
- sense:gcsetup:compression:delta:X 8

Query Syntax
SENSe<ch>:GCSetup:COMPression:DELTa:X?

Return Type Numeric

Default 10

SENSe<ch>:GCSetup:COMPression:DELTa:Y <num>
(Read-Write) Set and read the "Y" value in the delta X/Y compression algorithm.

**Parameters**
- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: Y value in dB. Choose from 30 to (-30)

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:GCS:COMP:DELT:Y</td>
<td>9</td>
</tr>
<tr>
<td>sense:gcsetup:compression:delta:Y</td>
<td>8</td>
</tr>
</tbody>

**Query Syntax**
SENSe<ch>:GCSetup:COMPression:DELTa:Y?

**Return Type**
Numeric

**Default**
9

---

**SENSe<ch>:GCSetup:COMPres:sion:INTerpоляtion <bool>**

(Read-Write) Sets whether or not interpolation should be performed on 2D measured compression data. Applies ONLY to 2D acquisition modes.

**Parameters**
- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - **ON** or (1) Interpolate the results
  - **OFF** or (0) Do NOT interpolate the results but return the value closest to compression.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:GCS:COMP:INT</td>
<td>1</td>
</tr>
<tr>
<td>sense:gcsetup:compression:interpolation</td>

</tr>
</tbody>
</table>

**Query Syntax**
SENSe<ch>:GCSetup:COMPres:sion:INTerpоляtion?

**Return Type**
Boolean

**Default**
OFF

---

**SENSe<ch>:GCSetup:COMPression:LEVel <num>**

2621
(Read-Write) Set and read the desired gain reduction (from reference gain).

This value is used for Compression from Linear Gain and Compression from Maximum Gain.

Use \texttt{SENS:GCS:COMP:ALG CFLG} to set this compression algorithm.

\textbf{Parameters}

- \texttt{<ch>}: Any existing GCA channel. If unspecified, value is set to 1.
- \texttt{<num>}: Compression level in dB. Choose a value greater than 0.1 dB.

\textbf{Examples}

\begin{verbatim}
SENS:GCS:COMP:LEV 1
sense:gcsetup:compression:level 3
\end{verbatim}

\textbf{Query Syntax}

\texttt{SENSe<ch>:GCSetup:COMPression:LEVel?}

\textbf{Return Type}

Numeric

\textbf{Default}

1

\begin{verbatim}
SENSe<ch>:GCSetup:COMPression:SATuration:LEVel <num>
\end{verbatim}

(Read-Write) Set and read the deviation dB from the maximum Pout. This is the point of saturation.

Use \texttt{SENS:GCS:COMP:ALG CFLG} to set this compression algorithm.

\textbf{Parameters}

- \texttt{<ch>}: Any existing GCA channel. If unspecified, value is set to 1.
- \texttt{<num>}: Saturation level in dB. Choose a value greater than 0.01 dB.

\textbf{Examples}

\begin{verbatim}
SENS:GCS:COMP:SAT:LEV 1
sense:gcsetup:compression:saturation:level 3
\end{verbatim}

\textbf{Query Syntax}

\texttt{SENSe<ch>:GCSetup:COMPressionSATuration:LEVel?}

\textbf{Return Type}

Numeric

\textbf{Default}

.1 dB

\begin{verbatim}
SENSe<ch>:GCSetup:EOSoperation <char>
\end{verbatim}
(Read-Write) Set and read the This setting is used to protect a sensitive device from too much power during the sweep retrace. Other instrument settings or channels may over-ride this setting. Learn more.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<char> End Of Sweep operation. Choose from:

- STANdard Use the default PNA method. Learn more.
- POFF Always turn power OFF while waiting.
- PSTArt Sweep Start power
- PSTOp Sweep Stop power.

Examples

```
SENS:GCS:EOS PSTA
```

```
sense:gcsetup:eosoperation standard
```

Query Syntax
SENSe<ch>:GCSetup:EOSperation?

Return Type
Character

Default
STANdard

SENSe<ch>:GCSetup:PMAP <in>,<out>

(Write-only) Set the DUT-to-PNA port mapping for the Gain Compression measurement.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<in> PNA port which is connected to the DUT input.
<out> PNA port which is connected to the DUT output.

Examples

```
SENS:GCS:PMAP 1,2
```

```
sense:gcsetup:pmap 2,1
```

Query Syntax
Not Applicable

Default
1,2

SENSe<ch>:GCSetup:PMAP:INPut?
(Read-only) Read the PNA port number to be connected to the DUT Input.

Use `SENS:GCS:PORTMap` to set the port mapping.

### Parameters

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:GCS:PMAP:INP?</code></td>
<td>Get the input port mapping</td>
</tr>
<tr>
<td><code>sense:gcsetup:pmap:input?</code></td>
<td>Get the input port mapping</td>
</tr>
</tbody>
</table>

### Return Type

- **Numeric**

### Default

- **1**

---

`SENS<ch>:GCSetup:PMAP:OUTPut?`

(Read-only) Read the PNA port number to be connected to the DUT Output.

### Parameters

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:GCS:PMAP:OUTP?</code></td>
<td>Get the output port mapping</td>
</tr>
<tr>
<td><code>sense:gcsetup:pmap:output?</code></td>
<td>Get the output port mapping</td>
</tr>
</tbody>
</table>

### Return Type

- **Numeric**

### Default

- **2**

---

`SENS<ch>:GCSetup:POWer:LINear:INPut:LEVel <num>`

(Read-Write) Set and read the input power at which Linear Gain and all S-parameters are measured.

### Parameters

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: Input power level in dBm. Choose a value from +30 to (-30).

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:GCS:POW:LIN:INP:LEV 0</code></td>
<td>Set the input power to 0 dBm</td>
</tr>
<tr>
<td><code>sense:gcsetup:power:linear:input:level -10</code></td>
<td>Set the input power to -10 dBm</td>
</tr>
</tbody>
</table>

### Query Syntax

`SENS<ch>:GCSetup:POWer:LINear:INPut:LEVel?`

### Return Type

- **Numeric**

### Default

- **-25 dBm**
SENSe<ch>:GCSetup:POWer:REVerse:LEVel <num>

(Read-Write) Set and read the reverse power level to the DUT. This is applied to the DUT output port when making reverse measurements like S22.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Reverse power level in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:POW:REV:LEV 0
sense:gcsetup:power:reverse:level -5
```

**Query Syntax**

`SENSe<ch>:GCSetup:POWer:REVerse:LEVel?`

**Return Type**

Numeric

**Default**

-5

---

SENSe<ch>:GCSetup:POWer:STARt:LEVel <num>

(Read-Write) Set and read the start power level.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Start power level in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:POW:STAR:LEV 0
sense:gcsetup:power:start:level -5
```

**Query Syntax**

`SENSe<ch>:GCSetup:POWer:STARt:LEVel?`

**Return Type**

Numeric

**Default**

-30

---

SENSe<ch>:GCSetup:POWer:STOP:LEVel <num>
(Read-Write) Set and read the stop power level.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Stop power level in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:POW:STOP:LEV 0
sense:gcsetup:power:stop:level -5
```

**Query Syntax**

```
SENSe<ch>:GCSetup:POWer:STOP:LEVel?
```

**Return Type** Numeric

**Default** -5

---

**SENSe<ch>:GCSetup:SAFE:CPADjustment <num>**

(Read-Write) Set and read the Safe Sweep COARSE power adjustment. [Learn more](#).

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Coarse power adjustment setting in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:SAFE:CPAD 2
sense:gcsetup:safe:cpadjustment 3.5
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SAFE:CPADjustment?
```

**Return Type** Numeric

**Default** 3.0

---

**SENSe<ch>:GCSetup:SAFE:ENABle <bool>**
(Read-Write) Set and read the (ON | OFF) state of Safe Sweep mode. Learn more

**Parameters**

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: (Boolean) - Safe Sweep state. Choose from:
  - OFF (or 0) - Disable Safe Sweep
  - ON (or 1) - Enable Safe Sweep

**Examples**

```
SENS:GCS:SAFE:ENAB 0
sense:gcsetup:safe:enable 1
```

**Query Syntax**

SENSe<ch>:GCSetup:SAFE:ENABle?

**Return Type**

Boolean

**Default**

0

---

**SENSe<ch>:GCSetup:SAFE:FPADjustment <num>**

(Read-Write) Set and read the Safe Sweep FINE power adjustment. Learn more

**Parameters**

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: Fine power adjustment setting in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:SAFE:FPAD 2
sense:gcsetup:safe:fpadjustment .5
```

**Query Syntax**

SENSe<ch>:GCSetup:SAFE:FPADjustment?

**Return Type**

Numeric

**Default**

1.0 dBm

---

**SENSe<ch>:GCSetup:SAFE:FTHReshold <num>**
(Read-Write) Set and read the compression level in which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment. [Learn more]

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Threshold setting in dB. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:SAFE:FTHR .1
```

```
sense:gcsetup:safe:fthreshold .75
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SAFE:FTHReshold?
```

**Return Type**

Numeric

**Default**

0.5 dB

---

`SENSe<ch>:GCSetup:SAFE:MLimit <num>`

(Read-Write) When the PNA port that is connected to the DUT Output measures this value, the input power to the DUT is no longer incremented at that frequency. Safe Mode must be enabled with `SENS:GCS:SAFE:ENAB ON` [Learn more]

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Maximum power limit in dBm. Choose a value from -100 to +100

**Examples**

```
SENS:GCS:SAFE:MLIM 20
```

```
sense:gcsetup:safe:mlimit 30
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SAFE:MLIMIT?
```

**Return Type**

Numeric

**Default**

30

---

`SENSe<ch>:GCSetup:SFAilures?`
(Read-only) Returns a comma-separated list of the frequency indexes that were out of tolerance for SMART Sweep mode, or at the power limit for 2D acquisition modes. Zero (0) is the first frequency data point.

Must be Single triggered. Invalid results occur if the GCA channel is continuously sweeping.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.

**Examples**

```
SENS : GCS : SFA?
sense : gcsetup : sfailures?
```

**Return Type** Comma-separated list of frequency indexes.

**Default** Not Applicable

**SENSe<ch>:GCSetup:SMARt:MIterations <num>**

(Read-Write) Set and read the maximum permitted number of iterations which SMART Sweep may utilize to find the desired compression level, to within the specified tolerance.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Maximum number of iterations. Choose a value between 1 and 10e8

**Examples**

```
SENS : GCS : SMAR : MIT 5
sense : gcsetup : smart : miterations 3
```

**Query Syntax** `SENSe<ch>:GCSetup:SMARt:MIterations?`

**Return Type** Numeric

**Default** 20

**SENSe<ch>:GCSetup:SMARt:SIterations <bool>**
(Read-Write) Set and read enable for showing intermediate results for each iteration of SMART Sweep

Parameters

[ch] Any existing GCA channel. If unspecified, value is set to 1.
<bool> Choose from:

ON or (1) Compression traces are updated after each iteration.

OFF or (0) Compression traces are updated after ALL iterations are complete.

Examples

SENS:GCS:SMAR:SIT 1
sense:gcsetup:smart:siterations off

Query Syntax

SENSe[ch]:GCSetup:SMARt:SITerations?

Return Type

Boolean

Default

OFF

SENS[ch]:GCSetup:SMARt:STIMe <num>

(Read-Write) Set and read the amount of time SMART Sweep will dwell at the first point where the input power changes by the Backoff or X level. Applies only to SMART Sweep when Backoff or XY compression methods are selected. Learn more.

Parameters

[ch] Any existing GCA channel. If unspecified, value is set to 1.
<bool> Settling time in seconds. Choose any positive value.

Examples

SENS:GCS:SMAR:STIM 1
sense:gcsetup:smart:stime .1

Query Syntax

SENSe[ch]:GCSetup:SMARt:STIMe?

Return Type

Numeric

Default

0

SENS[ch]:GCSetup:SMARt:TOlerance <num>
(Read-Write) Set and read the acceptable range SMART Sweep will allow for the measured compression level.

**Parameters**

- <ch> Any existing GCA channel. If unspecified, value is set to 1.
- <num> Tolerance level in dBm. Choose a value between .01 and 10

**Examples**

```plaintext
SENS:GCS:SMAR:TOL .1
sense:gcsetup:smart:tolerance .05
```

**Query Syntax**

SENSe<ch>:GCSetup:SMAR:t:Lerance?

**Return Type** Numeric

**Default** .05

---

**SENSe<ch>:GCSetup:SWEep:FREQuency:POINts <num>**

(Read-Write) Set and read the number of data points in each frequency sweep. Learn more

**Parameters**

- <ch> Any existing GCA channel. If unspecified, value is set to 1.
- <num> Frequency points. Do not exceed the max number of data points.

**Examples**

```plaintext
SENS:GCS:SWE:FREQ:POIN 201
sense:gcsetup:sweep:frequency:points 101
```

**Query Syntax**

SENSe<ch>:GCSetup:SWEep:FREQuency:POINts?

**Return Type** Numeric

**Default** 201

---

**SENSe<ch>:GCSetup:SWEep:POWer:POINts <num>**
(Read-Write) Set and read the number of data points in each power sweep. Applies ONLY to 2D acquisition modes.

Parameters

<ch>   Any existing GCA channel. If unspecified, value is set to 1.
<num>  Power points. Do not exceed the max number of data points.

See Data Points Limit

Examples

SENSe:GCS:SWE:POW:POIN 50
sense:gcsetup:sweep:power:points 21

Query Syntax  SENSe<ch>:GCSetup:SWEep:POWer:POINts?
Return Type   Numeric

Default        26

**SENSe<cnum>:IF:FILT:FILTer:SAMPle:COUNt <num>**

(Read-Write) Sets and returns the number of taps in the IF filter. The IF filter sample count setting is only used when SENSe:IF:FILT:FILTer:SAMPle:COUNt:MODE is set to MANUAL.

For use with the E836xC Opt H11

**Parameters**

- `<cnum>` Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.
- `<num>` An integer value. (MIN and MAX return the minimum and maximum allowed values, respectively.)

**Examples**

```
SENS:IF:FILT:SAMP:COUN 40
sense2:if:filter:sample:count maximum
```

**Query Syntax** SENSe:IF:FILT:FILTer:SAMPle:COUNt?

**Return Type** Numeric

**Default** Instrument dependent.
SENSe<cnum>:IF:FILT: Samp: Count: MODE <char>

(Read-Write) Sets and returns the IF filter sample count mode to the specified value. When in MANUAL mode, the value specified for the IF Filter sample count is used as the number of taps in the IF filter.

For use with the E836xC Opt H11

Parameters

- <cnum> Existing channel number to manipulate. If unspecified, <cnum> is set to 1.
- <char> Choose either AUTO or MANUAL.

Examples

SENSe:IF:FILT:SAMP:COUN:MODE MANUAL
sense2:if:filter:sample:count:mode AUTO

Query Syntax
SENSe:IF:FILT: Samp: Count: MODE?

Return Type
Character

Default
AUTO

SENSe<cnum>:IF:FILT: Samp: PERiod <num>

(Read-Write) Sets and returns the IF filter sample period. The IF filter sample period setting is only used by the instrument when the SENS:IF:FILT: Samp: PER: MODE is set to MANUAL.

For use with the E836xC Opt H11

Parameters

- <cnum> Existing channel number to manipulate. If unspecified, <cnum> is set to 1.
- <num> Sample period. Choose from values returned from the SENS:IF:FILT:SAMP:PER: MODE?

Examples

SENSe:IF:FILT:SAMP:PER 6 us
sense2:if:filter:sample:period maximum

Query Syntax
SENSe:IF:FILT: Samp: PERiod?

Return Type
Numeric

Default
Instrument dependent.

SENSe<cnum>:IF:FILT: Samp: PERiod: CATalog?
(Read-Only) Returns the list of allowed IF filter sample periods for this instrument.

For use with the E836xC Opt H11

Parameters

- `<cnum>` Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.

Examples

```
SENS:IF:FILT:SAMP:PER:CAT?
sense2:if:filter:sample:period:catalog?
```

Query Syntax

SENS:IF:FILTER:SAMPLE:PERIOD:CATalog?

Return Type

String

Default

AUTO

---

SENSe<cnum>:IF:FILTer:SAMPle:PERiod:MODE <char>

(Read-Write) Sets and returns the IF filter sample period mode to the specified value.

For use with the E836xC Opt H11

Parameters

- `<cnum>` Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.
- `<char>` Sample period mode. Choose from AUTO or MANUAL

Examples

```
SENS:IF:FILT:SAMP:PER:MODE MANUAL
sense2:if:filter:sample:period:mode AUTO
```

Query Syntax

SENS:IF:FILTER:SAMPLE:PERIOD:MODE?

Return Type

Character

Default

AUTO

---

SENSe<cnum>:IF:GAIN:ALL[:STATe] <char>

(Write only) Sets the gain state for ALL receivers to Auto or Manual.

For use with the E836xC Opt H11

Parameters

- `<cnum>` Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from AUTO or MANUAL

Examples

```
SENS:IF:GAIN:ALL AUTO
sense:if:gain:all:state manual
```

Query Syntax

Not Applicable

Return Type

Character
SENSe<cnum>:IF:GAIN:LEVEL <id>, <level>

(Read Write) Manually sets the gain level for the specified receiver. This setting can be made for E836x and selected N5230A models. Learn more.

Parameters

- `<cnum>`: Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.
- `<id>`: (String) Choose from: 'A', 'B', 'R1', 'R2'..
- `<level>`: Gain level. Choose from:
  0 - Lowest gain setting
  1
  2 - Highest gain setting

Examples

```
SENS:IF:GAIN:LEVEL 'A', 1
```

Query Syntax

```
SENSe<cnum>:IF:GAIN:LEVEL? <id>
```

Return Type

Numeric

Default

0

SENSe<cnum>:IF:GAIN[:STATe]? <id>

(Read only) Returns the gain state for the specified receiver. Use SENS:IF:GAIN:ALL to set the gain state for all receivers in the channel. This setting can be made for E836x and selected N5230A models.

Parameters

- `<cnum>`: Existing channel number to manipulate. If unspecified, `<cnum>` is set to 1.
- `<id>`: String. Choose from: 'A', 'B', 'R1', 'R2'.

Note: The A and R1 receivers are always switched together. B and R2 are also always switched together. For example, if you specify 'A', R1 will also be switched.

Examples

```
SENS:IF:GAIN? 'A'
```

Return Type

Character - Returns AUTO or MAN. See SENS:IF:GAIN:ALL.

Default

AUTO
SENSe<cnum>:IF:GATE[:STATe] <boolean>

(Read-Write) Sets or returns the IF gate state.
For use with the E836xC Opt H11

Parameters

- <cnum> Existing channel number to manipulate. If unspecified, <cnum> is set to 1.
- <boolean> Choose from ON or OFF

Examples

```
SENS:IF:GATE ON
sense2:if:gate:state 0
```

Query Syntax

SENSe:IF:GATE[:STATe]?

Return Type

Boolean

Default

---

SENSe<cnum>:IF:SOURce:PATH <id>, <char>

(Read Write) Sets the source path for the specified receiver. An error is returned if <id> is not valid, or if <char> is not valid for the specified <id>.
For use with the E836xC Opt H11

Parameters

- <cnum> Existing channel number to manipulate. If unspecified, <cnum> is set to 1.
- <id> Choose from: 'A', 'B', 'R1', 'R2'

  Note: The A and R1 receivers are always switched together. B and R2 are also always switched together. For example, if you specify "A", R1 will also be switched.

- <char> Choose from:
  - NORMal - the PNA decides the appropriate IF input paths.
  - EXTernal - always use the rear panel IF inputs.

Examples

```
SENS:IF:SOUR:PATH 'A', Ext
```

Query Syntax

SENSe<cnum>:IF:SOURce:PATH? <id>

Return Type

Character

Default

Normal

---

### PNA-X DSP Block diagram

All of the Sense:IF commands, except the frequency commands, make settings related to the DSP section of the IF Path.

See the entire [IF Path Configuration](#).
For any of the Filter "Stage" parameters to take effect, `SENS:IF:FILT:AUTO` must be set to OFF (MANUAL) and mode, and `SENS:IF:FILT:CMOD` must be set to OFF.

Stage2 settings are ignored when using DSP 5 versions.

Programs that control these settings, or state files that are saved, will yield different results when run or recalled on PNAs with DSP 4 versions versus DSP 5 versions. Learn more about DSP versions.

**Critical Note:** These commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:Select`.

### SENSE\<cnum\>:IF:FILTER:AUTO <bool>

(Read-Write) Sets and returns whether the PNA configures the 3-stage digital filter settings or they will be configured manually. When making manual settings, also send `SENS:IF:FILT:CMOD OFF` which routes the IF through the 3-stage filter.

**Critical Note**

**Parameters**
- `<cnum>`: Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<bool>`: (Boolean)
  - **ON** (or 1) - Automatic: PNA controls digital filter settings.
  - **OFF** (or 0) - Manual: You control digital filter settings using other Sens:IF commands.

**Examples**
- `SENS:IF:FILT:AUTO 1`
- `sense2:if:filter:auto 0`

**Query Syntax**
- `SENSe\<cnum\>:IF:FILTER:AUTO?`

**Return Type**
- Boolean
- **Default**
  - ON

### SENSE:IF:FILTER:CMODE <bool>
(Read-Write) Sets and returns the ADC capture mode modeled as a 2-pole switch in the above diagram. The switch either bypasses or routes the IF through the 3-stage digital filter.

**Critical Note**

**Parameters**

<bool> (Boolean)

**ON** (or 1) - The digital filters are bypassed and the raw ADC readings are taken directly. With DSP 4 versions, a maximum of 4096 data points per sweep can be acquired.

With DSP 5 versions, the PNA maximum data points per sweep can be acquired. Learn more about DSP Versions.

**OFF** (or 0) - The digital filters are used to process IF information. The filters can be configured automatically or manually using SENS:IF:FILT:AUTO.

**Examples**

SENS:IF:FILT:CMOD 1
sense2:if:filter:cmode 0

**Query Syntax**

SENSe<cnum>:IF:FILT:ERRors?

**Return Type**

Boolean

**Default**

OFF

---

**SENS<cnum>:IF:FILT:ERRors?**

(Read-only) Returns the error string associated with the digital filters. The return string has three fields separated by commas: "stage1 status, stage2 status, stage3 status"

Each of these fields can contain one or more of the following error codes:

- **NO ERROR**
- **NUMBER-OF-COEFFICIENTS** - the number of coefficients is excessive for that filter-stage
- **COEFFICIENT VALUE** - one or more coefficients are out of range for that filter-stage
- **SUM-OF-COEFFICIENTS** - the sum of all coefficients is excessive for that filter-stage,
- **FREQUENCY** - the frequency for Stage 1 is out of range (only applies stage1 field),
- **PARAMETER** - one or more parameters are out of range (only applies to stage 3 field)

---

2641
SENSe<cn>u>m>:IF:FiLT:STAGE<n>:COEFFicients <coef>

(Read-Write) Sets and returns the digital filter coefficients of the specified stage.

**Note:** Stage2 settings are ignored when using DSP Version 5. [Learn more.]

### Critical Note

#### Parameters

- `<cn>` Existing channel number. If unspecified, `<cn>` is set to 1.
- `<n>` Stage number. Choose 1 or 2
- `<coef>` An array of real numbers. Filter coefficients

#### Examples

```
SENS:IF:FILT:STAG2:COEF 0,0.1,0.7,0.7,0.1
```

#### Query Syntax

```
SENSe<cn>:IF:FILTer:STAGE<n>:COEFFicients?
```

#### Example

```
SENS:IF:FILT:STAG2:COEF?
```

#### Return Type

**Default** Stage dependent

---

**SENSe<cn>:IF:FILTer:STAGE<n>:COUNt? [char]**
(Read-only) Returns the number of taps in the digital filter of the specified stage. The filter sample count setting is only used when SENSE:IF:FILTer:AUTO is set to False (MANUAL).

Note: Stage2 settings are ignored when using DSP Version 5. Learn more.

Critical Note

Parameters

- `<cnum>`: Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<n>`: Stage number. Choose 1 or 2
- `[char]`:
  - Optional parameter. Choose from:
    - `not specified`: returns the current number of coefficients for the specified stage.
    - `MIN`: returns the minimum number of coefficients for the specified stage. Stage1: 10, Stage2: 1
    - `MAX`: returns the maximum number of coefficients for the specified stage. Stage1 & 2: 1024

Examples

```
SENS:IF:FILT:STAG2:COUN?
sense2:if:filter:stage1:count? max
```

Return Type

- Numeric
- Default: Stage dependent

SENSe<cnum>:IF:FILTer:STAGE1:FREQuency <value>

(Read-Write) Sets and returns the Numerically Controlled Oscillator (NCO) frequency. This command is only used when SENSE:IF:FILTer:AUTO is set to False (Manual).

Critical Note

Parameters

- `<cnum>`: Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<value>`: Stage 1 Frequency. Min value= 0 Hz
  - With DSP 4 versions, Max value= 15 MHz.
  - With DSP 5 versions, Max value = 38 MHz.
  - Or programmatically use the Max and Min queries to determine the range of settable values.

Learn more about DSP versions.
Example: SENS:IF:FILT:STAGe1:FREQ 9e6
sense2:if:filter:stage1:frequency 9.2e6

Query Syntax
SENS<cnm>:IF:FILTer:STAGE1:FREQuency?
'returns the current parameter value
SENS<cnm>:IF:FILTer:STAGE1:FREQuency? Min
'returns the minimum frequency value.
SENS<cnm>:IF:FILTer:STAGE1:FREQuency? Max
'returns the maximum frequency value.

Return Type
Numeric
Default: Nominal IF Frequency. Learn more

SENS<cnm>:IF:FILTer:STAGE3:CATalog?
(Read-only) Returns a list of strings for the currently supported filter types that can be used for the stage 3 filter. This command is only used when SENS:IF:FILTer:AUTO is set to False (Manual). See SENS:IF:FILT:STAGe3:TYPE for a list of currently supported filter types.

Parameters
<cnm> Existing channel number. If unspecified, <cnm> is set to 1.

Examples
SENS:IF:FILT:STAGE3:CAT?
sense2:if:filter:stage3:catalog?

Return Type
String array
Default: Not Applicable

SENS<cnm>:IF:FILTer:STAGE3:TYPE <value>
(Read-Write) Sets and returns the Stage 3 filter type. This command is only used when `SENSe:IF:FILTER:AUTO` is set to False (Manual).

**Critical Note**

**Parameters**

```
<cnum>
```
Existing channel number. If unspecified, `<cnum>` is set to 1.

```
<value>
```
(String) Filter type. Choose from:

- "RECT" Rectangular Window Filter
- "TUKEY" Tukey Filter
- "PWIN" Pulse Window Filter

**Examples**

```
SENS:IF:FILT:STAGE3:TYPE RECT
```

```
sense2:if:filter:stage3:type pwin
```

**Query Syntax**

```
SENSe<cnum>:IF:FILTer:STAGE3:TYPE?
```

**Return Type**

String

**Default**

"TUKEY"

---

`SENSe<cnum>:IF:FILTER:STAGE3:PARameter <p>, <value>`

(Read-Write) Sets and returns the Stage 3 filter parameters.

Must first select the filter type (`SENS:IF:FILT:STAGE3:TYPE`) before setting these parameters.

Use `SENSe:IF:FILT:STAGE3:PCAT?` to return a list of the available parameters for the currently selected filter type.

**Critical Note**

**Parameters**

```
<cnum>
```
Existing channel number. If unspecified, `<cnum>` is set to 1.

```
<p>
```
(String) Filter parameter. Choose from:

- "C" - Tap count (Tukey, RECT, PWIN)
- "P" - Period (PWIN ONLY)
- "D" - Delay (PWIN ONLY)
- "W" - Width (PWIN ONLY)
- "R" - Ramp Count (PWIN ONLY)
<value> (String) Parameter Value for the specified stage 3 parameter. Use the query form to return the minimum and maximum values for the specified parameter.

**Examples**

```
SENS:IF:FILT:STAGE3:PAR "C", 64
sense2:if:filter:stage3:parameter "d", 0.5E-6
```

**Query Syntax**

- returns the current parameter value
- `SENS<cnm>:IF:FILTer:STAGE3:PARameter? <p>,Min`
  - returns the minimum parameter value.
- `SENS<cnm>:IF:FILTer:STAGE3:PARameter? <p>,Max`
  - returns the maximum parameter value.

**Examples**

```
SENS:IF:FILT:STAGE3:PAR? "C"
sense2:if:filter:stage3:parameter? "d", min
```

**Return Type**

- Numeric

**Default**

- `RECT: C = 1`
- `PWIN: C=1E6, P=10ms, D=50us, W=50us, R=7`
- `TUKEY: C=1`

---

**SENS<cnm>:IF:FILTer:STAGE3:PCATalog?**

*(Read-only) Returns a list of the available parameters for the currently selected filter type.*

**Critical Note**

- **Parameters**
  - `<cnm>` Existing channel number. If unspecified, `<cnm>` is set to 1.

**Examples**

```
SENS:IF:FILT:STAGE3:PCAT?
sense2:if:filter:stage3:pcatalog?
```

**Return Type**

- String

**Default**

- Not Applicable

---

**SENS<cnm>:IF:FREQuency:AUTO <bool>**
(Read-Write) Sets and returns the method for specifying the way the IF Frequency is determined.

**Critical Note**

**Parameters**

- <cnum>: Existing channel number. If unspecified, <cnum> is set to 1.
- <bool>: (Boolean)
  - **ON** (or 1) - Automatic. PNA determines the setting for the IF frequency. The IF frequency is based on many PNA settings, including measurement frequency. Therefore, it is NOT possible to read the IF frequency that is being used.
  - **OFF** (or 0) - Manual. Use SENS:IF:FREQ to set the frequency.

**Examples**

```
SENS:IF:FREQ:AUTO 1
sense2:if:frequency:auto 0
```

**Query Syntax**

SENSe<cnum>:IF:FREQuency:AUTO?

**Return Type**

Boolean

**Default**

ON

---

**SENSe<cnum>:IF:FREQuency[:VALue] <value>**

(Read-Write) Sets and returns the IF frequency for ALL receiver paths being used for the specified channel. To set this frequency, SENS:IF:FREQ:AUTO must be set to OFF (Manual). Also returns the maximum and minimum allowable frequency settings. Learn more.

**Critical Note**

**Parameters**

- <cnum>: Existing channel number. If unspecified, <cnum> is set to 1.
- <value>: (Numeric) Frequency value. Use the Max and Min Queries to determine the range of this setting. (SENS:IF:FREQ? Max)

**Examples**

```
SENS:IF:FREQ 9.1e6
sense2:if:frequency:value 8.9e6
```

**Query Syntax**

SENSe<cnum>:IF:FREQuency?

- 'returns the current frequency setting
- SENS:IF:FREQ? Max

- 'returns the maximum allowable frequency setting
- SENS:IF:FREQuency? Min

- 'returns the minimum allowable frequency setting
Return Type  Numeric
Default  9 MHz

**Other Swept IMD commands**

- **CALC:CUSTom:DEFine** - creates a gain compression measurement.
- **Swept IMD Calibration** - these are supplemental to the Guided Cal commands

- **Synchronizing the PNA and Controller**
SENSe<chn>:IMD:SWEep:TYPE <char>

(Read-Write) Sets and returns the sweep type for the IMD measurement.

**Parameters**

- `<chn>`  Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<char>`  Sweep type. Choose from:

  - **FCENTer** - (Center Frequency) Maintaining a constant tone spacing (DeltaF) and tone powers (P1 and P2), the center frequency (FC) is swept from Start to Stop.
  - **DFRequency** - (Delta Frequency) The center frequency (FC) is held constant. The tone spacing is increased from StartDeltaF to StopDeltaF.
  - **POWer** - The main tone frequencies are specified as either F1 and F2, or as FC and DeltaF. These frequencies are held constant while the power of each tone is stepped from the Start Power to the Stop Power.
  - **CW** - The main tone frequencies (F1 and F2) and power levels (P1 and P2) are held constant. Measurements are taken for the specified Number of Points.
  - **SEGment** - Not available for IMDx. Same as FCenter sweep, except that the center frequencies for the sweep are constructed using the standard **segment sweep commands**.
  - **LOPower** - All frequencies are fixed while the LO power is swept from Start to Stop power.

For each sweep type, use the commands that follow:

**FCENTer:**

- **SENS:IMD:FREQ:FCEN:STAR**
- **SENS:IMD:FREQ:FCEN:STOP**
- **SENS:IMD:FREQ:FCEN:CEN**
- **SENS:IMD:FREQ:FCEN:SPAN**
- **SENS:IMD:FREQ:DFR:[CW]**
- **SENS:IMD:TPOW:F1**
- **SENS:IMD:TPOW:F2**
DFRequency

- SENS:IMD:FREQ:DFR:STAR
- SENS:IMD:FREQ:DFR:STOP
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

POWer

- SENS:IMD:FREQ:F1:[CW]
- SENS:IMD:FREQ:F2:[CW]
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1:STAR
- SENS:IMD:TPOW:F1:STOP
- SENS:IMD:TPOW:F2:STAR
- SENS:IMD:TPOW:F2:STOP

CW

- SENS:IMD:FREQ:F1:[CW]
- SENS:IMD:FREQ:F2:[CW]
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

SEGMen - Not available for IMDx.

- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- **SENS:IMD:TPOW:F2**

  Use the standard *segment sweep commands* to set freq start and stop

**LOPower - IMDx ONLY**

- **SENS:MIX:LO:POW:STAR**
- **SENS:MIX:LO:POW:STOP**
- **SENS:IMD:FREQ:F1:[CW]**
- **SENS:IMD:FREQ:F2:[CW]**
- **SENS:IMD:FREQ:FCEN:[CW]**
- **SENS:IMD:FREQ:DFR:[CW]**
- **SENS:IMD:TPOW:F1**
- **SENS:IMD:TPOW:F2**

**Examples**

<table>
<thead>
<tr>
<th>SENSE IMD SWEep TYPE CW</th>
<th>sense2 imd sweep type power</th>
</tr>
</thead>
</table>

**Query Syntax**

SENSe<cnum>:IMD:SWEep:TYPE?

**Return Type** Character

**Default** FCENTer

---

**SENSe<cnum>:IMD:CSO:NDPRoducts <num>**

*(Read-Write)* Sets and returns the “N = number of distortion products” value for the calculation of the CSO parameter.

**Learn more.**

**Parameters**

- **<cnum>** Channel number of the IMD measurement. If unspecified, value is set to 1.
- **<num>** Number of distortion products.

**Examples**

| SENS IMD CSO NDPR 30 | sense2 imd cso ndproducts 7 |

**Query Syntax**

SENSe<cnum>:IMD:CSO:NDPRoducts?

**Return Type** Numeric

**Default** 40
SENSe<nump>:IMD:CSO:NORMalized:POWer <num>

(Read-Write) Sets and returns the CSO Power for POWER normalization mode. Valid only with measurement parameters: CSO2Lo and CSO2Hi and for Normalization Modes dBm and dBmV.  Learn more.

**Parameters**

- `<nump>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Power level. The units are determined by Sens:IMD:Norm:Mode, which must be set first.

**Examples**

SENSe<ch>:IMD:CSO:NORM:POW 0

sense2:imd:cso:normalized:power -5

**Query Syntax**

SENSe<nump>:IMD:CSO:NORMalized:POWer?

**Return Type**

Numeric

**Default**

0

---

SENSe<nump>:IMD:CSO:OFFSet <num>

(Read-Write) Sets and returns the offset that is applied to CSO measurements. Valid only with measurement parameters: CSO2Lo and CSO2Hi.  Learn more.

**Parameters**

- `<nump>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Offset value in dBm

**Examples**

SENSe<ch>:IMD:CSO:OFFS 3

sense2:imd:cso:offset 7

**Query Syntax**

SENSe<nump>:IMD:CSO:OFFSet?

**Return Type**

Numeric

**Default**

0

---

SENSe<nump>:IMD:CTB:NCARriers <num>
(Read-Write) Sets and returns the “N = Total number of carriers” value used in the calculation of the XMOD parameter. Learn more.

Parameters
<cnm> Channel number of the IMD measurement. If unspecified, value is set to 1.
<num> Number of carriers.

Examples
SENS:IMD:CTB:NCAR 10
sense2:imd:ctb:ncarriers 50

Query Syntax
SENS<cnm>:IMD:CTB:NCARriers?

Return Type
Numeric

Default
40

SENSe<cnm>:IMD:CTB:NORMalized:POWer <num>
(Read-Write) Sets and returns the CTB Power. Valid only with measurement parameters: CTBLo and CTBHi and for Normalization Modes dBm and dBmV. Learn more.

Parameters
<cnm> Channel number of the IMD measurement. If unspecified, value is set to 1.
<num> Power level. The units are determined by Sens:IMD:Norm:Mode, which must be set first.

Examples
SENS:IMD:CTB:NORM:POW 0
sense2:imd:ctb:norm:power -5

Query Syntax
SENS<cnm>:IMD:CTB:NORMalized:POWer?

Return Type
Numeric

Default
0

SENSe<cnm>:IMD:CTB:OFFSet <num>
(Read-Write) Sets and returns the offset that is applied to CTB measurements. Valid only with measurement parameters: CTB, CTBLo, CTBH, CTBE, CTBEL, and CTBEH. Learn more.

Parameters
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Offset value in dBm

Examples
```
SENS:IMD:CTB:OFFS 3
sense2:imd:ctb:offset 7
```

Query Syntax
SENSe<cnum>:IMD:CTB:OFFSet?

Return Type
Numeric

Default
0

---

SENSe<cnum>:IMD:FREQuency:DFRequency[:CW] <num>
(Read-Write) Sets and returns fixed tone spacing.

Parameters
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Tone spacing frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Examples
```
SENS:IMD:FREQ:DFR 1e6
sense2:imd:frequency:dfrequency:cw 2e7
```

Query Syntax
SENSe<cnum>:IMD:FREQuency:DFRequency[:CW]?

Return Type
Numeric

Default
1 MHz

---

SENSe<cnum>:IMD:FREQuency:DFRequency:STARt <num>
(Read-Write) Sets and returns the starting main tone separation for sweep type = DFRequency (delta frequency).

**Parameters**

- **<cnum>** Channel number of the IMD measurement. If unspecified, value is set to 1.
- **<num>** Starting tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:

  \[
  \begin{align*}
  F1 \text{ (start)} &= \text{FREQ:FCEN} - \text{DFR:Start} / 2 \\
  F2 \text{ (start)} &= \text{FREQ:FCEN} + \text{DFR:Start} / 2
  \end{align*}
  \]

**Examples**

```plaintext
SENS:IMD:FREQuency:DFRequency:START 1e6
sense2:imd:frequency:dfrequency:start 2e7
```

**Query Syntax**  
SENS<cnun>:IMD:FREQuency:DFRequency:START?

**Return Type**  
Numeric

**Default**  
1 MHz

---

**SENS<cnun>:IMD:FREQuency:DFRequency:STOP <num>**

(Read-Write) Sets and returns the stopping main tone separation for sweep type = DFRequency (delta frequency).

**Parameters**

- **<cnum>** Channel number of the IMD measurement. If unspecified, value is set to 1.
- **<num>** Stopping tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the PNA where:

  \[
  \begin{align*}
  F1 \text{ (stop)} &= \text{FREQ:FCEN} - \text{DFR:Stop} / 2 \\
  F2 \text{ (stop)} &= \text{FREQ:FCEN} + \text{DFR:Stop} / 2
  \end{align*}
  \]

**Examples**

```plaintext
SENS:IMD:FREQuency:DFRequency:STOP 1e6
sense2:imd:frequency:dfrequency:stop 2e7
```

**Query Syntax**  
SENS<cnun>:IMD:FREQuency:DFRequency:STOP?

**Return Type**  
Numeric

**Default**  
10 MHz

---

**SENS<cnun>:IMD:FREQuency:F1[:CW] <num>**
(Read-Write) Sets and returns the frequency of the F1 tone.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` F1 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Examples

```
SENS:IMD:FREQ:F1 1e9
sense2:imd:frequency:F1:cw 2e7
```

Query Syntax

```
SENSe<cnum>:IMD:FREQuency:F1[:CW]?
```

Return Type

Numeric

Default

.9995 GHz

(Read-Write) Sets and returns the frequency of the F2 tone.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` F2 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

Examples

```
SENS:IMD:FREQ:F2 1e9
sense2:imd:frequency:F2:cw 2e7
```

Query Syntax

```
SENSe<cnum>:IMD:FREQuency:F2[:CW]?
```

Return Type

Numeric

Default

1.0005 GHz

SENSe<cnum>:IMD:FREQuency:FCENter[:CW] <num>
(Read-Write) Sets and returns the center frequency of the main tones.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Tone center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMD:FREQ:FCEN 1e9
sense2:imd:frequency:fcenter:cw 2e7
```

**Query Syntax**

```
SENSe<cnum>:IMD:FREQuency:FCENter[:CW]?
```

**Return Type** Numeric

**Default** 1.0 GHz

---

**SENSe<cnum>:IMD:FREQuency:FCENter:CENTer <num>**

(Read-Write) Sets and returns the sweep center frequency when sweeping the main tones.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMD:FREQ:FCEN:CENT 1e9
sense2:imd:frequency:fcenter:cent 2e7
```

**Query Syntax**

```
SENSe<cnum>:IMD:FREQuency:FCENter:CENTer?
```

**Return Type** Numeric

**Default** 13.255 GHz

---

**SENSe<cnum>:IMD:FREQuency:FCENter:SPAN <num>**
(Read-Write) Sets and returns the frequency span when sweeping the main tones.

**Parameters**

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Frequency span in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMD:FREQ:FCEN:SPAN 1e9
sense2:imd:frequency:fcenter:span 2e7
```

**Query Syntax**

SENSe<cnum>:IMD:FREQuency:FCENter:SPAN?

**Return Type**

Numeric

**Default**

26.489 GHz

---

SENSe<cnum>:IMD:FREQuency:FCENter:STARt <num>

(Read-Write) Sets and returns the start frequency when sweeping the main tones.

**Parameters**

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Start frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMD:FREQ:FCEN:STAR 1e9
sense2:imd:frequency:fcenter:start 2e7
```

**Query Syntax**

SENSe<cnum>:IMD:FREQuency:FCENter:STARt?

**Return Type**

Numeric

**Default**

10.5 MHz

---

SENSe<cnum>:IMD:FREQuency:FCENter:STOP <num>

2660
(Read-Write) Sets and returns the stop frequency when sweeping the main tones.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Stop frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the PNA.

**Examples**

```plaintext
SENS:IMD:FREQ:FCEN:STOP 1e9
sense2:imd:frequency:fcenter:stop 2e9
```

**Query Syntax**

SENSe<cnum>:IMD:FREQuency:FCENter:STOP?

**Return Type**

Numeric

**Default**

26.4995 GHz

---

**SENSe:IMD:HOPRooduct?**

(Read-only) Returns the highest order product that can be measured by SweptIMD.

**Parameters**

None

**Examples**

```plaintext
SENS:IMD:HOPR?
```

'always returns 9

**Return Type**

Numeric

**Default**

9

---

**SENSe<cnum>:IMD:IFBWidth:MAIN <num>**

(Read-Write) Sets and returns the IF Bandwidth for measurement of the main F1 and F2 tones. Learn more about setting IFBW for IMD.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

If an invalid number is specified, the analyzer will round up to the closest valid number.
**Examples**

<table>

</table>

**SENSe<cnum>:IMD:IFBWidth:IMTone <num>**

*(Read-Write)* Sets and returns the IF Bandwidth for measurement of the intermodulation products. Learn more about setting IFBW for IMD.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

If an invalid number is specified, the analyzer will round up to the closest valid number.

**Examples**

</tbody>
</table>

**SENSe<cnum>:IMD:NORMalized:MODE <char>**
(Read-Write) Sets and returns the method by which CTB and CSO calculations are performed.

**Parameters**

<cnun> Channel number of the IMD measurement. If unspecified, value is set to 1.
<char> Normalization mode. Choose from:

**NONE** - the normalized power is not used in calculation

**NCARrier** - CTB and CSO is corrected by subtracting 10*log(N/2), where

- N = # of carriers for CTB
- N = # of distortion products for CSO

**DBM** - the composited normalized power for CTB or CSO is treated as a dBm value

**DBMV** - the composited normalized power for CTB or CSO is treated as a dBmV value.

**Note:** Power values are stored using the currently-set units. Therefore, first set units with this command, then set power values using:

**Examples**

```
SENS:IMD:NORM:MODE NCAR
sense2:imd:normalized:mode none
```

**Query Syntax**

`SENSe<cnun>:IMD:NORMALized:MODE?`

**Return Type**

Character

**Default**

NCARrier

**SENSe<cnun>:IMD:PMAP <input>,<output>**
(Write-only) Sets the input port and output port of an IMD or IMDx channel. This setting is necessary only when using the limited port mapping feature. Learn more.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<input>` PNA port connected to the DUT Input. Choose from 1 or 3. When input is 3, an external combiner must be used.
- `<output>` PNA port connected to the DUT Output.
  
  When input is 1, output must be 2.

  When input is 3, output must be 4.

Examples

```
SENS:IMD:PMAP 3,4
sense2:imd:pmap 3,4
```

Query Syntax

Not Applicable

Default

1,2

SENS<cnm>:IMD:PMAP:INPut?

(Read-only) Returns the PNA test port to be connected to the DUT input for an IMD or IMDx channel. Set the PNA port to DUT mapping using SENS:IMD:PMAP

Parameters

- `<cnum>` IMD channel number. If unspecified, value is set to 1.

Examples

```
SENS:IMD:PMAP:INP?
sense2:imd:pmap:input?
```

Default

1

SENS<cnm>:IMD:PMAP:OUTPut?
(Read-only) Returns the PNA test port to be connected to the DUT output for an IMD or IMDx channel. Set the PNA port to DUT mapping using SENS:IMD:PMAP

**Parameters**

- <cnum> IMD channel number. If unspecified, value is set to 1.

**Examples**

```plaintext
SENS:IMD:PMAP:OUTP?
sense2:imd:pmap:output?
```

**Default** 2

**SENSe<cnum>:IMD:TPOWer:COUPle[:STATe] <bool>**

(Read-Write) Sets and returns the state of power coupling for F1 and F2. Learn more about tone power.

**Parameters**

- <cnum> Channel number of the IMD measurement. If unspecified, value is set to 1.
- <bool> Tone power level coupling state. Choose from:
  - **ON (or 1)** - F1 and F2 power is coupled.
  - **OFF (or 0)** - F1 and F2 power is NOT coupled. Set power levels individually.

**Examples**

```plaintext
SENS:IMD:TPOW:COUP 0
sense2:imd:tpower:couple:state ON
```

**Query Syntax**

SENSe<cnum>:IMD:TPOWer:COUPle[:STATe]?

**Return Type** Boolean

**Default** ON

**SENSe<cnum>:IMD:TPOWer:EQUalize:STATe <bool>**
(Read-Write) Sets and returns the state of Equal Tone Power setting. Learn more about tone power.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<bool>` Equal Tone Power state. Choose from:
  - **ON (or 1)** - Equalize f1 and f2 power.
  - **OFF (or 0)** - Do NOT equalize f1 and f2 power. Use source power cal.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:IMD:TPOWer:EQUalize:STATe?</td>
</tr>
</tbody>
</table>

**Return Type** Boolean

**Default** OFF

**SENSe<cnum>:IMD:TPOWer:F1 <num>**

(Read-Write) Sets and returns the power level of the F1 tone. When SENSe:IMD:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. Learn more about tone power.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:IMD:TPOWer:F1 0</td>
</tr>
<tr>
<td>sense2:imd:tpower:F1 -10</td>
</tr>
</tbody>
</table>

**Query Syntax** SENSe<cnum>:IMD:TPOWer:F1?

**Return Type** Numeric

**Default** -20 dBm

**SENSe<cnum>:IMD:TPOWer:F2 <num>**
(Read-Write) Sets and returns the power level of the F2 tone. When SENS:IMD:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. Learn more about tone power.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:IMD:TPOW:F2 0</td>
</tr>
<tr>
<td>sense2:imd:tpower:F2 -10</td>

</tbody>
</table>

**Query Syntax**

SENS<cnum>:IMD:TPOWER:F2?

**Return Type**

Numeric

**Default**

-20 dBm

SENSe<cnum>:IMD:TPOWer:F1:STARt `<num>`

(Read-Write) Sets and returns the start power level of the F1 tone. Learn more about tone power.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Start power in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:IMD:TPOW:F1:STAR 0</td>

</tbody>
</table>

**Query Syntax**

SENS<cnum>:IMD:TPOWER:F1:STARt?

**Return Type**

Numeric

**Default**

-20 dBm

SENSe<cnum>:IMD:TPOWer:F1:STOP `<num>`
(Read-Write) Sets and returns the stop power level of the F1 tone. Learn more about tone power.

**Parameters**
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Stop power in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**
```
SENS:IMD:TPOW:F1:STOP 0
sense2:imd:tpower:F1:stop 10
```

**Query Syntax**
SENSe<cnum>:IMD:TPOWer:F1:STOP?

**Return Type**
Numeric

**Default**
-10 dBm

---

**SENSe<cnum>:IMD:TPOWer:F2:STARt <num>**
(Read-Write) Sets and returns the start power level of the F2 tone. Learn more about tone power.

**Parameters**
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Start power in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**
```
SENS:IMD:TPOW:F2:STAR 0
sense2:imd:tpower:F2:start -10
```

**Query Syntax**
SENSe<cnum>:IMD:TPOWer:F2:STARt?

**Return Type**
Numeric

**Default**
-20 dBm

---

**SENSe<cnum>:IMD:TPOWer:F2:STOP <num>**
**SENS<cnm>:IMD:TPOWer:F2:STOP**

(Read-Write) Sets and returns the stop power level of the F2 tone.  Learn more about tone power.

### Parameters

- `<cnm>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Stop power in dBm. Choose a value between +30 dBm and -30 dBm.

### Examples

```
SENS:IMD:TPOW:F2:STOP 0
sense2:imd:tpower:F2:stop 10
```

### Query Syntax

`SENS<cnm>:IMD:TPOWer:F2:STOP?`

### Return Type

Numeric

### Default

-10 dBm

---

**SENS<cnm>:IMD:TPOWer:SET <char>**

(Read-Write) Sets and returns whether tone power is specified at the DUT input or output.

### Parameters

- `<cnm>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<char>` Choose from:

  - **INPUT** - Specified power level is set at the DUT input.
  - **OUTPUT** - Specified power level is set at the DUT output.

### Examples

```
SENS:IMD:TPOW:SET INPUT
sense2:imd:tpower:SET output
```

### Query Syntax

`SENS<cnm>:IMD:TPOWer:SET?`

### Return Type

Character

### Default

INPUT

SENSe<cnun>:IMS:PMAP <input>,<output>

(Write-only) Sets the input port and output port of an IMS or IMSx channel. This setting is necessary only when using the **limited port mapping feature**. [Learn more.](#)

**Parameters**

- **<cnun>** Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- **<input>** PNA port connected to the DUT Input. Choose from 1 or 3. When input is 3, an external combiner must be used.
- **<output>** PNA port connected to the DUT Output.
  
  When input is 1, output must be 2.
  
  When input is 3, output must be 4.

**Examples**

SENSE:IMS:PMAP 3,4

sense2:ims:pmap 3,4
**SENSe<cnum>:IMS:PMAP:INPut?**

*(Read-only)* Returns the PNA test port to be connected to the DUT input for an IMS or IMSx channel. Set the PNA port to DUT mapping using **SENSe:IMS:PMAP**

**Parameters**

- `<cnum>`: IMS channel number. If unspecified, value is set to 1.

**Examples**

```
SENSe:IMS:PMAP:INP?
sense2:ims:pmap:input?
```

**Default** 1

**SENSe<cnum>:IMS:PMAP:OUTPut?**

*(Read-only)* Returns the PNA test port to be connected to the DUT output for an IMS or IMSx channel. Set the PNA port to DUT mapping using **SENSe:IMS:PMAP**

**Parameters**

- `<cnum>`: IMS channel number. If unspecified, value is set to 1.

**Examples**

```
SENSe:IMS:PMAP:OUTP?
sense2:ims:pmap:output?
```

**Default** 2

**SENSe<cnum>:IMS:RBW <num>**
**(Read-Write)** Sets and returns the Resolution Bandwidth for the IM Spectrum measurement.

**Parameters**

- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`: Resolution BW in Hz. Choose from: 60k | 100k | 150k | 300k, 600k | 1.0M | 3.0M

  If an invalid number is specified, the PNA will round up to the closest valid number.

**Examples**

```
SENS:IMS:RBW 600e3
sense2:ims:rbw 1MHz
```

**Query Syntax**

```
SENSe<cnum>:IMS:RBW?
```

**Return Type**

Numeric

**Default**

600 kHz

---

**SENSe<cnum>:IMS:RESPonse:STARt <num>**

**(Read-Write)** Sets and returns the receiver Start frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**Parameters**

- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`: Start frequency in Hz. Choose a frequency within the range of the PNA.

**Examples**

```
SENS:IMS:RESP:STAR 1e9
sense2:ims:response:start 100e6
```

**Query Syntax**

```
SENSe<cnum>:IMS:RESPonse:STARt?
```

**Return Type**

Numeric

**Default**

950 MHz

---

**SENSe<cnum>:IMS:RESPonse:STOP <num>**
(Read-Write) Sets and returns the receiver Stop frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**Parameters**
- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>` Stop frequency in Hz. Choose a frequency within the range of the PNA.

**Examples**
```
SENS:IMS:RESP:STOP 26e9
sense2:ims:response:stop 100e6
```

**Query Syntax**
```
SENSe<cnum>:IMS:RESPonse:STOP?
```

**Return Type** Numeric

**Default** 1.05 MHz

---

**SENSe<cnum>:IMS:RESPonse:CENTer <num>**
(Read-Write) Sets and returns the receiver Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**Parameters**
- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>` Center frequency in Hz. Choose a frequency within the range of the PNA.

**Examples**
```
SENS:IMS:RESP:CENT 26e9
sense2:ims:response:center 100e6
```

**Query Syntax**
```
SENSe<cnum>:IMS:RESPonse:CENTer?
```

**Return Type** Numeric

**Default** 1.0 GHz

---

**SENSe<cnum>:IMS:RESPonse:SPAN <num>**
(Read-Write) Sets and returns the Span of receiver frequencies for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**Parameters**

- **<cnum>**  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- **<num>**  Frequency span in Hz. All receiver frequencies should be within the range of the PNA.

**Examples**

```
SENS:IMS:RESP:SPAN 10e9
sense2:ims:response:span 100e6
```

**Query Syntax**  SENSe<cnum>:IMS:RESPonse:SPAN?

**Return Type**  Numeric

**Default**  100 MHz

---

**SENSe<cnum>:IMS:STIMulus:DFRequency <num>**

(Read-Write) Sets and returns the DeltaF (tone spacing) for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

**Parameters**

- **<cnum>**  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- **<num>**  Delta frequency in Hz. All stimulus settings MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMS:STIM:DFRequency 1e6
sense2:ims:stimulus:dfrequency 100e6
```

**Query Syntax**  SENSe<cnum>:IMS:STIMulus:DFRequency?

**Return Type**  Numeric

**Default**  10 MHz

---

**SENSe<cnum>:IMS:STIMulus:FCENter <num>**
(Read-Write) Sets and returns the Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

**Parameters**

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>` Center frequency in Hz. All stimulus settings MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMS:STIM:FCEN 1e6
sense2:ims:stimulus:fcenter 100e6
```

**Query Syntax**

`SENSe<cnum>:IMS:STIMulus:FCENter?`

**Return Type** Numeric

**Default** 1.0 GHz

---

**SENSe<cnum>:IMS:STIMulus:F1FRequency <num>**

(Read-Write) Sets and returns the F1 frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

**Parameters**

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>` F1 frequency in Hz. All stimulus settings MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMS:STIM:F1FR 1e6
sense2:ims:stimulus:f1frequency 100e6
```

**Query Syntax**

`SENSe<cnum>:IMS:STIMulus:F1FRequency?`

**Return Type** Numeric

**Default** 995 MHz

---

**SENSe<cnum>:IMS:STIMulus:F2FRequency <num>**
(Read-Write) Sets and returns the F2 frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

**Parameters**

- `<cnum>`  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`  F2 frequency in Hz. All stimulus settings MUST be within the frequency range of the PNA.

**Examples**

```
SENS:IMS:STIM:F2FR 1e6
sense2:ims:stimulus:f2frequency 100e6
```

**Query Syntax**

`SENSe<cnum>:IMS:STIMulus:F2FRequency?`

**Return Type**  Numeric

**Default**  1.005 MHz

---

`SENSe<cnum>:IMS:SWEep:TYPE <char>`

(Read-Write) Sets and returns the method in which the spectrum of signals to view are specified. When Tracking is enabled the frequency of the main tones (f1 and f2) are always determined by the Swept IMD channel.

**Parameters**

- `<cnum>`  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<char>`  IM Spectrum sweep type. Choose from:
  
  - **LiNear**  When Tracking is enabled, allows tuning the Response Settings (receiver) to any values within the frequency range of the PNA. When Tracking is NOT enabled also allows setting the Stimulus (sources) to any values within the frequency range or the PNA.
  
  - **SECond**  The receiver is tuned to view the 2nd order products (f2-f1 and f1+f2) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
  
  - **THIRD**  The receiver is tuned to view the 3rd order products (2f1-f2 and 2f2-f1) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
  
  - **NTH**  The frequency range is set to N * DeltaF. This algorithm will NOT tune the receivers to view the EVEN order products.
Examples

SENS:IMS:SWEep:TYPE LIN
sense2:ims:sweep:type nth

Query Syntax

SENSe<cnum>:IMS:SWEep:TYPE?

Return Type

Character

Default

NTH

SENSe<cnum>:IMS:SWEep:ORDer <num>

(Read-Write) Sets and returns the order number of signals to view when SENS:IMS:SWE:TYPE NTH is specified.

Parameters

- <cnum>: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- <num>: Order number of IM products to view. The frequency range is set to N (this number) x DeltaF (set with SENS:IMS:STIM:DFR).

Examples

SENS:IMS:SWEep:ORD 5
sense2:ims:sweep:order 12

Query Syntax

SENSe<cnum>:IMS:SWEep:ORDer?

Return Type

Numeric

Default

9

SENSe<cnum>:IMS:TPOWer:COUPle[:STATe] <bool>
(Read-Write) Sets and returns the state of power coupling for F1 and F2.

**Parameters**
- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<bool>` Tone power level coupling. Choose from:
  - **ON (or 1)** - F1 and F2 power is coupled.
  - **OFF (or 0)** - F1 and F2 power is NOT coupled. Set power levels individually.

**Examples**
- `SENS:IMS:TPOW:COUP 0`
- `sense2:ims:tpower:couple:state ON`

**Query Syntax**
- `SENSe<cnum>:IMS:TPOWer:COUPle[:STATe]?

**Return Type**
- Boolean

**Default**
- ON

---

**SENSe<cnum>:IMS:TPOWer:EQUalize:STATe <bool>**

(Read-Write) Sets and returns the state of Equal Tone Power setting. Learn more about tone power.

**Parameters**
- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<bool>` Equal Tone Power state. Choose from:
  - **ON (or 1)** - Equalize f1 and f2 power.
  - **OFF (or 0)** - Do NOT equalize f1 and f2 power. Use source power cal.

**Examples**
- `SENS:IMS:TPOW:EQU 0`
- `sense2:ims:tpower:equalize:state ON`

**Query Syntax**
- `SENSe<cnum>:IMS:TPOWer:EQUalize:STATe?`

**Return Type**
- Boolean

**Default**
- OFF

---

**SENSe<cnum>:IMS:STIMulus:TPOWer:F1 <value>**
(Read-Write) Sets and returns the power level of the F1 tone. When SENS:IMS:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. This setting is ignored if SENS:IMS:TRAC:STAT is enabled.

**Parameters**

- `<cnum>` Channel number of the IM Spectrum measurement. If unspecified, value is set to 1.
- `<value>` F1 tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

```plaintext
SENS:IMS:STIM:TPower:F1 -10
sense2:ims:stimulus:tpower:f1 0
```

**Query Syntax**

SENSe<cnum>:IMS:STIMulus:TPOWer:F1?

**Return Type**

Numeric

**Default**

-20

---

**SENSe<cnum>:IMS:STIMulus:TPOWer:F2 <value>**

(Read-Write) Sets and returns the power level of the F2 tone. When SENS:IMS:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. This setting is ignored if SENS:IMS:TRAC:STAT is enabled.

**Parameters**

- `<cnum>` Channel number of the IM Spectrum measurement. If unspecified, value is set to 1.
- `<value>` F2 tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

```plaintext
SENS:IMS:STIM:TPower:F2 -10
sense2:ims:stimulus:tpower:f2 0
```

**Query Syntax**

SENSe<cnum>:IMS:STIMulus:TPOWer:F2?

**Return Type**

Numeric

**Default**

-20

---

**SENSe<cnum>:IMS:TPOWer:SET <char>**
(Read-Write) Sets and returns whether tone power is specified at the DUT input or output.

**Parameters**

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<char>` Choose from:

  - **INPUT** - Specified power level is set at the DUT input.
  - **OUTPUT** - Specified power level is set at the DUT output.

**Examples**

```
SENS:IMS:TPOW:SET INPUT
sense2:ims:tpower:set output
```

**Query Syntax**

```
SENSe<cnum>:IMS:TPOWer:SET?
```

**Return Type** Character

**Default** INPUT

---

**SENSe<cnum>:IMS:TRACking:CHANnel <num>**

(Read-Write) Sets and returns the IMD channel number to which the IM Spectrum channel is coupled.

**Parameters**

- `<cnum>` IMS channel. If unspecified, value is set to 1.
- `<num>` Existing IMD channel to which frequency and power settings are coupled.

**Examples**

```
SENS:IMS:TRAC:CHAN 2
sense2:ims:tracking:channel 1
```

**Query Syntax**

```
SENSe<cnum>:IMS:TRACking:CHANnel?
```

**Return Type** Numeric

**Default** First IMD channel

---

**SENSe<cnum>:IMS:TRACking:MSENable <bool>**
(Read-Write) Sets and returns the step sweep mode for the IM Spectrum channel.

**Parameters**

- `<cnum>` IMS channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **OFF (or 0)** - Automatic Step
  - **ON (or 1)** - Manual Step

**Examples**

```
SENS:IMS:TRAC:MSEN 1
sense2:ims:tracking:msenable 0
```

**Query Syntax**

`SENSe<cnum>:IMS:TRACking:MSENable?`

**Return Type** Boolean

**Default** 0 - Automatic

---

**SENSe<cnum>:IMS:TRACking:SINDex <num>**

(Read-Write) When `SENS:IMS:TRAC:MSEN = Manual`, sets and returns the data point number at which a sweep is performed.

**Parameters**

- `<cnum>` IMS channel. If unspecified, value is set to 1.
- `<num>` Step index. Choose from 1 to the specified number of points.

**Examples**

```
SENS:IMS:TRAC:SINDex 201
sense2:ims:tracking:sindex 1
```

**Query Syntax**

`SENSe<cnum>:IMS:TRACking:SINDex?`

**Return Type** Numeric

**Default** 1

---

**SENSe<cnum>:IMS:TRACking:STATe <bool>**
(Read-Write) When an IMD channel exists, allows the IM Spectrum frequency and power setting to track (couple with) the IMD channel settings.

Parameters

<cn> IMS channel. If unspecified, value is set to 1.

<bool> Tracking state. Choose from:

ON (or 1) - IM Spectrum frequency and power settings track the IMD channel settings.

OFF (or 0) - IM Spectrum frequency and power settings are specified in the IMS channel.

Examples

SENS:IMS:TRAC:STAT 0
sense2:ims:tracking:state ON

Query Syntax

SENSe<cn>:IMS:TRACking:STATe?

Return Type

Boolean

Default

OFF

Note: If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**SENSe<ch>:MIXer:APPLy**

(Write only) Applies the mixer setup settings and turns the channel ON. (Performs the same function as the Apply button on the mixer setup dialog box).

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1

**Examples**

- **SENS: MIX: APPL**

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

**SENSe<ch>:MIXer:AVOidspurs <bool>**
(Read Write) Sets and returns the state of the avoid spurs feature. Learn more about avoid spurs.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<bool> Avoid spurs state. Choose from

- 0 - Avoid spurs OFF
- 1 - Avoid spurs ON

**Examples**

```plaintext
SENS:MIX:AVO
sense2:mixer:avoidspurs 1
```

**Query Syntax**

SENS<ch>:MIXer:AVOidspurs?

**Return Type**

Boolean

**Default**

0 (OFF)

---

**SENS<ch>:MIXer:CALCulate <char>**

(Write only) Calculates the Input, IF, or Output frequencies of the mixer setup and updates the channel settings.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<char> Mixer port to be calculated. Choose from:

<table>
<thead>
<tr>
<th>&lt;char&gt;</th>
<th>1st or only stage requires:</th>
<th>In addition, 2nd stage requires:</th>
</tr>
</thead>
<tbody>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>
</tbody>
</table>

#### Examples

**SENSe:MIX:DISC**

**Query Syntax** | Not Applicable
---|---
**Default** | Not Applicable
SENSe<ch>:MIXer:IF:FREQuency:SIDeband <char>

(Read-Write) When two LO stages are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the buttons on LO1 on the Mixer setup dialog.
- This setting is ignored when ONE LO stage is selected.
- Also set SENS:MIX:OUTP:FREQ:SID to LOW or HIGH to determine the output frequency of the mixer.

See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<char> Sideband value. Choose from

LOW - Difference (-)

HIGH - Sum (+)

Examples

SENS:MIX:IF:FREQ:SID LOW
SENSe2:MIXer:IF:FREQ:SIDeband HIGH

Query Syntax

SENSe<ch>:MIXer:IF:FREQuency:SIDeband?

Return Type Character

Default LOW

SENSe<ch>:MIXer:IF:FREQuency:STARt <num>

(Read-Write) Sets or returns the IF start frequency value of the mixer. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<num> IF Start Frequency value

Examples

SENS:MIX:IF:FREQ:STAR 1e9
SENSe2:MIXer:IF:FREQ:STARt 1000000000

Query Syntax

SENSe<ch>:MIXer:IF:FREQuency:STARt?

Return Type Numeric

Default Not Applicable
**SENSe<ch>:MIXer:IF:FREQuency:STOP <num>**

(Read-Write) Sets or returns the stop frequency value of the mixer IF frequency. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<num>` IF Stop Frequency value

**Examples**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:</td>
<td>MIX:IF:FREQ:STOP 2e9</td>
</tr>
<tr>
<td>SENSe2:</td>
<td>MIXer:IF:FREQ:STOP 2000000000</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<ch>:MIXer:IF:FREQuency:STOP?

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:INPut:FREQuency:DENominator <value>**

(Read-Write) Sets or returns the denominator value of the Input Fractional Multiplier. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Input denominator value.

**Examples**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:</td>
<td>MIX:INP:FREQ:DEN 5</td>
</tr>
<tr>
<td>SENSe2:</td>
<td>MIXer:INPut:FREQ:DENominator 4</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<ch>:MIXer:INPut:FREQuency:DENominator?

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:INPut:FREQuency:FIXed<value>**
**SENSe<ch>:MIXer:INPut:FREQuency:FIXed** <value>

(Read-Write) Sets or returns the fixed frequency of the input. See Note

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<value>`: Input frequency.

**Examples**

```
SENSe:MIXer:INPut:FREQ:FIXed 1e9
SENSe2:MIXer:INPut:FREQ:FIXed 1000000000
```

**Query Syntax**

```
SENSe<ch>:MIXer:INPut:FREQuency:FIXed?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:INPut:FREQuency:MODE** `<char>`

(Read-Write) Sets or returns the Input sweep mode.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<char>`: Input sweep mode. Choose either **FIXED** or **SWEPT**

**Examples**

```
SENS:MIX:INP:FREQ:MODE FIXED
SENSe2:MIXer:INPut:FREQ:MODE swept
```

**Query Syntax**

```
SENSe<ch>:MIXer:INPut:FREQuency:MODE?
```

**Return Type**

Character

**Default**

Fixed

---

**SENSe<ch>:MIXer:INPut:FREQuency:NUMerator** `<value>`

(Read-Write) Sets or returns the numerator value of the Input Fractional Multiplier. See Note

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<value>`: Input numerator value.

**Examples**

```
SENS:MIX:INP:FREQ:NUM 3
SENSe2:MIXer:INPut:FREQ:NUMerator 1
```

**Query Syntax**

```
SENSe<ch>:MIXer:INPut:FREQuency:NUMerator?
```

**Return Type**

Numeric

**Default**

Not Applicable
SENSe<ch>:MIXer:INPut:FREQuency:STARt <value>
(Read-Write) Sets or returns the Input start frequency value of the mixer. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<value> Input Start frequency

Examples

SENSe:MIX:INP:FREQ:STAR 1e9
SENSe2:MIXer:INPut:FREQ:STARt 1000000000

Query Syntax
SENSe<ch>:MIXer:INPut:FREQuency:STARt?

Return Type
Numeric

Default
Not Applicable

SENSe<ch>:MIXer:INPut:FREQuency:STOP <value>
(Read-Write) Sets or returns the Input stop frequency value of the mixer. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<value> Input stop frequency

Examples

SENSe:MIX:INP:FREQ:STOP 2e9
SENSe2:MIXer:INPut:FREQ:STOP 2000000000

Query Syntax
SENSe<ch>:MIXer:INPut:FREQuency:STOP?

Return Type
Numeric

Default
Not Applicable

SENSe<ch>:MIXer:INPut:POWer <value>
(Read-Write) Sets or returns the value of the Input Power.

**Parameters**

<ch>  Any existing channel number. If unspecified, value is set to 1.

<value>  Input power in dBm.

**Examples**

```
SENS:MIX:INP:POW 9
SENSe2:MIXer:INPut:POWer 5
```

**Query Syntax**  
SENSe<ch>:MIXer:INPut:POWer?

**Return Type**  
Numeric

**Default**  
Not Applicable

---

**SENSe<ch>:MIXer:INPut:POWer:USENominal <bool>**

(Read-Write) Toggles the Use Nominal Incident Power setting ON and OFF. This setting is ONLY to be used with SMC measurements. [Learn more about Nominal Incident Power](#).

**Parameters**

<ch>  Any existing channel number. If unspecified, value is set to 1.

<value>  (boolean) - Nominal Incident Power State. Choose from:

ON (1) - Turn nominal incident power ON

OFF (0) - Turn nominal incident power OFF

**Examples**

```
SENS:MIX:INP:POW:USEN 1
SENSe2:MIXer:INPut:POWer:USENominal OFF
```

**Query Syntax**  
SENSe<ch>:MIXer:INPut:POWer:USENominal?

**Return Type**  
Boolean

**Default**  
OFF

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:DENominator <value>**
(Read-Write) Sets or returns the denominator value of the LO Fractional Multiplier. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2.
- `<value>` LO denominator.

**Examples**

```
SENS:MIX:LO:FREQ:DEN 5
SENS2:MIXer:LO2:FREQ:DENominator 4
```

**Query Syntax**

```
SENSe<ch>:MIXer:LO<n>:FREQuency:DENominator?
```

**Return Type**

Numeric

**Default**

1

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:FIXed <value>**

(Read-Write) Sets or returns the fixed frequency of the specified mixer LO. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2.
- `<value>` LO frequency.

**Examples**

```
SENS:MIX:LO:FREQ:FIX 1e9
SENS2:MIXer:LO2:FREQ:FIXed 1000000000
```

**Query Syntax**

```
SENSe<ch>:MIXer:LO<n>:FREQuency:FIXed?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:ILT1 <bool>**
(Read-Write) Specifies whether to use the Input frequency that is greater than the LO or less than the LO. To learn more, see the mixer setup dialog box help.

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2
- `<bool>` **ON** (1) - Use the Input that is Greater than the specified LO.
  **OFF** (0) - Use the Input that is Less than the specified LO.

**Examples**
```
SENS:MIX:LO1:FREQ:ILT I 1
sense2:mixer:lo2:frequency:ilti ON
```

**Query Syntax**
```
SENSe<ch>:MIXer:LO<n>:FREQuency:ILT I?
```

**Return Type**
Boolean

**Default**
OFF

```
SENSe<ch>:MIXer:LO<n>:FREQuency:MODE <char>
```

(Read-Write) Sets or returns the LO sweep mode.

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2
- `<char>` LO sweep mode. Choose either **FIXED** or **SWEPT**

**Examples**
```
SENS:MIX:LO:FREQ:MODE FIXED
SENSe2:MIXer:LO2:FREQ:MODE swept
```

**Query Syntax**
```
SENSe<ch>:MIXer:LO<n>:FREQuency:MODE?
```

**Return Type**
Character

**Default**
Fixed

```
SENSe<ch>:MIXer:LO<n>:FREQuency:NUMerator <value>
```
(Read-Write) Sets or returns the numerator value of the LO Fractional Multiplier. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> LO stage number. Choose 1 or 2

<value> LO Numerator.

Examples

SENS:MIX:LO:FREQ:NUM 5
SENS2:MIXer:LO2:FREQ:NUMerator 4

Query Syntax SENSe<ch>:MIXer:LO<n>:FREQuency:NUMerator?

Return Type Numeric

Default Not Applicable

SENSe<ch>:MIXer:LO<n>:FREQuency:STARt <value>

(Read-Write) Sets or returns the LO start frequency value. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> LO stage number. Choose 1 or 2

<value> LO Start Frequency in Hertz.

Examples

SENS:MIX:LO:FREQ:STAR 5E9

Query Syntax SENSe<ch>:MIXer:LO<n>:FREQuency:STARt?

Return Type Numeric

Default Not Applicable

SENSe<ch>:MIXer:LO<n>:FREQuency:STOP <value>
(Read-Write) Sets or returns the LO stop frequency value. See Note

Parameters

  <ch>  Any existing channel number. If unspecified, value is set to 1.
  <n>  LO stage number. Choose 1 or 2
  <value>  LO Stop Frequency in Hertz.

Examples  SENS:MIX:LO:FREQ:STOP 5E9

Query Syntax  SENSe<ch>:MIXer:LO<n>:FREQuency:STOP?

Return Type  Numeric

Default  Not Applicable

SENSe<ch>:MIXer:LO<n>:NAME <value>

(Read-Write) Sets or returns the name of the PNA internal source or external source to use as the LO in a converter measurement.

See Remotely Specifying a Source Port.

Parameters

  <ch>  Any existing channel number. If unspecified, value is set to 1.
  <n>  LO stage number. Choose 1 or 2.
  <value>  (string) - LO Source name. Use Source:CAT? to return a list of valid source ports. An external source must be configured and selected to be valid. Learn more about external source configuration.

Examples  SENS:MIX:LO:NAME "MySource"

Query Syntax  SENSe<ch>:MIXer:LO<n>:NAME?

Return Type  String

Default  "Not Controlled"

SENSe<ch>:MIXer:LO<n>:POWer <value>
(Read-Write) Sets or returns the LO Power fixed value.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1 or 2
- `<value>` LO Power in dBm

**Examples**

```
SENS: MIX: LO: POW 9
```

**Query Syntax**

`SENSe<ch>: MIXer: LO<n>: POWer?`

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe<ch>: MIXer: LO<n>: POWer: STARt <value>**

(Read-Write) For an LO power sweep, sets or returns the LO power start value.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1
- `<value>` LO start power in dBm

**Examples**

```
SENS: MIX: LO1: POW: STAR -10
```

**Query Syntax**

`SENSe<ch>: MIXer: LO1: POWer: STARt?`

**Return Type** Numeric

**Default** - 20 dBm

---

**SENSe<ch>: MIXer: LO<n>: POWer: STOP <value>**
(Read-Write) For an LO power sweep, sets or returns the LO power stop value.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1
- `<value>` LO stop power in dBm

**Examples**

```
SENS:MIX:LO1:POW:STOP 10
```

**Query Syntax**

SENSe<ch>:MIXer:LO1:POWer:STOP?

**Return Type**

Numeric

**Default** -10 dBm

---

**SENSe<ch>:MIXer:LOAD <name>**

(Write-only) Loads a previously-configured mixer attributes file (.mxr)

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<name>` Path and file name (including .mxr extension) to load.

**Examples**

```
SENSe:MIXer:LOAD "C:/Program Files/Agilent/Network Analyzer/Documents/Mixer/MyMixer.mxr"
```

**Default** Not Applicable

---

**SENSe<ch>:MIXer:NORMalize <value>**

(Read-Write) Sets or returns the data point for normalizing the phase measurement. Learn more.

**Parameters**

- `<ch>` Channel number of the SMC measurement. If unspecified, value is set to 1.
- `<value>` Normalization data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.

**Examples**

```
SENS:MIX:NORM 101
sense2:mixer:normalize 50
```

**Query Syntax**

SENSe<ch>:MIXer:NORMalize?

**Return Type**

Numeric

**Default** Middle point in the sweep
SENSe<ch>:MIXer:OUTPut:FREQuency:FIXed <value>

(Read-Write) Sets or returns the output fixed frequency of the mixer. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<value> Output fixed frequency in Hertz.

Examples

```
SENS:MIX:OUTP:FREQ:FIX 5e9
```

Query Syntax

SENSe<ch>:MIXer:OUTPut:FREQuency:FIXed?

Return Type Numeric

Default Not Applicable

SENSe<ch>:MIXer:OUTPut:FREQuency:MODE <char>

(Read-Write) Sets or returns the Output sweep mode.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<char> Output sweep mode. Choose either FIXED or SWEPT

Examples

```
SENS:MIX:OUTP:FREQ:MODE FIXED
SENSe2:MIXer:OUTput:FREQuency:MODE swept
```

Query Syntax

SENSe<ch>:MIXer:OUTPut:FREQuency:MODE?

Return Type Character

Default Fixed

SENSe<ch>:MIXer:OUTPut:FREQuency:SIDeband <value>
Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input + or - LO1 = Output frequency
- When two LOs are used: IF1 + or - LO2 = Output frequency

Use `SENS:MIX:IF:FREQ:SID` when two LOs are used to determine the IF1 frequency.

Use `Sens:Mixer:Stage` to set 1 or 2 LOs

See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Sideband value. Choose from

  - **LOW** - Low or Difference (-)
  - **HIGH** - High or Sum (+)

**Examples**

- `SENS:MIX:OUTP:FREQ:SID LOW`
- `SENSe2:MIXer:OUTPut:FREQ:SIDeband HIGH`

**Query Syntax**

`SENSe<ch>:MIXer:OUTPut:FREQuency:SIDeband?`

**Return Type**

Character

**Default**

LOW

---

`SENSe<ch>:MIXer:OUTPut:FREQuency:STARt <value>`

(Read-Write) Sets or returns the Output start frequency of the mixer. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Output start frequency

**Examples**

- `SENS:MIX:OUTP:FREQ:STAR 1e9`
- `SENSe2:MIXer:OUTPut:FREQ:STARt 1000000000`

**Query Syntax**

`SENSe<ch>:MIXer:OUTPut:FREQuency:STARt?`

**Return Type**

Numeric

**Default**

Not Applicable

---

`SENSe<ch>:MIXer:OUTPut:FREQuency:STOP <value>`
(Read-Write) Sets or returns the Output stop frequency of the mixer. See Note

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Output stop frequency

Examples

```
SENS:MIX:OUTP:FREQ:STOP 1e9
SENS2:MIXer:OUTPut:FREQ:STOP 1000000000
```

Query Syntax

```
SENSe<ch>:MIXer:OUTPut:FREQuency:STOP?
```

Return Type

Numeric

Default

Not Applicable

**SENSe<ch>:MIXer:PHASe <bool>**

(Read Write) Sets and returns the state of SMC Phase measurements and calibrations. Learn more.

In the User Interface, there are two "enable phase" checkboxes: in the Phase Settings dialog and in the Calibration Wizard. Checking one enables both. This single command also enables both.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Include Phase measurement state. Choose from

  - ON or 1 - Include phase in SMC measurements
  - OFF or 0 - Do NOT include phase in SMC measurements

Examples

```
SENS:MIX:PHAS 1
sense2:mixer:phase off
```

Query Syntax

```
SENSe<ch>:MIXer:PHASe?
```

Return Type

Boolean

Default

0 (OFF)

**SENSe<ch>:MIXer:PMAP <in>,<out>**
(Write-only) Sets the PNA to DUT port map for FCA measurements. Use SENS:MIX:PMAP:INP? and SENS:MIX:PMAP:OUTP? to read these values. Learn about selectable FCA DUT ports.

Changing the ports may limit your ability to use an internal second source. If a selected port is shared by one of the sources, then that source will not be available as an LO source. Learn more about Internal second sources.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<in>` PNA port to connect to the DUT input.
  - For SMC, choose any unused PNA port.
  - For VMC, set to 1.
- `<out>` PNA port to connect to the DUT output. Choose any unused port for SMC and VMC.

**Examples**

```
SENS:MIX:PMAP 2,1
sense2:mixer:pmap 4,2
```

**Query Syntax** Not Applicable

**Default** 1,2

---

**SENS[ch]:MIXer:PMAP:INPut?**

(Read-only) Returns the PNA port that is mapped to the DUT input. Use SENS:MIX:PMAP to set this value.

Learn about selectable FCA DUT ports.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

```
SENS:MIX:PMAP:INP?
sense2:mixer:pmap:input?
```

**Default** 1

---

**SENS[ch]:MIXer:PMAP:OUTPut?**
(Read-only) Returns the PNA port that is mapped to the DUT output. Use **SENS:MIX:PMAP** to set this value.

Learn about selectable FCA DUT ports.

**Parameters**

<ch>  
Any existing channel number. If unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:PMAP:OUTP?</td>
<td></td>
</tr>
<tr>
<td>sense2:mixer:pmap:output?</td>
<td></td>
</tr>
</tbody>
</table>

**Default**  
2

**SENS<ch>:MIXer:RECalculate**

(Write only) Repeats the last calculation that was performed, including all ON (state) segments in segment table.

**Parameters**

<ch>  
Any existing channel number. If unspecified, value is set to 1

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:REC</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

**SENS<ch>:MIXer:REV**re <bool>

(Read-Write) Sets whether to include SC12 sweeps during measurements.

**Parameters**

<ch>  
Any existing channel number. If unspecified, value is set to 1.

<bool>  
(Boolean) Choose from:

- **ON (1)** - Include the SC12 (reverse) sweep.
- **OFF (0)** - Do NOT Include the SC12 (reverse) sweep.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:REV 1</td>
<td></td>
</tr>
<tr>
<td>sense2:mixer:reverse ON</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**  
SENS<ch>:MIXer:REV?  

**Return Type**  
Boolean

**Default**  
ON (1)
**SENSe<ch>:MIXer:ROLE:CATalog? - Superseded**

*(Read-only)* This command is replaced with **SENSe:ROLE:CATalog** which can be used by all channels.

Returns a list of valid roles for the IMD Converter application.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1.

**Examples**

```
SENS:MIX:ROLE:CAT?
sense2:mixer:role:catalog?
```

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ROLE:DEVice <role>,<source> - Superseded**

*(Read-Write)* This command is replaced with **SENSe:ROLE:DEVice** which can be used by all channels.

Assigns a configured external source to the specified role for the converter application.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1.
- **<role>** (String) Role to which the external source is assigned. Choose from:
  - For IMDX and IMSX, choose from:
    - "RF2"
    - "LO1"
    - "LO2"
  - For all other converter applications, choose from:
    - "LO1"
    - "LO2"
- **<source>** String) Source name from *Source Configuration dialog.*

**Examples**

```
SENS:MIX:ROLE:DEV "LO1", "LO1Name"
sense2:mixer:role:device "LO1", "LO1Name"
```

**Query Syntax**

```
SENSe<ch>:MIXer:ROLE:DEVice? <source>
```

2704
SENSe<ch>:MIXer:SAVE <name>

(Write-only) Saves the settings for the mixer/converter test setup to a mixer attributes file.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<name> Path and file name (including .mxr extension) to save.

Examples

SENSe:MIXer:SAVE "C:/Program Files/Agilent/Network Analyzer/Documents/Mixer/MyMixer.mxr"

Default Not Applicable

SENSe<ch>:MIXer:STAGe <n>

(Read-Write) Number of IF stages (LOs) used in the mixer. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<n> Number of stages. Choose either 1 or 2

Examples

SENSe:MIX:STAG 2
SENSe:MIXer:STAGE 1

Query Syntax

SENSe<ch>:MIXer:STAGe?

Return Type

Numeric

Default

1

SENSe<ch>:MIXer:XAXis <char>
(Read-Write) Sets or returns the swept frequency range to display on the X-axis for the IMDx channel.

For FCA and GCX measurements, use `CALC:MIXer:XAXis`

**Parameters**

- `<ch>` Channel number of the IMDx Converter measurement. If unspecified, value is set to 1.
- `<char>` Frequency range to display on the X-Axis. NOT case-sensitive. Choose from:
  - `INPUT` - Input frequency range
  - `LO_1` - LO frequency range
  - `OUTPUT` - Output frequency range

If the specified frequency range is not swept, the default swept range is used.

**Examples**

```
SENSe:MIXer:XAXis INPUT
sense2:mixer:xaxis LO_1
```

**Return Type** Character

**Default** Search is made in the following order until a swept range is found:

1. OUTPUT
2. INPUT (If the OUTPUT is fixed)
3. Number of Points (If ALL ranges are fixed)

---

_Last Modified:_

- 25-Mar-2010  Added Include Phase (9.2)
- 12-Feb-2010  Added Include Reverse
- 12-Oct-2009  Clarified Stages
- 13-Mar-2009  Added roles and X-axis for IMDx
- 3-Mar-2009   Fixed Mix:Calc for INP and OUTP
- 24-Feb-2009  Replaced True/False
- 17-Dec-2008  Fixed map & typo
- 2-Oct-2008   Clarification of sideband commands
- 5-May-2008   Added Port Map commands
- 6-Mar-2008   Added note to page top
- 23-Jul-2007  Clarified LO Name command
Sense:Mixer:ELO Commands

Allows measurements of a Mixer with an Embedded LO.

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Learn about Embedded LO Settings
- Synchronizing the PNA and Controller
**Note:** The Embedded LO DIAGnostic commands read data from the various broadband and precise tuning sweeps, similar to the textual and graphical data that are available in the user interface.

**SENSe<ch>:MIXer:ELO:LO:DELTa <num>**

(Read-Write) Sets and returns LO Frequency Delta. There is usually no need to set this value. Read this value to determine the difference between the LO Frequency that is stated in the Mixer dialog box and the last measured LO Frequency.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` LO Frequency delta in Hertz.

**Examples**

```plaintext
SENS:MIX:ELO:LO:DELT 10.3
```

**Query Syntax**

SENSe<ch>:MIXer:ELO:LO:DELTa?

**Return Type**

Numeric

**Default** Not Applicable

**SENSe<ch>:MIXer:ELO:LO:RESet**

(Write-only) Resets the LO Delta Frequency to 0 (zero).

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```plaintext
SENS:MIX:ELO:LO:RES
sense2:mixer:elo:lo:reset
```

**Query Syntax** Not Applicable

**Default** Not Applicable

**SENSe<ch>:MIXer:ELO:NORMalize:POINt <num>**
(Read-Write) Sets and returns the sweep data point around which to perform broadband and precise tuning.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Mixer Sweep data point. Choose a data point number, between 1 and the max number of data points in the sweep, that has the least amount of expected noise.

**Examples**

```
SENS:MIX:ELO:LO:NORM:POIN 200
sense2:mixer:elo:normalize:point 101
```

**Query Syntax**

`SENS<ch>:MIXer:ELO:NORMalize:POINt?`

**Return Type**

Numeric

**Default** Center point in the sweep span

---

**SENSe<ch>:MIXer:ELO:STATe <bool>**

(Read-Write) Sets and returns the ON | OFF state of Embedded LO.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ON | OFF state. Choose from
  - 0 - Embedded LO OFF
  - 1 - Embedded LO ON

**Examples**

```
SENS:MIX:ELO:STAT 1
sense2:mixer:elo:state 0
```

**Query Syntax**

`SENSe<ch>:MIXer:ELO:STATe?`

**Return Type**

Boolean

**Default** OFF

---

**SENSe<ch>:MIXer:ELO:TUNing:IFBW <num>**
**SENSe<ch>:MIXer:ELO:TUNing:IFBW <num>**

*(Read-Write)* Sets and returns the IF Bandwidth for Broadband and Precise tuning sweeps.

**Parameters**

- **<ch>**  Any existing channel number. If unspecified, value is set to 1
- **<num>**  IF Bandwidth

**Examples**

```
SENS:MIX:ELO:TUN:IFBW 10kHz
sense2:mixer:elo:tuning:ifbw 20e3
```

**Query Syntax**

```
SENSe<ch>:MIXer:ELO:TUNing:IFBW?
```

**Return Type**  Numeric

**Default**  30kHz

---

**SENSe<ch>:MIXer:ELO:TUNing:INTerval <num>**

*(Read-Write)* Sets and returns how often a tuning sweep is performed.

**Parameters**

- **<ch>**  Any existing channel number. If unspecified, value is set to 1
- **<num>**  Tuning sweep interval

**Examples**

```
SENS:MIX:ELO:TUN:INT 2
sense2:mixer:elo:tuning:interval 1
```

**Query Syntax**

```
SENSe<ch>:MIXer:ELO:TUNing:INTerval?
```

**Return Type**  Numeric

**Default**  1

---

**SENSe<ch>:MIXer:ELO:TUNing:ITERations <num>**
(Read-Write) Sets and returns the maximum number of tuning iterations to achieve the precise tolerance.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Number of tuning iterations. Choose a number between 1 and 100.

Examples

```
SENS:MIX:ELO:TUN:ITER 5
sense2:mixer:elo:tuning:iterations 3
```

Query Syntax

`SENSe<ch>:MIXer:ELO:TUNing:ITERations?`

Return Type

Numeric

Default 5

---

`SENSe<ch>:MIXer:ELO:TUNing:MODE <char>`

(Read-Write) Sets and returns the method used to determine the embedded LO Frequency.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Tuning mode. Choose from:
  - **BROadband** Both broadband and precise tuning
  - **PRECise** Precise tuning only
  - **NONE** No tuning; just apply the LO Frequency Delta value.

Examples

```
SENS:MIX:ELO:TUN:MODE BRO
sense2:mixer:elo:tuning:mode precise
```

Query Syntax

`SENSe<ch>:MIXer:ELO:TUNing:MODE?`

Return Type

Character

Default BROadband

---

`SENSe<ch>:MIXer:ELO:TUNing:RESet`
(Write-only) Resets the tuning parameters to their default values.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:MIX: ELO:TUN:RES
sense2:mixer: elo: tuning: reset
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:ELO:TUNing:SPAN <num>**

(Read-Write) Sets and returns the frequency span for the broadband tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Broadband frequency span in Hz.

**Examples**

```
SENS:MIX: ELO:TUN:SPAN 1e6
sense2:mixer: elo: tuning: span 1mhz
```

**Query Syntax**

SENSe<ch>:MIXer:ELO:TUNing:SPAN?

**Return Type**

Numeric

**Default**

3 MHz

---

**SENSe<ch>:MIXer:ELO:TUNing:TOLerance <num>**
(Read-Write) Sets and returns the tuning tolerance for precise tuning.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<num> Tuning tolerance in Hz. Choose a number between .001 and 1e3.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:ELo:TUN:TOL .5</td>
</tr>
<tr>
<td>sense2:mixer:elo:tuning:tolerance 1</td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<ch>:MiXer:ELo:TUNing:TOLerance?

Return Type

Numeric

Default

1 Hz

SENSe<ch>:MiXer:ELo:DIAGnostic:CLEar

(Write-only) Clears current diagnostic information.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:ELo:DIAG:CLEar</td>
</tr>
<tr>
<td>sense2:mixer:elo:diagnostic:clear</td>
</tr>
</tbody>
</table>

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<ch>:MiXer:ELo:DIAGnostic:STATus?
(Read-only) Returns a string that describes the result of the last tuning sweeps.

### Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1

### Examples

```
SENS:MIX:ELO:DIAG:STAT?
sense2:mixer:elo:diagnostic:status
```

### Return Type

String

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep:COUNT?**

(Read-only) Returns the number of tuning sweeps used for the latest embedded LO measurement.

### Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1

### Examples

```
SENS:MIX:ELO:DIAG:SWEep:COUNT
sense2:mixer:elo:diagnostic:sweep:count?
```

### Return Type

Numeric

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:DATA?**
(Read-only) Returns an array of data that describes the data retrieved from the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
SENS:MIX:ELO:DIAG:SWE2:DATA?
sense2:mixer:elo:diagnostic:sweep1:data?
```

**Return Type** Array

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:LO:DELTa?**

(Read-only) Returns the LO frequency delta from the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:lo:delta?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:ANNotation?**
(Read-only) Returns the Y-axis marker value from the specified tuning sweep. This command assumes that a marker was used. Use SENS:MIX:ELO:DIAG:SWE:MARK:STATe? to confirm if a marker was used for the tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

**Examples**

SENS:MIX:ELO:DIAG:SWE2:MARKer:ANN?

**Return Type** Numeric

**Default** Not Applicable

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:POSition?**

(Read-only) Returns the X-axis marker position from the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

**Examples**

SENS:MIX:ELO:DIAG:SWE2:MARKer:POS?

sense2:mixer:elo:diagnostic:sweep1:marker:position?

**Return Type** Numeric

**Default** Not Applicable

**SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:STATe?**
(Read-only) Returns whether or not a marker was used for the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:marker:position?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELo:DIAGnostic:SWEep<n>:PARameter?**

(Read-only) Returns the name of the parameter of the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
SENS:MIX:ELO:DIAG:SWE2:PAR?
sense2:mixer:elo:diagnostic:sweep1:parameter?
```

**Return Type** String - either "VC21" or "B,1"

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELo:DIAGnostic:SWEep<n>:TIITLE?**
(Read-only) Returns the title of the specified tuning sweep.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

**Examples**

SENS:MIX:ELO:DIAG:SWE2:TITL?
sense2:mixer:elo:diagnostic:sweep1:title?

**Return Type** String

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELo:DIAGnostic:SWEep<n>:X:ANNotation?**

(Read-only) Returns the X-Axis annotation of the specified tuning sweep.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

**Examples**

sense2:mixer:elo:diagnostic:sweep1:x:annotation?

**Return Type** String - either "Hz" or "s"

**Default** Not Applicable

---

**SENSe<ch>:MIXer:ELo:DIAGnostic:SWEep<n>:X:STARt?**
Returns the start value of the specified tuning sweep.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNt?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:x:start?
```

**Return Type**: Numeric

**Default**: Not Applicable

---

Returns the stop value of the specified tuning sweep.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNt?` to find the number of sweeps taken.

**Examples**

```
SENS:MIX:ELO:DIAG:SWE2:X:STOP?
sense2:mixer:elo:diagnostic:sweep1:x:stop?
```

**Return Type**: Numeric

**Default**: Not Applicable

---

(Read-only) Returns the annotation of the specified tuning sweep.
(Read-only) Returns Y-axis annotation value of the specified tuning sweep.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1
- **<n>** Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:y:annotation?
```

**Return Type** String - either "U" or "Phase"

**Default** Not Applicable
Sense:Multiplexer Commands

Controls External Test Sets (N44xx, E5091A, "Z", and "H" series).

Click on a blue keyword to view the command details.

Red commands are superseded.

See Also

- See an example program using these commands.
- Learn about External Test Set Control
- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe:MULTiplexer<id>:ADDRess <address>

(Read-Write) Sets and returns the address for the external test set at the specified ID. This command should be immediately preceded by the SENSe:MULT:TYPE command.

Parameters

- <id>  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.

- <address> Integer  The test set address.

  - For a GPIB test set (N44xx and some specials), this is the GPIB address.
  - For a test set I/O test set (some specials), it is the position of the test set in the chain (starting at 0).
  - For USB test sets (E5091A), the address is set by DIP switches on the rear panel.
Examples

SENS:MULT1:TYPE "Z5623A_K66" ' use K66 test set, and reference it through ID 1
SENS:MULT1:ADDR 0 ' first test set in sequence
' All subsequent commands using SENS:MULT1 will refer to this test set

Query Syntax
SENSe:MULTiplexer<id>:ADDRess?

Return Type
Numeric

Default
Not Applicable

SENSe<cnum>:MULTiplexer<id>:ALLPorts <string>
(Read-Write) Sets or gets the port selections for all available ports on the specified channel.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1.

<id> Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.

<string> Comma-separated list of port selections, one for each port. Each port selection must correspond to one of the values returned by SENS:MULT:PORT:CAT?.

Do NOT include + and -.

Examples

' for channel 5 and test set 1, set port 1 to T1,
' port 2 to A, port 3 to R2+, port 4 to R3-
SENS5:MULT1:ALLP "T1,A,R2,R3 "

Query Syntax
SENSe<cnum>:MULTiplexer<id>:ALLPorts?

Return Type
STRING

Default
Not Applicable

SENSe:MULTiplexer:CATalog?
(Read-Only) Returns a comma-separated list of the external test sets models that are currently supported. Choose one of these items to send SENS:MULT1:TYPE.

Examples

SEN :MULT:CAT?

Return Type
String

Default
Not Applicable
SENSe:MULTiplexer<id>:COUNT?

(Read-Only) Returns the total number of ports of the specified test set.

Returns 0 if no test set is connected (GPIB test sets only).

Parameters

   <id>  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.

Examples

    SENS:MULT1:COUN?
    sense:multiplexer2:count?

Return Type Numeric

Default Not Applicable

SENSe:MULTiplexer<id>:DISPLAY[:STATE] <bool>

(Read-Write) Turns ON and OFF the display of the test set control status bar. This status bar indicates the test set that is being controlled and the current port mappings. This setting is turned ON automatically when the test set is enabled.

Parameters

   <id>  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.
   <bool> ON(1) Turns ON the display.
          OFF (0) Turns OFF the display.

Examples

    SENS:MULT1:DISP 1
    sense:multiplexer2:display:state on

Query Syntax SENSe:MULTiplexer<id>:DISPLAY[:STATE]?

Return Type Boolean

Default OFF (0)
(Read-Only) Returns the number of input ports for the specified test set.

- For test sets such as the E5091A that do NOT use jumper cables to route the stimulus and response signals, this command returns the number of test set ports that can be connected to the PNA.
- For test sets that DO use jumper cables to route the stimulus and response signals, such as the N44xx, the return value is not valid.

**Parameters**

**<id>**  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSE:MULT:TYPE command.

**Examples**  
SENSe3:MULT:INC?  'returns the number of input ports for test set 1 on channel 3

**Return Type**  Numeric

**Default**  Not Applicable

---

**SENSe<cnum>:MULTiplexer:LAbel <string>**

(Read-Write) Sets and returns the display label for the testset on the specified channel. The label appears in a status bar at the bottom of the PNA display when SENS:MULT:DISP is set to ON.

**Parameters**

**<cnum>**  Any existing channel number. If unspecified, value is set to 1.

**<string>**  Display label text.

**Examples**  SENSe3:MULT:LAB 'High-power output'

**Query Syntax**  SENSe<cnum>:MULTiplexer:LAbel?

**Return Type**  String

**Default**  Not Applicable

---

**SENSe<cnum>:MULTiplexer<id>:OUTPut[:DATa] <num>**
(Read-Write) Sets or returns the control line value for the specified channel.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1.
- `<id>`    Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the `SENSe:MULT:TYPE` command.
- `<numr>`  An integer specifying the decimal value of the control line. Values are obtained by adding weights from the following table that correspond to individual lines.

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

**Note:**

- The E5091A interprets SENS:MULT1:OUTP 0 as all lines OFF.
- All "Z"and "H" series test sets interpret SENS:MULT1:OUTP 0 as all lines ON.

Refer to your test set documentation for setting control line values.

**Examples**

`SENSe3:MULT1:OUTP 48`  'For Z5623A K64, lines 5 and 6 are OFF; all other lines are set to ON state.'

**Query Syntax**

`SENSe<cnum>:MULTiplexer<id>:OUTPut[:DATa]`?

**Return Type**

Numeric

**Default**

Not Applicable
(Read-Only) Returns a comma-separated list of valid port selections for the specified port.

**Parameters**

- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the `SENSe:MULT:TYPE` command.
- `<pnum>`: Integer - Input port number for which to return valid Output port selections. Read the number of input ports for the test set using `SENSe:MULT:INCount?`.

**Examples**

```
SENSe:MULT1:PORT3:CAT?  'returns the valid port selections for port 3
```

**Return Type**

String

**Default**

Not Applicable

---

**SENSe<cnum>:MULTiplexer<id>:PORT<pnum>:SELect <string>**

(Write-Only) Sets and returns a port mapping for a single port. If this command creates a conflict with an existing port, the PNA will resolve the conflict.

**Note:** This command is not supported for the Z5623AK44.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, value is set to 1.
- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the `SENSe:MULT:TYPE` command.
- `<pnum>`: Integer - Logical port number.
- `<string>`: Physical port number.

**Examples**

```
SENSe:MULT1:PORT3:SEL "4"  'sets logical port 3 to physical port 4.
```

**Return Type**

String

**Default**

Not Applicable

---

**SENSe:MULTiplexer<id>:STATe <bool>**
(Read-Write) Enables and disables (ON/OFF) the port mapping and control line output of the specified test set.

If the specified test set is not connected or not ON, then setting State ON will report an error. All other properties can be set when the test set is not connected.

When this command is set to ON, then the display of the test set status bar (SENS:MULT:DISP) is also set to ON.

**Parameters**

- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSE:_MULT:TYPE command.
- `<bool>`: ON(1) Enables test set control.
  - OFF (0) Disables test set control.

**Examples**

```plaintext
SENS:MULT1:STAT 1
sense2:multiplexer2:state on
```

**Query Syntax**

SENSe<cnum>:MULTiplexer<id>:STATe?

**Return Type**

Boolean

**Default**

OFF (0)

---

SENSe<cnum>:MULTiplexer<id>:TSET9:OUTPut[:DATA] <data> Superseded

**Note:** This command is replaced with SENS:MULT:OUTP

(Read-Write) Sets the control lines of the specified E5091A. Control lines, provided through a E5091A front panel connector, are used to control external equipment such as a part handler. See your E5091A documentation to learn more about control lines.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, value is set to 1.
- `<id>`: Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- `<data>`: Data value used to set control lines. Values are obtained by adding weights from the following table that correspond to individual lines. HIGH =1; LOW=0.
<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

0 - Sets all lines low

255 - Sets all lines high

**Examples**

'The following sets line 3 and 4 high. All other lines low.

SENS:MULT1:TSET9:OUTP 12

**Query Syntax**

SENSe<cnum>:MULTiplexer<id>:TSET9:OUTPut[:DATA]?

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:MULTiplexer<id>:TSET9:PORT1 <char> Superseded**

**Note:** This command is replaced with SENS:MULT:ALLPorts which sets ALL ports to the specified outputs.

(Read-Write) Switches Port 1 of the specified E5091A to one of the available outputs.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<id>` Id of the E5091A test set. Choose from 1 or 2. [Learn how to set ID value](#).
- `<char>` Output port to be switched to. Choose from:
  - A
  - T1 - (If Port 2 already is connected to T1, then Port 2 will be switched to T2.)

**Examples**

SENS:MULT1:TSET9:PORT1 A

**Query Syntax**

SENSe<cnum>:MULTiplexer<id>:TSET9:PORT1?
SENSe<cnum>:MULTiplexer<id>:TSET9:PORT2 <char> Superseded

Note: This command is replaced with SENS:MULT:ALLPorts which sets ALL ports to the specified outputs.

(Read-Write) Switches Port 2 of the specified E5091A to one of the available outputs.

Parameters
- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <id> Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- <char> Output port to be switched to. Choose from:
  - T1 - If Port 1 already is connected to T1, then Port 1 will be switched to A.
  - T2

Examples

SENS:MULT1:TSET9:PORT2 T2

Query Syntax
SENSe<cnum>:MULTiplexer<id>:TSET9:PORT2?

Return Type Character
Default T1

SENSe<cnum>:MULTiplexer<id>:TSET9:PORT3 <char> Superseded

Note: This command is replaced with SENS:MULT:ALLPorts which sets ALL ports to the specified outputs.

(Read-Write) Switches Port 3 of the specified E5091A to one of the available outputs.

Parameters
- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <id> Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- <char> Output port to be switched to. Choose from:
  - R1 (R1+)
  - R2 (R2+)
R3 (R3+) If option 007 (7port), R2 is selected.

Examples
SENS: MULT1: TSET9: PORT3 R2

Query Syntax
SENSe<cnum>: MULTiplexer<id>: TSET9: PORT3?

Return Type
Character

Default
R1

SENSe<cnum>: MULTiplexer<id>: TSET9: PORT4 <char> Superseded

Note: This command is replaced with SENS: MULT: ALLPorts which sets ALL ports to the specified outputs.

(Read-Write) Switches Port 4 of the specified E5091A to one of the available outputs.

Parameters

<cnun> Any existing channel number; if unspecified, value is set to 1.
:id> Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
<char> Output port to be switched to. Choose from:

R1 (R1-)
R2 (R2-)
R3 (R3-) If option 007 (7port), R2 is selected.

Examples
SENS: MULT1: TSET9: PORT4 R2

Query Syntax
SENSe<cnum>: MULTiplexer<id>: TSET9: PORT4?

Return Type
Character

Default
R1

SENSe: MULTiplexer<id>: TYPe <name>
(Read-Write) Loads a configuration file for the specified type of external test set.

This command should be immediately followed by the `SENSe:MULT:ADDResS` command.

**Parameters**

- `<name>`: String  The name of the type of test set. Must be one of the items in the list returned by the `SENSe:MULT:CATalog?` query.

- `<id>`: Id of the external test set. Set by this command. Use consecutive values starting at 1.

**Examples**

```
SENSe:MULT1:TYPE "Z5623AK66"  ' use K66 test set, and reference it through ID 1
```

**Query Syntax**: `SENSe:MULTiplexer<id>:TYPe?`

**Return Type**: String

**Default**: Not Applicable

---

Other Noise Figure SCPI commands

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- `CALC:CUSTom:DEFine` - creates a noise figure measurement.
- `CONTrol:NOISe:SOURce` or `OUTPut:MANual:NOISe[:STATe]` - turns the Noise Source ON and OFF.
- `SENSe:PATH:CONF:ELEMENT[:STATE]` - sets the port 1 and port 2 noise switches.
- `SYST:PREF:ITEM:SWIT:DEF` - Sets the default setting of the Noise Tuner switch
- `SENS:CORR:NOISe` commands - noise calibration
- `SENS:CORR:Guided` commands - performs most of noise cal.

- [SCPI Command Tree](#)

---

**SENSe<ch>:NOISe:AVERage[:COUNT] <num>**

*(Read-Write)* Set and read the averaging factor for the noise receiver. Learn more

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<num>` Averaging value. Choose any number from 1 to 99.

**Examples**

```
SENSe:NOISe:AVER 20
sense:noise:average:count 10
```

**Query Syntax**

`SENSe:NOISe:AVERage[:COUNT]?

**Return Type**

Numeric

**Default**

1
SENSe<ch>:NOISe:AVERage:STATe <bool>
(Read-Write) Turns noise averaging ON and OFF.

Parameters
<ch> Noise Figure channel number. If unspecified, value is set to 1.
<bool> Averaging state. Choose from

0 - Noise averaging OFF
1 - Noise averaging ON

Examples
SENSe:NOISe:AVER:STAT 0
sense:noise:average:state 1

Query Syntax
SENSe:NOISe:AVERage:STATe?

Return Type
Boolean

Default
O - OFF

SENSe<ch>:NOISe:BWIDth[:RESolution] <num>
(Read-Write) Set and read the bandwidth of the noise receiver. Learn more

Parameters
<ch> Noise Figure channel number. If unspecified, value is set to 1.
<num> Bandwidth value. Choose from:

For Sens:Noise:Receiver = NOISe (Opt 029) choose from: 800 KHz, 2 MHz, 4 MHz, 8 MHz, or 24 MHz or the numerical equivalent, such as 8e6 and so forth.

For Sens:Noise:Receiver = NORMal (Opt 028) choose from: 720 kHz or 1.2 MHz

If the value does not match one of these, it is rounded up to the next valid bandwidth value.

Examples
SENSe:NOISe:BWID 2e6
sense:noise:bwidth:resolution 8mhz

Query Syntax
SENSe:NOISe:BWIDth[:RESolution]?

Return Type
Numeric
**SENSe<ch>:NOISe:CALibration:METHod <string>**
(Read-Write) Set and read the method for performing a calibration on a noise channel.

**Parameters**
- <ch> Noise Figure channel number. If unspecified, value is set to 1.
- <string> Calibration method. NOT case-sensitive. Choose from:
  - "VectorFull" or "Vector"
  - "SParameter" (Not available for NFX measurements)
  - "ScalarFull" or "Scalar"

**Examples**
```
SENSe:NOISe:CAL:METH "Vector"
sense:noise:calibration:method "SParameter"
```

**Query Syntax**  SENSe:NOISe:CALibration:METHod?

**Return Type**  String

**Default**  "VectorFull"

---

**SENSe<ch>:NOISe:CALibration:RMEThod <string>**
(Read-Write) Set and read the method used to characterize the noise receivers. [Learn more.](#)

**Parameters**
- <ch> Noise Figure channel number. If unspecified, value is set to 1.
- <string> Receiver characterization method. NOT case-sensitive. Choose from:
  - "NoiseSource" - Use a noise source. This selection is NOT allowed when a standard PNA receiver is used as the noise receiver (SENSe:NOIS:REC NORM).
  - “PowerMeter” - Use a power meter.

**Examples**
```
SENSe:NOISe:CAL:RMET "PowerMeter"
sense:noise:calibration:rmethod "noisesource"
```

**Query Syntax**  SENSe:NOISe:CALibration:RMEThd?

---
SENSe<ch>:NOIS:ENR:FILename <string>

(Read-Write) Set and read the path and name of the ENR file associated with the noise source.

**Parameters**

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<string> Full path, filename, and extension of the ENR file.

**Examples**

```
SENSe:NOIS:ENR:FIL "c:/ProgramFiles/Agilent/NetworkAnalyzer/Documents/ENR/346C.enr"
SENSe:NOIS:ENR:FIL "c:/ProgramFiles/Agilent/NetworkAnalyzer/Documents/ENR/346C.enr"
```

**Query Syntax**

SENSe:NOIS:ENR:FILename?

**Return Type** String

**Default** "NoiseSource"

SENSe<ch>:NOIS:GAIN <num>

(Read-Write) Set and read the amount of gain for the noise receiver. This setting is NOT used when Sens:Noise:Receiver = NORMal (Opt 028)

**Parameters**

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<num> Gain value. Choose from:

- 0 - Low gain; select if the gain of your DUT is relatively high (>35 dB).
- 15 - Medium gain; select if the gain of your DUT is about average (20 dB to 45 dB)
- 30 - High gain; select if the gain of your DUT is relatively low (<30 dB).

Learn more about Noise Receiver Gain setting.

If the value does not match one of these, it is rounded up to the next legal value.

**Examples**

```
SENSe:NOIS:GAIN 15
SENSe:NOIS:GAIN 0
```
SENSe<ch>:NOISe:IMPedance:COUNt <num>

(Read-Write) Sets the number of impedance states to use during calibrated measurements.

**Parameters**

<ch> Noise Figure channel number. If unspecified, value is set to 1.

<num> Number of impedance states to use. Choose between 4 and the maximum number allowed by the noise tuner device. The more states that are used, the more accurate, and slower, the measurement. If the specified number exceeds the capability of the device, the measurement will use the maximum number of states the device allows.

**Examples**

SENSe:NOISe:IMP:COUNT 5

sense:noise:impedance:count 7

Query Syntax  SENSE:NOISE:IMPedance:COUNt?

Return Type  Numeric

Default  4

SENSe<ch>:NOISe:PMAP <in>,<out>

(Write-only) Set and read the DUT-to-PNA port mapping for Noise Figure. Port mapping is allowed ONLY when SENSe:NOISe:REC is set to NORM (standard PNA-X receiver).

**Parameters**

<ch> Any existing NF or NFX channel. If unspecified, value is set to 1.

<in> PNA port which is connected to the DUT input.

<out> PNA port which is connected to the DUT output.

**Examples**

SENSe:NOISe:PMAP 1,2

sense:noise:pmap 2,1

See example program

Query Syntax  Not Applicable

Default  1,2
SENSe<ch>:NOISe:PMAP:INPut?
(Read-only) Read the PNA port number to be connected to the DUT Input.

Use SENS:NOISE:PMap to set the port mapping.

Parameters

<ch> Any existing NF or NFX channel. If unspecified, value is set to 1.

Examples

SENSe:NOISe:PMAP:INPut?
sense:noise:pmap:input?

Return Type Numeric

Default 1

SENSe<ch>:NOISe:PMAP:OUTPut?
(Read-only) Read the PNA port number to be connected to the DUT Output.

Parameters

<ch> Any existing NF or NFX channel. If unspecified, value is set to 1.

Examples

SENSe:NOISe:PMAP:OUTPut?
sense:noise:pmap:output?

Return Type Numeric

Default 2

SENSe<ch>:NOISe:PULL[:STATe] <bool>
(Read-Write) Enables and disables the use of source pull technique to compute S22. Learn more.

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<bool>` Source pull technique state. Choose from:
  - **OFF** or **0** - Disable use of source pull technique.
  - **ON** or **1** - Enable use of source pull technique.

**Examples**

```
SENS:NOIS:PULL 0
sense2:noise:pull:state ON
```

**Query Syntax**

```
SENSe:NOISe:PULL[:STATe]?
```

**Return Type** Boolean

**Default** 0 - OFF

---

**SENSe<ch>:NOISe:RECeiver <char>**

(Read-Write) Sets and returns the noise receiver to use for noise measurements.

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<char>` Noise receiver. Choose from:
  - **NORMal** The standard PNA receiver. (Opt 028 and Opt 029)
  - **NOISe** The low-noise receivers. (Opt 029 only)

**Examples**

```
SENS:NOIS:REC NORM
sense2:noise:receiver noise
```

**Query Syntax**

```
SENSe:NOISe:RECeiver?
```

**Return Type** Character

**Default** NOISe

---

**SENSe<ch>:NOISe:SOURce:CKIT <string>**
(Read-Write) Set and read the Cal Kit that will be used for the Noise Source adapter.

An adapter is always necessary to connect a 346C Noise Source to the PNA port 2. Select a Cal Kit that is the same type and gender as the noise source connector.

If the Noise Source mates directly to PNA port 2, then set this type to "None".

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` Cal Kit. Case sensitive.

To read possible cal kit strings for the adapter:

- Change the port connector type to that of the noise source using:
  ```
  SENS:CORR:COLL:GUID:CONN:PORT<n>
  ```
- Then read the possible cal kit strings for that port using:
  ```
  ```

**Examples**

```
SENS:NOIS:SOUR:CKIT "N4691-60004 ECal"
SENSe:NOIs:SOUs:CKIT
```

**Query Syntax**

```
SENSe:NOIS:SOURce:CKIT?
```

**Return Type**

String

**Default**

Not applicable

---

**SENSe<ch>:NOISe:SOURce:CONNector <string>**

(Read-Write) Set and read the Noise Source connector type and gender. The Agilent 346C has an "APC 3.5 male" connector.

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` Noise source connector type and gender. Case sensitive.

Use **SENS:CORR:COLL:GUID:CONN:CAT?** to read possible connector strings.

**Examples**

```
SENS:NOIS:SOUR:CONN "APC 3.5 male"
SENSe:NOIs:SOUs:CONNector "APC 3.5 female"
```

**Query Syntax**

```
SENSe:NOISe:SOURce:CONNector?
```

**Return Type**

String
SENSe<ch>:NOISe:TEMPerature:AMBient <num>

(Read-Write) Sets the temperature at which the current noise measurement is occurring. Learn more

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<num>` Ambient temperature in Kelvin.

**Examples**

```
SENS:NOIS:TEMP:AMB 292
sense:noise:temperature 289
```

**Query Syntax**

SENSe:NOISe:TEMPerature:AMBient?

**Return Type**

Numeric

**Default**

295

---

SENSe<ch>:NOISe:TUNer:ID <string>

(Read-Write) Set and read the identity of the noise tuner. This is an ECal model and serial number string. To read the identities of the connected ECal modules, use SENSe:CORRection:CKIT:ECAL:LIST? and SENSe:CORRection:CKIT:ECAL<mod>:INFormation?

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` ECal model and serial number string. The ECal module must be connected when this command is sent.

**Examples**

```
SENS:NOIS:TUN:ID "N4691-60004 ECal 02822"
sense:noise:tuner:id ""N4691-60004 ECal 02822"
```

**Query Syntax**

SENSe:NOISe:TUNer:ID?

**Return Type**

String

**Default**

Not applicable

---

SENSe<ch>:NOISe:TUNer:INPut <string>
(Read-Write) Sets and reads the port of the ECal noise tuner that is connected to the PNA SOURCE OUT.

Parameters

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<string> ECal port identifier. Case sensitive.

Examples

SENSe:NOISe:TUNer:INPut "B"
sense:noise:tuner:input "A"

Query Syntax

SENSe:NOISe:TUNer:INPut?

Return Type

String

Default

"B"

SENSe<ch>:NOISe:TUNer:ORIent[:STATe] <bool>

(Read-Write) Sets the state of auto orientation for a noise tuner during Noise Figure for NFX.

Parameters

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<bool> Auto-orientation state. Choose from:

**OFF** or 0 - Disable Auto-orientation

**ON** or 1 - Enable Auto-orientation

Examples

SENSe:NOISe:TUNer:ORIent 0
sense:noise:tuner:orient:state ON

Query Syntax

SENSe:NOISe:TUNer:ORIent[:STATe]?

Return Type

Boolean

Default

1 - ON

SENSe<ch>:NOISe:TUNer:OUTPut <string>
(Read-Write) Sets and reads the port of the ECal noise tuner that is connected to the CPLR THRU.

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` ECal port identifier. Case sensitive.

**Examples**

```
SENS:NOIS:TUN:OUTP "B"

sense:noise:tuner:output "A"
```

**Query Syntax**

`SENSe:NOISe:TUNer:OUTput?`

**Return Type**

String

**Default**

"A"

---

---

**SENSe<nump>:OFFSet: CW <bool>**

*(Read-Write)* Turns stimulus CW Override mode ON or OFF. Use this setting to establish a fixed (CW) stimulus frequency while measuring the Response over a swept frequency range.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>`
  - ON (or 1) - turns CW override ON.
  - OFF (or 0) - turns CW override OFF.

**Examples**

- `SENS:OFFS:CW ON`
- `sense2:offset:cw off`

**Query Syntax**

`SENSe<nump>:OFFSet: CW?`

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<nump>:OFFSet:DIVisor <num>**
(Read-Write) Specifies (along with the multiplier) the value to multiply by the stimulus.

Parameters

<cnmu> Any existing channel number. If unspecified, value is set to 1
<num> Divisor value. Range is 1 to 1000

Examples
SENS:OFFS:DIV 3
sense2:offset:divisor 2

Query Syntax
SENSe<cnmu>:OFFSet:DIVisor?

Return Type
Numeric

Default
1

SENSe<cnmu>:OFFSet:MULTiplier <num>

(Read-Write) Specifies (along with the divisor) the value to multiply by the stimulus.

Parameters

<cnmu> Any existing channel number. If unspecified, value is set to 1
<num> Multiplier value. Range is +/- 1000. Negative multipliers cause the stimulus to sweep in decreasing direction. For mixer measurements, this would be for setups requiring the RF frequency to be less than LO frequency

Examples
SENS:OFFS:MULT 2
sense2:offset:multiplier 4

Query Syntax
SENSe<cnmu>:OFFSet:MULTiplier?

Return Type
Numeric

Default
1

SENSe<cnmu>:OFFSet:OFFSet <num>
Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Offset frequency. Range is +/- 1000 GHz. Offsets can be positive or negative

**Examples**

```
SENS:OFFS:OFFS 1GHz
sense2:offset:offset 1e9
```

**Query Syntax**

`SENSe<cnum>:OFFSet:OFFSet?`

**Return Type** Numeric

**Default** 0 Hz

---

`SENSe<cnum>:OFFSet:STARt?`

(Read-Only) Returns the response start frequency

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:OFFS:STAR?
sense2:offset:start?
```

**Return Type** Numeric

**Default** Not applicable

---

`SENSe<cnum>:OFFSet:[STATe] <bool>`
(Read-Write) Enables Frequency Offset Mode on ALL measurements that are present on the active channel. This immediately causes the source and receiver to tune to separate frequencies. The receiver frequencies are specified with the other SENS:OFFSet commands. To make the stimulus settings use the SENS:FREQ commands.

Tip: To avoid unnecessary errors, first make other offset frequency settings, then set Frequency Offset ON.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ON (or 1) - turns Frequency Offset ON.
  
  OFF (or 0) - turns Frequency Offset OFF.

**Examples**

```
SENS:OFFS ON
sense2:offset:state off
```

**Query Syntax**

SENSe<cnum>:OFFSet:[STATe]?

**Return Type** Boolean

**Default** OFF (0)

---

**SENSe<cnum>:OFFSet:STOP?**

(Read-Only) Returns the response stop frequency.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:OFFS:STOP
sense2:offset:stop
```

**Return Type** Numeric

**Default** Not applicable

---

- Synchronizing the PNA and Controller
- SCPI Command Tree

SENSe:PATH:CONFig:CATalog?

(Read-only) Returns a list of configuration names stored in the PNA.

| Examples | SENS : PATH : CONF : CAT? |
| Return Type | Comma-separated list of double-quoted strings |
| Default | Not Applicable |

SENSe<ch>:PATH:CONFig:COPY <num>
Copies the mechanical switch and attenuator settings from the specified channel <num> to channel <ch>.

To avoid potential conflicts, all port couplings in the calling channel will be turned OFF and all port attenuator settings will be set to manual before copying the switch or attenuator settings. The two channels CAN be of different measurement classes.

Use SYSTem:MACRo:COPY:CHANnel to copy ALL settings from one channel to another.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Channel number to copy mechanical settings to. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Channel number to copy mechanical settings from.</td>
</tr>
</tbody>
</table>

Examples

Copies mechanical settings from chan 2 to chan 1.

SENS1:PATH:CONF:COPY 2

Return Type Not Applicable

Default Not Applicable

SENSe:PATH:CONFig:DELete <string>

(Write-only) Deletes the specified configuration name from the PNA. The factory configurations cannot be deleted. This is the only method of distinguishing a factory configuration from a user-named configuration.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;string&gt;</td>
<td>Configuration name to be deleted.</td>
</tr>
</tbody>
</table>

Examples

SENS:PATH:CONF:DEL "MyMixer"

Return Type Not Applicable

Default Not Applicable

SENSe:PATH:CONFig:DTEXt <string>
(Read-Write) Write and read descriptive text associated with the configuration. This text is displayed in the path configuration dialog. Text is generally used to describe external connections that must be made manually to complete the configuration setup.

**Parameters**

<string> Descriptive text enclosed in quotes. Double quotes are not allowed within the descriptive text.

**Examples**

SENS:PATH:CONF:DTEX "Connect J1 jumper on the rear panel."

**Query Syntax**

SENSe<ch>:PATH:CONFig:DTEXt?

**Return Type**

String

**Default** Not Applicable

---

**SENSe<ch>:PATH:CONFig:ELEMENT:CATalog?**

(Read-only) Returns the names of configurable elements as a comma-delimited list of strings. See a list of configurable elements and settings for various PNA models.

**Parameters**

<ch> Any existing channel number; if unspecified, value is set to 1.

**Examples**

SENS:PATH:CONF:ELEM:CAT?

'returns

"Combiner", "Src1", "Src2"

**Default** Not Applicable

---

**SENSe<ch>:PATH:CONFig:ELEMENT[:STATE] <elem>, <setting>**
(Read-Write) Write or read the setting of a specified element in the current configuration. See a list of configurable elements and settings for various PNA models.

Parameters

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<elem>` Name of the element for which a setting is to be made.

Examples

```
SENS:PATH:CONF:ELEM "Combiner", "Normal"
```

Query Syntax

SENSe<ch>:PATH:CONFig:ELEMent? "Combiner"

Returns the current state of the Combiner element.

Return Type

String

Default

Not applicable

SENSe<ch>:PATH:CONFig:ELEMENT:VAL ue:CATalog? <element>

(Read-only) Returns the list of valid settings that can be used with the specified element. See a list of configurable elements and settings for various PNA models.

Parameters

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<element>` String. Element name for which to return valid settings.

Examples

```
  'returns "Normal", "Reversed"
```

Default

Not Applicable

SENSe<ch>:PATH:CONFig:NAME?
(Read-only) Returns the name of the current configuration only if NO individual element settings had been changed since selecting or storing a configuration. When element settings change, the path configuration name is cleared.

**Parameters**

<ch> Any existing channel number; if unspecified, value is set to 1.

**Examples**

SENS:PATH:CONF:NAME?
'returns  "Default"

**Return Type**

String

**Default**

Not Applicable

---

**SENSe<ch>:PATH:CONFig:SELect <string>**

(Write only) Loads the named configuration onto the specified channel.

Use SENSe:PATH:CONFig:CAT? to return the configuration names that are stored on the PNA.

**Parameters**

<ch> Any existing channel number; if unspecified, value is set to 1.

<string> Configuration name. "Default" is the default factory configuration.

**Examples**

SENS:PATH:CONF:SEL 'default'
sense2:path:CONFig:select "MyMixer"

**Query Syntax**

Not Applicable

**Default**

"Default"

---

**SENSe<ch>:PATH:CONFig:STORe <name>**
(Write only) Saves the path configuration currently associated with channel <ch> to the specified configuration name.

**Parameters**

- **<ch>** Any existing channel number; if unspecified, value is set to 1.
- **<name>** String. Configuration name. Factory configurations can NOT be overwritten. Specifying the name of a pre-defined factory configuration will result in an error.

**Examples**

```
SENS:PATH:CONF:STOR "MyMixer"
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

Sense:Power Command

Learn about Receiver Attenuation

SENSe<nun>:POWer:ATTenuator <recvr>,<num>

(Read-Write) Sets the attenuation level for the specified receiver.

**Note:** Attenuation cannot be set with Sweep Type set to Power

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<recvr>`: Receiver to get attenuation. Choose from:
  - AREceiver - receiver A
  - BREceiver - receiver B
  - CREceiver - receiver C
  - DREceiver - receiver D

Receiver attenuation can NOT be set using logical receiver notation.

- `<num>`: Attenuation value in dB. To determine how many receiver attenuators, the maximum receiver attenuation, and attenuation step size, for a PNA model, see PNA Models and Options.

  If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19 is entered for the E8361A/C, then 10 dB attenuation will be selected.

**Examples**
- SENSe:POW:ATT AREC, 10
- sense2:power:attenuator breceiver, 30

**Query Syntax**
SENSe<nun>:POWer:ATTenuator? <rec>

**Return Type**
Numeric

**Default**
0

Sense:Pulse Commands

Configures the 5 pulse generators in the PNA-X.

SENSe:PULSe
  | DELay
  | DINCrement
  | INVert
  | PERiod
  | STATe
  | SUBPointtrig
  | TPOLarity
  | TTYPe
  | WIDTH

Click on a blue keyword to view the command details.

See Also

- **SENS:SWEep:PULSE** - configures the channel for pulse measurements
- PNA-X IF Path Block diagram
- SENS:IF configuration commands
- Example Programs
- PNA-X Integrated Pulse Application
- Synchronizing the PNA and Controller
- SCPI Command Tree
**Pulse Definitions**

- **D** = Delay; the time before each pulse begins
- **W** = Width; the time the pulse is ON
- **P** = Period; one complete pulse cycle
- Duty Cycle = \( \frac{W}{P} \)

**Important:** If \( D + W \) is greater than \( P \), then undefined PNA behavior results. There is NO error message or warning.

**SENSe<ch>:PULSe<n>:DELay <value>**

*(Read-Write)* Sets the pulse delay. The amount of time before a new pulse begins.

See Pulse Definition diagram.

**Parameters**

- **<ch>** Any existing channel number; if unspecified, value is set to 1.
- **<n>** Pulse generator number. Choose from 0 to 4.
  - 0 is the generator that pulses the ADC.
- **<value>** Delay value in seconds. Choose a value from about 33ns to about 70 seconds.

**Examples**

```
SENS:PULS1:DEL .5
```

**Query Syntax**

```
SENSe<ch>:PULSe<n>:DELay?
```

**Return Type** Numeric

**Default** 0

**SENSe<ch>:PULSe<n>:DINCrement <value>**
(Read-Write) Sets the pulse delay increment. The delay increments with each pulse by the <value> amount.

For example, in this diagram the delay starts as 1. On the second pulse, delay=2. On the third pulse, delay=3.

**Important:** If D + W is greater than P, then undefined PNA behavior results. There is NO error message or warning. Delay includes the incremented value.

This is useful for pulse profiling.

See Pulse Definition diagram.

**Parameters**
- **<ch>** Any existing channel number; if unspecified, value is set to 1.
- **<n>** Pulse generator number. Choose from 0 to 4.
  - 0 is the generator that pulses the ADC.
- **<value>** Delay increment value in seconds.

**Examples**
- `SENS:PULS1:DINC .5`

**Query Syntax**
- `SENSe<ch>:PULSe<n>:DINCrement?`

**Return Type**
- Numeric

**Default**
- 0

`SENSe<ch>:PULSe<n>:INVert <bool>`
(Read-Write) Sets whether to invert the polarity of the pulse.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
- `<bool>`  ON (or 1) - Invert the pulse generator polarity. This causes the pulse ON time to be active low and OFF be active high.
  
  OFF (or 0) - Do NOT Invert the pulse generator polarity.

**Examples**

```
SENS:PULS1:INV 1
```

**Query Syntax**

```
SENSe<ch>:PULSe:INVert?
```

**Return Type**

Boolean

**Default**

OFF (0)

---

**SENSe<ch>:PULSe:PERiod <value>**

(Read-Write) Sets the pulse-period (1/PRF) for ALL pulse generators.

The resolution of the period is 16.667nS.

See Pulse Definition diagram.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<value>` Pulse period in seconds. Choose a value from about 33ns to about 70 seconds.

**Examples**

```
SENS:PULS:PERiod .5
```

**Query Syntax**

```
SENSe<ch>:PULSe:PERiod?
```

**Return Type**

Numeric

**Default**

1e-3 sec

---

**SENSe<ch>:PULSe<n>[:STATe] <bool>**
(Read-Write) Turns the pulse output ON and OFF.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
  
  0 is the generator that pulses the ADC.
- `<bool>` ON (or 1) - turns pulse output ON.
  
  OFF (or 0) - turns pulse output OFF.

**Examples**

```
SENS:PULS1 1
```

**Query Syntax**

```
SENSe<ch>:PULSe[:STATe]?
```

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<ch>:PULSe<n>:SUBPointtrig <bool>**

(Read-Write) Enables / Disables subpoint triggering. When enabled and performing Point Averaging, each rising edge of P0 triggers a subpoint (one of N acquisitions in an N point average). Must also enable the P0 generator using SENS:PULS0:STAT.

**Learn more about the PNA-X pulse generators.**

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. **Must be 0** as this is the generator that triggers the ADC.
- `<bool>` ON (or 1) - turns subpoint triggering ON.
  
  OFF (or 0) - turns subpoint triggering OFF.

**Examples**

```
SENS:PULS0:SUBP 1
```

**Query Syntax**

```
SENSe<ch>:PULSe0:SUBPointtrig?
```

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<ch>:PULSe:TPOLarity <char>**
Sets the polarity of the trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.

**Note:** This feature requires DSP version: **4.0 FPGA: 34** or higher. [Learn more](#).

Learn more about the PNA-X pulse generators.

### Parameters

- **<ch>** Any existing channel number; if unspecified, value is set to 1.
- **<char>** Pulse polarity. Choose from:
  - **POSitive** - PNA responds to rising edge or HIGH level
  - **NEGative** - PNA responds to falling edge or LOW level.

Set Edge or Level triggering using `SENS:PULS:TTYPe`.

### Examples

```plaintext
SENS:PULS:TPOL NEG
```

### Query Syntax

`SENSe<ch>:PULSe<ch>:TTYPe`

### Return Type

Character

### Default

`POSitive` - Also the polarity used when the PNA-X does not have the required DSP hardware.

---

Sets the type of trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.

**Note:** This feature requires DSP version: **4.0 FPGA: 34** or higher. [Learn more](#).

Learn more about the PNA-X pulse generators.

### Parameters

- **<ch>** Any existing channel number; if unspecified, value is set to 1.
- **<char>** Trigger type. Choose from:
  - **EDGE** - PNA responds to the edge (rising or falling) of a signal
  - **LEVelo** - PNA responds to the level (HIGH or LOW) of a signal

Set polarity using `SENS:PULS:TPOL`.

### Examples

```plaintext
SENS:PULS:TTYP EDGE
```

---

2760
**Query Syntax**  
SENSe<ch>:PULSe:TTYPe?

**Return Type**  
Character

**Default**  
LEVel - Also the type used when the PNA-X does not have the required DSP hardware.

---

**SENSe<ch>:PULSe<n>:WIDTh <value>**

*(Read-Write)* Sets the pulse width. The amount of time that the pulse is ON.

*See Pulse Definition diagram.*

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
- `<value>` Pulse width in seconds. Choose a value from about 33ns to about 70 seconds.

**Examples**  
**SENSe:PULS:WIDT 0.5**

**Query Syntax**  
SENSe<ch>:PULSe<n>:WIDTh?

**Return Type**  
Numeric

**Default**  
1e-4 sec

---

**Sense:Roscillator Command**

Learn about the Reference Osc.

See the rear-panel 10 MHz connector.

**SENSe:ROSCillator:SOURce?**

(Read-only) Applying a 10 MHz signal to the Reference Oscillator connector automatically sets the Reference Oscillator to EXTernal. This command allows you to check that it worked.

- **EXT** is returned when a signal is present at the 10 MHz Reference Oscillator connector.
- **INT** is returned when NO signal is present at the 10 MHz Reference Oscillator connector.

**Examples**

```
SENS:ROSC:SOUR?
sense:roscillator:source?
```

**Return Type** Character

**Default** Not applicable
**Sense:Segment Commands**

Defines the segment sweep settings.

Enable segment sweep with `SENS:SWE:TYPE SEGment`.

```
SENSe:Segment
  | ADD
  | ARBitrary
  | BWIDth
    | [RESolution]
    | CONTrol
  | COUNt
  | DELeTe
    | ALL
  | FREQuency
    | CENTER

### SENSE<cnun>:SEGMENT<snun>:ADD

*(Write-only)* Adds a segment.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snun>` Segment number to add. If unspecified, value is set to 1. Segment numbers must be sequential. If a new number is added where one currently exists, the existing segment and those following are incremented by one.

**Examples**

Two segments exist (1 and 2). The following command will add a new segment (1). The existing (1 and 2) will become (2 and 3) respectively.

```
SENS:SEGM1:ADD
sense2:segment1:add
```

**Query Syntax**

Not applicable. Use Sense:Segment:Count to determine the number of segments in a trace.

**Default**

Not Applicable

### SENSE<cnun>:SEGMENT:ARBitrary <ON | OFF>
(Read-Write) Enables you to setup a segment sweep with arbitrary frequencies. The start and stop frequencies of each segment can overlap other segments. Also, each segment can have a start frequency that is greater than its stop frequency which causes a reverse sweep over that segment. Learn more about Arbitrary Segment Sweep.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`
  - ON (or 1) - Allows the setup of arbitrary segment sweep.
  - OFF (or 0) - Prevents the setup of arbitrary segment sweep.

Examples

```
SENS:SEGM:ARB ON
sense2:segment:arbitrary off
```

Query Syntax

SENSe<cnum>:SEGMent:ARBitrary?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

---

**SENSe<cnum>:SEGMent<snum>:BWIDth[:RESolution] <num>**

(Read-Write) Sets the IF Bandwidth for the specified segment. First set SENS:SEGM:BWIDth:CONTrol ON. All subsequent segments that are added assume the new IF Bandwidth value.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Segment number to modify. Choose any existing segment number.
- `<num>` IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the PNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

Examples

```
SENS:SEGM:BWID 1KHZ
sense2:segment2:bwidth:resolution max
```

Query Syntax

SENSe<cnum>:SEGMent<snum>:BWIDth[:RESolution]?

Return Type

Numeric

Default

See **Preset IFBW** for your PNA model.

---

**SENSe<cnum>:SEGMent:BWIDth[:RESolution]:CONTrol <ON | OFF>**
(Read-Write) Specifies whether the IF Bandwidth resolution can be set independently for each segment.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`: ON (or 1) - turns Bandwidth control ON. Bandwidth can be set for each segment. OFF (or 0) - turns Bandwidth control OFF. Use channel bandwidth setting

**Examples**
```
SENS:SEGM:BWID:CONT ON
sense2:segment:bwidth:control off
```

**Query Syntax**
```
SENSe<cnum>:SEGMent:BWIDth[:RESolution]:CONTrol?
```

**Return Type**
Boolean (1 = ON, 0 = OFF)

**Default**
OFF

---

**SENSe<cnum>:SEGMent:COUNT?**

(Read-only) Queries the number of segments that exist in the specified channel.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.

**Examples**
```
SENS:SEG:M:COUN?
sense2:segment:count?
```

**Return Type**
Numeric

**Default**
1 segment

---

**SENSe<cnum>:SEGMent<snum>:DELe**

(Write-only) Deletes the specified sweep segment. When ALL segments are deleted, `SEN:SWE TYPE` is automatically set to Linear because there are no segments to sweep.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<snum>`: Number of the segment to delete. If unspecified, value is set to 1.

**Examples**
```
SENS:SEG:M:DEL
sense2:segment2:delete
```

**Query Syntax**
Not applicable

**Default**
Not Applicable
SENSe<cnum>:SEGMen<tn>:DELete:ALL

(Write-only) Deletes all sweep segments. When this command is executed, SENS:SWE:TYPE is automatically set to Linear because there are no segments to sweep.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:SEG:DEL:ALL
sense2:segment:delete:all
```

**Query Syntax**

Not applicable

**Default** Not Applicable

---

SENSe<cnum>:SEGMen<snum>:FREQuency:CENTer <num>

(Read-Write) Sets the Center Frequency for the specified segment. The Frequency Span of the segment remains the same. The Start and Stop Frequencies change accordingly.

**Note:** All previous segment's Start and Stop Frequencies that are larger than the new Start Frequency are changed to the new Start Frequency. All following segment's start and stop frequencies that are smaller than the new Stop Frequency are changed to the new Stop Frequency.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Segment number to modify. Choose any existing segment number.
- `<num>` Center Frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENS:SEGM:FREQ:CENT 1MHZ
sense2:segment2:frequency:center 1e9
```

**Query Syntax**

SENSe<cnum>:SEGMen<snum>:FREQuency:CENTer?

**Return Type** Numeric

**Default** Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.

---

SENSe<cnum>:SEGMen<snum>:FREQuency:SPAN <num>

2767
(Read-Write) Sets the Frequency Span for the specified segment. The center frequency of the segment remains the same. The start and stop frequencies change accordingly.

**Note:** All previous segment's Start and Stop Frequencies that are larger than the new Start Frequency are changed to the new Start Frequency. All following segment's start and stop frequencies that are smaller than the new Stop Frequency are changed to the new Stop Frequency.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Frequency Span in Hz. Choose any number between the **minimum** and **maximum** frequency of the analyzer.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENS:SEG:SPAN 1MHZ
sense2:segment2:frequency:span max
```

**Query Syntax**

`SENSe<cnum>:SEGMent<snum>:FREQuency:SPAN?`

**Return Type**

Numeric

**Default**

If first segment, frequency span of the analyzer. Otherwise 0.

---

**SENSe<cnum>:SEGMent<snum>:FREQuency:START <num>**

(Read-Write) Sets the Start Frequency for the specified sweep segment.

**Notes**

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

To return the start and stop frequency of the entire sweep (all segments), Use **SENS:FREQ:START?** and **SENS:FREQ:STOP?**

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Start Frequency in Hz. Choose any number between the **minimum** and **maximum** frequency of the analyzer.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter.
See SCPI Syntax for more information.

Examples

SENSe<cnun>:SEGMent<snum>:FREQuency:STAR 1MHZ
sense2:segment2:frequency:start minimum

Query Syntax
SENSe<cnun>:SEGMent<snum>:FREQuency:STARt?

Return Type
Numeric

Default
Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.

SENSe<cnun>:SEGMent<snum>:FREQuency:STOP <num>
(Read-Write) Sets the Stop Frequency for the specified sweep segment.

Notes
All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

To return the start and stop frequency of the entire sweep (all segments), Use SENS:FREQ:STARt? and SENS:FREQ:STOP?

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.
<num> Stop Frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
SENSe<cnun>:SEGMent<snum>:FREQuency:STOP 1MHZ
sense2:segment2:frequency:stop maximum

Query Syntax
SENSe<cnun>:SEGMent<snum>:FREQuency:STOP?

Return Type
Numeric

Default
If first segment, stop frequency of the analyzer. Otherwise, start frequency of the segment.

SENSe<cnun>:SEGMent:LIST <char>,<numSegs>,<data>
(Read-Write) Reads or writes the entire list of values in the segment sweep table.

2769
Note: For binary data transfer, specify 64-bit instead of 32-bit using FORMat[:DATA]. This is because higher frequencies used on PNA exceed the maximum value that can be represented by a 32-bit floating point number.

When sending/receiving this data as binary (FORMat[:DATA] REAL,64), use FORMat:BORDer to specify the correct 'endianness' (byte ordering) corresponding to your programming environment / computer platform.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - SSTOP - Frequency values are Start and Stop for each segment.
  - CSPAN - Frequency values are Center and Span for each segment.
- `<numSegs>` Total number of sweep segments being input. This allows the PNA to determine how many values per-each-segment are in the input `<data>` block.
- `<data>` A 2-dimensional array of Segment data as a single data block. The data elements within a segment are each represented as real floating-point numbers as follows, and the data block is formed by interleaving all the segments together consecutively:

  1. Segment state (Boolean 1 for ON and 0 for OFF)
  2. Number of Points in the segment
  3. Start Freq (when `<char>` is SSTOP), or Center Freq (when `<char>` is CSPAN)
  4. Stop Freq (when `<char>` is SSTOP), or Freq Span (when `<char>` is CSPAN)
  5. IFBW (optional for the Write)
  6. Dwell Time (optional for the Write)
  7. Power (optional for the Write) - see below.

The first four data elements must always be supplied. After those values, data must be supplied for successive optional elements. For example, to set dwell time values, you must also supply IFBW values, because IFBW (#5) precedes dwell time (#6) in the array order.

The IF Bandwidth, Sweep Time and Source Power Control settings do NOT affect the order in which elements are interpreted.

The number of elements to supply for Power depends on the following two
settings:

1. **Source Power Option** - ON allows segments to have independent power levels.
2. **Couple Ports** = Off allows different power levels for each test port.

<table>
<thead>
<tr>
<th>CouplePorts</th>
<th>SourcePowerOption</th>
<th>Number of Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>Each port has its own channel-wide power setting, which is set using <code>SOURce:POWer[:LEVel]</code>. Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>Provide 6 elements + total number of ports. The first 7 elements are still interpreted the same. The remaining elements (in-order) are interpreted as the power levels to set on that segment for Ports 2 through N, where N is the total number of ports currently enabled for the PNA or for a PNA with multiport external test set.</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>Provide exactly 7 elements per segment. The last element (power) is honored.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:SEG:LIST SSTOP,1,1,201,10E6,26.5E9,1E3,0,—10 1 segment, state ON, 201 points, 10 MHz to 26.5 GHz, 1kHz IFBW, 0 dwell time, —10 dBm (port powers coupled)

sense2:segment:list? cspan
```

See [Upload and Download a Segment List](#) example program

**Query Syntax**

`SENSe<cnum>:SEGment:LIST? [char].`  
If unspecified, char is set to SSTOP.
The number of data elements per segment returned will be 6 + total number of source ports, regardless of the IF Bandwidth, Sweep Time and Source Power Control settings. For the N5264A, which has no source ports, the query will return just 6 values per segment. For all other PNA models, the last elements in each segment correspond to the power level for each port.

**Return Type**
Returns block data in the format specified by `FORM:[:DATA].`

**Default**
Not Applicable

---

**SENSe<cnm>:SEGMe nt<snm>:POW<port>[[:LEV]el] <num>**

When *port power is Coupled*, setting port power for one port will apply port power for all source ports.

All subsequent segments that are added assume the new Power Level value.

**Parameters**
- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<snm>` Segment number to modify. Choose any existing segment number.
- `<port>` Port number of the source. If unspecified, value is set to 1.
- `<num>` Power level.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, send `SOUR:POW? MAX` and `SOUR:POW? MIN`. *(SOUR:POW:ATT:AUTO* must be set to ON).

Actual achievable leveled power depends on frequency.

**Examples**

```
SEN:S:SEG:M:POW 0
sense2:segment2:power1:level -10
```

**Query Syntax**

`SENSe<cnm>:SEGMe nt<snm>:POW<port>[[:LEV]el]?`

**Return Type**
Numeric

**Default**
0

---

**SENSe<cnm>:SEGMe nt:POW<port>[[:LEV]el]:CONTr ol <ON | OFF>**
(Read-Write) Specifies whether Power Level can be set independently for each segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - turns Power Level control ON. Power level can be set for each segment. OFF (or 0) - turns Power Level control OFF. Use the channel power level setting.

**Examples**

```
SENS:SEGM:POW:CONT ON
sense2:segment:power:level:control off
```

**Query Syntax**

```
SENSe<cnum>:SEGMent:POWer[:LEVel]:CONTrol?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**SENSe<cnum>:SEGMent<snum>[:STATe] <ON | OFF>**

(Read-Write) Turns the specified sweep segment ON or OFF. At least ONE segment must be ON or Sweep Mode is automatically set to Linear.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to be turned ON or OFF
- `<ON | OFF>`: ON (or 1) - turns segment ON. OFF (or 0) - turns segment OFF.

**Examples**

```
SENS:SEGm ON
sense2:segment2:state off
```

**Query Syntax**

```
SENSe<cnum>:SEGMent<snum>[:STATe]?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**SENSe<cnum>:SEGMent<snum>:SWEep:POINts <num>**
(Read-Write) Sets the number of data points for the specified sweep segment.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Any existing segment number. If unspecified, value is set to 1
- `<num>`: Number of points in the segment. The total number of points in all segments cannot exceed 20001. A segment can have as few as 1 point.

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See [SCPI Syntax](#) for more information.

**Examples**

```
SENS:SEGM:SWE:POIN 51
sense2:segment2:sweep:points maximum
```

**Query Syntax**

```
SENSe<cnum>:SEGMent<snum>:SWEep:POINts?
```

**Return Type**

Numeric

**Default**

21

---

**SENSe<cnum>:SEGMent<snum>:SWEep:TIME <num>**

(Read-Write) Sets the time the analyzer takes to sweep the specified sweep segment.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Any existing segment number.
- `<num>`: Sweep time in seconds. Choose a number between 0 and 100

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See [SCPI Syntax](#) for more information.

**Examples**

```
SENS:SEGM:SWE:TIME 1ms
sense2:segment2:sweep:time .001
```

**Query Syntax**

```
SENSe<cnum>:SEGMent<snum>:SWEep:TIME?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<cnum>:SEGMent:SWEp:TIME:CONTrol <ON | OFF>**
(Read-Write) Specifies whether Sweep Time can be set independently for each sweep segment.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`
  - **ON** (or 1) - turns Sweep Time control ON. Sweep Time can be set for each segment.
  - **OFF** (or 0) - turns Sweep Time control OFF. Uses the channel Sweep Time setting.

**Examples**

```plaintext
SENS:SEGM:SWE:TIME:CONT ON
sense2:segment:sweep:time:control off
```

**Query Syntax**

`SENSe<cnum>:SEGMent<snum>:SWEep:TIME:CONTrol?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**SENSe<cnum>:SEGMent<snum>:X:SPACing <char>**

(Read-Write) Sets X-axis spacing ON or OFF

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number. (This parameter is ignored)
- `<char>`
  - **LINear** - turns X-axis point spacing OFF
  - **OBASe** - turns X-axis point spacing ON

**Examples**

```plaintext
SENS:SEGM:X:SPACing LIN
sense2:segment1:spacing obase
```

**Query Syntax**

`SENSe<cnum>:SEGMent<snum>:X:SPACing?`

**Return Type**

Character

**Default**

LINear

---

Click on a blue keyword to view the command details.

**See Also**

- Example Programs
SENSe<cnm>:SWEep:DWEL <num>

{(Read-Write)} Sets the dwell time between each sweep point.

- Dwell time is **ONLY** available with SENSe:SWEep:GENeration set to **STEpped**; It is **Not** available in **ANALOG**.
- Sending dwell = 0 is the same as setting SENS:SWE:DWEL:AUTO **ON**. Sending a dwell time > 0 sets SENS:SWE:DWEL:AUTO **OFF**.

**Parameters**

<cnm> Any existing channel number. If unspecified, value is set to 1
<num> Dwell time in seconds.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```
SENSe:SWE:DWEL .1
sense2:sweep:dwell min
```

**Query Syntax**

SENSe<cnm>:SWEep:DWEL?

**Return Type**

Numeric

**Default**

0 - (Note: dwell time set to 0 is the same as dwell:auto ON)

---

SENSe<cnm>:SWEep:DWEL:AUTO <ON | OFF>
(Read-Write) Specifies whether or not to automatically calculate and set the minimum possible dwell time. Setting Auto **ON** has the same effect as setting dwell time to **0**.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - turns dwell ON.
  OFF (or 0) - turns dwell OFF.

**Examples**

```
SENS:SWE:DWEL:AUTO ON
sense2:sweep:dwell:auto off
```

**Query Syntax**

SENSe<cnun>:SWEep:DWELl:AUTO?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**SENSe<cnun>:SWEep:DWELl:SDELay <num>**

(Read-Write) Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to **Dwell Time** and **External Trigger** delay if enabled.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Sweep delay in seconds.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```
SENS:SWE:DWEL:SDEL .1
sense2:sweep:dwell:sdelay .5
```

**Query Syntax**

SENSe<cnun>:SWEep:DWELl:SDELay?

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnun>:SWEep:GENeration <char>**
(Read-Write) Sets sweep as Stepped or Analog.

**Parameters**

| <cnum> | Any existing channel number. If unspecified, value is set to 1 |
| <char> | Choose from: |

**STEPped** - source frequency is CONSTANT during measurement of each displayed point. More accurate than ANALog. Dwell time can be set in this mode.

**ANALog** - source frequency is continuously RAMPING during measurement of each displayed point. Faster than STEPped. Sweep time (not dwell time) can be set in this mode.

**Examples**

```
SENSe<sweep>:GENeration
sense2:sweep:generation analog
```

**Query Syntax**

```
SENSe<cnum>:SWEep:GENeration?
```

**Return Type**

Character

**Default**

Analog

---

**SENSe<cnum>:SWEep:GENeration:POINtsweep <bool>**

(Read-Write) Turns ON and OFF point sweep mode. When enabled, the PNA measures both the forward and reverse parameters at each frequency point before stepping to the next frequency. [Learn more.](#)

**Parameters**

| <cnum> | Any existing channel number. If unspecified, value is set to 1 |
| <char> | Choose from: |

**ON** or (1) - Enable point sweep mode.

**OFF** or (0) - Disable point sweep mode.

**Examples**

```
SENSe:SWEep:GENeration
SENSe2:sweep:generation:pointsweep
```

**Query Syntax**

```
SENSe<cnum>:SWEep:GENeration:POINtsweep?
```

**Return Type**

Boolean

**Default**

OFF
SENSe<cnum>:SWEep:GROups:COUNt <num>

(Read-Write) Sets the trigger count (groups) for the specified channel. Set trigger mode to group after setting this count.

Parameters

-  <cnum> Any existing channel number. If unspecified, value is set to 1
-  <num> Count (groups) number. Choose any number between: 1 and 2e6 (1 is the same as single trigger)

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SWE:GRO:COUN 10</td>
<td>Sets the trigger count to 10 groups for channel 1</td>
</tr>
<tr>
<td>sense2:sweep:groups:count 50</td>
<td>Sets the trigger count to 50 groups for channel 2</td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<cnum>:SWEep:GROups:COUNt?

Return Type

Numeric

Default

1

SENSe<cnum>:SWEep:MODE <char>

(Read-Write) Sets the number of trigger signals the specified channel will ACCEPT.

See Triggering the PNA Using SCPI.

Parameters

-  <cnum> Any existing channel number. If unspecified, value is set to 1
-  <char> Trigger mode. Choose from:

<table>
<thead>
<tr>
<th>Trigger Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOLD</td>
<td>channel will not trigger</td>
</tr>
<tr>
<td>CONTinuous</td>
<td>channel triggers indefinitely</td>
</tr>
<tr>
<td>GROups</td>
<td>channel accepts the number of triggers specified with the last SENS:SWE:GRO:COUN &lt;num&gt;. This is one of the PNA overlapped commands. Learn more.</td>
</tr>
<tr>
<td>SINGle</td>
<td>channel accepts ONE trigger, then goes to HOLD.</td>
</tr>
</tbody>
</table>

Note: Beginning with 7.50, the SINGle argument makes it no longer necessary to use SENS:SWE:GRO:COUN 1.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SWE:MODE CONT</td>
<td>Sets the trigger mode to continuous for channel 1</td>
</tr>
<tr>
<td>sense2:sweep:mode hold</td>
<td>Sets the trigger mode to hold for channel 2</td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<cnum>:SWEep:MODE?
SENSe<cn}>{SWEep:POINts <num>
(Read-Write) Sets the number of data points for the measurement.

Parameters
<cn>
Any existing channel number. If unspecified, value is set to 1
<num>
Choose any number between 1 and the PNA maximum number of points.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
SENSe:SWEep:POINts 51
SENSe2:SWEep:POINts MAX

Query Syntax
SENSe<cn>:SWEep:POINts?

Return Type
Character
Default
CONTinuous

SENSe<cn>:SWEep:SRCPort <1 | 2>
Superseded
This command is superseded. The Calc:Par:Def:Ext and Calc:Par:Mod:Ext can now optionally include the source port.

(Read-Write) Sets the source port when making non S-parameter measurements. Has no effect on S-parameter measurements.

Parameters
<cn>
Any existing channel number. If unspecified, value is set to 1
<1 | 2>
1 - Source power comes out Port 1
2 - Source power comes out Port 2

Examples
SENSe:SWEep:SRCPort 1
SENSe2:SWEep:SRCPort 2

Query Syntax
SENSe<cn>:SWEep:SRCPort?

Return Type
Character
Default
1
SENSe<cnm>:SWEep:SPEed <ch> 
(Read-Write) Sets and returns the state of Fast Sweep mode. Learn more about Fast Sweep.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1
<ch> Fast Sweep mode. Choose from:

- **FAST** - turns Fast Sweep Mode ON
- **NORMAL** - turns Fast Sweep Mode OFF (Normal Mode).

Examples

```
SENSe:SWE:SPE NORM
sense2:sweep:speed fast
```

Query Syntax

SENSe<cnm>:SWEep:SPEed?

Return Type
Character

Default
NORMAL

SENSe<cnm>:SWEep:TIME <nm>
(Read-Write) Sets the time the analyzer takes to complete one sweep. If sweep time accuracy is critical, use ONLY the values that are attained using the up and down arrows next to the sweep time entry box. See Sweep Time.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1
<nm> Sweep time in seconds. Choose a number between 0 and 86,400 (24hrs),

To select the fastest sweep speed, either send MIN as an argument to this command, or send SENS:SWE:TIME:AUTO 1.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
SENSe:SWE:TIME 1ms
sense2:sweep:time .001
```

Query Syntax

SENSe<cnm>:SWEep:TIME?

Return Type
Numeric

Default
NA
SENSe<nump>:SWEep:TIME:AUTO <ON | OFF>

(Read-Write) Turns the automatic sweep time function ON or OFF.

**Parameters**

<nump> Any existing channel number. If unspecified, value is set to 1

<ON | OFF> ON (or 1) - turns the automatic sweep time ON.

OFF (or 0) - turns the automatic sweep time OFF.

**Examples**

SENSe:SWEep:TIME:AUTO
sense2:sweep:time:auto off

**Query Syntax**

SENSe<nump>:SWEep:TIME:AUTO?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

SENSe<nump>:SWEep:TRIGger:DELay <num>

(Read-Write) Sets and reads the trigger delay for all measurements in the specified CHANNEL. This delay is only applied while TRIG:SOURce EXTERNAL and TRIG:SCOP CURREnT. After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for all channels (Global), use TRIG:DEL.

**Parameters**

<nump> Any existing channel number. If unspecified, value is set to 1

<num> Trigger delay value in seconds. Range is from 0 to 107 seconds

**Examples**

SENSe:SWEep:TRIGger:DELay .003
sense2:sweep:trigger:delay 1

**Query Syntax**

SENSe<nump>:SWEep:TRIGger:DELay?

**Return Type**

Numeric

**Default**

0

SENSe<nump>:SWEep:TRIGger:MODE <char>
(Read-Write) Sets and reads the trigger mode for the specified channel. This determines what EACH signal will trigger. Learn more.

**Note:** Setting Point and Sweep mode forces **Trigger:SCOpe** = CURRent

### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: Trigger mode. Choose from:
  - **CHANNEL**: Each trigger signal causes **ALL traces** in that channel to be swept.
  - **Sweep**: Each Manual or External trigger signal causes **ALL traces that share a source port** to be swept.
  - **POINT**: Each Manual or External trigger signal causes one data point to be measured.
  - **TRACE**: Allowed ONLY when **SENS:SWE:GEN:POIN** is enabled. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.

### Examples

```
SENS:SWE:TRIG:MODE SWEEP
sense2:sweep:trigger:mode point
```

### Query Syntax

`SENSe<cnum>:SWEep:TRIGger:MODE?`

### Return Type

Character

**Default**

Channel

`SENSe<cnum>:SWEep:TRIGger:POINt <ON | OFF> Superseded`
This command is replaced with `SENS:SWE:TRIG:MODE POINT`

(Read-Write) Specifies whether the specified channel will measure one point for each trigger or all of the measurements in the channel. Setting any channel to POINt mode will automatically set the TRIGger:SCOPe = CURRent.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - Channel measures one data point per trigger.
  
  OFF (or 0) - All measurements in the channel made per trigger.

**Examples**

- `SENS:SWE:TRIG:POIN ON`
- `sense2:sweep:trigger:point off`

**Query Syntax**

`SENSe<cnum>:SWEep:TRIGger:POINt`?

**Return Type**

Boolean (1 = Point, 0 = Measurement)

**Default**

0 - Measurement

---

`SENSe<cnum>:SWEep:TYPE <char>`

(Read-Write) Sets the type of analyzer sweep mode. First set sweep type, then set sweep parameters such as frequency or power settings.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: Choose from:
  
  LINear | LOGarithmic | POWer | CW | SEGment | PHASE

**Note:** SWEep TYPE cannot be set to SEGment if there are no segments turned ON. A segment is automatically turned ON when the analyzer is started.

**Examples**

- `SENS:SWE:TYPE LIN`
- `sense2:sweep:type segment`

**Query Syntax**

`SENSe<cnum>:SWEep:TYPE?`

**Return Type**

Character

**Default**

LINear

---

`SENSe<cnum>:SWEep:TYPE:FACW <num>`
(Read-Write) Enables Fast CW sweep and sets the number of data points for the channel. **Sweep Type** must already be set to CW and FIFO must already be enabled.

**See Also**

FIFO commands

Example program

N5264A Measurement Receiver

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Number of data points to measure in Fast CW mode. This setting overwrites the standard number of points setting for the channel.

Set to 0 to disable Fast CW.

**Examples**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SWE:TYPE:FACW 1e6</td>
<td>SENSE2:sweep:type facw 1e3</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:SWEep:TYPE:FACW?

**Return Type**

Numeric

**Default**

0 - Disabled

---

Last Modified:

- 3-Dec-2010 Added sweep type Phase
- 6-May-2010 Added sweep type note
- 1-Mar-2010 Added Sweep Delay
- 10-Oct-2008 Added FACW and point sweep
- 26-Aug-2008 Added sweep speed
- 21-Jun-2007 Increased max number of points
- 18-Jun-2007 Added Single to Mode
- 24-Apr-2007 Clarified Sweep mode
X Values Command

**SENSe<cnm>:X[:VALues]?**

*(Read-only)* Returns the stimulus values for the specified channel. If the channel is sweeping the source backwards, the values will be in descending order.

**Note:** For channels that can have different traces with different x-axis values (like GCA, SMC and VMC), this command (SENs:X?) returns only the channel's default x-axis values. To get x-axis values for specific traces, use **CALC:X**?

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnm&gt;</td>
<td>Any existing channel number; if unspecified, value is set to 1.</td>
</tr>
</tbody>
</table>

### Examples

- **SENs:X?**
- **sense2:x:values?**

### Return Type

Depends on **FORM:DATA** command

- **Default** Not applicable

---

Last Modified:

9-Apr-2010 Added Note
Source Commands

Controls the power delivered to the DUT.

SOURce<cnum>:CATalog?

(Read-Write) Returns a list of valid port names that can be controlled. Some ports only have string names, NOT numbers. All commands that require a port argument have provisions for specifying either a port number OR a string name.

See also: Remotely Specifying a Source Port.

**Parameters**

**Examples**

```
SOUR:CAT?
sour:catalog

'Some PNA-X models return
"Port 1,Port 2,Port 3,Port 4,Port 1 Src2"
```

**Return Type** Comma-separated list of strings.

**Default** Not applicable

SOURce<cnum>:POWer<port>:ALC[:MODE] <char>, [src]
Sets and returns the ALC mode for the specified channel and port. Use `SOUR:POW:ALC:MODE:CAT?` to return a list of valid ALC modes for the PNA.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<char>` ALC Mode.

For the PNA-X choose from:

- **INTernal** Standard ALC loop
- **OPENloop** No ALC loop

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SOUR:POW:ALC INT
source2:power2:alc:mode openloop
source:power:alc:mode openloop,"Port 1 Src2"
```

**Query Syntax** `SOURce<cnum>:POWer<port>:ALC:MODE? [src]`

**Return Type** Character

**Default** INTernal

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:CATalog? [src]
```
(Read-only) Returns a list of valid ALC modes for the specified channel and port number. Use the returned values to set SOUR:POW:ALC:MODE.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:CAT?
source2:power2:alc:mode:catalog?
source:power:alc:mode:catalog? "Port 1 Src2"
```

**Return Type** Comma-separated list of strings.

**Default** Not applicable

---

**SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver <bool>, [src]**

(Read-Write) Sets and returns the state of Receiver Leveling for the specified source port.

**Learn more about Receiver Leveling**

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<bool>` Receiver Leveling state.

**ON or 1** - Receiver Leveling ON

**OFF or 0** - Receiver Leveling OFF

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC 1
source2:power2:alc:mode:receiver on
source:power:alc:mode:receiver off,"Port 1 Src2"
```

See ReceiverLeveling example

**Query Syntax**

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver? [src]
```

**Return Type**

Boolean

**Default**

OFF

**SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:FAST <bool>, [src]**

*(Read-Write)* Sets and returns the state of a separate IFBW setting for leveling sweeps. ON allows a higher (faster) IFBW than the measurement sweep. It also causes leveling sweeps to be noisier.

Learn more about Receiver Leveling

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<bool>` Separate IFBW setting state.
  - **ON** or **1** - Separate IFBW setting. Specify IFBW using
    SOUR:POW:ALC:MODE:REC:IFBW
  - **OFF** or **0** - Same IFBW as the measurement sweep. Specify IFBW using
    Sens:BWID

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both
Arguments are specified, [src] takes priority.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOUR:POW:ALC:REC:FAST 1</td>
<td>Source 2 power 2 ALC mode receiver fast off</td>
</tr>
<tr>
<td>source2:power2:alc:mode:receiver:fast off</td>
<td>&quot;Port 1 Src2&quot;</td>
</tr>
<tr>
<td>source:power:alc:mode:receiver:fast off,&quot;Port 1 Src2&quot;</td>
<td>See ReceiverLeveling example</td>
</tr>
</tbody>
</table>

### Query Syntax

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:FAST? [src]

Return Type: Boolean

Default: ON

### SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:IFBW <value>, [src]

(Read-Write) Sets and returns the IFBW to be used for leveling sweeps. Enable separate IFBW for leveling sweeps using SOUR:POW:ALC:MODE:REC:FAST 1

Learn more about Receiver Leveling

#### Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- **<value>** IFBW for leveling sweeps in Hz. The list of valid IF Bandwidths is different depending on the PNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

This parameter supports MIN and MAX as arguments. Learn more.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

#### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOUR:POW:ALC:REC:IFBW 100E3</td>
<td>Source 2 power 2 ALC mode receiver ifbw 100kHz</td>
</tr>
<tr>
<td>source2:power2:alc:mode:receiver:ifbw 100kHz</td>
<td>&quot;Port 1 Src2&quot;</td>
</tr>
<tr>
<td>source:power:alc:mode:receiver:ifbw 70e3,&quot;Port 1 Src2&quot;</td>
<td>&quot;Port 1 Src2&quot;</td>
</tr>
</tbody>
</table>
**Query Syntax**

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:ITERation <value>, [src]

(Read-Write) Sets and returns the maximum iterations to be used in order to achieve the tolerance setting.

**Learn more about Receiver Leveling**

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<value>`: Max iterations. Choose a value between 1 and 25.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an **external source**, **true mode balanced port**, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

SOUR:POW:ALC:REC:ITER 5

source2:power2:alc:mode:receiver:iteration 10

source:power:alc:mode:receiver:iteration 7,"Port 1 Src2"

**Query Syntax**

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:ITERation? [src]

**Return Type**

Numeric

**Default**

5

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:LSPC <bool>, [src]
(Read-Write) Sets and returns the state of **Use Last Result for Source Power Cal**. When Leveling Mode is switched back to Internal, this feature turns Source Power Cal correction ON using the latest receiver leveling correction data.

**Learn more about Receiver Leveling**

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<bool>` **State of Use Last Result for Source Power Cal.**
  - **ON** or **1** - When Leveling Mode is switched back to Internal, Source Power Cal correction is turned ON using the latest receiver leveling correction data.
  - **OFF** or **0** - When Leveling Mode is switched back to Internal, Source Power Cal correction is NOT turned ON.
- `[src]` **String.** (NOT case sensitive). Source port. Optional. Use **SOUR:CAT?** to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SOUR:POW:ALC:REC:LSPC 1
```

```
source2:power2:alc:mode:receiver:lspc off
```

```
source:power:alc:mode:receiver:lspc off,"Port 1 Src2"
```

**See ReceiverLeveling example**

**Query Syntax**  SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:LSPC? [src]

**Return Type**  Boolean

**Default**  OFF
(Read-Write) Sets and returns the power level offset value.

Learn more about Receiver Leveling

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<value>`: Power level offset in dB. Choose a value between +200 and -200.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

```
SOUR:POW:ALC:REC:OFFS 10
source2:power2:alc:mode:receiver:offset 5
source:power:alc:mode:receiver:offset 7,"Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

`SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:OFFSet? [src]`

Return Type

Numeric

Default

0

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:RATio? [src]
```
Returns the receiver ratio to be used with receiver leveling. This receiver ratio parameter is the same as the one set in SOUR:PHAS:PARameter.

Learn more about Receiver Leveling

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<value>`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

```
SOUR:POW:ALC:REC:RAT 10
source2:power2:alc:mode:receiver:ratio "a1/a3,3"
source:power:alc:mode:receiver:ratio "R1/R3,3","Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:REFerence <rec>, [src]
```

The receivers and paired port are separated by a comma.

Return Type **String**

**Default** "a1/a3,3"
(Read-Write) Sets and returns the reference receiver to be used with Receiver Leveling.

Learn more about Receiver Leveling

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<rec>` (String) PNA receiver. Choose the PNA physical receiver that works with the source port `<port>`.

For example: `<port 1> = "R1"`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an **external source, true mode balanced port**, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SOUR:POW:ALC:REC:REF 'r1'
source2:power2:alc:mode:receiver:reference 'r2'
source:power1:alc:mode:receiver:reference "r1","Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

`SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:REFerence? [src]`

Return Type

**String** - Name of the reference receiver.

Default

OFF

`SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE <bool>, [src]`
(Read-Write) Sets and returns the state of Safe Mode.

Learn more about Receiver Leveling

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- **<bool>** Safe mode state.
  - **ON** or **1** - Safe mode ON
  - **OFF** or **0** - Safe mode OFF

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:POW:ALC:REC:SAFE 1

source2:power2:alc:mode:receiver:safe on

source:power:alc:mode:receiver:safe off,"Port 1 Src2"

See ReceiverLeveling example

Query Syntax

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE? [src]

Return Type

Boolean

Default

OFF

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:MAX <value>, [src]
(Read-Write) Sets and returns the maximum power level for Safe Mode.

**Learn more about Receiver Leveling**

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- **<value>** Maximum power level in dB.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```plaintext
SOUR:POW:ALC:REC:SAFE:MAX 10
source2:power2:alc:mode:receiver:safe:max 20
source:power:alc:mode:receiver:safe:max 15,"Port 1 Src2"
```

See ReceiverLeveling example

**Query Syntax**

`SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:MAX? [src]`

**Return Type** Numeric

**Default** 30 dB
(Read-Write) Sets and returns the minimum power level for Safe Mode.

Learn more about Receiver Leveling

Parameters

- **<cnum>**  Any existing channel number. If unspecified, value is set to 1
- **<port>**  Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- **<value>** Minimum power level in dB.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
source2:power2:alc:mode:receiver:safe:min -80
source:power:alc:mode:receiver:safe:min -40,"Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:MIN?

Return Type  Numeric

**Default**  -95 dB

SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:STEP <value>, [src]
(Read-Write) Sets and returns the maximum step power level for Safe Mode.

Learn more about Receiver Leveling

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<port>`: Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<value>`: Maximum Step power level in dB.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SOUR:POW:ALC:REC:SAFE:STEP 2
source2:power2:alc:mode:receiver:safe:step 1.5
source:power:alc:mode:receiver:safe:min 2,"Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:STEP?
```

Return Type: Numeric

**Default**: 1 dB

```
SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:TOLerance <value>, [src]
```
(Read-Write) Sets and returns the tolerance value for leveling sweeps.

**Learn more about Receiver Leveling**

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<port>`  Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<value>`  Tolerance level in dB.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

- `SOUR:POW:ALC:REC:TOL .01`
- `source2:power2:alc:mode:receiver:tolerance .5`
- `source:power:alc:mode:receiver:tolerance .2,"Port 1 Src2"

See ReceiverLeveling example

**Query Syntax**  
`SOURce<cnum>:POWer<port>:ALC[:MODE]:RECeiver:TOLerance?` [src]

**Return Type**  Numeric

**Default**  .1 dB

---

**SOURce<cnum>:POWe<port>:ATTenuation <num>, [src]**

(Read-Write) Sets the attenuation level for the selected channel. Sending this command turns automatic attenuation control (`SOUR:POW:ATT:AUTO`) to OFF. If the ports are coupled, changing the attenuation on one port will also change the attenuation on all other ports. To turn port coupling OFF use `SOURce:POWe:COUPlE OFF`.

**Note:** Attenuation cannot be set with **Sweep Type** set to **Power**

See `Sens:Power:ATT` to change receiver attenuation.

**Parameters**
<cnum>  Any existing channel number. If unspecified, value is set to 1

<port>  Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num>  Attenuation value. The range of settable values depends on the PNA model. To determine the valid settings, do one of the following:

- See PNA models and options to see the range and step size for each model / option.

- Perform a query using MAX, then MIN, as an argument. Example:
  SOURce:POWer:ATT? Max  However, this will not tell you the attenuation step size.

If an invalid attenuation setting is entered, the PNA will select the next lower valid value. For example, if 19 is entered, then for an E8361A, 10 dB attenuation will be selected.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:POW:ATT 10
source2:power2:attenuation maximum
source:power:att 20, "Port 1 Src2"

Query Syntax  SOURce<cnum>:POWer<port>:ATTenuation? [min/max] [src]
              [min/max,src]

Return Type  Numeric

Default  0

SOURce<cnum>:POWer<port>:ATTenuation:AUTo <bool>, [src]
(Read-Write) Turns automatic attenuation control ON or OFF. Setting an attenuation value (using SOURce:POWer:ATTenuation <num>) sets AUTO OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<bool>` **ON** (or 1) - turns coupling ON. The analyzer automatically selects the appropriate attenuation level to meet the specified power level.
  
  **OFF** (or 0) - turns coupling OFF. Attenuation level must be set using SOURce:POWer:ATTenuation <num>.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW2:ATT:Auto On
source2:power:attentuation:auto off
sour:pow:att:auto 1, "Port 1 Src2"
```

**Query Syntax**

SOURce<cnum>:POWer:ATTenuation:Auto? [src]

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

**SOURce<cnum>:POWer:CENTer <num>**
(Read-Write) Sets the power sweep center power. Must also set: SENS:SWE:TYPE POWer and SOURce:POWer:SPAN <num>.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Center power. Actual achievable leveled power depends on frequency.

**Examples**

```
SOUR:POW:CENT -15
source2:power:center -7
```  

**Query Syntax**

SOURce<cnum>:POWer:CENTer?

**Return Type**

Numeric

**Default**

0 dBm

---

**SOURce<cnum>:POWer:COUPle <ON | OFF>**

(Read-Write) Turns Port Power Coupling ON or OFF.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - turns coupling ON. The same power level is used for both source ports.  
  OFF (or 0) - turns coupling OFF. Power level can be set individually for each source port.

**Examples**

```
SOUR:POW:COUP ON
source2:power:couple off
```  

**Query Syntax**

SOURce<cnum>:POWer:COUPle?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

**SOURce<cnum>:POWer:DETector <char> OBSOLETE**
The PNA models with external leveling are now OBSOLETE.

Sets the source leveling loop as Internal or External.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: `INTERNAL` - Internal leveling is applied to the source
  
  `EXTERNAL` - External leveling is applied to the source through a rear-panel connector. ONLY provided on 3 GHz, 6 GHz, and 9 GHz PNA models.

**Examples**

- `SOUR:POW:DET INT`  
- `source2:power:detector` `EXTERNAL`  

**Query Syntax**

- `SOURce<cnum>:POWer:DETector?`

**Return Type**

- Character

**Default**

- `INTERnal`

---

**SOURce<cnum>:POWer<port>[:LEVEL][:IMMediate] [:AMPLitude] <num>, [src]**

(Read-Write) Sets the RF power output level.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<num>`: Source power in dBm.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer? Max

Actual achievable leveled power depends on frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both
arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW1 5
source2:power:level:immediate:amplitude maximum
sour:pow 5, "Port 1 Src2"
```

**Query Syntax**

```
SOURce<cnum>:POWer[:LEVel][:IMMediate][:AMPLitude]? [src]
```

**Return Type**

Numeric

**Default**

0 dBm

---

**SOURce<cnum>:POWer[:LEVel]:SLOPe <num>**

*(Read-Write)* Sets the RF power slope value.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Slope value in dB/GHz. Choose any integer between -2 and 2 (0 is no slope).

**Examples**

```
SOUR:POW:SLOP 2
source2:power:slope -2
```

**Query Syntax**

```
SOURce<cnum>:POWer[:LEVel]:SLOPe?
```

**Return Type**

Numeric

**Default**

0

---

**SOURce<cnum>:POWer[:LEVel]:SLOPe:STATe <ON | OFF>**

*(Read-Write)* Turns Power Slope ON or OFF.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON|OFF>`: ON (or 1) - turns slope ON.
  - OFF (or 0) - turns slope OFF.

**Examples**

```
SOUR:POW:SLOP:STAT ON
source2:power:slope:state off
```

**Query Syntax**

```
SOURce<cnum>:POWer[:LEVel]:SLOPe:STATe?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF
SOURce<cnum>:POWer<port>:MODE <state>, [src]

(Read-Write) Sets the state of PNA source for the specified port.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the PNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<state>` Source state. Choose from:
  - **AUTO** Source power is turned ON when required for a measurement.
  - **ON** Source power is always ON regardless of the measurement.
  - **OFF** Source power is always OFF regardless of the measurement.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:MODE ON
source2:power4:mode OFF
sour:pow:mode on, "Port 1 Src2"
```

**Query Syntax** SOURce<cnum>:POWer<port>:MODE? [src]

**Return Type** Character

**Default** Auto

---

SOURce<cnum>:POWer<port>:PORT:STARt <num>, [src]
(Read-Write) Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set SENS:SWE:TYPE POWer and SOUR:POW:COUPle OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the PNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<num>` Start power in dBm.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

Actual achievable leveled power depends on frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

SOUR:POW1:PORT:STAR -15
source2:power:port:start 5, "bal port 1"

**Query Syntax** SOURce<cnum>:POWer<port>:PORT:STARt? [src]

**Return Type** Numeric

**Default** -10 dBm

**SOURce<cnum>:POWer<port>:PORT:STOP <num>, [src]**
(Read-Write) Sets and reads the power sweep stop power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set SENS:SWE:TYPE POWer and SOUR:POW:COUPle OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the PNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<num>` Stop power in dBm.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

Actual achievable leveled power depends on frequency.

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

SOUR:POW1:PORT:STOP -15  
source2:power:port:stop 5, "bal port 1"

**Query Syntax** SOURce<cnum>:POWer<port>:PORT:STOP? [src]

**Return Type** Numeric

**Default** 0 dBm

---

**SOURce<cnum>:POWer:SPAN <num>**
(Read-Write) Sets the power sweep span power. Must also set:

SENS:SWE:TYPE POWer and SOURce:POWer:CENTer <num>.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<num>` Span power. Actual achievable leveled power depends on frequency.

**Examples**

```plaintext
SOUR:POW:SPAN -15
source2:power:span -7
```

**Query Syntax** SOURce<cnum>:POWer:SPAN?

**Return Type** Numeric

**Default** 0 dBm

---

**SOURce<cnum>:POWer:STARt <num>**

(Read-Write) Sets the power sweep start power for ALL ports being used by the specified channel. Must also set:

SENS:SWE:TYPE POWer and SOURce:POWer:STOP <num>.

To set start power for a specific port, use SOUR:POW:PORT:STARt.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Start power.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

**Examples**

```plaintext
SOUR:POW:STAR -15
source2:power:start -7
```

**Query Syntax** SOURce<cnum>:POWer:STARt?

**Return Type** Numeric

**Default** 0 dBm
**SOURCE<cnum>::POWER::STOP <num>**

(Read-Write) Sets the power sweep stop power for ALL ports being used by the specified channel. Must also set: **SENS:SWE:TYPE POWER** and **SOURCE::POWER::START <num>**.

To set start power for a specific port, use **SOURCE::POWER::PORT::STOP**.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Stop power.

**Note:** The range of settable power values depends on the PNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (**SOURCE::POWER::ATT::AUTO** must be set to ON)  Example: **SOURCE::POWER::STOP? MAX**

Actual achievable leveled power depends on frequency.

**Examples**

```
SOUR::POW::STOP -15
source2:power:stop -7
```

**Query Syntax**  
**SOURCE<cnum>::POWER::STOP?**  

**Return Type**  
Numeric

**Default**  
0 dBm

- Synchronizing the PNA and Controller
- SCPI Command Tree

Note: The SOURce:POWer:CORRection:COLLect:ACQuire command, used to step the PNA and read a power meter, cannot be sent over the GPIB unless the power meter is connected to a different GPIB interface. See the alternative methods described in the command details.

**SOURce<cnum>:POWer<port>:CORRection:COLLect:ABORt**

(Write-only) Aborts a source power calibration sweep that is in progress.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.

**Examples**

SOUR:POW:CORR:COLL:ABOR
source1:power2:correction:collect:abort

**Query Syntax** Not Applicable

**Default** Not Applicable

**SOURce<cnum>:POWer<port>:CORRection:COLLect[:ACQuire] <char>,<id>[,src][,sync]**

**Note:** With PNA Rev. 6.2, a new "id" argument has been added to this command, replacing SOUR:POW:CORR:COLL:METH.

(Write-only) Initiates a source power cal acquisition sweep using the power sensor attached to the specified channel (A or B) on the power meter, using a USB power sensor, or using the specified PNA receiver.

**Note:** This command, when used with a power meter, can NOT be sent over the GPIB unless the power meter is connected to a different GPIB interface or USB. Use one of the following methods to perform this command or its equivalent:

- If present, use the GPIB dedicated controller port.
Connect the power meter to the PNA using a USB / GPIB interface (Agilent 82357A).

SCPI programming of the PNA using a LAN Client interface (see example).

Send SCPI commands through the COM interface using the SCPI String Parser object.

Directly control the Power Meter and PNA to step frequency; then acquire and store the Power reading. (see example).

Configure the Power Meter/Sensor as a PMAR Device. Learn how, See SCPI commands.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<char>` Acquisition Choose from:
  - **PMETer** - Power Meter is used for all readings.
  - **PMReceiver** - Power meter for the first iteration; then use the reference receiver for remaining readings if necessary (same as “fast iteration” box checked on dialog box)
  - **RECeiver** - Use PNA measurement receiver for all readings.
- `<id>` String (Not case sensitive). The power sensor or PNA receiver to use for measuring power.
  
  For **PMETer** or **PMRECeiver**, choose from:
  
  - "ASENSOR" or "BSENSOR". For U series USB sensors, always specify "ASENSOR"

  For **RECeiver**, choose from:
  
  - Any PNA receiver to acquire readings using physical or logical receiver notation.
  - Any configured PMAR device name. Learn more about PMAR Devices. See PMAR commands.

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.
If this argument is specified, must also specify [src].

Choose from:

- SYNChronous - Blocks SCPI commands during standard measurement (default behavior).
- ASYNchnous - Does NOT block SCPI commands during standard measurement.

Examples

SOUR:POW:CORR:COLL PMET,"ASEN","Port 1",ASYN  'acquires power meter readings using the A sensor, source port 1, asynchronous.

source1:power2:correction:collect:acquire receiver,"a1"  'acquires source cal readings using the reference receiver for port 1.

Query Syntax  Not Applicable

Default  Not Applicable

SOURce:POWer:CORRection:COLLect:AVERage[:COUNt] <num>

(Read-Write) This command, along with SOUR:POW:CORR:COLL:AVER:NTOLerance, allows for settling of the power sensor READINGS.

Specifies the maximum number of power readings that are taken at each stimulus point to allow for measurement settling. Each reading is averaged with the previous readings at that stimulus point.

When this average meets the Average:NTOLerance value or this number of readings has been made, the average is returned as the valid reading.

This setting is not necessary when using a PNA receiver (SOUR:POW:CORR:COLL REC) to make the measurement.

Learn more.

Parameters

- <num> Maximum number of readings to make to allow for settling. Choose any number between 3 and 25.

Examples

SOUR:POW:CORR:COLL:AVER 2
source:power:correction:collect:average:count 3

Query Syntax  SOURce:POWer:CORRection:COLLect:AVERage[:COUNt]?

Return Type  Numeric
SOURce:POWer:CORRection:COLLect:AVERage:NTOLerance <num>

(Read-Write) This command, along with SOUR:POW:CORR:COLL:AVER:COUNT, allows for settling of the power sensor READINGS.

Each power reading is averaged with the previous readings at each stimulus point. When the average meets this nominal tolerance value or the max number of readings has been made, the average is returned as the valid reading.

This setting is not necessary when using a PNA receiver (SOUR:POW:CORR:COLL REC) to make the measurement.

Learn more.

Parameters

<num>  Power measurement settling tolerance value in dB. Choose any number between 0 and 5.

Examples

SOUR:POW:CORR:COLL:AVER:NTOL .05
source1:power2:correction:collect:average:ntolerance .003

Query Syntax

SOURce:POWer:CORRection:COLLect:AVERage:NTOLerance?

Return Type  Numeric

Default  .050 dBm

SOURce<cnum>:POWer:CORRection:COLLect:DISPlay[:STATe] <ON | OFF>

(Read-Write) Enables and disables the display of power readings on the PNA screen. Send this command BEFORE you begin a source power cal acquisition. After the source power cal data is acquired, this setting is reset to ON.

Parameters

<cnun>  Any existing channel number. If unspecified, value is set to 1

<ON|OFF>  

ON (1)  Source power calibration dialog box is shown on the PNA screen. Power readings are plotted against the Tolerance value as limit lines.

OFF (0) - Source power calibration dialog box is NOT shown on the PNA screen.

Examples

SOUR:POW:CORR:COLL:DISP ON
source1:power2:correction:collect:display:state off
**Query Syntax**
```
SOURce:POWer:CORRection:COLLect:DISPlay[:STATe]?
```

**Return Type**
Boolean (1 = ON, 0 = OFF)

**Default**
ON (1)

**SOURce<cnum>:POWer:CORRection:COLLect:FCHeck[:STATe] <ON | OFF>**
(Read-Write) Enables and disables frequency checking of source power cal acquisition sweeps. ONLY use when you have more than one power sensor.

**Parameters**
- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<ON|OFF>**
  - **ON (1)** turns source power cal frequency checking ON. A requested acquisition will only succeed for those frequency points which fall within a frequency range specified for the power sensor being used. An acquisition will pause in mid-sweep if the frequency is about to exceed the maximum frequency limit specified for that sensor. When the sweep is paused in this manner, a sensor connected to the other channel input of the power meter can be connected to the measurement port in place of the previous sensor, and used to complete the sweep. However, the maximum frequency specified for the second sensor would need to be sufficient for the sweep to complete. Frequency limits are specified using the `SOUR:POW:CORR:COLL:SEN` command.
  - **OFF (0)** - turns source power cal frequency checking OFF. An acquisition will use just one power sensor for the entire sweep, regardless of frequency.

**Examples**
```
SOUR:POW:CORR:COLL:FCH ON
source1:power2:correction:collect:fcheck:state off
```

---

**SOURce:POWer:CORRection:COLLect:ITERation[:COUNt] <num>**
This command, along with `SOUR:POW:CORR:COLL:ITER:NTOL`, describes the number of adjustments to make to the source power.

Sets the maximum number of readings to take at each data point for iterating the source power. Power READINGS (performed by `SOUR:POW:CORR:COLL:AVER:COUNT` and `SOUR:POW:CORR:COLL:AVER:NTOLerance`) will continue to be made, and source power adjusted, until the measurement is within the iteration tolerance value or this max number of measurements has been met. The last value is the valid measurement for that data point.

**Parameters**

- `<num>` Maximum number of readings. Choose any number between 1 and 100.

**Examples**

```
SOUR:POW:CORR:COLL:ITER 2
source:power:correction:collect:iteration 3
```

**Query Syntax**

`SOURce:POWer:CORRection:COLLect:ITERation[:COUNt]?
```

**Return Type** Numeric

**Default** 1

---

This command, along with `SOUR:POW:CORR:COLL:ITER:COUNt`, describes the number of adjustments to make to the source power.

Sets the maximum desired deviation from the sum of the test port power and the offset value. Power READINGS (performed by `SOUR:POW:CORR:COLL:AVER:COUNT` and `SOUR:POW:CORR:COLL:AVER:NTOLerance`) will continue to be made, and source power adjusted, until a measurement is within this tolerance value or the max number of measurements has been met. The last value is the valid measurement for that data point.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<num>` Tolerance value in dBm. Choose any number between 0 and 5

**Examples**

```
SOUR:POW:CORR:COLL:ITER:NTOL .005
source:power:correction:collect:iteration:ntolerance .1
```

**Query Syntax**

`SOURce:POWer:CORRection:COLLect:ITERation:NTOLerance?`
**Return Type**  Numeric

**Default**  .05

---

**SOURce<cnum>:POWer<port>:CORRection:COLLect:METHod <char> Superseded**

This command is replaced with **SOUR:POW:CORR:COLLect[:ACQuire]** which now specifies the method and the device. The only parameter required by that command was either ASEN sor or BSEN sor which are still supported but not documented.

*(Read-Write)* Selects the calibration method to be used for the source power cal acquisition.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<port>`  Port number to correct for source power. If unspecified, value is set to 1.
- `<char>`  Choose from:
  - **NONE** - No Cal method
  - **PMETer** - Power Meter is used for all readings. (same as "fast iteration" box not checked on dialog box)
  - **PMReceiver** - Power meter for the first iteration; then use the reference receiver for remaining readings if necessary (same as "fast iteration" box checked on dialog box)

**Examples**  SOUR:POW:CORR:COLL:METH PMET

source1:power2:correction:collect:method pmreceiver

**Query Syntax**  SOURce:POWer:CORRection:COLLect:METHod?

**Return Type**  Character

**Default**  NONE

---

**SOURce:POWer:CORRection:COLLect:SAVE [<RREC>]**
(Write-only) Applies the array of correction values after a source power calibration sweep has completed. The source power correction will then be active on the specified source port for channel <cnum>. This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.

Parameters

<RREC> Optional argument.

**RRECeiver** In addition to a source Power Cal, perform a calibration of the reference receiver used in the measurement. ONLY the Reference Receiver calibration is then saved to a Cal Set or Cal Register as specified by the current setting of SENS:CORR:PREF:CSET:SAVE.

This argument only applies to standard S-parameter channels.

**Examples**

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SOURce<cnum>:POWer:CORRection:COLLect:<pmChan>SENsor[:FRANge] <num1>,<num2>**

(Read-Write) Specifies the frequency range over which the power sensors connected to the specified channels (A and B) of the power meter can be used (minimum frequency, maximum frequency). If the power meter has only a single channel, that channel is considered channel A.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1

<pmChan> Power Meter channel. Choose from:

A - Channel A

B - Channel B

<num1> Minimum frequency for the sensor. If a frequency unit is not specified, Hz is assumed. No limits are placed on this value.

<num2> Maximum frequency for the sensor. If a frequency unit is not specified, Hz is assumed. No limits are placed on this value.

**Examples**

SOUR:POW:CORR:COLL:ASEN 100E3, 3E9

source1:power2:correction:collect:bsensor:frange 10 MHz, 18 GHz
**Query Syntax**

SOURce:POWer:CORRection:COLLect:ASENsor[:FRANge]?

SOURce:POWer:CORRection:COLLect:BSENsor[:FRANge]?

**Return Type**

Numeric

**Default**

0,0

---

**SOURce<cnm>:POWer:CORRection:COLLect:<pmChan>SENsor:RCFactor <num>**

(Read-Write) Specifies the reference cal factor for the power sensor connected to channel A or B of the power meter. If the power meter has only a single channel, that channel is considered channel A.

**Note:** If the sensor connected to the specified channel of the power meter contains cal factors in EPROM (such as the Agilent E-series power sensors), those will be the cal factors used during the calibration sweep. The reference cal factor value associated with this command, and any cal factors entered into the PNA for that sensor channel, will not be used.

**Parameters**

- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<pmChan>` Power Meter channel. Choose from:
  - A - Channel A
  - B - Channel B
- `<num>` Reference cal factor in percent. Choose any number between 1 and 150.

**Examples**

```
SOUR:POW:COR:COLL:ASEN:RCF 98.7
source1:power2:correction:collect:bsensor:rcfactor 105
```

**Query Syntax**

SOURce:POWeR:CORRection:COLLect:ASENsor:RCFactor?

SOURce:POWeR:CORRection:COLLect:BSENsor:RCFactor?

**Return Type**

Numeric

**Default**

100

---

**SOURce<cnm>:POWeR:CORRection:COLLect:<pmChan>SENsor:SELect**
Sets and returns the power sensor channel (A or B) to be used. This performs the same function as the Use this sensor only checkbox in the Power Sensor Settings dialog.

**Note:** This write portion of this command is only necessary when performing an SMC calibration.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<pmChan>`: Power Meter channel. Choose from:
  - **A**: Channel A
  - **B**: Channel B

**Examples**

```plaintext
SOUR:POW:CORR:COLL:<pmChan>SEN:SEL 'Write
source1:power2:correction:collect:bsensor:select? 1e9 'Read
```

**Query Syntax**

- SOURce:POWer:CORRection:COLLect:ASENsor:SELect? <Frequency>
- SOURce:POWer:CORRection:COLLect:BSENsor:SELect? <Frequency>

Returns a boolean 1 or 0 (ON or OFF) indicating whether the sensor is to be used at the specified frequency.

If frequency checking is OFF, then the `<Frequency>` parameter is ignored. The query returns if the sensor is selected for ALL frequencies.

**Return Type**

Numeric

**Default**

Not Applicable

---

```
SOURce<cnum>:POWer:CORRection:COLLect:TABLE:DATA <data>
```
(Read-Write) Read or write data into the selected table. Each table can contain up to 100 segments. Use SOUR:POW:CORR:COLL:TABL:SESelect to select a table.

- When the power sensor table is selected, the data is interpreted as cal factors in percent.
- When the loss table is selected, POSITIVE values in dB are interpreted as LOSS. To compensate for gain, use negative values. Learn more about Power Loss Compensation.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<data>` Data to write into the selected table.

**Examples**

```bash
SOURce:POWer:CORRection:COLLect:TABLE:DATA 0.12, 0.34, 0.56
```

**Query Syntax**

SOURce<cnum>:POWer:CORRection:COLLect:TABLE:DATA?

If the selected table is currently empty, no data is returned.

**Return Type**

Numeric - one number per table segment.

**Default**

Not Applicable

---

**SOURce<cnum>:POWer:CORRection:COLLect:TABLE:FREQuency <data>**

(Read-Write) Read or write frequency values for the selected table (cal factor table for a power sensor, or the loss compensation table). Use SOUR:POW:CORR:COLL:TABL:SESelect to select a table.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<data>` Frequency data to write into the selected table.

**Examples**

```bash
SOURce:POWer:CORRection:COLLect:TABLE:FREQuency 10E6, 1.5E9, 9E9
```

**Query Syntax**

SOURce<cnum>:POWer:CORRection:COLLect:TABLE:FREQuency?

If the selected table is currently empty, no data is returned.

**Return Type**

Numeric - one number per table segment

**Default**

Not Applicable

---

**SOURce<cnum>:POWer:CORRection:COLLect:TABLE:LOSS[:STATe] <ON | OFF>**
(Read-Write) Indicates whether or not to adjust the power readings using the values in the loss table during a source power cal sweep. Learn more about Power Loss Compensation.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<ON|OFF>** ON (or 1) - turns use of the loss table ON.
  
  OFF (or 0) - turns use of the loss table OFF.

**Examples**

```
SOUR:POW:CORR:COLL:TABL:LOSS ON
source1:power2:correction:collect:table:loss:state off
```

**Query Syntax**

```
SOURce:POWer:CORRection:COLLect:TABLe:LOSS[:STATe]?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF (0)

---

### SOURce<cnum>:POWer:CORRection:COLLect:TABLe:POINts?

(Read-only) Returns the number of segments that are currently in the selected table.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SOUR:POW:CORR:COLL:TABL:POIN?
source1:power2:correction:collect:table:points?
```

**Return Type**

Numeric

**Default**

0

---

### SOURce<cnum>:POWer:CORRection:COLLect:TABLE[:SELect] <char>

2827
(Read-Write) Selects which table you want to write to or read from. Read or write using
SOURce:POWer:CORRection:COLLect:TAble:FREQuency and
SOURce:POWer:CORRection:COLLect:TAble:DATA

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1
<char> Choose from:

NONE - No table selected

ASEnsor - Cal Factor table for Power Sensor A

BSeNsor - Cal Factor table for Power Sensor B

LOSS - Loss compensation table

Examples

SOUR:POW:CORR:COLL:TabL ASEN
source1:power2:correction:collect:table:select bsensor

Query Syntax

SOURce:POWer:CORRection:COLLect:TAble[>:SELect]?

Return Type

Character

Default

NONE

SOURce<cnun>:POWer<port>:CORRection:DATA <data>[,src]

(Read-Write) Writes and reads source power calibration data.

The effect from this command on the channel is immediate. Do NOT send
SOUR:POW:CORR:COLL:SAVE after this command as it may invalidate the uploaded data.

When querying source power calibration data, if no source power cal data exists for the specified
channel and source port, then no data is returned.

If a change in the instrument state causes interpolation and/or extrapolation of the source power cal,
the correction data associated with this command correspond to the new instrument state (interpolated
and/or extrapolated data).

If the channel is sweeping the source backwards, then the first data point is the highest frequency
value; the last data point is the lowest. Use the SENS:X:VALues? command to return the X-axis
values in the displayed order.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1
Port number to correct for source power. If unspecified, value is set to 1.

Correction Data

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples SOURce1:POWer2:CORRection:DATA 0.12, -0.34, 0.56

Query Syntax SOURce<cnum>:POWer<port>:CORRection:DATA? [src]

Return Type Depends on FORMat:DATA command

Default Not Applicable

SOURce<cnum>:POWer<port>:CORRection:DATA:PRIor <data>,[src]

(Read-Write) Writes and reads power correction values from the previous iteration of the source power cal. Data for which the first power meter reading were within the tolerance limit, the ‘prior’ correction value is 0.

In all other respects, this command is the same as SOUR:POW:CORR:DATA.

This command can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits. The formula for determining the power reading (in dB):

Power reading = Target power at the source port + specified power cal offset value + ‘prior’ iteration corr value – actual power corr value.

The "actual" value in this equation is returned with SOUR:POW:CORR:DATA?

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1

<port> Port number to correct for source power. If unspecified, value is set to 1.

<data> Correction Data

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise,
the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

SOURc1:POWer2:CORRection:DATA:PRIor 0.12, -0.34, 0.56

**Query Syntax**

SOURce<cnum>:POWer<port>:CORRection:DATA:PRIor? [src]

**Return Type**

Depends on FORMat:DATA command

**Default**

Not Applicable

**SOURce<cnum>:POWer<port>:CORRection:LEVel[:AMPLitude] <num>[,src]**

*(Read-Write)* Specifies the power level that is expected at the desired reference plane (DUT input or output). This is not used for **segment sweep with independent power levels** or **power sweeps**.

**Note:** Although this command still works, it is recommended that you specify cal power by setting the **test port power** and **offset** value.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Port number to correct for source power. If unspecified, value is set to 1.
- **<num>** Cal power level in dBm. Because this could potentially be at the output of a device-under-test, no limits are placed on this value here. It is realistically limited by the specifications of the device (power sensor) that will be used for measuring the power. The power delivered to the PNA receiver must never exceed PNA specifications for the receiver!
- **[src]** **String.** (NOT case sensitive). Source port. Optional. Use SOUR:CAT? to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

SOUR:POW:CORR:LEV 10
sourcel:power2:correction:level:amplitude 0 dbm

**Query Syntax**

SOURce:POWer:CORRection:LEVel[:AMPLitude]? [src]

**Return Type**

Numeric

**Default**

0 dBm

**SOURce<cnum>:POWer<port>:CORRection:OFFSet[:MAGNitude] <num>[,src]**
Sets or returns a power level offset from the PNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT.

Cal power is the sum of the test port power setting and this offset value. Following the calibration, the PNA power readouts are adjusted to the cal power.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Port number to correct for source power. If unspecified, value is set to 1.
- **<num>** Gain or loss value in dB. Choose a value between -200 and 200

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:CORR:OFFS 10
source1:power2:correction:offset:magnitude -3
```

**Query Syntax** SOURce:POWer:CORRection:OFFSet[:MAGNitude]? [src]

**Return Type** Numeric

**Default** 0 dB

```
SOURce<cnum>:POWer<port>:CORRection[:STATe] <bool>[,src]
```
(Read-Write) Enables and disables source power correction for the specified port on the specified channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<bool>` ON (or 1) turns source power correction ON.
  
  OFF (or 0) - turns source power correction OFF.
  

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:CORR ON
source1:power2:correction:state off
```

**Query Syntax** SOURce:POWer:CORRection[:STATe]? [src]

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF (0)

Status Register Commands

The status registers enable you to query the state of selected events that occur in the analyzer.

Note: This documentation requires familiarity with the "Standard Status Data Structure - Register Model" as defined in IEEE Std 488.2-1992. Also, first read Learn about Status Registers

Click on a blue keyword to view the command details.

See Also

- Example Programs
- Learn about Status Registers
- Synchronizing the PNA and Controller
- SCPI Command Tree

Notes:

- Any bit not shown in the registers is not used but may be reserved for future use.
- The SCPIStringParser can NOT be used with SCPI Status Reporting. However, the *OPC? will work.
**Status Byte Register**

Summarizes the states of the other registers and monitors the PNA output queue. It also generates service requests. The Enable register is called the Service Request Enable Register.

<table>
<thead>
<tr>
<th>Commands</th>

**STATus:QUEStionable:INTegrity:MEASurement<n> <keyword>**

**Note:** This register can be used ONLY with standard S-parameter measurements.

Monitors the lag between changing a channel setting and when the data is ready to query.

When you change the channel state (start/stop freq, bandwidth, and so forth), then the questionable bit for that channel is set. This indicates that your desired channel state does not yet match the data you would get if querying a data trace. When the next sweep is complete (without aborting in the middle), and the data trace matches the channel state that produced it, the bit is cleared for that channel.

</table>
To determine Register, Bit number, and Weight for trace numbers between 113 and 560 (not shown in the above table) use the following calculations.

The limit status for trace numbers higher than 580 can NOT be tracked.

The following example calculates the Register, Bit number, and Bit Weight for trace # 400:

- To determine Limit **Register** number, use $$((\text{Trace} \# - 1) / 14) + 1$$.
- To determine Limit **Bit Number**, use the **remainder** +1 of the above calculation.
- $$((400-1)/14) + 1 = \text{Register}# \ r+1\text{Bit}$$
  - $$399/14 = 28 r7$$
  - $$28+1= \text{Register} 29$$
  - $$7+1= \text{Bit number} 8$$
- To determine Limit **Bit Weight**: Use above table. For example: Bit 8 = 256

**Standard Event Status Register**

Monitors "standard" events that occur in the analyzer. This register can only be cleared by:

- a Clear Command (*CLS).
- reading the Standard Enable Status Register (*ESE?).
- a power-on transition. The analyzer clears the register and then records any transitions that occur, including setting the Power On bit (7).

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>

</tr>
</tbody>
</table>
To determine Register, Bit number, and Weight for trace numbers between 113 and 560 (not shown in the above table) use the following calculations.

The averaging status for trace numbers higher than 580 can NOT be tracked.

The following example calculates the Register, Bit number, and Bit Weight for trace # 400:

- To determine **Register** number, use \(((\text{Trace #} - 1) / 14) + 1\).
- To determine **Bit Number**, use the **remainder** +1 of the above calculation.
- \(((400-1)/14) + 1 = \text{Register# } r+1\text{Bit}
  
  - 399/14 = 28 r7
  - 28+1= Register 29
  - 7+1= Bit number 8
To determine **Bit Weight**: Use above table. For example: Bit 8 = 256

### STATus:OPERation:DEFine<keyword>

SYSTem:ACTive:CHANnel?
(Read-only) Returns the number of the active channel or an error message if there is no active channel. The active channel is the channel number that contains the active measurement.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:PRES</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SYST:ACT:CHAN?</td>
</tr>
<tr>
<td></td>
<td>'Returns 1</td>
</tr>
</tbody>
</table>

**Return Type** Integer

**Default** Not Applicable

---

**SYSTem:ACTive:MEASurement?**

(Read-only) Returns the name of the active measurement or an error message if there is no active measurement. While looking at the PNA display, the active measurement is the trace that has an indented **Trace Status button** and a label in the upper-left corner of the display. Only displayed measurements can be active.

<table>
<thead>
<tr>

</table>

**Return Type** String

**Default** Not Applicable

---

**SYSTem:CHANnels:CATalog?**

(Read-only) Returns the channel numbers currently in use.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:CHAN:CAT?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>system:channels:catalog?</td>
</tr>
<tr>
<td></td>
<td>'Returns:</td>
</tr>
<tr>
<td></td>
<td>&quot;1,2,3&quot;</td>
</tr>
</tbody>
</table>

**Return Type** String of comma-separated numbers

**Default** Not Applicable

---

**SYSTem:CHANnels:COUPle[:STATe] <bool>**
(Read-Write) Sets and reads the state of channel coupling. This causes the PNA to emulate Agilent 8720 channel coupling.

When set to ON, all existing S-parameter channels receive the stimulus settings of the active channel. Subsequent changes made to any coupled channel are changed on all coupled channels.

Channels with applications such as SMC, VMC, GCA, Noise, IMD are not affected.

Coupling is primarily aimed at stimulus settings (such as start, stop, points, power) but also applies to many trigger settings and to Cal Set pointers.

**Parameters**

<bool> ON (or 1) Channels are coupled

OFF (or 0) Channels are NOT coupled

**Examples**

SYST:CHAN:COUP 1

system:channels:couple:state OFF

**Query Syntax**

SYSTem:CHANnels:COUPle[:STATe]?

**Default**

OFF

**SYSTem:CHANnels:DELete <value>**

(Write-only) Deletes the specified channel.

**Parameters**

<value> Channel number to delete

**Examples**

SYST:CHAN:DEL 2

**Query Syntax**

Not Applicable

**Default**

Not Applicable

**SYSTem:CHANnels:HOLD**

(Write-only) Places all channels in hold mode. To place a single channel in hold mode, use SENS:SWE:MODE.

**Examples**

SYST:CHAN:HOLD

**Query Syntax**

Not Applicable

**Default**

Not Applicable
SYSTem:CHANnels:RESuMe

(Write-only) Resumes the trigger mode of all channels that was in effect before sending SYSTem:CHANnels:HOLD (must be sent before SYST:CHAN:RESuMe).

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:CHAN:RES</th>

</tbody>
</table>

SYSTem:COMMunicate:GPIB:PMETer[:ADDRes] <num> Superseded

**Note:** This command is replaced with SYST:COMM:PSENsor

(Read-Write) Specifies the GPIB address of the power meter to be used in a source power calibration. When performing a source power cal, the PNA will search VISA interfaces that are configured in the Agilent IO Libraries on the PNA.

Use

**Parameters**

<num> GPIB address of the power meter. Choose any integer between 0 and 30.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:COMM:GPIB:PMET 13</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>system:communicate:gpib:pmeter:address 14</td>
</tr>
</tbody>
</table>

| Query Syntax | SYSTem:COMMunicate:GPIB:PMETer[:ADDRes]?
| Return Type  | Numeric |
| Default      | 13 |

SYSTem:COMMunicate:GPIB:RDEVice:CLOSE<e> <ID>

(Write only) Closes the remote GPIB session. This command should be sent when ending every successful OPEN session.

**Parameters**

<ID> Session identification number that was returned with the OPEN? command.

<table>
<thead>
<tr>
<th>Examples</th>
<th>See an example program</th>
</tr>
</thead>
</table>

| Query Syntax | Not Applicable |
| Default      | Not Applicable |
**SYSTem:COMMunicate:GPIB:RDEVice:OPEN**  <bus>, <addr>, <timeout>

(Read-Write) Initiates a GPIB pass-through session. First send this OPEN command, then send the OPEN query to read the session ID number. An existing GPIB pass-through session remains open after an instrument preset.

To learn more about GPIB pass-through capability, see the [example program](#).

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;bus&gt;</td>
<td>Bus ID number.</td>
</tr>
<tr>
<td></td>
<td>You can find the USB-GPIB adapter bus number by looking at the dialog that appears when the USB-GPIB device is connected. Error 1073 indicates the bus or address number is incorrect. Use 0 (zero) when connected using a GPIB cable to the PNA controller port.</td>
</tr>
<tr>
<td>&lt;addr&gt;</td>
<td>GPIB Address of the device to be controlled</td>
</tr>
<tr>
<td>&lt;timeout&gt;</td>
<td>The amount of time (in milliseconds) to wait for a response from the remote device after sending a command. A &quot;timeout&quot; error is displayed after this time has passed without a response.</td>
</tr>
</tbody>
</table>

**Examples**

See an example program

**Query Syntax**

SYSTem:COMMunicate:GPIB:RDEVice:OPEN?

Returns the session identification number that is used when communicating with this device.

**Return Type**

Numeric

**Default**

Not Applicable

---

**SYSTem:COMMunicate:GPIB:RDEVice:READ?**  <ID>

(Read-only) Returns data from the GPIB pass-through device.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ID&gt;</td>
<td>Session identification number that was returned with the OPEN? command.</td>
</tr>
</tbody>
</table>

**Examples**

See an example program

**Return Type**

String

**Default**

Not Applicable
**SYSTem:COMMunicate:GPIB:RDEVice:RESet**

(Write-only) Performs the same function as SYST:COMM:GPIB:RDEV:CLOS except that ALL pass-through sessions are closed.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:COMM:GPIB:RDEV:RES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query Syntax</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**SYSTem:COMMunicate:GPIB:RDEVice:WBINary <ID>,<data>**

(Write-only) Sends data to a GPIB pass-through device. This command requires a header that specifies the size of the data to be written. The header (described below) is not passed along to the device.

Use this command if too many embedded quotes prevent you from using SYST:COMM:GPIB:RDEV:WRIT.

Use SYST:COMM:GPIB:RDEV:OPEN to open the pass through session.

**Parameters**

- **<ID>** Session identification number that was returned with the OPEN? command.
- **<data>** Data to be sent to the GPIB pass-through device. Use the following syntax:

  ```
  #<num_digits><byte_count><data_bytes><NL><END>
  ```

  - **<num_digits>** specifies how many digits are contained in **<byte_count>**
  - **<byte_count>** specifies how many data bytes will follow in **<data_bytes>**

**Examples**

| SYSTem:COMMunicate:GPIB:RDEVice:WBINary 101,#17ABC+XYZ<nl><end> |

- # - always sent before data.
- 1 - specifies that the byte count is one digit (7).
- 7 - specifies the number of data bytes that will follow, not counting <NL><END>.
- ABC+XYZ - Data block
- <nl><end> - always sent at the end of block data.

The following example sends a line feed at the end.
**SYSTem:COMMunicate:GPIB:RDEVice:WBIN** <ID>,<data>

*(Write-only)* Same as **SYSTem:COMM:GPIB:RDEV:WBIN** (above) but the header **IS** passed along to the device.

Use this command if too many embedded quotes prevent you from using **SYST:COMM:GPIB:RDEV:WRITe**.

**Parameters**

- **<ID>**  
  Session identification number that was returned with the **OPEN?** command.
- **<data>**  
  Data to be sent to the GPIB pass-through device. See previous command.

**Examples**  
See previous example.

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

---

**SYSTem:COMMunicate:GPIB:RDEVice:WRITe** <ID>,<string>

*(Write-only)* Sends ASCII string data to the GPIB pass-through device.

A line feed is NOT appended to the string data. To send a line feed, see the example in **SYST:COMM:GPIB:RDEV:WBIN**.

**Parameters**

- **<ID>**  
  Session identification number that was returned with the **OPEN?** command.
- **<string>**  
  Commands to be sent to the GPIB pass-through device.

**Examples**  
See an example program

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

---

**SYSTem:COMMunicate:LAN HOSTname?**
(Read-only) Returns the LAN hostname that is visible in the Help, About Network Analyzer dialog box. Learn more. This is the same information that is visible on the LXI compliance dialog.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>SYST:CONF:LAN:HOSTname?</td>
</tr>
<tr>
<td>Return Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

**SYStem:COMMunicate:PSENsor <char>, <string>**

This command replaces SYST:COMM:GPIB:PMET:ADDR.

(Read-Write) Specifies the type and location of the power meter to be used in a source power calibration.

**Parameters**

- **<char>** Type of power meter/ sensor. Choose from:
  - **GPIB** GPIB power meter
  - **USB** USB power sensor or USB power sensor
  - **LAN** LAN enabled power meter

- **<string>** For **GPIB**, address of the power meter. Choose any integer between 0 and 30.
  For **USB**, the ID string of the power meter or power sensor. Use SYST:COMM:USB:PMET:CAT? to see a list of ID strings of connected power meters and sensors.
  For **LAN**, the hostname or IP address of the power meter.

**Examples**

- SYST:COMM:PSEN gpib, "14"
- syst:comm:psen lan, "mymeter.agilent.com"

**Query Syntax** SYSTem:COMMunicate:PSENo?  
**Return Type** Character / String  
**Default** GPIB
**SYSTem:COMMunicate:USB:PMETer:CATalog?**

*(Read-only)* Returns the ID string of power meters / sensors that are connected to the PNA USB. Use the list to select a power sensor for a **source power cal**.

These meter/sensor ID strings can NOT be used as the resource string for configuring a USB-based PMAR (**SYST:CONF:EDEV:IOConfig**).

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
</table>
| **Examples** | **SYST:COMM:USB:PMET:CAT?**  
**system:communicate:usb:pmeter:catalog?** |

**Return Type** Comma-delimited strings. Two power sensor strings are separate by a semicolon.

**Default** Not applicable

**SYSTem:COMMunicate:TCPip:CONTrol?**

*(Read-only)* Queries the TCP/IP port number to use for opening a TCP/IP socket control connection to the PNA. The control connection is used for two purposes:

1. To perform a Device Clear operation on the PNA
2. To detect when a Service Request (SRQ) event occurs on the PNA.

The port number can range from 5000 to 5099. The PNA will skip over 5025 as it is being used for the primary socket connection.

To detect an SRQ, your program sends the appropriate commands via the regular socket connection to set up for a SRQ event to occur – the same sequence of commands as if you were sending them via GPIB. You write your program so that while your program is doing SCPI transactions on the standard socket connection, a second thread of execution in your program detects the SRQ on the control connection and responds to the event. When the SRQ event occurs, the PNA sends a “SRQ +xxx/n” message on the control connection (where ‘/n’ is linefeed character, ASCII value 10 decimal). The xxx value in the “SRQ +xxx/n” string is the IEEE 488.2 status byte at the time the SRQ was generated. So ‘listening’ for that on the control connection is how your program detects the event. If for your socket communication you’re using a software API that provides for asynchronous communication via a callback mechanism (for example, if you’re using Microsoft’s ‘winsock’ API, or their .NET ‘Socket’ class as in the example program below), in that case your ‘listener’ execution thread is created implicitly for you so your program doesn’t have to create one explicitly.

**Note:** If this SCPI query is sent to the PNA via a SCPI parser other than a TCP/IP socket connection (for example, if sent via GPIB), the query is not applicable in that case and will return value of 0.
**Parameters**  None

**Example**  See example program

**Return Type**  Integer

**Default**  Not applicable

---

**SYSTem:CONFigure <model>,<address>**

(Write-only) Restarts as an "N-port" PNA using the specified multiport test set.

Learn more about PNA Multiport capability.

See other commands to configure multiport test sets.

**Parameters**

- **<model>**  String - Model of the test set with which to restart.
  
  Use "Native" to restart without a test set.

  To see a list of supported test sets, use **SENS:MULT:CAT?**

- **<address>**  Numeric - GPIB Address of the test set. Ignored when model = "Native".

**Examples**

```
SYST:CONF "NATIVE",0  
system:configure "N44xx",18
```

**Query Syntax**  Not Applicable

**Default**  Not Applicable

---

**SYSTem:CONFigure:REVision:CPU?**
(Read-only) Returns a number that corresponds to the PNA CPU speed that is visible in the Help, About Network Analyzer dialog box. Learn more.

Use the following table to learn the clock speed using the returned value.

<table>
<thead>
<tr>
<th>Reported CPU version</th>
<th>Clock speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>266 MHz</td>
</tr>
<tr>
<td>2.0</td>
<td>500 MHz</td>
</tr>
<tr>
<td>3.0</td>
<td>1100 MHz</td>
</tr>
<tr>
<td>4.0</td>
<td>1600 MHz</td>
</tr>
<tr>
<td>5.0</td>
<td>2000 MHz</td>
</tr>
</tbody>
</table>

### Parameters
- None

### Example
```
SYST:CONF:REV:CPU?
```

### Return Type
String

### Default
Not applicable

**SYSTem:CONFigure:REVision:DSP?**

(Read-only) Returns the DSP Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.

### Parameters
- None

### Example
```
SYST:CONF:REV:DSP?
```

### Return Type
String

### Default
Not applicable

**SYSTem:CONFigure:REVision:DSPFpga?**
(Read-only) Returns the DSP FPGA Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.

**Parameters**
None

**Example**
SYST:CONF:REV:DSPF?

**Return Type**
String

**Default**
Not applicable

**SYSTem:CORRection:WIZard[:IMMediate] <char>**

(Write-only) Launches either the Calibration Wizard or the Version 2 Calibration Kit File Manager dialog box.

Remote operation returns immediately after the dialog is launched. This is done to avoid timeout issues with I/O protocols such as VISA. Although it is possible to send commands to the PNA while the dialog is open, this is not encouraged. Application programs should wait until the dialog is closed before resuming remote operations.

**Parameters**

<char> Choose from:

- **MAIN** - Launches the Calibration Wizard which matches the current channel, such as standard S-params, NoiseFigure, GCA, and so forth.
- **CKIT** - Launches the Version 2 Calibration Kit File Manager dialog box.

Both display on the PNA screen.

**Examples**

SYST:CORR:WIZ MAIN
system:correction:wizard:immediate ckit

**Query Syntax**
Not Applicable

**Default**
Not Applicable

**SYStem:ERRor?**
(Read-only) Returns the next error in the error queue. Each time the analyzer detects an error, it places a message in the error queue. When the SYSTEM:ERROR? query is sent, one message is moved from the error queue to the output queue so it can be read by the controller. Error messages are delivered to the output queue in the order they were received. The error queue is cleared when any of the following conditions occur:

- When the analyzer is switched ON.
- When the *CLS command is sent to the analyzer.
- When all of the errors are read.

If the error queue overflows, the last error is replaced with a "Queue Overflow" error. The oldest errors remain in the queue and the most recent error is discarded.

See list of all SCPI Errors.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:ERR?</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>system:error?</td>
<td></td>
</tr>
</tbody>
</table>

**SYSTem:ERRor:COUNt?**

(Read-only) Returns the number of errors in the error queue. Use SYST:ERR? to read an error.

See list of all SCPI Errors.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:ERR:COUN?</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>system:error:count?</td>
<td></td>
</tr>
</tbody>
</table>

**SYSTem:ERRor:REPort:SUNLeveled <bool>**
(Read-Write) Specifies whether or not to report Source Unleveled errors to the SCPI system error buffer.

This setting will revert to the default (OFF) setting on Instrument Preset.

**Parameters**

- ON (or 1) Report Source Unleveled Errors. Read errors from the system error buffer using `SYST:ERR?`
- OFF (or 0) Do NOT report Source Unleveled Errors.

**Examples**

```
SYST:ERR:REP:SUNL 1
system:error:report:sunleveled ON
```

**Query Syntax**

```
SYSTem:ERRor:REPort:UNLeveled?
```

**Default**

OFF

---

**SYSTem:FPReset**

(Write-only) Performs a standard Preset, then deletes the default trace, measurement, and window. The PNA screen becomes blank.

**Examples**

```
SYST:FPR
system:fpreset
```

**Default**

Not applicable

---

**SYSTem:MACRo:COPY:CHANnel<cnum>[:TO] <num>**

(Write-only) Copies ALL settings from <cnum> channel to <num> channel. Learn more about copy channels.

Use `SENS:PATH:CONF:COPY` to copy ONLY mechanical switch and attenuator settings.

**Parameters**

- <cnum> Channel number to copy settings from. If unspecified, value is set to 1.
- <num> Channel number to copy settings to.

**Examples**

```
SYST:MACR:COPY:CHAN1 2
system:macro:copy:channel2:to 3
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable
SYSTem:MACRo:COPY:CHANnel<fromChan>:SOURce <fromPort>,<toChan>,<toPort>

(Write-only) Copies and applies an existing Source Power Calibration to another channel. Learn more about source power calibration.

Parameters

<fromChan> Channel number of the existing source power correction.
<fromPort> Port number of the existing source power correction.
<toChan> Channel number to which the source power correction will be copied.
<toPort> Port number to which the source power correction will be applied.

Examples

```
SYST:MACR:COPY:CHAN1:SOUR 1,2,1
```

```
system:macro:copy:channel2:source 2,1,2
```

Query Syntax Not Applicable

Default Not Applicable

SYSTem:MCLass:CATalog?

(Read-only) Returns measurement classes available on the PNA. Learn more about Measurement Classes.

Parameters None

Examples

```
SYST:MClass:CAT?
```

Return Type String of comma-separated measurement class names. See the complete list of measurement class names.

Default Not Applicable

SYSTem:MEASurement:CATalog? [chan]
(Read-only) Returns ALL measurement numbers, or measurement numbers from a specified channel.

**Parameters**

[chann] Optional. Channel number to catalog. If not specified, all measurement numbers are returned.

**Examples**

'Returns all measurement names

SYST:MEAS:CAT?

'Returns the measurement names on channel 2

system:measurement:catalog? 2

**Return Type**

String of comma-separated numbers

For example: "1,2"

**Default** Not Applicable

---

**SYSTem:MEASurement<n>:NAME?**

(Read-only) Returns the name of the specified measurement.

**Parameters**

<n> Measurement number for which to return the measurement name. If unspecified, value is set to 1.

**Examples**

'Returns the name of measurement 2

SYST:MEAS2:NAME?

**Return Type** String

**Default** Not Applicable

---

**SYSTem:MEASurement<n>:TRACe?**
(Read-only) Returns the trace number of the specified measurement number. Trace numbers restart for each window while measurement numbers are always unique.

Parameters

<n> Measurement number for which to return the trace number. If unspecified, value is set to 1.

Examples

'Seconds the trace number of measurement 1
SYST:MEAS1:TRAC?

Return Type Numeric
Default Not Applicable

SYSTem:MEASurement<n>:WINDow?

(Read-only) Returns the window number for the specified measurement number.

Parameters

<n> Measurement number for which to return the window number. If unspecified, value is set to 1.

Examples

'Seconds the window number of measurement 2
SYST:MEAS2:WIND?

Return Type Numeric
Default Not Applicable

SYSTem:POWer<pnum>:LIMit <value>

(Read-Write) Sets and returns the power limit for the specified port. Learn more about Power Limit.

Parameters

<pnum> Port number. Choose any PNA port.
<value> Power limit in dBm

Examples

SYST:POW1:LIM 5
system:power2:limit 0

Query Syntax SYSTem:POWer<pnum>:LIMit?

Return Type Numeric
Default 100 dBm
**SYSTem:POWER:LIMit:LOCK <bool>**

(Read-Write) Enables or disables the ability to change the power limit values through the user interface. Learn more about Power Limit.

**Parameters**

- **<bool>** Power limit lock. Choose from:
  - **ON or 1** - Enables the ability to change the power limit values from the user interface.
  - **OFF or 0** - Disables the ability to change the power limit values from the user interface.

**Examples**

```
SYST:POW:LIM:LOCK 1
system:power:limit:lock OFF
```

**Query Syntax**

SYSTem:POWer:LIMit:LOCK?

**Return Type**

Boolean

**Default**

OFF

---

**SYSTem:POWER<pnum>:LIMit:STATe <bool>**

(Read-Write) Enables or disables the power limit for the specified port. Learn more about Power Limit.

**Parameters**

- **<pnum>** Port number. Choose any PNA port.
- **<value>** Power limit state. Choose from:
  - **ON or 1** Enables the power limit for the port<pnum>
  - **OFF or 0** Disables the power limit for the port<pnum>

**Examples**

```
SYST:POW1:LIM:STAT ON
system:power2:limit:state 0
```

**Query Syntax**

SYSTem:POWer<pnum>:LIMit:STATe?

**Return Type**

Boolean

**Default**

OFF
**SYSTem:PRESet**

(Write-only) Deletes all traces, measurements, and windows. In addition, resets the analyzer to factory defined default settings and creates a S11 measurement named "CH1_S11_1". For a list of default settings, see Preset.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the PNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

If the PNA display is disabled with DISP:ENAB OFF then SYST:PRES will NOT enable the display.

This command performs the same function as *RST with one exception: Syst:Preset does NOT reset Calc:FORMAT to ASCII as does *RST.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:PRES system:reset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

**SYSTem:SECurity[:LEVel] <char>**

(Read-Write) Sets and returns the display of frequency information on the PNA screen and printouts.

Learn more about security level.

**Parameters**

<char> Choose from:

- **NONE** - ALL frequency information is displayed.
- **LOW** - NO frequency information is displayed. Frequency information can be redisplayed using the Security Setting dialog box or this command.
- **HIGH** - LOW setting plus GPIB console is disabled. Frequency information can be redisplayed ONLY by performing a Preset, recalling an instrument state with None or Low security settings, or using this command.
- **EXTRa** - HIGH setting plus:
  - ASCII data saving is disabled. Same method to redisplay frequency information as HIGH setting.
  - Mixer setup files (*.mxr) can NOT be saved.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:SEC LOW system:security:level high</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query Syntax</td>
<td>SYSTem:SECurity[:LEVel]?</td>
</tr>
</tbody>
</table>
**Return Type**  Character

**Default**  None

---

**SYSTem:SET <block>**

(Read-Write) Sends a definite-length binary block Instrument state and sets the PNA with those settings. This command does the same as saving a *.sta file to the PNA (MMEM:STOR STATE) and then MMEM:TRAN to transfer the file to the computer.

**Parameters**

- `<block>`  The Instrument state file as definite-length arbitrary binary block.

**Examples**  SYST:SET <block>

**Query Syntax**  SYSTem:SET?  (This saves the instrument state file to the remote computer.)

**Return Type**  Definite-length arbitrary binary block.

**Default**  Not Applicable

---

**SYSTem:SHORTcut<n>:ARGuments<string>**

(Read-Write) Reads and writes the arguments for the specified macro. On the Edit Macro Dialog, this is called the "Macro run string parameters".

**Parameters**

- `<n>`  Numeric. Number of the macro that is stored in the PNA.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all 12 macros for the desired macro title.

- `<string>`  Arguments for the specified macro.

**Examples**  SYST:SHORT1:ARG

**Query Syntax**  SYSTem:SHORTcut<n>:ARGuments?

**Default**  Not Applicable

---

**SYSTem:SHORTcut<n>:DELeTe**
(Write-only) Removes the specified macro from the list of macros in the PNA. Does not delete the macro executable file.

**Parameters**

<n> Numeric. Number of the macro that is stored in the PNA.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all 12 macros for the desired macro title.

**Examples**

SYST:SHOR1:DEL

**Query Syntax** Not Applicable

**Default** Not Applicable

**SYSTem:SHORtcut<n>:EXECute**

(Write-only) Executes (runs) the specified Macro (shortcut) that is stored in the PNA.

**Parameters**

<n> Numeric. Number of the macro that is stored in the PNA.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all 12 macros for the desired macro title.

**Examples**

SYST:SHOR1:EXEC

**Query Syntax** Not Applicable

**Default** Not Applicable

**SYSTem:SHORtcut<n>:PATH <string>**
(Read-Write) Defines a Macro (shortcut) by linking a path and file name to the Macro number. To be executed, the executable file must be put in the PNA at the location indicated by this command.

**Parameters**

- <n> Numeric. Number of the macro to be stored in the analyzer. If the index number already exists, the existing macro is replaced with the new macro.
- <string> Full path, file name, and extension, of the existing macro "executable" file.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all 12 macros for the desired macro title.

**Examples**

```
SYST:SHOR1:PATH "C:/Program Files/Agilent/Network Analyzer/Documents/unguideMultiple.vbs"
```

**Query Syntax**

```
SYSTem:SHORtcut<n>:PATH?
```

**Default** Not Applicable

---

**SYSTem:SHORtcut<n>:TITLe<string>**

(Read-Write) Reads and writes the name of the specified macro.

**Parameters**

- <n> Numeric. Number of the macro that is stored in the PNA.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all 12 macros for the desired macro title.

- <string> The name to be assigned to the macro.

**Examples**

```
SYST:SHOR1:TITL "Guided 4-Port Cal"
```

**Query Syntax**

```
SYSTem:SHORtcut<n>:TITLe?
```

**Default** Not Applicable

---

**SYSTem:TOUChscreen[:STATe] <bool>**
(Read-Write) Enables and disables the PNA-X touchscreen.

This setting remains until changed again from the front-panel or remotely, or until the hard drive is changed or reformatted.

**Parameters**

<bool> Choose from:

- **ON (1)** Enables the touchscreen.
- **OFF (0)** Disables the touchscreen.

**Examples**

```
SYST:TOUC 1
system:touchscreen:state OFF
```

**Query Syntax**

SYSTem:TOUCHscreen[:STATe]?

**Return Type**

Boolean

**Default**

ON when shipped from factory.

**SYSTem:UPReset**

(Write-only) Performs a User Preset. There must be an active User Preset state file (see **Load** and **Save**) or an error will be returned. Learn more about User Preset.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the PNA to the factory preset settings, and **SYST:UPReset** will always perform a User Preset.

**Examples**

```
SYST:UPReset
system:upreset
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

**SYSTem:UPReset:FPANel[:STATe] <bool>**
(Read-Write) 'Checks' and 'clears' the enable box on the User Preset dialog box. This only affects subsequent Presets from the front panel user interface.

Regardless of the state of the User Preset Enable checkbox, the `SYST:PRESet` command will always preset the PNA to the factory preset settings, and `SYST:UPReset` will always perform a User Preset.

**Parameters**

<bool> Front Panel User Preset State. Choose from:

0 User Preset OFF

1 User Preset ON

**Examples**

```
SYST:UPR:FPAN 1
system:upreset:fpanel:state 0
```

**Query Syntax**

`SYSTem:UPReSet:FPANel[:STATe]`?

**Return Type**

Boolean

**Default**

0

---

**SYSTem:UPReSet:LOAD[:FILE] <file>**

(Write-only) Loads an existing instrument state file (.sta or .cst) to be used for User Preset. Subsequent execution of `SYSTem:UPReSet` will cause the PNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `SYST:PRESet` command will always preset the PNA to the factory preset settings, and `SYST:UPReSet` will always perform a User Preset.

**Learn more about User Preset.**

**Parameters**

<file> String - Name of the file to be loaded. The default folder "C:/Program Files/Agilent/Network Analyzer/Documents" is used if unspecified. Change the default folder name using `MMEMory:CDIRectory`.

**Examples**

```
SYST:UPR:LOAD '1MHzto20GHzUserPreset.cst'
```

system:upreset:load:file 'C:/Documents and Settings/Administrator/My Documents/NewUserPreset.cst'

**Query Syntax**

Not Applicable

**Default**

Not Applicable
**SYSTem:UPReset:SAVE[:STATe]**

*(Write-only)* Saves the current instrument settings as UserPreset.sta. Subsequent execution of `SYSTem:UPReset` will cause the PNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `SYST:PRESet` command will always preset the PNA to the factory preset settings, and `SYST:UPReset` will always perform a User Preset. Learn more about User Preset.

**Examples**

- `SYST:UPR:SAVE`
- `system:upreset:save:state`

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SYSTem:WINDows:CATalog?**

*(Read-only)* Returns the numbers of window that are currently being used.

**Examples**

- `SYST:WIND:CAT?`
- `system:windows:catalog?`

**Return Type** String of comma-separated numbers.

For example: "1,2"

**Default** Not Applicable

---

**Last modified:**

- **11-Jan-2011**  Minor edit
- **4-Nov-2010**  Security for external sources (9.33)
- **14-Oct-2010**  Added note to PMET:CAT?
- **16-Sep-2010**  Added channel delete (A.09.30)
- **9-Apr-2010**  Added Preset note to 'unleveled' command
- **30-Nov-2009**  Added Help About read commands(9.1)
- **30-Jul-2009**  Added syst:conf:edev and RTOF (9.0)
- **24-Feb-2009**  Added Chan:Coup; Replaced True/False
- **4-Nov-2008**  Added FIFO (8.33)
- **30-Oct-2008**  Added several meas/trace/window query commands (8.33.x)
- **29-Sep-2008**  Removed rev from Psensor example
- **17-Sep-2008**  Added Syst:Pres vs *RST note

Example: Configure a PMAR Device

**SYST:PREF:ITEM:EDEV:DPOL** - Determines whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

Synchronizing the PNA and Controller

SCPI Command Tree

---

**SYSTem:CONFigure:EDEVice:ADD <name>**

*(Write-only)* Adds an external device to the list of configured devices. This is the same as pressing **New** on the **Select an External Device** dialog.

Upon creation, all settings on the new device are set to the defaults. The device is not active until set using **SYST:CONF:EDEV:STAT**

**Parameters**

- `<name>` String - Model and type of the external device.

To see a list of configured external devices, use **SYST:CONF:EDEV:CAT?**

**Examples**

```
SYST:CONF:EDEV:ADD "myDevice"
```

```
system:configure:edev:add "myDevice"
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SYSTem:CONFigure:EDEVice:CAT?**
(Read-only) Returns a list of names of all configured devices. These are devices that appear in the External Devices dialog.

Use `SENS:FOM:CAT?` to report all active devices.
Use `Source:CAT?` to report all active sources.

**Parameters**

None

**Example**

```
SYST:CONF:EDEV:CAT?
```
```
system:configure:edevice:cat
```

**Return Type**

String of comma-separated devices. "name,name"

**Default**

Not applicable

---

**SYSTem:CONFigure:EDEVice:DRIVer <name>,<value>**

(Read-Write) Sets and returns the external device driver (model).

**Parameters**

- `<name>` String - Name of the device.
- `<value>` String - External device driver (model). Choose from the following:
  - `AGPM` for all power meters.
  - See a list of supported external source drivers.

**Examples**

```
SYST:CONF:EDEV:DRIV "myDevice","AGPM"
```
```
system:configure:edevice:driver "myDevice","AGESG"
```

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:DRIVer? <name>
```

**Return Type**

String

**Default**

"AGGeneric"

---

**SYSTem:CONFigure:EDEVice:DTYPE <name>,<type>**
**SYSTem:CONFigure:EDEVice:DTYPe <name>,<type>**

*(Read-Write)* Sets and returns the Device Type for the external device.

**Parameters**

- `<name>`: String - Name of the device to modify.
- `<type>`: String - Device type - not case sensitive. Choose from:
  - "Source" - external source
  - "Power Meter" - power meter

**Examples**

- `SYST:CONF:EDEV:DTYP "myDevice","Power Meter"

**Query Syntax**

- `SYSTem:CONFigure:EDEVice:DTYPe? <name>`

**Return Type**

- String

**Default**

- None

---

**SYSTem:CONFigure:EDEVice:IOConfig <name>,<value>**

*(Read-Write)* Sets and return the configuration path for the specified external device.

**Parameters**

- `<name>`: String - Name of the device.
- `<value>`: String - Configuration path. Any valid VISA resource shown in the IO Configuration field of the External Devices dialog, enclosed in quotes.
  
  Do NOT use the ID string of a PMAR USB power sensor as the resource string. The ID string is returned by `SYST:COMM:USB:PMET:CAT`?

**Examples**

- `SYST:CONF:EDEV:IOC "myDevice","GPIB0::13::INSTR"

**Query Syntax**

- `SYSTem:CONFigure:EDEVice:IOConfig? <name>`

**Return Type**

- String

**Default**

- " " Empty String

---

**SYSTem:CONFigure:EDEVice:IOENable <name>,<value>**
Enable or disable communication with an external device. When attempting to enable a device, the PNA-X will verify communication with the device. An error will result if communication cannot be verified. Generally, an external device should only be enabled after all other configuration settings have been made. Learn more.

**Parameters**

- `<name>` String - Name of the device.
- `<value>` Boolean - Choose from:
  - OFF or 0 - Device communication enabled
  - ON or 1 - Device communication disabled

**Examples**

```bash
SYST:CONF:EDEV:IOEN "myDevice", ON
system:configure:edevice:ioenable "myDevice", 0
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:IOENable? <name>

**Return Type**

Boolean

**Default**

ON

---

**SYSTem:CONFigure:EDEVice:REMove <name>**

(Write-only) Removes the specified device from the list of configured devices. If the device is a Source and both Active and I/O Enabled is checked (ON), then the RF power state is set to OFF. Learn more.

**Parameters**

**Examples**

```bash
SYST:CONF:EDEV:REM "myDevice"
system:configure:edevice:remove "myDevice"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SYSTem:CONFigure:EDEVice:STATe <name>,<value>**

(Read-Write) Set and return the state of activation of the device. Learn more.
Send this command AFTER sending other External Device settings (especially SYST:CONF:EDEV:DTYP) to avoid communicating with the device before it has been fully configured.
See Also: SYST:PREF:ITEM:EDEV:DPOL - Determines whether External Devices remain activated or are de-activated when the PNA is Preset or when a Instrument State is recalled.

Parameters

- `<name>`: String - Name of the device.
- `<value>`: Boolean - Choose from:
  - OFF or 0 - Device is NOT activated
  - ON or 1 - Device is activated.

Examples

SYST:CONF:EDEV:STAT "myDevice", ON
system:configure:edevice:state "myDevice", 0

Query Syntax

SYSTem:CONFigure:EDEVice:STATe? <name>

Return Type

Boolean

Default

OFF - When configured using the front panel user interface, the device is ON (activated) by default.

SYSTem:CONFigure:EDEVice:TOUT <name>,<value>

(Read-Write) Set and return the time out value for the specified external device. This is the time allowed for communication with the device before an error is generated.

Parameters

- `<name>`: String - Name of the device.
- `<value>`: Time out value in seconds.

Examples

SYST:CONF:EDEV:TOUT "myDevice", 2
system:configure:edevice:tout "myDevice", 5

Query Syntax

SYSTem:CONFigure:EDEVice:TOUT? <name>

Return Type

Numeric
**SYSTem:CONFigure:EDEVice:SOURce:DPP <name>,<value>**

*(Read-Write)* Sets and returns the amount of time the PNA should wait after for an external source to settle before making a measurement at each data point. This setting applies to all channels that use this external source.

**Parameters**

- `<name>`  String - Name of the device.
- `<value>` Dwell time in seconds.

**Examples**

```
sYST:CONF:EDEV:SOUR:DPP "myDevice",2
system:configure:edevice:source:dpp "myDevice",.1
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:SOURce:DPP? <name>

**Return Type** Numeric

**Default** 3.114 e-3

---

**SYSTem:CONFigure:EDEVice:SOURce:TMODe <name>,<value>**

*(Read-Write)* Sets and returns the trigger mode for an external source. Learn more.

**Parameters**

- `<name>`  String - Name of the device.
- `<value>` Trigger Mode. Choose from:
  - CW - Software CW mode
  - HW - Hardware list mode

**Examples**

```
system:configure:edevice:source:tmode HW,"myDevice"
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:SOURce:TMODe? "myDevice"

**Return Type** Character
**SYSTem:CONFigure:EDEVice:SOURce:TPORt <name>,<value>**

(Read-Write) Sets and returns the PNA port through which an external source is to be triggered.

**Parameters**

- **<name>** String - Name of the device.
- **<value>** Trigger Port. Choose from:
  - For PNA 'C' models, choose `bnc1`
  - For PNA-X models, choose from `aux1` or `aux2`

**Examples**

```
SYST:CONF:EDEV:SOUR:TPOR "myDevice",bnc1
system:configure:edevice:source:tmode "myDevice",aux1
```

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:SOURce:TMODe? <name>
```

**Return Type** Character

**Default** For PNA 'C' models - `bnc1`
For PNA-X models - `aux1`

---

**SYSTem:CONFigure:EDEVice:PMAR:FLIMit <name>,<value>**

(Read-Write) Enable or disable the power meter min and max frequencies.

**Parameters**

- **<name>** String - Name of the power meter.
- **<value>** Boolean. State of min and max frequency. Choose from:
  - `OFF` or `0` - Min and max frequencies disabled.
  - `ON` or `1` - Min and max frequencies enabled.

**Examples**

```
SYST:CONF:EDEV:PMAR:FLIM "myDevice", 0
system:configure:edevice:pmar:flimit "myDevice", ON
```

See example program
SYSTem:CONFigure:EDEVice:PMAR:FMAXimum <name>,<value>

(Read-Write) Set and return the maximum frequency of the power meter.

Parameters

- `<name>` String - Name of the power meter.
- `<value>` Numeric - Max frequency in Hz.

Examples

```
SYST:CONF:EDEV:PMAR:FMAX "myDevice", 1e10
system:configure:edev:pmar:fmaximum "myDevice", 3e9
```

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:FMINimum? <name>
(Read-Write) Set and return the minimum frequency of the power meter.

**Parameters**

- `<name>` String - Name of the power meter.
- `<value>` Numeric - Min frequency in Hz.

**Examples**

```
SYST:CONF:EDEV:PMAR:FMIN "myDevice", 1e10
system:configure:edevice:pmar:fminimum "myDevice", 3e9
```

See example program

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:PMAR:FMAXimum? <name>
```

**Return Type**

Numeric

**Default** Not Applicable

---

**SYSTem:CONFigure:EDEVice:PMAR:READing:COUNt <name>,<value>**

(Read-Write) This command, along with SYST:CONF:EDEV:PMAR:READ:NTOL, allows for settling of the power sensor READINGS.

Set and return the maximum number of power readings that are taken at each stimulus point to allow for measurement settling. Each reading is averaged with the previous readings at that stimulus point.

When this average meets the Average:NTOLerance value or this number of readings has been made, the average is returned as the valid reading.

**Parameters**

- `<name>` String - Name of the power meter.
- `<value>` Number of readings. Choose a value between 1 and 25

**Examples**

```
```

See example program

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:PMAR:READing:COUNt? <name>
```

**Return Type**

Numeric
SYSTem:CONFigure:EDEVice:PMAR:READing:NTOLerance <name>,<value>

(Read-Write) This command, along with SYST:CONF:EDEV:PMAR:READ:COUN, allows for settling of the power sensor READINGS.
Each power reading is averaged with the previous readings at each stimulus point. When the average meets this nominal tolerance value, or the max number of readings has been made, the average is returned as the valid reading.

Parameters

<name>  String - Name of the power meter.
<value>  Power measurement settling tolerance value in dB. Choose any number between 0 and 5.

Examples
system:configure:edevice:pmar:reading:ntolerance "myDevice", .01
See example program

SYSTem:CONFigure:EDEVice:PMAR:SENSor <name>,<value>

Query Syntax SYSTem:CONFigure:EDEVice:PMAR:READing:NTOLerance? <name>
Return Type Numeric

Default .05
(Read-Write) Sets and returns the power sensor channel (1 or 2) to be used. This performs the same function as the Use this sensor only checkbox.

**Parameters**

- **<name>** String - Name of the power meter.
- **<value>** Power Meter channel.
  - 1 - Channel A
  - 2 - Channel B

**Examples**

```markdown
SYST:CONF:EDEV:PMAR:SENS "myDevice",2
system:configure:edevice:pmar:sensor "myDevice",1
```

See example program

**Query Syntax**

```markdown
SYSTem:CONFigure:EDEVice:PMAR:TABLe:CFAC:DATA <name>,<value>[,.value]
```

**Return Type** Numeric

**Default** 1

---

**SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:DATA <name>,<value>[,.value]**

(Read-Write) Sets and returns the cal factor data for the power sensor.

**Parameters**

- **<name>** String - Name of the power meter.
- **<value>[,.value]** Cal factor data in percent. For each frequency used with SYST:CONF:EDEV:PMAR:TABLE:CFAC:FREQ, enter a cal factor number between 1 and 100.

**Examples**

```markdown
system:configure:edevice:pmar:table:cfac:data "myDevice", 97,97,97
```

See example program

**Query Syntax**

```markdown
SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:DATA? <name>
```

**Return Type** Numeric - one number per table segment.
SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:FREQuency <name>,<value> [,value]

(Read-Write) Sets and returns the cal factor frequencies for the power sensor.

**Parameters**

*<name>*  
String - Name of the power meter.

*<value> [,value]*  
Cal factor frequencies in Hz.

**Examples**

```
SYST:CONF:EDEV:PMAR:TAB:CFAC:FREQ "myDevice", 1e7, 1e8, 1e9
```

```
SYSTEM:CONFIGURE:EDevice:PMAR:TABLE:CFAC:FREQuency "myDevice", 5e7, 5e8, 5e9
```

See example program

**Query Syntax**

SYStem:CONFigure:EDEVice:PMAR:TABLE:CFAC:FREQuency? <name>

**Return Type**

Numeric - one number per table segment.

**Default**

Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:TABLE:LOSS:DATA <name>,<value> [,value]

(Read-Write) Sets and returns the power loss data for the power sensor.

**Parameters**

*<name>*  
String - Name of the power meter.

*<value> [,value]*  
Loss data in dB. POSITIVE values in dB are interpreted as LOSS. To compensate for gain, use negative values.

For each frequency used with SYST:CONF:EDEV:PMAR:TABLE:LOSS:FREQ, enter a cal factor number between 1 and 100.
SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:DATA "myDevice", .01, .02, .03

See example program

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:FREQuency <name>, <value>[,value]

(Read-Write) Sets and returns frequencies for the power loss data.

Parameters

- <name>  String - Name of the power meter.
- <value>[,value]  Power Loss frequencies in Hz.

Examples  SYST:CONF:EDEV:PMAR:TABL:LOSS:FREQ "myDevice", 1e7, 1e8, 1e9
  system:configure:edevice:pmar:table:loss:frequency "myDevice", 5e7, 5e8, 5e9
  See example program

Query Syntax  SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:FREQuency? <name>

Return Type  Numeric - one number per table segment.

Default  Not Applicable

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:STATe <name>, <value>
(Read-Write) Sets and returns whether to use the power loss table.

**Parameters**

- `<name>`  String - Name of the power meter.
- `<value>`  Boolean. State of the power loss table. Choose from:
  - OFF or 0 - Power loss table not used.
  - ON or 1 - Power loss table used.

**Examples**

```
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:STATe? <name>

**Return Type**

Boolean

**Default**

OFF

---

**SYSTem:CONFigure:EDEVice:PMAR:TABLe:RFACtor <name>,<value>**

(Read-Write) Sets and returns the reference cal factor for the power sensor.

Note: If the sensor connected to the power meter contains cal factors in EPROM (such as the Agilent E-series power sensors), those will be the cal factors used. The reference cal factor value associated with this command, and any cal factors entered into the PNA for that sensor channel, will not be used.

**Parameters**

- `<name>`  String - Name of the power meter.
- `<value>`  Reference cal factor in percent. Choose any number between 1 and 150.

**Examples**

```
SYST:CONF:EDEV:PMAR:TABL:RFAC "myDevice", 1
system:configure:edevice:pmar:table:rfactor "myDevice", 1
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:RFACtor? <name>

**Return Type**

Numeric
Last Modified:

14-Oct-2010  Added note to IOConfig
24-Mar-2010  Fixed configure and added Remove
15-Jan-2010  Added "AG" to driver example

**TRIGger:AUXiliary:COUNt?**

(Read-only) Returns the number of AUX trigger input / output connector pairs in the instrument.

- PNA-X = 2
- E836xB and PNA-L models = 1

**Parameters**

**Examples**

```
TRIG:AUX:COUN?
```

```
trigger:auxiliary:count?
```

**Return Type** Numeric

**Default** Not Applicable

**TRIGger:CHANnel<ch>:AUXiliary<n>:DELay <num>**
**(Read-Write)** Specifies the delay that should be applied by the PNA after the Aux trigger input is received and before the acquisition is made.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connectors used to send or receive signals.

  - PNA-X - choose from 1 *(AUX TRIG 1 IN)* or 2 *(AUX TRIG 2 IN)*
  
  - All other models: choose 1.

  If unspecified, value is set to 1.

- `<num>` Delay value in seconds. Choose a value between 0 and 3.0 seconds.

**Examples**

```
TRIG:CHAN:AUX:DEL .5
```

```
trigger:channel2:aux2:delay 1.5
```

**Query Syntax**

`TRIGger:CHANnel<ch>:AUXiliary<n>:DELay?`

**Return Type** Numeric

**Default** 0

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:DURation <num>**

**(Read-Write)** Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.

  - PNA-X - choose from 1 *(AUX TRIG 1)* or 2 *(AUX TRIG 2)*
  
  - All other models: choose 1. *(BNC Trig I/O)*

  If unspecified, value is set to 1.

- `<num>` Duration value in seconds. Choose a value between 1us (1E-6) and 1

**Examples**

```
TRIG:CHAN:AUX:DUR .1
```

```
trigger:channel2:aux2:duration .01
```

**Query Syntax**

`TRIGger:CHANnel<ch>:AUXiliary<n>:DURation?`
**TRIGger:CHANnel<ch>:AUXiliary<n>[:ENABle] <bool>**

(Read-Write) Turns ON / OFF the trigger output.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.
  - PNA-X - choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - All other models: choose 1. (BNC Trig I/O)
  If unspecified, value is set to 1.
- `<bool>` ON (or 1) - turns trigger output ON.
  OFF (or 0) - turns trigger output OFF.

**Examples**

```
TRIG:CHAN:AUX 1
trigger:channel2:aux2:enable off
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>[:ENABle]?

**Return Type** Boolean

**Default** OFF

**TRIGger:CHANnel<ch>:AUXiliary<n>:HANDshake <bool>**
(Read-Write) Turns handshake ON / OFF.

To enable handshake, the main trigger enable must also be set using `TRIG:CHAN:AUX:ENAB`.

When ON, PNA waits indefinitely for the input line to be asserted before continuing with the acquisition. When OFF, the PNA acquires data without waiting.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.
  - PNA-X - choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - All other models: choose 1. (BNC Trig I/O)

  If unspecified, value is set to 1.
- `<bool>` ON (or 1) - turns handshaking ON.
  
  OFF (or 0) - turns handshaking OFF.

**Examples**

```
TRIG:CHAN:AUX:HAND 1
trigger:channel2:aux2:handshake off
```

**Query Syntax**

`TRIGger:CHANnel<ch>:AUXiliary<n>:HANDshake?`

**Return Type**

Boolean

**Default**

OFF

```
TRIGger:CHANnel<ch>:AUXiliary<n>:INTerval <char>
```
(Read-Write) Specifies how often a trigger output signal is sent.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.

- PNA-X - choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
- All other models: choose 1. (BNC Trig I/O)

If unspecified, value is set to 1.

- `<char>` Choose from:
  - **POINT** Trigger signal is sent every data point. (effectively the same as **Point sweep**)
  - **SWEep** Trigger signal is sent once every sweep.

**Examples**

```
TRIG:CHAN:AUX:INT POI
```

```
trigger:channel2:aux2:interval sweep
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:INTerval?

**Return Type** Character

**Default** SWEep

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:IPOLarity  <char>**

(Read-Write) Specifies the polarity of the trigger IN signal to which the PNA will respond.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.

- PNA-X - choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
- All other models: choose 1. (BNC Trig I/O)

If unspecified, value is set to 1.

- `<char>` Choose from:
  - **POSitive** PNA responds to leading edge or HIGH level
- **NEGative**  PNA responds to trailing edge or LOW level.

Set Edge or Level triggering using `TRIG:CHAN:AUX:TYPE`

**Examples**

<table>
<thead>
<tr>
<th>TRIG:CHAN:AUX:IPOL POS</th>
</tr>
</thead>
<tbody>
<tr>
<td>trigger:channel2:aux2:ipolarity negative</td>
</tr>
</tbody>
</table>

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:IPOLarity?

**Return Type**

Character

**Default**

NEGative

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:OPOLarity <char>**

(Read-Write)  Specifies the polarity of the Aux Output signal being supplied by the PNA.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<n>`  Rear panel connector used to send or receive signals.

- PNA-X - choose from 1  *(AUX TRIG 1)*  or 2  *(AUX TRIG 2)*
- All other models: choose 1. *(BNC Trig I/O)*

If unspecified, value is set to 1.

- `<char>`  Choose from:

  - **POSitive**  PNA sends positive going pulse.
  - **NEGative**  PNA sends negative going pulse.

**Examples**

<table>
<thead>
<tr>
<th>TRIG:CHAN:AUX:OPOL NEG</th>
</tr>
</thead>
<tbody>
<tr>
<td>trigger:channel2:aux2:opolarity positive</td>
</tr>
</tbody>
</table>

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:OPOLarity?

**Return Type**

Character

**Default**

NEGative

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:POSition <char>**
(Read-Write) Specifies whether the aux trigger out signal is sent BEFore or AFTer the acquisition.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.
  - PNA-X - choose from 1 *(AUX TRIG 1)* or 2 *(AUX TRIG 2)*
  - All other models: choose 1. *(BNC Trig I/O)*

If unspecified, value is set to 1.

- `<char>` Choose from:
  - **BEFore** Use if the external device needs to be triggered before the data is acquired, such as a power meter.
  - **AFTer** Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the PNA.

**Examples**

```
TRIG:CHAN:AUX:POS BEF
```

```
trigger:channel2:aux2:position after
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:POSition?

**Return Type**

Character

**Default**

AFTer

```
TRIGger:CHANnel<ch>:AUXiliary<n>:TYPE <char>
```
(Read-Write) Specifies the type of Aux input detection that the PNA will employ.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Rear panel connector used to send or receive signals.
  - PNA-X - choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - All other models: choose 1. (BNC Trig I/O)

If unspecified, value is set to 1.

- `<char>` Choose from:
  - **EDGE** PNA responds to the leading edge of a signal
  - **LEVEL** PNA responds to the level (HIGH or LOW) of a signal

**Examples**

```
TRIG:CHAN:AUX:TYPE EDGE
trigger:channel2:aux2:type level
```

**Query Syntax**

```
TRIGger:CHANnel<ch>:AUXiliary<n>:TYPE?
```

**Return Type**
Character

**Default**
EDGE

---

**TRIGger:CHANnel<ch>:ROUTE:INPut <char>**

(Read-Write) Specifies the connector to use for the external trigger input. (Similar to **CONTROL:SIGNal <conn>**)

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Choose from:
  - **MAIN** - meas trig ready
  - **MATH** - material handler
  - **AUXT** - auxio (PNA-L and E836xB ONLY)

**Examples**

```
TRIG:CHAN:ROUT:INPut MAIN
trigger:channel2:route:input main
```

**Query Syntax**

```
TRIGger:CHANnel<ch>:ROUTE:INPut?
```

2900
**Return Type** Character

**Default** PNA model dependent

---

**TRIGger:CHANnel<ch>:ROUTE:READy <char>**

*(Read-Write)* Specifies the connector to use for the external trigger OUT ready line.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Choose from:
  - **MAIN** - Meas trig ready
  - **MATH** - Material handler pin 21
  - **AUXT** - AUX I/O pin 18 (PNA-L and E836xB ONLY)

**Examples**

```
TRIG:CHAN:ROUT:READ main
trigger:channel2:route:ready auxt
```

**Query Syntax**

`TRIGger:CHANnel<ch>:ROUTE:READy?`

**Return Type** Character

**Default** PNA model dependent

---

**TRIGger:DELay <num>**

*(Read-Write)* Sets and reads the trigger delay for ALL channels (globally). This delay is only applied while **TRIG:SOURce** = EXTernal and **TRIG:SCOP** = ALL. After an external trigger is applied, the start of the sweep is held off for an amount of time equal to the delay setting plus any inherent latency.

To apply a trigger delay for the specified channel ONLY, use **SENS:SWE:TRIG:DELay**

**Parameters**

- `<num>` Delay value in seconds. Choose from 0 to 107.

**Examples**

```
TRIG:DEL .0003
```

Sets the trigger delay to 300 microseconds. The sweep will not start until approximately 300 microseconds after an external trigger is applied.

**Query Syntax**

`TRIGger:DELay?`

**Return Type** Numeric
**TRIGger:PREFerence:AIGLobal <bool>**

(Read-Write) Sets the Trigger OUT behavior to either Global or Channel. [Learn more about this setting.](#)

This command will cause the PNA to Preset.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

To send this command using the PNA front panel, open the **GPIB Command Processor Console**, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the PNA took the command.

**Parameters**

<bool>  Choose from:

- **ON** (or 1) - Trigger properties apply to ALL channels (Global).
  - Allows use of **CONT:SIGNal** command to configure the external trigger properties.
  - "Per Point" trigger property is not settable. Use the channel's **Point trigger** setting.
  - Default setting for E836xB and PNA-L models.

- **OFF** (or 0) - External Trigger properties apply to each channel independently.
  - Must use **TRIG:CHAN:AUX** commands to configure the external trigger properties. **CONT:SIGNal** will NOT work.
  - "Per Point" trigger output property is set using the channel's **Point trigger** setting **AND** **TRIG:CHAN:AUX:INTerval**.
  - Default setting for PNA-X models.

**Examples**

```
TRIG:PREF:AIGL 1
```

```
trigger:preference:aiglobal 0
```

**Query Syntax**

TRIGger:PREFerence:AIGLobal?

**Return Type**  Boolean

---

**Default**  0
**Default**  
1 - E836xB and PNA-L models  
0 - PNA-X models

**TRIGger:READy:POLarity <char>**  
(Read-Write) Specifies the polarity of Ready for Trigger output.

All existing Ready for Trigger outputs for PNA-X and PNA-L models are configured simultaneously with this command. [See Capabilities Summary](#).

The Ready for Trigger polarity can NOT be configured for E836x models.

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<char>`
  - **LOW** - Outputs a TTL low when the PNA is ready for trigger.
  - **HIGH** - Outputs a TTL high when the PNA is ready for trigger.

**Examples**
- `TRIG:READ:POL HIGH`
- `trigger:ready:polarity low`

**Query Syntax**
- `TRIGger:READy:POLarity?`

**Return Type**
- Character

**Default** Low

---

**TRIGger[:SEQuence]:LEVel <char> - Superseded**

This command is replaced with [CONTrol:SIGNal](#).

(Read-Write) Triggers either on a High or Low level trigger signal. This setting only has an effect when TRIG:SOURce EXTERNAL is selected.

**Parameters**
- `<char>` Choose from:
  - **HIGH** - analyzer triggers on TTL High
  - **LOW** - analyzer triggers on TTL Low

**Examples**
- `TRIG:LEV HIGH`
- `trigger:sequence:level low`

**Query Syntax**
- `TRIGger[:SEQuence]:LEVel?`
**TRIGger[:SEQuence]:SCOPe <char>**

(Read-Write) Specifies whether a trigger signal is sent to all channels or only the current channel.

See [Triggering the PNA using SCPI](#).

**Parameters**

<char> Choose from:

- **ALL** - trigger signal is sent to all channels. Also sets SENS:SWEep:TRIG:POINT OFF on ALL channels.
- **CURRENT** - trigger signal is sent to only one channel at a time. With each trigger signal, the channel is incremented to the next triggerable channel.

**Examples**

TRIG:SCOP ALL
TRIGGER:SEQUENCE:SCOPE CURRENT

**Query Syntax**

TRIGger[:SEQuence]:SCOPe?

**Return Type** Character

**Default** ALL

---

**TRIGger[:SEQuence]:SLOPe <char>**

(Read-Write) Specifies the polarity expected by the external trigger input circuitry. Also specify TRIG:TYPE (Level |Edge).

See [Triggering the PNA using SCPI](#).

**Parameters**

<char> Choose from:

- **POSitive** (rising Edge) or High Level
- **NEGative** (falling Edge) or Low Level

**Examples**

TRIG:SLOP NEG
TRIGGER:SEQUENCE:SLOPE POSITIVE

**Query Syntax**

TRIGger[:SEQuence]:SLOPe?

**Return Type** Character
**TRIGger[:SEQuence]:SOURce <char>**

(Read-Write) Sets the source of the sweep trigger signal. This command is a super-set of
INITiate:CONTinuous which can NOT set the source to External. To configure external triggering,
see CONTrol:SIGNal.

See Triggering the PNA using SCPI.

**Parameters**

<char> Choose from:

- **EXTernal** - external (rear panel) source.
- **IMMediate** - internal source sends continuous trigger signals
- **MANual** - sends one trigger signal when manually triggered from the front panel or INIT:IMM is sent.

**Examples**

| TRIG:SOUR EXT trigger:sequence:source immediate |

**Query Syntax**

TRIGger[:SEQuence]:SOURce?

**Return Type**

Character

**Default** IMMEDIATE

---

**TRIGger:TYPE <char>**

(Read-Write) Specifies the type of EXTERNAL trigger input detection used to listen for signals on
the Ext I/O Trig and Meas Trig IN connectors. Edge triggers are most commonly used.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1.

<char> Choose from:

- **EDGE** PNA responds to the rising and falling edge of a signal.
- **LEVel** PNA responds to a level (HIGH or LOW).

Use TRIG:SLOPe to specify Rising or falling - High or Low.
### Examples

<table>
<thead>
<tr>
<th>TRIG:TYPE EDGE</th>
</tr>
</thead>
</table>

| trigger:type level |

### Query Syntax

TRIGger:TYPE?

### Return Type

Character

### Default

EDGE

---

Catalog Measurements using SCPI

This Visual Basic Program does the following:

- Catalogs the currently defined measurements, windows, and traces
- Selects a measurement for further definition
- Adds a Title to the window

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

```vbs
Dim Meas as String
Dim Win as String
Dim Trace as String

' Read the current measurements in Channel 1
GPIB.Write "CALCulate1:PARameter:CATalog?"
Meas = GPIB.Read
MsgBox ("Ch1 Measurements: " & Meas)

' Read the current windows
GPIB.Write "DISPlay:CATalog?"
Win = GPIB.Read
MsgBox ("Windows: " & Win)

' Read current traces in window 1
GPIB.Write "DISPlay:WINDow1:CATalog?"
Trace = GPIB.Read
MsgBox ("Traces in Window1: " & Win)
```
Channels, Windows, and Measurements using SCPI

SOURce and most SENSSe commands act on the channel that is specified in the command. Channel 1 is default if not specified.

Most DISPPlay commands act on the window and trace specified in the command. Window1 and Trace1 are default if not specified.

CALCulate commands act on the selected measurement in the specified channel. Select the measurement for each channel using CALCulate<channel number>:PARameter:SELect <meas name>. You can select one measurement in each channel.

The following Visual Basic program does the following:

- Presets the analyzer
- Create 2 windows
- Create 2 Measurements
- Feed the measurements to windows / traces
- Change frequency ranges for channels
- Select both measurements
- Turn marker 1 ON for each measurement

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

GPIB.Write "SYSTem:PRESet"

'Create Measurements
GPIB.Write "CALCulate1:PARameter:DEFine:EXT 'Meas1',S11"
GPIB.Write "CALCulate2:PARameter:DEFine:EXT 'Meas2',S21"

'Turn on windows - creates if new
GPIB.Write "DISPlay:WINDow1:STATE ON"
GPIB.Write "DISPlay:WINDow2:STATE ON"

'Associate ("FEED") the measurement name('Meas1') to WINDow(1), and give the new TRACe a number(1).
GPIB.Write "DISPlay:WINDow1:TRACe1:FEED 'Meas1'"
GPIB.Write "DISPlay:WINDow2:TRACe2:FEED 'Meas2'"

'Change each channel's frequency range
GPIB.Write "SENSe1:FREQuency:SPAN 1e9"
GPIB.Write "SENSe2:FREQuency:SPAN 2e9"
Select both measurements
GPIB.Write "CALCulate1:PARameter:SELect 'Meas1'"
GPIB.Write "CALCulate2:PARameter:SELect 'Meas2'"

Turn marker 1 ON for each measurement
GPIB.Write "CALCulate1:MARKer:STATE ON"
GPIB.Write "CALCulate2:MARKer:STATE ON"
PNA as Controller and Talker / Listener

This Visual Basic Program uses VISA to do the following:

- Control the PNA using a VISA LAN Client interface on the PNA.
- Control another instrument using the PNA as GPIB controller.
- Queries both the analyzer and other instrument to identify themselves with *IDN?

Note: This program can be modified to work from a remote PC to control both instruments. In that case, set up the PNA to be a talker/listener.

To run this program, you need to do the following:

- Add module visa32.bas to the VB project. It is located on the analyzer at C:/Program Files/HP/VXIPNP/WINNT/Include/VISA32.bas
- Configure the PNA for VISA / SICL
- Set up the PNA to be GPIB system controller.
  1. On the System menu, point to Configure. Click SICL / GPIB
  2. Click System Controller
- Connect another instrument to the analyzer through a GPIB cable with Primary address of 13 on GPIB0 interface

See Other SCPI Example Programs

Sub main()

' This application run from onboard the PNA
' can control both the PNA and another GPIB instrument.
'
' To run this program the module visa32.bas must be added
' to the project.

'VISA function status return code
Dim status As Long

Create a Balanced Measurement using SCPI

This example program does the following:

- creates several Balanced measurements in separate windows
- generates markers
- calculates statistics
- sets limit lines and queries results
- queries a measurement to determine if we have a balanced parameter and what type it is.

**Note:** By their nature, balanced measurements are extremely sensitive to phase differences between the two RF paths that make up the balanced port, especially at higher frequencies. A good calibration (not performed in this example) is critical to achieving good balanced measurement results.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Balanced.vbs. Learn how to setup and run the macro.

### See Other SCPI Example Programs

```vbscript
Dim app
Dim scpi

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

Create a Measurement using SCPI

This VBScript program creates a new S21 measurement and displays it on the PNA screen.
The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.
This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as NewMeas.vbs. Learn how to setup and run the macro.

See Other SCPI Example Programs

Dim app
Dim scpi
' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' A comment
'Preset the analyzer
scpi.Execute ("SYST:FPReset")
' Create and turn on window 1
scpi.Execute ("DISPlay:WINDow1:STATE ON")
'Define a measurement name, parameter
scpi.Execute ("CALCulate:PARameter:DEFine:EXT 'MyMeas',S21")
'Associate ("FEED") the measurement name ('MyMeas') to WINDow (1), and give the new TRACe a number (1).
scpi.Execute ("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")
Create a Narrowband Point-in-Pulse Measurement using the PNA-X

The following SCPI example demonstrates how to create a Narrowband Point-in-Pulse measurement using the Pulsed Application DLL on the PNA-X.

It first gets valid configuration settings and then uses those settings to configure the PNA and internal pulsed generators.

To run this program, you need:

- PNA-X
- Pulsed Application (Option H08)

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as PulseProfile.vbs. Learn how to setup and run the macro.

Note: Because of the long length of some commands in this example, word wrapping may occur when copying. These lines require modification after pasting.

Configure a PMAR Device

This VB Script program configures a new Power Meter as Receiver device and creates a trace using the PMAR. Learn more about Power Meter as a Receiver

These programs can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as PMAR.vbs. Learn how to setup and run the macro.

See all External Device Configuration commands

See Other SCPI Example Programs

Create a Swept IMDX Measurement

This program configures several Swept IMDx parameters using power sweep. In this configuration, tone power is swept from -20 dBm to -5 dBm while the Input, LO, and Output frequencies are fixed as follows:

- Input center freq= 2.50 GHz
- Tone Delta freq = 10 MHz (f1 = 2.495 GHz and f2 = 2.505 GHz).
- LO freq = 2.00 GHz
- Output freq = 4.50 GHz

This program also allows you to optionally load a .mxr file to perform mixer setup.

To run this program without error, an external source named 'PSG' must be connected to drive the LO.

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as IMDX.vbs. Learn how to setup and run the macro.

See all Swept IMD commands.
See all Mixer Setup commands.

Create a Wideband Pulsed Measurement using the PNA-X

This Visual Basic example shows you how to configure the PNA-X internal pulse generators and modulators to make wideband pulsed measurements in pulse profile mode using the PNA-X.

Visit the PNA website where you can download a free Wideband Pulsed Application that performs this measurement on the PNA-X.

See all SCPI Pulsed examples

Private Sub Form_Load()
Dim app
Dim scpi

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

'Preset the analyzer
scpi.Execute ("*RST")

'Set BW to 5 MHz
scpi.Execute ("SENS:BWID 5MHZ")

'Set sweep type to CW mode
scpi.Execute ("SENS:SWE:TYPE CW")

'Delete S11 trace
scpi.Execute ("DISP:WIND:TRAC1:DEL")

'Create S21 trace
scpi.Execute ("CALCulate:PARameter:DEFine:EXT 'MyMeas',S21")
scpi.Execute ("DISP:WIND:TRAC1:FEED 'MyMeas'")

'Set modulation source to Pulse1
scpi.Execute ("sens:path:conf:elem 'PulseModDrive','Pulse1'")

'Set power leveling mode to Openloop
scpi.Execute ("sour:pow1:alc:mode open")

'Enable pulse modulator 1
scpi.Execute ("sens:path:conf:elem 'Src1Out1PulseModEnable','Enable'")

'Set clock of internal pulse generator to internal
scpi.Execute ("sens:path:conf:elem 'PulseTrigInput','Internal'")

'Turn on Pulse0
scpi.Execute ("SENS:PULS0:STAT 1")
'Turn on Pulse1
scpi.Execute ("SENS:PULS1:STAT 1")
' Set pulse period to 1 ms
scpi.Execute ("sens:puls:per .001")
' Set Pulse1 width to 10 us
scpi.Execute ("sens:puls1:width 0.00001")
' Set Pulse1 delay to 8 us
scpi.Execute ("sens:puls1:delay 0.000008")
' Set Pulse0 width to 1 us
scpi.Execute ("sens:puls0:width 0.000001")
' Set Pulse0 delay to 400 ns
scpi.Execute ("sens:puls0:delay 0.0000004")
' Set trigger scope to Channel
scpi.Execute ("TRIG:SCOP CURRENT")

End Sub
Create an FOM Measurement

All three VBScript examples in this topic create a FOM measurement with the following attributes:

- Sweep the Source (input) from 1 GHz to 2 GHz
- Sweep the Receivers (output) from 2 GHz to 3 GHz
- You provide an LO at 1 GHz

Learn more about Frequency Offset Mode

These programs can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as FOM.vbs. Learn how to setup and run the macro.

See Other SCPI Example Programs

The following example will run on any PNA model with FOM (opt 080). However, these commands have no provisions for internal second source. It uses Sens:Offset commands introduced before 'enhanced FOM' was released for the A.07.10 release.

```
' This section gets the PNA application
' starts the scpi parser, and presets the PNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")
' Create and turn on window 1
scpi.Execute("DISPlay:WINDow1:STATE ON")
' Define a measurement name, parameter
scpi.Execute("CALCulate:PARameter:DEFine:EXT 'MyMeas',S21")
' Associate ("FEED") the measurement name ("MyMeas") to WINDow (1)
' and give the new TRACe a number (1).
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")

scpi.Execute("SENS:FREQ:START 1e9")
scpi.Execute("SENS:FREQ:STOP 2e9")
' set the receivers to be 2e9 -> 3e9
scpi.Execute("SENS:OFFS:OFFS 1e9")
scpi.Execute("SENS:OFFS ON")
```
The following example can be run ONLY on a PNA with revision A.07.10 or later and has FOM (opt 080). It uses new Sens:FOM commands.

```vba
' This section gets the PNA application
' starts the scpi parser, and presets the PNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")
' Create and turn on window 1
scpi.Execute("DISPlay:WINDow1:STATE ON")
' Define a measurement name, parameter
scpi.Execute("CALCulate:PARameter:DEFine 'MyMeas',S21")
' Associate ("FEED") the measurement name ('MyMeas') to WINDow (1), and give the new TRACe a number (1).
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")
scpi.Execute("SENS:FREQ:START 1e9")
scpi.Execute("SENS:FREQ:STOP 2e9")
' set the receivers to be 2e9 -> 3e9
scpi.Execute("SENS:FOM:RANG3:FREQ:OFFS 1e9")
scpi.Execute("SENS:OFFS ON")
```

The following example can be run ONLY on a PNA with a second internal source, has revision A.07.10 or later, and has FOM (opt 080). It uses the internal 2nd source for the fixed LO frequency.

```vba
' This section gets the PNA application
' starts the scpi parser, and presets the PNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")
' Create and turn on window 1
scpi.Execute("DISPlay:WINDow1:STATE ON")
' Define a measurement name, parameter
scpi.Execute("CALCulate:PARameter:DEFine 'MyMeas',S21")
' Associate ("FEED") the measurement name ('MyMeas') to WINDow (1), and give the new TRACe a number (1).
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")
```
scpi.Execute("SENS:FREQ:START 1e9")
scpi.Execute("SENS:FREQ:STOP 2e9")
' set the receivers to be 2e9 -> 3e9
scpi.Execute("SENS:FOM:RANG3:FREQ:OFFS 1e9")
' setup the 2nd source frequencies
scpi.Execute("SENS:FOM:RANG4:COUP 0")
scpi.Execute("SENS:FOM:RANG4:FREQ:START 1e9")
scpi.Execute("SENS:FOM:RANG4:FREQ:STOP 1e9")
' turn off coupling
scpi.Execute("SOUR:POW:COUP 0")
' set LO power to 10dBm
scpi.Execute("SOUR:POW3 10")
'turn ON port 3, our LO signal
scpi.Execute("SOUR:POW3:MODE ON")
scpi.Execute("SENS:FOM:STAT ON")
Create an iTMSA Measurement

This example program does the following:

- Create an iTMSA Balanced Sdd21 measurement
- Set sweep type = power
- Set phase offset on balanced port 1=180 degrees

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Balanced.vbs. Learn how to setup and run the macro.

See Other SCPI Example Programs

```vbs
Dim app
Dim scpi

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Reset the system
scpi.Parse("SYST:FPRESET")

' This example uses DUT topology Bal-Bal -
' a DUT with a True-mode balanced input and balanced output.

' Port mapping for our DUT:
' logical port 1 = physical ports 1 and 3
' logical port 2 = physical ports 2 and 4

' logical 1          logical 2
' 1 ------|   DUT   |------ 2 +
' 3 ------|_________|------ 4 -

' Turn on a window
scpi.Parse("DISP:WIND1:STATE ON")

' Create a trace called "sdd21", and for that trace turn on the balanced
```
transformation and set the balanced transformation to BBAL SDD21.

scpi.Parse("CALC:PAR:DEF:EXT ""sdd21"",S11")

' Feed the sdd21 trace to window 1, trace 1
scpi.Parse("DISP:WIND1:TRAC1:FEED ""sdd21""")
scpi.Parse("CALC:PAR:SEL ""sdd21""")

' Set the topology of measurement
scpi.Parse("CALC:FSIM:BAL:DEVice BBALanced")
scpi.Parse("CALC:FSIM:BAL:TOPology:BBAL:PPORts 1,3,2,4")

' Set up stimulus
scpi.Parse("SENS:SWE:POINts 801")
scpi.Parse("SENS:FREQ:STARt 10e6")
scpi.Parse("SENS:FREQ:STOP 1e9")
scpi.Parse("CALC:FSIM:BAL:PAR:STATe ON")

' Recall a 4-port Cal Set or perform a 4-port Cal here

' Set the sweep type to power sweep
scpi.Parse("SENS:SWE:TYPE POWer")

' Set iTMSA parameters
**Create an SMC Fixed Output Measurement**

This VB Script example creates a calibrated SMC fixed output measurement using an external, controlled LO. Then a single sweep is taken and data is retrieved. The external LO is NOT required when using the internal second PNA source for the LO.

Requirements:

- The external LO should be configured to match the SENS:MIX:LO:NAME command below.

Fixed output measurements require that an external LO source be swept and synchronized with the PNA source. FCA performs this synchronization using the external source configuration settings. See Configure an External Source using SCPI.

The fastest, and recommended, method of controlling the LO source is Hardware List (BNC) triggering mode. However, in this mode, FCA channels will not respond to manual triggers. Therefore, the example uses the following mechanism to trigger a sweep:

```plaintext
Write "SENS:SWE:MODE HOLD"   'place channel 1 in HOLD mode
Write "INIT:CONT ON"         'place PNA in internal trigger mode
Write "SENS:SWE:MODE SINGle  'place channel 1 in HOLD mode
Write "*OPC?"                'wait until the sweep is complete
Read
```

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You can run a VBScript (*.vbs) program from the PNA using Macros. To run this program, copy the following code into a text editor and save it as a *.vbs file.

```vbs
option explicit
' Setup infrastructure to use the SCPI over COM
dim app
set app = createobject("Agilentpna835x.application")
dim p
set p = app.scpistringparser
dim returnStr
sub Write (command)
    if len(returnStr) <> 0 then
        err.Raise 55,"Write","Query Unterminated"
    end if
    returnStr = p.parse(command)
end sub
sub WriteIgnoreError(command)
    returnStr = p.Execute(command)
p.Parse("SYST:ERR?")   ' clear error queue
end sub
```
function Read
    if len(returnStr) = 0 then
        err.Raise 55, "Read", "Bad read"
    end if
    Read = returnStr
    returnStr = ""
end function

Write "SYST:PRES"
' When programming in remote mode, hold mode is recommended
Write "SENS:SWE:MODE HOLD"
' Delete the standard measurement
Write "CALC:PAR:DEL:ALL"
' Create an SC21 measurement
Write "CALC:CUST:DEF 'MySC21', 'Scalar Mixer/Converter', 'SC21'"
Write "DISP:WIND:TRACE:FEED 'MySC21'"
Write "CALC:PAR:SEL 'MySC21'"
' Set number of points to 11
Write "SENS:SWE:POIN 11"

Write "SENS:SWE:MODE SINGle"
Write "*OPC?"
Read

' Retrieve the SC21 data
Write "CALC:PAR:SEL 'MySC21'"
Write "CALC:DATA? SDATA"

  dim data
data = Read()
wscript.echo("SC21=" & data)

' Retrieve the S11 data
Write "CALC:PAR:SEL 'MyS11'"
Write "CALC:DATA? SDATA"
data = Read()
wscript.echo("S11=" & data)
Create and Cal a GCA Measurement

This VBS program does the following:

- creates and configures GCA to perform a SMART Sweep
- performs a calibration using an ECal with 3.5 mm Female on Port A and 3.5 mm Male connectors on Port B

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as GCA.vbs. Learn how to setup and run the macro.

See the Gain Compression commands

Create and Cal a GCX Measurement

This VBS program does the following:

- creates and configures GCX
- performs a calibration using an ECal with 3.5 mm Female on Port A and 3.5 mm Male connectors on Port B

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as GCX.vbs. Learn how to setup and run the macro.

See the Gain Compression and Mixer Commands

```vbs
option explicit

Create and Cal a Noise Figure Measurement

This example program creates a Noise Figure measurement, then calibrates the measurement. You MUST change the ECal Identification strings (in Blue font).

Optional: Uncomment the following lines (in Blue font) to change these settings:

- Noise Receiver = Noise Receiver to Std (PNA) Receiver
- Cal Method = "Vector" to "Scalar"
- Receiver Characterization Method = "NoiseSource" to "Power Meter"

This VBScript program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as NF.vbs. Learn how to setup and run the macro. See the Noise figure commands.

See Other SCPI Example Programs

9-Jun-2011   Updated with Rcvr Char Method A.09.41.
Create and Cal a VMC Measurement

The following example program sets up a 1-stage mixer, then performs a full VMC calibration. By removing the comments (' ') at the start of the BLUE code, it can also do the following:

- Load a mixer setup file
- Use an ECal Module
- Perform manual ECal orientation
- Load a Mixer Characterization
- Perform a Mixer Characterization ONLY

See Also

Create and Cal an NFX Measurement

This program does the following:

- Setup a Noise Figure SC21 Measurement
- Calibrate Noise Figure channel
- Optional - Configure for an Embedded LO

To run this program, make the following edits, highlighted in yellow:

- Set **hostname** to your PNA computer name
- Set **tunerEcal** and **pullEcal** to your ECal model and info
- Set **ENR** to correct file name and location
- Set **connector types** for ECal, power sensor, and noise source

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as NFX.vbs. **Learn how to setup and run the macro.**

Create and Cal an SMC Measurement

This VB Script example creates and calibrates a scalar mixer measurement.

To run this example without modification you need the following:

- An ECal module that covers the frequency range of the measurement.
- A power meter must be available to the PNA. This can be accomplished either by attaching the meter to the PNA via a GPIB cable, or by using SCPI over LAN.

By removing the comments ( ` ) at the start of the BLUE code, it can also do the following:

- Load a mixer setup file
- Use ECal characterizations
- Specify Mechanical Cal Kits
- Perform manual ECal orientation.
- Specify the thru measurement method.
- Omit the isolation part of the 2-port cal.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface. For example, during the power meter portion of this calibration, scpi.Parse will not process a command until the power meter routine has completed. Traditional GPIB would require a serial polling technique to ensure the routine has completed before proceeding.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```vb
Dim app
Dim scpi

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Create a Scalar Mixer Forward Measurement
' First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"

' Create a forward scalar mixer measurement and configure it in channel 1. The first parameter is a unique identifying string (specified by the user) to allow subsequent commands to be directed at this specific measurement.
```
scpi.Parse "CALC:CUST:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'"

'Setup the new measurement as the 2nd trace in the active window

scpi.Parse "DISP:WIND:TRAC2:FEED 'My SC21'"

'Make the new trace the active measurement

scpi.Parse "CALC:PAR:SEL 'My SC21'"

'The parameters of the mixer measurement can now be configured.
'This can be done by either using the SENS:MIX commands
'for each of the parameters or by loading a mixer setup file.
'Uncomment the following line to load a mixer setup file. The path name
'for the mixer file may be loaded from other mapped drives.
'scpi.Parse "SENS:MIXer:Load 'C:/Program Files/Agilent/Network Analyzer/Documents/Mixer/MyMixer.mxr'"

' Setup Stimulus
' Points and IFBW are channel settings
scpi.Parse "SENS:SWEep:POINts 21"
s CPI.Parse "SENS:BANDwidth 1e3"

'The rest are mixer settings
scpi.Parse "SENS:MIX:INPut:FREQ:MODE SWEp"t"
s CPI.Parse "SENS:MIX:INPut:FREQ:STAR 3.6e9"
s CPI.Parse "SENS:MIX:INPut:FREQ:STOP 3.9e9"
s CPI.Parse "SENS:MIX:LO:FREQ:MODE FIXED"
s CPI.Parse "SENS:MIX:LO:FREQ:FIX 1e9"
s CPI.Parse "SENS:MIX:LO:POW 10"
s CPI.Parse "SENS:MIX:OUTP:FREQ:SID LOW"
s CPI.Parse "SENS:MIX:CALC Output"
s CPI.Parse "SENS:MIX:LO:NAME 'Port 3'"
s CPI.Parse "SENS:MIX:APPLY"

'---------------------------Perform A Scalar Mixer Calibration---------------------------

'Specify the connector types and the cal kits for each of the ports.
s CPI.Parse "SENS:CORR:COLL:GUID:CONN:PORT1:SEL "APC 3.5 male""
s CPI.Parse "SENS:CORR:COLL:GUID:CONN:PORT2:SEL "APC 3.5 female""
Non-factory characterizations are specified as follows:
'scpi.Parse "sens:corr:coll:guid:ckit:port2 'N4691-60004 User 1 ECal"
' When two or more ECal modules with the same model number are connected
' also specify the serial number as follows:
' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:
'
' Specify Mechanical cal kits
'scpi.Parse "sens:corr:coll:guid:ckit:port1 '85033D/E"
'scpi.Parse "sens:corr:coll:guid:ckit:port1 '85033D/E"
'
'Optional settings
'Specify the thru measurement method.
'scpi.Parse "SENS:CORR:COLL:GUID:PATH:TMET 1,2,""UNDEFINED THRU"
'Omit the isolation part of the 2-port cal (default behavior).
'scpi.Parse "SENS:CORR:COLL:GUID:ISOL NONE"
' Uncomment the following lines to manually orient
' the ecal port A connected to PNA port 1
'scpi.Parse "SENS:CORR:PREF:ECAL:ORI OFF"
'
'Initialize an SMC guided calibration.
scpi.Parse "SENS:CORR:COLL:GUID:INIT"
'Tell the wizard to generate and report the number of steps in this cal.
Dim steps
Dim desc
'Determine the number of steps required to complete the calibration.
steps = scpi.Parse ("SENS:CORR:COLL:GUID:STEP?")
For i = 1 To steps
'Display the prompt for each step
MsgBox (desc)
'Perform the measurement for each step
scpi.Parse "SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i)
'Finish the cal and save the calset

scpi.Parse("SENS:CORR:COLL:GUID:SAVE ON")

Msgbox("SMC cal saved to CH1_CALREG")

Last Modified:

23-May-2011  Added mixer setup commands
5-Apr-2011    Edited ECal commands
8-Mar-2011    Updated with new SMC commands
4-Jun-2009    Added 'Done' command
Calibrate Multiple SMC Channels

This example allows you to calibrate multiple SMC channels while connecting the power meter and required standards or ECaI module only once.

In the example program:

- Modify `chans = 2` to indicate the number of channels to calibrate.
- You can also change the connector type and cal kit for each port.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as MultChanCal.vbs. Learn how to setup and run the macro.

```vbscript
Dim app
Dim scpi
Dim chans
Dim i
Dim steps
Dim desc

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
app.Preset

' Set number of channels to create
chans = 2
ReDim calset(chans - 1)

For i = 1 To chans
    chanStr = CStr(i+1)  ' calibrate on channels 2 and 3
    Dim parm, measName, sens, calc
    parm = "S" & CStr(i) & CStr(i)
    measName = "My" & parm
    sens = "SENS" & chanStr
    calc = "CALC" & chanStr
    scpi.Parse calc & ":CUST:DEF '" & measName & '"', 'Scalar Mixer/Converter', '" & parm & '"'

    'Setup the new measurement as the 2nd trace in the active window
```
scpi.Parse "DISP:WIND:TRAC" & chanStr & ":FEED '" & measName & "'
'Make the new trace the active measurement
scpi.Parse calc & ":PAR:SEL '" & measName & "'

'--------------Perform A FCA Mixer Calibration--------------
'Set ports and cal kits for 2 port calibration portion
scpi.Parse sens & ":CORR:COLL:GUID:CONN:PORT1:SEL "APC 3.5 male"
scpi.Parse sens & ":CORR:COLL:GUID:CONN:PORT2:SEL "APC 3.5 female"
'ECal modules are specified with the same command

'Specify the thru measurement method.
scpi.Parse sens & ":CORR:COLL:GUID:PATH:TMET 1,2,"DEFINED THRU"

'Omit the isolation part of the 2-port cal
scpi.Parse sens & ":CORR:COLL:GUID:ISOL NONE"

'Initialize an SMC guided calibration.
scpi.Parse sens & ":CORR:COLL:GUID:INIT"
'Determine the number of steps required to complete the calibration.
steps = scpi.Parse (sens & ":CORR:COLL:GUID:STEP?"
Next
For j = 1 To CInt(steps)
'Display the prompt for each step
MsgBox (desc)
'Measure the same standard for each channel
For i = 1 To chans
    chanStr = CStr(i+1) ' channel number as string
    scpi.Parse "SENS" & chanStr & ":CORR:COLL:GUID:ACQ STAN" & CStr(j)
    opc_comp = scpi.Parse("*OPC?"
Next
Next
'Finish the cal and save the calsets
For i = 1 To chans
    calset(i - 1) = scpi.Parse("SENS" & CStr(i+1) & ":CORR:COLL:GUID:SAVE ON")
Next
MsgBox ("SMC Cals Complete!")
Create New Cal Kit using SCPI

When creating new cal kits programmatically, the order in which cal kit commands are sent can be important. For example to create a kit with opens, shorts, loads, and thurs. Be sure to use the following sequence for each newly defined standard.

1. Programmmatically select the standard number
2. Programatically select the standard type.
3. Program the cal standard's values.
4. Repeat steps 1, 2, 3 for additional new standards being defined.

10  !
20  !
30  ! This example program demonstrates how to create
40  ! new PNA calibration kits.
50  !
60  ! 1) Select a kit not previously defined
70  ! 2) Define open, short, load, and thru cal standards
80  !   Note: Each of the newly defined standards is assigned
90  !   a default connector name. These default connector names
100 ! will be replaced in subsequent steps.
110 ! 3) Use the delete connector command to remove default
120 !   connector names.
130 ! 4) Add connectors. Specify:
140 !   Start and Stop Freq
150 !   Z - Impedance
160 !   sex - MALE, FEMALE, NONE
170 !   media - COAX, WAVE
180 !   cutoff - Frequency for waveguide
190 ! 5) Assign the appropriate connector to each standard
200 ! 6) Modify the class assignments for the standards defined
210 ! 7) Verify the kit values
220 !
230 ! Additional Note: After setting each new cal kit value, it is
240 ! recommended that the program periodically perform queries to
250 ! verify the new values.
260 !
270 ! This will prevent program synchronization issues that can affect
280 ! final values stored within new cal kits.
290 !
300 !------------------------------------------------------------
310 !

Create a Custom Power Meter Driver

This topic requires that you have a working knowledge of Visual Basic.

This topic will help you create your own power meter driver for use with Source Power Calibration on the PNA. If you are using an Agilent Power Meter to perform a Source Power Calibration, you do NOT need to create your own driver.

Your Power Meter driver will be created from a template written in Visual Basic using VISA over the GPIB bus.

*Note:* This procedure applies to Visual Basic 6.0. Applicability to Visual Basic .NET has not yet been investigated.

- **Prepare Template Files**
- **Modify Template Files**
- **Compile, Copy, and Register, Your New Driver**
- **Test Your new Driver**

---

**Other SCPI Example Programs**

**Prepare Template Files**

1. Copy all the files from the PNA hard drive C:/Program Files/Agilent/Network Analyzer/Automation/Power Meter Driver Template folder, to a folder on your development PC.

2. In Visual Basic click **File**, then **Open Project…**, find **MyPowerMeter.vbp** (a file you copied from the PNA). Click **Open**. This is a VB ActiveX EXE template, which you will fill in to become your driver.

3. Click **Project**, then **MyPowerMeter Properties**. Click the **General** tab.

4. Overwrite the Project Name with a name of your own choosing. This will be the name of your driver’s type library (also the default name of your exe).

*Note* If the name of your exe does not match the VB Project Name with which it was compiled, registration of the exe on the PNA will not succeed.

5. Set the Project Description. After building your driver if you wish to test it using VB, this is the string that will show up in the VB References list of your test project, and also in the lower pane of the VB Object Browser.

6. Set the Thread Pool size to 1 thread.

7. Click **OK** to close the project properties dialog.

8. From the VB **Project** menu, click **References…** Ensure that **Agilent PNA Power Meter 1.0 Type Library** and **VISA Library** are checked. Click **OK**.

*Note:* Agilent's implementation of VISA is installed as part of the Agilent I/O Libraries on the PNA. For help on
VISA, go to the Windows Start button on your PNA, select Programs, Agilent IO Libraries, VISA Help.

Modify Template Files
From Visual Basic View menu click Project Explorer. Expand the Modules and Class Modules folders. Ensure there is one module (WinAPI) and one class module (PowerMeter).

Let's look at the WinAPI module first.

1. In the Project Explorer window, click WinAPI.
2. From the View menu click Code.

There is only one line of code you should need to modify in this module: the value of the string constant named sIDSEARCH. The comments preceding the declaration of that string describe how to change it. The rest of this module contains functions which will use the Microsoft Windows API to insure proper registration of your driver on the PNA. If you know of other Windows API functions you feel might be helpful to call from within your PowerMeter class module (to help in formatting data, for example), this module would be the place to declare them.

Now let's look at the class module.

1. In the Project Explorer window, click PowerMeter.
2. From the View menu click Properties Window. The Instancing property must be set to MultiUse. This allows other applications to create objects from this class, such that one instance of your driver EXE can supply more than one such object at a time.
3. From the View menu click Code.

Do NOT modify the Interfaces to IPowerMeter subroutines and functions. PNA source power cal expects to find these interfaces as they are currently defined.

The only members that you need to supply code to are those containing “Your code here” comments.

In addition, comments have been provided at the beginning of each member to describe the information that member needs to be read from or written to the power meter.

To get an idea of how communicate with the power meter using the VISA functions viWrite and viRead, examine the code which has been implemented for you in IPowerMeter_Connect, IPowerMeter_QueryMeter, and IPowerMeter_WriteMeter.

Compile, Copy, and Register Your New Driver
When your driver is ready to run, you will first need to compile it into an EXE.
From the File menu select Make exe.
After compiling, the following will instruct VB to use the same ID (GUID) every time you re-compile your project.

1. From the Project menu, click PowerMeter Properties.
2. On the Component tab, select Binary Compatibility and click ...
3. Browse to and select your project EXE. Click Open.
4. Click OK to close Project Properties.

5. Save your project.

6. Copy your driver EXE file to a folder on your PNA (do NOT use C:/Program Files/Agilent/Network Analyzer/Automation/Power Meter Driver Template folder).

7. Run the EXE file. A message box will pop up reporting whether or not registration was successful. If not successful, it will make a suggestion on what to fix.

When your driver is properly registered, PNA Source Power Cal should be able to associate it with the ID string of your power meter.

---

**Test Your Power Meter Driver**

We have also provided a Visual Basic project to test your new Power Meter driver. This project individually calls every IPowerMeter method and property in your driver to verify that it performs correctly. Before running the test your PC and PNA must be configured to communicate using DCOM.

1. Connect your PC and the PNA to LAN.

2. Add your PC logon to the PNA. Both logons and password must match to communicate using DCOM. See [Additional PNA users](#).

3. Configure your driver using DCOM Config on the PNA. This will give you permission to launch and access the driver. See [Configure for COM-DCOM Programming](#).

**Modify the Test Project**

1. In Visual Basic click File, then Open Project..., find MyPowerMeterTest.vbp (a file you copied from the PNA). Click Open.

2. From the Project menu, click References... From the list, find and check your new Power Meter Driver. (It should have been registered on your PC when you successfully made your driver EXE.) Click OK.

3. From the View menu click Code.

4. Modify the CreateObject line as follows:
   - Replace MyPowerMeter with the Project Name that you chose for your driver
   - Replace MyPNA with the Computer Name of your PNA.
   - For example:

   ```vba
   Set PowerMeterObj = CreateObject("AcmeBrand.PowerMeter", "AGILENT-PNA123")
   ```
   (This assumes that you kept PowerMeter as class module name in your driver.)

**Run the Test Project**

Ensure your power meter is connected to the PNA with a GPIB cable.

Put the PNA in system controller mode:
1. From the PNA **System** menu point to **Configure** then click **SICL/GPIB**.

2. In the GPIB box click **System Controller**.

Run the test project. If there are no errors, the driver is created successfully. If there are errors, try to figure out what went wrong and fix it. Then re-compile, re-copy the .exe to the PNA, and re-run the test. You should not need to re-register the driver or re-modify the test program.
ECAL Confidence Check using SCPI

This Visual Basic program performs a complete ECAL confidence check.

To run this program, you need:

- An established GPIB interface connection
- Agilent's VISA or National Instrument's VISA installed on your PC
- The module visa32.bas added to your VB project.
- A form with two buttons: cmdRun and cmdQuit
- A calibrated S11 1-port or N-port measurement active on Channel 1
- Window 1 is visible

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the PNA disk.

### See Other SCPI Example Programs

```vba
' Session to VISA Default Resource Manager

End
End Sub
Establish a VISA Session

This Visual Basic program demonstrates how to send a SCPI command using VISA and the Agilent IO libraries. To run this program, you need:

- Your PC and PNA both connected to a LAN (for communicating with each other).
- The SICL and VISA components of Agilent’s I/O Libraries software installed on your PC. Both are included when you install the software, unless you already have another vendor’s VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor’s VISA.
- The module visa32.bas added to your VB project. After you install VISA, the module will be located at C:/VXI/PNP/WinNT (or equivalent)/INCLUDE/Visa32.bas
- A form with two buttons: cmdRun and cmdQuit.
- Your PC configured to be a VISA LAN Client, and the SICL Server capability enabled on the PNA. See Configure for VISA and SICL

See Other SCPI Example Programs

Note: This example is a piece of a larger VISA program that performs a source power calibration.

```
' Session to VISA Default Resource Manager
Private defRM As Long
' Session to PNA
Private viPNA As Long
' VISA function status return code
Private status As Long

Private Sub Form_Load()
  defRM = 0
End Sub

Private Sub cmdRun_Click()
  ' String to receive data from the PNA.
  ' Dimensioned large enough to receive scalar comma-delimited values
  ' for 21 frequency points (20 ASCII characters per point)
  Dim strReply As String * 420
  
  ' Open the VISA default resource manager
  status = viOpenDefaultRM(defRM)
  If (status < VI_SUCCESS) Then HandleVISAError
  
  ' Open a VISA session (viPNA) to the SICL LAN server
  ' at “address 16” on the PNA pointed to by the “GPIB0”
  ' VISA LAN Client on this PC.
  ' CHANGE GPIB0 TO WHATEVER YOU PNA IS SET TO
  status = viOpen(defRM, "GPIB0::16::INSTR", 0, 0, viPNA)
  If (status < VI_SUCCESS) Then HandleVISAError
  
  ' Need to set the VISA timeout value to give all our calls to
```
'myGPIBRead sufficient time to complete before a timeout error occurs.
For this example, let's try setting the limit to 30000 milliseconds (30 seconds).
status = viSetAttribute(viPNA, VI_ATTR_TMO_VALUE, 30000)
If (status < VI_SUCCESS) Then HandleVISAError

Preset the PNA
status = myGPIBWrite(viPNA, "SYST:PRES")
If (status < VI_SUCCESS) Then HandleVISAError

Print the data using a message box
MsgBox strReply
End Sub

Private Sub cmdQuit_Click()
' Close the resource manager session (which also closes the session to the PNA).
If defRM <> 0 Then Call viClose(defRM)

' End the program
End
End Sub

Private Function myGPIBWrite(ByVal viHandle As Long, ByVal strOut As String) As Long
' The "+ Chr$(10)" appends an ASCII linefeed character to the output, for terminating the write transaction.
myGPIBWrite = viVPrintf(viHandle, strOut + Chr$(10), 0)
End Function

Private Function myGPIBRead(ByVal viHandle As Long, strIn As String) As Long
myGPIBRead = viVScanf(viHandle, "%t", strIn)
End Function

Sub HandleVISAError()
Dim strVisaErr As String * 200
Call viStatusDesc(defRM, status, strVisaErr)
MsgBox "*** Error : " + strVisaErr, vbExclamation
End
End Sub
This program demonstrates the use of several External Test Set Control commands. The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do not need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as ExtTS.vbs. Learn how to setup and run the macro.

```vbs
' Demonstrate some SCPI commands for external testsets.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Set scpi = pna.ScpiStringParser
' The K64 testset is only usable on a 4-port PNA
If (pna.NumberOfPorts <> 4) Then
    MsgBox("This program only runs on 4-port analyzers.")
Else
    ' If Help is active, show the measurement window and help
    scpi.Execute("DISP:ARR TILE")
    ' Return the list of supported test sets
    list = scpi.Execute("SENS:MULT:CATalog?")
    MsgBox(list)
    '************* K64 *****************
    ' The K64 is connected using the Testset I/O
    ' connector. There is no handshake information.
    ' Therefore, a testset need not be connected.
    ' Load a configuration file.
    scpi.Execute("SENS:MULT1:TYPE 'Z5623AK64'")
    scpi.Execute("SENS:MULT1:ADDR 0")
    ' return stuff about the test set
    ' Returns number of input ports
    Inports = scpi.Execute("SENS:MULT1:INCount?")
    MsgBox("Input Ports: " & CStr(Inports))
    ' Returns number of output ports
    ports = scpi.Execute("SENS:MULT1:COUNt?")
    MsgBox("Output Ports: " & CStr(ports))
    ' Returns valid output ports for each input port
```

2994
For portNum = 1 To Inports

    ports = scpi.Execute("SENS:MULT1:PORT" & CStr(portNum) & ":CAT?"")
    MsgBox("Port " & CStr(portNum) & " catalog: " & (ports))

Next

'Set different port mapping
scpi.Execute("SENS:MULT1:ALLPorts '1 ext R,2 ext R,3 ext R,4 ext R'"")

'Return port mapping
portMap = scpi.Execute("SENS:MULT1:ALLPorts?"")
MsgBox("Ports will be mapped to " & CStr(portMap))

'Enable external testset control and execute port mapping. This automatically enables status bar display as well.
scpi.Execute("SENS:MULT1:STATe 1")
MsgBox("Z5623A K64 Enabled")

End If
Getting and Putting Data using SCPI

This Visual Basic Program does the following:

- Reads data from the analyzer
- Puts the data back into memory
- To see the data on the analyzer after running the program, from the front panel click:
  Trace - Math/Memory - Memory Trace

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

Note: To change the read and write location of data, removing the comment from the beginning of ONE of the lines, and replace the comment in the beginning of the SDATA and SMEM lines.

```
Private Sub ReadWrite_Click()
  Dim i As Integer
  Dim t As Integer
  Dim q As Integer
  Dim dat As String
  Dim cmd As String
  Dim datum() As Double

  GPIB.Configure
  GPIB.Write "SYSTem:PRESet;*wai"

  'Select the measurement
  GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"

  'Read the number of data points
  GPIB.Write "SENSe1:SWEep:POIN?"
  numpts = GPIB.Read

  'Turn continuous sweep off
  GPIB.Write "INITiate:CONTinuous OFF"

  'Take a sweep
  GPIB.Write "INITiate:IMMediate;*wai"

  'Ask for the Data

  'PICK ONE OF THESE LOCATIONS TO READ
  GPIB.Write "CALCulate:DATA? FDATA" 'Formatted Meas
  GPIB.Write "CALCulate:DATA? FMEM" 'Formatted Memory
  GPIB.Write "CALCulate:DATA? SDATA" 'Corrected, Complex Meas
  GPIB.Write "CALCulate:DATA? SMEM" 'Corrected, Complex Memory
  GPIB.Write "CALCulate:DATA? SCORR1" 'Error-Term Directivity

  'Number of values returned per data point
```
'q = 1 ' Pick this if reading FDATA or FMEM
q = 2 ' Otherwise pick this

'Parse the data
ReDim datum(q, numpts)
For i = 0 To numpts - 1
    For t = 0 To q - 1
        'Read the Data
        dat = GPIB.Read(20)
        'Parse it into an array
        datum(t, i) = Val(dat)
    Next t
Next i

'PUT THE DATA BACK IN
GPIB.Write "format ascii"

'PICK ONE OF THESE LOCATIONS TO PUT THE DATA
'cmd = "CALCulate:DATA FDATA," 'Formatted Meas
'cmd = "CALCulate:DATA FMEM," 'Formatted Memory
'cmd = "CALCulate:DATA SDATA," 'Corrected, Complex Meas
cmd = "CALCulate:DATA SMEM," 'Corrected, Complex Memory
'cmd = "CALCulate:DATA SCORR1," 'Error-Term Directivity

For i = 0 To numpts - 1
    For t = 0 To q - 1
        If i = numpts - 1 And t = q - 1 Then
            cmd = cmd & Format(datum(t, i))
        Else
            cmd = cmd & Format(datum(t, i)) & "",
        End If
    Next t
Next i

GPIB.Write cmd
End Sub
** GPIB Pass-Through Example  

The SCPI **SYSTem** commands used in this example allow you to send GPIB commands to another GPIB device through the PNA. The other GPIB device cannot be connected to the GPIB bus through the PNA rear panel if the PNA is being controlled by a remote PC using that connector. The other device would typically be connected to the PNA using a **USB/GPIB interface**.

This VB Script example uses the COM **SCPIStringParser** object. However, this is not critical to the use of these commands; they can be sent using the normal syntax of your programming environment. Using the SCPIStringParser over LAN allows you to communicate with GPIB devices without requiring your remote PC to have a GPIB interface card installed.

Although this method of pass-through works for most applications, there are a couple of limitations:

- All data is transferred using ASCII format. Therefore, transferring large blocks of data is very slow.
- Only read and write functions are possible. Service Interrupts are not supported.

*See Other SCPI Example Programs*

```vbscript
option explicit

dim app
set app = CreateObject("AgilentPNA835x.Application")

dim p
set p = app.ScpiStringParser

' Open a new GPIB session on Bus:2 Device:14 Timeout: 100ms
p.Parse "SYST:COMM:GPIB:RDEV:OPEN 2,14,100"

dim handleAsStr

' Retrieve the handle (ID number)
handleAsStr = p.Parse("SYST:COMM:GPIB:RDEV:OPEN?")

' Convert the handle to an integer
dim handleAsInt
handleAsInt = CInt(handleAsStr)

' Send the "*IDN?" query
p.Parse "SYST:COMM:GPIB:RDEV:WRITE " & handleAsInt & ",*IDN?"

' Read its results
dim idn
msgbox idn

' Close the GPIB session
p.Parse "SYST:COMM:GPIB:RDEV:CLOSE " & handleAsInt
```

```
Load Error Terms during a Cal Sequence

This example requires that you already have a Cal Set named "foo" that contains a 1-port cal on port 1 and a 1-port cal on port 2.

This example starts a Guided Calibration specifying an Unknown Thru. It loads the 1-port Cals from the existing "foo" Cal Set, then recalculates the number of steps required to complete the cal. After loading the 1-port cals, only the Unknown Thru standard is left to acquire.

```
SENS:CORR:COLL:GUID:CONN:PORT1 "APC 3.5 female"
SENS:CORR:COLL:GUID:CONN:PORT2 "APC 3.5 female"
SENS:CORR:COLL:GUID:CKIT:PORT1 "85033D/E"
SENS:CORR:COLL:GUID:CKIT:PORT2 "85033D/E"
SENS:CORR:COLL:GUID:METH UNKN
' auto-create user calsets for SCPI
SENS:CORR:PREF:CSET:SAVU 1
SENS:CORR:COLL:GUID:INIT
' should return the number 7
SENS:CORR:COLL:GUID:STEPS?
' to port 1, from port 1 in calset
SENS:CORR:COLL:GUID:ETER:LOAD "foo",1,1
' to port 2, from port 2 in calset
SENS:CORR:COLL:GUID:ETER:LOAD "foo",2,2
' should now return the number 1
SENS:CORR:COLL:GUID:STEPS?
' measure the unknown thru
SENS:CORR:COLL:GUID:ACQ STAN1
' save the cal to new user calset
SENS:CORR:COLL:GUID:SAVE
```
Modify a Calibration Kit using SCPI

This Visual Basic program:

- Modifies Calibration kit number 3
- Completely defines standard #4 (thru)

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

'Modifying cal kit number 3

Perform a Guided 2-Port or 4-Port Cal using SCPI

This example performs a Guided 2-Port or 4-port Calibration using ONE set of calibration standards or an ECAL module.

A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated. The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the PNA hard drive as *.vbs.

Learn how to setup and run the macro.

See Guided Cal SCPI commands

---

```vbs
Dim app
Dim scpi
' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' To perform 2-port cal, Uncomment TwoPortGuidedCal()
' Then comment FourPortGuidedCal()

'Do 2-port Cal
'TwoPortGuidedCal()

'Do 4-port Cal
FourPortGuidedCal

Sub TwoPortGuidedCal()
' Select the connectors
scpi.Execute("sens:corr:coll:guid:conn:port1 ""APC 3.5 female""
scpi.Execute("sens:corr:coll:guid:conn:port2 ""APC 3.5 male""
scpi.Execute("sens:corr:coll:guid:conn:port3 ""Not used"
scpi.Execute("sens:corr:coll:guid:conn:port4 ""Not used"
MsgBox("Connectors defined for Ports 1 and 2")

' Select the Cal Kit for each port being calibrated.
scpi.Execute("sens:corr:coll:guid:ckit:port1 ""85052D"

' To use an ECAL module instead, comment out the above two lines
' and uncomment the appropriate lines below:
' Your ECAL module must already be connected
' via USB to the PNA.
```
Non-factory characterizations are specified as follows:

When two or more ECal modules with the same model number are connected also specify the serial number as follows:

When Disk Memory ECal user characterizations are used, specify both the User char and the serial number as follows:

MsgBox(“Cal kits defined for Ports 1 and 2”)

' Initiate the calibration and query the number of steps numSteps = GenerateSteps()
' Measure the standards, compute and apply the cal MeasureAndComplete(numSteps)

End Sub

Sub FourPortGuidedCal()

' Select the connectors
scpi.Execute("sens:corr:coll:guid:conn:port1 ""APC 3.5 female""")
scpi.Execute("sens:corr:coll:guid:conn:port2 ""APC 3.5 female""")
MsgBox("Connectors defined for Ports 1 to 4")

' Select the Cal Kit for each port being calibrated.

' To use an ECal module instead, comment out the above four lines
' and uncomment these four lines and use the part number printed on your module (which in our case was N4431-60003), followed by the word 'ECal'. Your ECal module must already be connected via USB to the PNA.

' see above for ECal options
MsgBox("Cal kits defined for Ports 1 to 4")

' Initiate the calibration and query the number of steps numSteps = GenerateSteps()
If your selected cal kit is not a 4-port ECal module which can
mate to all 4 ports at once, then you may want to choose which
thru connections to measure for the cal. You must measure at
least 3 different thru paths for a 4-port cal (for greatest
accuracy you can choose to measure a thru connection for all 6
pairings of the 4 ports). If you omit this command, the default
is to measure from port 1 to port 2, port 1 to port 3, and
port 1 to port 4. For this example we select to measure
from port 1 to port 2, port 2 to port 3, and port 2 to port 4.
scpi.Execute("sens:corr:coll:guid:thru:ports 1,2,2,3,2,4")
'Re-generate the connection steps to account for the thru changes
numSteps = GenerateSteps()
'Measure the standards, compute and apply the cal
MeasureAndComplete(numSteps)
End Sub

Function GenerateSteps()
'Initiate the calibration and query the number of steps
scpi.Execute("sens:corr:coll:guid:init")
GenerateSteps = scpi.Execute("sens:corr:coll:guid:steps?")
End Function

Sub MeasureAndComplete(numSteps)
MsgBox("Number of steps is " + CStr(numSteps))
'Measure the standards
For i = 1 To numSteps
step = "Step " + CStr(i) + " of " + CStr(numSteps)
MsgBox strPrompt, vbOKOnly, step
'Note: if you have set up a slow sweep speed (for example, if
'you're using a narrow IF bandwidth) or you're using ECal, and
'through a cal step is being measured you wish to have your program
'perform other operations (like checking for the click event of a
'Cancel button) and you're NOT using the COM ScpiStringParser,
you can use the optional ASYNchronous argument with the ACQuire
'command as shown in this commented-out line below. The SCPI
'parser then will return immediately while the cal step measurement
'proceeds (i.e., the parser will NOT block-and-wait for the
'measurement step to finish, so you can send additional commands
'in the meantime). So you can do "*ESR?" or "*STB?" queries to
'monitor the status register bytes to see when the OPC bit gets set,
'which indicates the cal measurement step has finished. This OPC
'detection works for all of the PNA’s SCPI parsers except the COM
'ScpiStringParser.
"sens:corr:coll:guid:acq STAN" + CStr(i) + ",ASYN;*OPC"
scpi.Execute("sens:corr:coll:guid:acq STAN" + CStr(i))
Next
'Conclude the calibration
MsgBox ("Cal is done!")
End Sub

scpi.parse "SYST:COMM:PSEN usb," + sensor
'do the measurement
scpi.parse "SOUR1:POW1:CORR:COLL:ACQ PMR,"ASENSOR"
'save the source cal and create an R-Channel response calset
scpi.parse "SOUR:POW:CORR:COLL:SAVE RREC"
Perform a Source and Receiver Power Cal using SCPI

Programming the PNA using COM or using SICL/VISA over LAN (as in this example) leaves the PNA free to control GPIB devices as needed.

The first example, using Visual Basic, demonstrates the following:

- Performing a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

The second example performs a Receiver Power Cal using VBScript.

Learn more about Power Calibrations.

See an example that Uploads a Source Power Cal.

Other SCPI Example Programs

To run this program, you need:

- One of the following power meters connected to the PNA through GPIB: E4416A, E4417A, E4418A/B, E4419A/B, 437B, 438A, EPM-441A, EPM-442A

Note: If your power meter is other than these, you can create your own Power Meter Driver using our template.

- Your PC and PNA both connected to a LAN (for communicating with each other).
- The SICL and VISA components of Agilent’s I/O Libraries software installed on your PC (both are included when you install the software, unless you already have another vendor’s VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor’s VISA.
- The module visa32.bas added to your VB project.
- A form with one button labeled cmdRun.
- A VISA interface configured on your remote PC to control the PNA. This could be GPIB interface or a VISA LAN Client.
- On the PNA connect a Thru cable from port 1 to port 2.

Note: The SOURce:POWer:CORRection:COLLect:ACQuire command, when used with a power meter, cannot be sent over the GPIB unless the power meter is connected to a different GPIB interface. See the alternative methods described in the command details.

Perform an ECal User Characterization

This example performs a user-characterization and stores it to both the ECal module memory and PNA disk memory. It also demonstrates the use of the EXPort, CLEar, IMPort and ‘KNAMe:INF?’ commands.

It then performs two 2-port cals: the first using the characterization from module memory, then using the characterization from disk memory.

**Note:** This example requires that channel 1 be already calibrated.

The SCPI commands in this example are sent over a COM interface using the **SCPIStringParser** object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the PNA hard drive as ECal.vbs.

**Learn how to setup and run the macro.**

**See all ECal User Characterization SCPI commands**

```
Option Explicit

Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim scpi
Set scpi = pna.ScpiStringParser

' Substitute here the model number and serial number of your own ECal.
' Note that this example corresponds to a 4-port ECal module with
' serial number 00001. If you have a 2-port ECal module, their model
' numbers are '5x5' numbers -- for example, 'N4691-60001'.
Dim ecalModelNum
ecalModelNum = "N4433A"
Dim ecalSerialNum
ecalSerialNum = "00001"

MsgBox "ECal module to be characterized is: " & 

' Set which user characterization number (1-12) the new characterization
' will be stored to in the ECal module when it is done. If you intend to
' store your user characterization just to PNA Disk Memory and NOT the
' ECal module's memory, then omit this command.
```
Dim characterizationNumber
characterizationNumber = 1

' The following commented-out lines of code show how you can access
' the list of connector type names you can set for the ports of an
' ECal when you user-characterize it. However, please note that if
' you are writing the user characterization to the ECAL module's memory,
' as of yet only the Factory Defined set of connector choices will work
' properly (see SENS:CORR:CKIT:ECAL:CHAR:CONN:CAT?). If you will be saving
' your characterization to just PNA Disk Memory only, then all connector
' names returned by this query will work,
' user-defined connector names as well as factory-defined.

'Dim connTypeList
'MsgBox connTypeList

' For each port of the ECAL module, specify which connector type
' is at the end of the adapter (or cable or fixture) that is
' connected to that port of the ECAL for the characterization
' (must be one of the connector types that is included in the
' list that "SENS:CORR:CKIT:ECAL:CHAR:CONN:CAT?" returns). The
default is "No adapter", which assumes you are characterizing that
' port of the ECAL "as is" (nothing attached to it). So in this
' example, Ports C and D of the ECAL are being characterized to just
' the ECAL's connectors.
scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:CONN:PORT1 'APC 3.5 male'" ' ECAL Port A

' As with the connector types, the information set in these next
' few properties also gets stored within the characterization.
' Set the name of the person and/or company that is producing
' this characterization.
' Set user-specified description of the PNA being used.
' Set descriptions of what you have connected to the ECAL module's
' ports for the characterization.
' Port A of the ECal
scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:DESC:PORT1 '3.5 mm adapter, SN 00001'"
' Port B of the ECal
scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:DESC:PORT2 '3.5 mm adapter, SN 00002'"
' Note that the "SENS:CORR:CKIT:ECAL:CHAR:" INITiate, ACQuire and SAVE
' ("CHAR:SAVE" but not "CHAR:DMEMory:SAVE") commands can all each take a
' significant
' amount of time to execute/complete. If you are looking at this example to
' leverage this functionality into a SCPI via GPIB or SCPI via SICL-LAN
' (VXI-11.2/11.3) application, then you could issue the "*CLS" and "*ESE 1"
' commands
' as shown in the commented-out lines below, and use your I/O libraries' Serial Poll
' function to repeatedly read the status byte until you detect bit 5 (weight of
' in that byte is set. That will happen when the command you are pairing with
' ";*OPC" has completed its operation. But that technique only works for the
' and SICL-LAN interfaces. If you need to use the TCPIP Socket or COM
' ScpiStringParser (as is used in this example) SCPI interfaces where there's
' no "built-in" Serial Poll type of function, to ensure your program operates in a
' synchronized manner it will need to wait on the "*OPC?" reply (and not time out)
' before proceeding to the next line of your program. In that event, we
' recommend
' you execute these commands on a thread of execution separate from your
' program's
' user interface thread.
' Of the "SENS:CORR:CKIT:ECAL:CHAR:" INITiate, ACQuire and SAVE commands, the
' SAVE
' command takes the longest amount of time to complete (unless you've set up your
' measurement channel to have a very slow sweep time, in which case the ACQuire
' command could take longer). For an ECal that is a N469x, N4432A or N4433A, or an
' 8509x or N4431x produced by Agilent in 2005 or later, the SAVE command can take a
' maximum of approximately 4 to 5 minutes to complete (that corresponds to a
' characterization that will result in the ECal's memory becoming completely
For an 8509x or N4431x ECal that was produced in 2004 or earlier, the SAVE command can take a maximum of 9 to 10 minutes to complete (again that corresponds to a characterization that will result in the ECal's memory becoming completely full).

Begin a user characterization on Channel 1.

If you will be storing this characterization to the ECal module's memory, then the boolean argument to this command is optional (but if you choose to include it for that case then you must specify it as 1 or ON). If you will be storing this characterization to PNA disk memory ONLY, then you should specify 0 or OFF for that argument. In this example we will be storing the characterization to both module memory and PNA disk memory, so we can just omit the argument and let it default to 1.

```scpi```
```
```

```vba```
```
Dim numSteps
Dim opcReply
'Dim statusByte
'Measure the steps.
'Note: prior to measuring the steps you must already have a calibration of the necessary number of ports applied to the channel (which in this example is Channel 1).
'Otherwise an error will be reported to the SCPI error queue.
Dim i
For i = 1 To numSteps
  'Display the step's description.
  'Clear the instrument's Status Byte.
  'scpi.Execute "*CLS"
  'Enable for the OPC bit (bit 0, which has weight 1) in the instrument's Event Status Register, so that when that bit's value transitions from 0 to 1 then the Event Status Register bit in the Status Byte (bit 5 of that byte, weight 32) will become set.
  'scpi.Execute "*ESE 1"
  'Issue the ACQuire command
```
'    scpi.Execute "SENS1:CORR:CKIT:ECAL:CHAR:ACQ STAN" & CStr(i) & ";*OPC"
'    Do
'        here is where if you leverage this example into an environment where
'        you are using SCPI via GPIB or SICL-LAN, that in this loop you could do a
'        Serial Poll via that interface to read the status byte into this
'        statusByte variable. Then this If statement would detect when bit 5 is
'        set.
'        If ( (statusByte/32) Mod 2) Then Exit Do
'        And note that normally you would want to have your program do some other
'        processing (for example, check for user input from keyboard/mouse, for
'        a cancellation request) here in this loop.
'    Loop
    MsgBox "ACQuire is complete"
Next
MsgBox "Now the user characterization will be saved to the ECal module and to PNA
disk memory"
'    scpi.Execute "*CLS:*ESE 1"
'    Save the user characterization to the ECal module's memory.
'Do
'    again here you could do a Serial Poll to get statusByte if using GPIB or
SICL-LAN
'    If ( (statusByte/32) Mod 2) Then Exit Do
'    Loop
'    Save the user characterization to PNA Disk Memory.
Dim characterizationName
characterizationName = "test"
Dim pnaDiskMemCalKitName
pnaDiskMemCalKitName = GetCalKitName(characterizationName)
'    Exporting the characterization from PNA disk memory into a file.
'    The file can be used for loading the characterization into PNA disk memory on
another PNA.
'Demonstrating that the characterization can be cleared from PNA disk memory and then re-loaded (IMPORTed) from the file that was created by the "SENS:CORR:CKIT:ECAL:EXP".

```vbnet
Dim moduleMemCalKitName
moduleMemCalKitName = GetCalKitName("User " & CStr(characterizationNumber))
MsgBox "Information about the characterization from ECal module memory = " & 
MsgBox "Information about the characterization from PNA disk memory = " & 
MsgBox "User characterization is complete. Now we will calibrate using it. First we will use it from ECal module memory."
DoTwoPortCal moduleMemCalKitName
MsgBox "Now we will calibrate using the characterization from PNA Disk Memory."
DoTwoPortCal pnaDiskMemCalKitName
MsgBox "Example has completed"
```

Function GetCalKitName(characterizationName)
Dim calKitName
    calKitName = ecalModelNum
    If Len(characterizationName) > 0 Then calKitName = calKitName & " " & characterizationName
    calKitName = calKitName & " ECal " & ecalSerialNum
    GetCalKitName = calKitName
End Function

Sub DoTwoPortCal(calKitName)
    ' Specify the DUT connector for each PNA port to be calibrated (DUT connector = ECal characterization's connector)
    scpi.Parse "SENS1:CORR:COLL:GUID:CONN:PORT1 'APC 3.5 male'"
    scpi.Parse "SENS1:CORR:COLL:GUID:CONN:PORT2 'APC 3.5 male'"
    ' Specify the "cal kit" for each of those ports
    scpi.Parse "SENS1:CORR:COLL:GUID:CKIT:PORT1 '" & calKitName & ""
    scpi.Parse "SENS1:CORR:COLL:GUID:CKIT:PORT2 '" & calKitName & ""
    ' This results in a calibration sequence of a single "connection step"
    scpi.Parse "SENS1:CORR:COLL:GUID:INIT"
```
' Acquire the cal connection step
opcReply = scpi.Parse("SENS1:CORR:COLL:GUID:ACQ STAN1:*OPC?")
' Again here instead of waiting for opcReply you could do a Serial Poll to get statusByte if using GPIB or SICL-LAN
'scpi.Execute "SENS1:CORR:COLL:GUID:ACQ STAN1:*OPC"
'Do
' If ( (statusByte/32) Mod 2) Then Exit Do
'Loop
' Conclude the cal and turn it on
scpi.Parse "SENS1:CORR:COLL:GUID:SAVE"
End Sub
Perform an Unguided Cal on a 4-Port PNA

This topic describes how to perform an unguided calibration on a multiport network analyzer using SCPI. The objective here is to make clear the relationship between the physical port on which a standard is being measured, the actual device in the cal kit, and the SCPI command used to acquire the device.

There are two sets of SCPI commands that acquire calibrations. One set is used for guided cal, the other for unguided. The SCPI commands that provide remote access to unguided cal are in the SENS:CORR:COLL block:

- SENS:CORR:COLL:METHod
- SENS:CORR:COLL:ACQuire
- SENS:CORR:COLL:SAVE

On a four port network analyzer, the remote programmer needs to be aware of the relationship between the physical port and the calibration kit class assignments. The example program (below) illustrates the usage by performing three unique 2 port cals, taking care to acquire the appropriate standards.

Calibration standards classes are ‘categories’ of standard types. To perform a 2 port calibration, the cal wizard requires the user to measure:

3 reflection standards on the forward port:

- Class S11A typically an open
- Class S11B typically a short
- Class S11C typically a load

Likewise, 3 reflection standards are required for the reverse port:

- Class S22A typically an open
- Class S22B typically a short
- Class S22C typically a load

There is also a transmission standard that is measured in both directions:

- Class S21T typically a thru

The following illustrates the relationship between cal kit physical standards and calibration classes.

Here is a list of the physical devices in my calibration kit.

Standard #1 = "3.5 mm male short"
Standard #2 = "3.5 mm male open"
Standard #3 = "3.5 mm male broadband load"
Standard #4 = "Insertable thru standard"
Standard #5 = "3.5 mm male sliding load"
Standard #6 = "3.5 mm male lowband load"
Standard #7 = "3.5 mm female short"
Standard #8 = "female to female characterized thru adapter"
Standard #9 = "0-2 Load"
Standard #10 = "Open"
Standard #11 = "Non-insertable thru"
Standard #12 = "3.5 mm female lowband load"
Standard #13 = "3.5 mm female sliding load"
Standard #14 = "3.5 mm female broadband load"
Standard #15 = "3.5 mm female open"

When you perform a calibration remotely using SCPI, you don’t specify the device number directly. Rather, you specify the class you want to measure. Each device in the calibration kit is assigned to a class. And since more than one device can be assigned to the same class, each class contains an ordered list of devices. The class assignments are user-settable using the Advanced Modify Cal Kit dialog or the SCPI command:

```
SENS:CORR:COLL:CKIT:ORDer <class>, <std>, <std>, <std>, <std>,<std>,<std>,<std>
```

The 85052B kit used in the example program had the following standard list for each class: The list was obtained by issuing the corresponding SCPI query:

```
SENS:CORR:COLL:CKIT:OLIST1? S11A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST2? S11B = +1,+7,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST3? S11C = +6,+5,+3,+12,+13,+14,+0
SENS:CORR:COLL:CKIT:OLIST4? S21T = +4,+8,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST5? S22A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST6? S22B = +1,+7,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST7? S22C = +6,+5,+3,+12,+13,+14,+0
SENS:CORR:COLL:CKIT:OLIST8? S12T = +4,+8,+0,+0,+0,+0,+0
```

When you perform the calibration, you acquire data by issuing the ACQuire command:

```
SENS:CORR:COLL:ACQ <class>[, <substd> ]
```

For example:

```
SENS:CORR:COLL:SFOR 1
SENS:CORR:COLL:ACQ STANA, SST2
```

The SFOR command tells the wizard to make the next acquisition in the forward direction. The ACQuire command specifies that we are measuring the 2nd device in the list for STANA. And since we are measuring SFORward, STANA refers to class #1 or S11A. The list of devices for this class are specified in the OLIST1 query above. The associations are shown in red.

Alternately, you could modify the device order for the S11A class to move device #15 into the first position (SENS:CORR:COLL:CKIT:ORDER1). When the desired device is in the first position, you needn’t specify the order number in the ACQuire command. The default is the first device in the OLIST. This worked well for two port network analyzers where the order for S11A,B,C classes were setup for port 1 and the order for S22A,B,C was set up for port 2. With the kit setup in the proper order, you could eliminate the specification of the substandard
When performing 2 port calibrations on 4 Port Network Analyzers (e.g.: PNA Model N5230A), the wizard applies S11A,B,C standards to the lower numbered port, S22A,B,C standards to the higher numbered port. Since the two classes (S11A,B,C and S22A,B,C) are applied to multiple ports, the programmer must take into account the ports being measured and take greater care when specifying the ACQuire command to ensure that the correct device is being measured.

### Port to class relationship

The following example program shows one method of handling two port cals on a multiport network analyzer. The connectors at the measurement plane are assumed to be (1) male, (2) female, (3) male, and (4) male. In the example, three cals are performed: 1-2 (insertable male to female), 2-3 (insertable female to male), and 3-4 (noninsertable using an characterized adapter).

```visualbasic
option explicit
public scpi
public pna
' assume a 4 port PNA with the following connectors:
' the standard measured on these ports will be the opposite gender
' PORT 1 = 3.5 male
' PORT 2 = 3.5 female
' PORT 3 = 3.5 male
' PORT 4 = 3.5 male
' To perform 2 port calibrations between 1-2, 2-3, and 3-4 you need to do the following

call main

sub main
set pna = CreateObject("AgilentPnA835x.Application")
set scpi = pna.ScpiStringParser
pna.Preset
' select a kit to use for this demonstration
' kit #1 for the N5230A is the 85052B 3.5mm kit with sliding load

Perform Global Delta Match Cal

The following program performs a Global Delta Match Calibration. This is required when performing an Unknown Thru Cal or TRL Cal on PNAs without a reference receiver for each test port. See example of Unknown Thru or TRL Cal.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Delta.vbs. Learn how to setup and run the macro.

```vbs
Sub PerformGlobalDeltaMatchCal()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Set scpi = pna.ScpiStringParser

    ' Initiate a Global Delta Match calibration, choosing connector and cal kit
    scpi.Parse "SENS:CORR:COLL:GUID:DMAT 'APC 3.5 female', '85033D/E'"

    ' Query the number of calibration steps
    retStr = scpi.Parse("SENS:CORR:COLL:GUID:STEP?")
    numSteps = CInt(retStr)

    ' Measure the cal standards
    For i = 1 To numSteps
        retVal = MsgBox(prompt, vbOKCancel)
        If retVal = vbCancel Then Exit Sub
        retStr = scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i) & ";*OPC?")
    Next

    ' Compute the error coefficients and save the cal to Global Delta Match CalSet
    scpi.Parse "SENS:CORR:COLL:GUID:SAVE"
    MsgBox "Cal is done!"
End Sub
```
Perform a Guided 1-Port Cal on Port 2

This VBScript program does the following:

1. Clear measurements from the PNA
2. Create a new S22 measurement
3. Set an instrument state
4. Select the connector types
5. Select a cal kit
6. Initiate a Guided calibration
7. Display a prompt to connect each standard
8. Save the calibration to a newly created cal set

Note: This example illustrates an important step when calibrating a reflection measurement in the reverse direction. You MUST create a reverse (S22) measurement and have it be the active (selected) measurement on the channel that is being calibrated. This is not necessary for any calibrating any other measurement parameter.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Guided.vbs. Learn how to setup and run the macro.

```vbs
Dim App
Set App = CreateObject("AgilentPNA835x.Application")
App.Preset

Dim step
Dim Parser
Dim prompt
Dim txtDat
Dim Chan

' Rem Clear old measurements
App.Reset

' Rem Create a new Measurement
Set Parser = App.SCPIStringParser
Parser.Parse "DISPlay:WINDow1:STATE ON"
Parser.Parse "CALCulate:PARameter:DEFine:EXT 'MyMeas',S22"
Parser.Parse "DISPlay:WINDow1:TRACe1:FEED 'MyMeas'"

' Rem Initialize state
Set Chan = App.ActiveChannel
Chan.StartFrequency = 200e6
```
Chan.StopFrequency = 1.5e9
Chan.IFBandwidth = 1000
step = 3

Rem Begin a guided calibration
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'Not used'"
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT2 'Type N (50) male'"
Parser.Parse "SENS:CORR:COLL:GUID:INIT"

Rem Query the number of steps

Rem Display the number of steps
MsgBox("Number of steps is " + txtDat)

Rem Set the loop counter limit
step = txtDat

Rem Measure the standards
For i = 1 To step
If i = 1 Then
MsgBox(prompt)
Parser.Parse ("sens:corr:coll:guid:acq STAN1")
ElseIf i = 2 then
MsgBox(prompt)
Parser.Parse ("sens:corr:coll:guid:acq STAN2")
ElseIf i = 3 then
MsgBox(prompt)
Parser.Parse ("sens:corr:coll:guid:acq STAN3")
End If
Next

Rem All standards have been measured. Save the result
Parser.Parse "SENS:CORR:COLL:GUID:SAVE"
MsgBox("The calibration has been completed")
Perform a Guided Calibration using SCPI

This VBScript program performs a Guided Calibration using ECal or Mechanical standards. This example includes optional ECal orientation features.

This example has been updated to include:

- Guided Power Cal (Oct 8, 2010)
- The setting of Unknown Thru or Adapter Removal adapter delay. (March 2006).
- The activation of a channel to be calibrated. (Aug. 2006).

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Guided.vbs. Learn how to setup and run the macro.

```vbs
' Performing a Guided 2-port cal (Ports 1 and 2)
TwoPortGuidedCal
Sub TwoPortGuidedCal
    Dim app
    Dim scpi
    Dim connList
    Dim selectedConn1, selectedConn2
    Dim kitList
    Dim selectedKit
    Dim message
    ' Create / Get the PNA application.
    Set app = CreateObject("AgilentPNA835x.Application")
    Set scpi = app.ScpiStringParser
    
    'The following demonstrates that the Active Channel is cal'd
    'Preset the PNA
    scpi.Execute "SYST:UPR"
    'Create a new measurement on Chan 2
    'Now there are two windows, channels and measurements
    'This becomes the Active Measurement
    scpi.Execute ("DISPlay:WINDow2:STATE ON")
    'Define a measurement name, parameter
```
scpi.Execute("CALCulate2:PARameter:DEFine:EXT 'MyMeas',S21")

"FEED" the measurement

scpi.Execute("DISPlay:WINDow2:TRACe1:FEED 'MyMeas'"")

'This is the Active Measurement

'Activate the 'Preset' measurement to cal chan 1
scpi.Execute("CALC1:PAR:SEL 'CH1_S11_1'"")

' Query the list of connectors that the PNA system recognizes
' Format the list with linefeed characters in place of the commas
connList = FormatList(connList)

message = "Enter your DUT connector for Port 1. Choose from this list:
message = message & Chr(10) & Chr(10) & connList

' Select the connector for Port 1
selectedConn1 = InputBox(message)
If selectedConn1 = "" Then Exit Sub

scpi.Execute("sens:corr:coll:guid:conn:port1 '" & selectedConn1 & "'")

message = "Enter your DUT connector for Port 2. Again, choose from this list:
message = message & Chr(10) & Chr(10) & connList

' Select the connector for Port 2
selectedConn2 = InputBox(message)
If selectedConn2 = "" Then Exit Sub

' Note: If your PNA has more than 2 ports, then uncomment
' one or both of these next two lines.
'scpi.Execute("sens:corr:coll:guid:conn:port3 ""Not used"" "
'scpi.Execute("sens:corr:coll:guid:conn:port4 ""Not used"" "

'This next block of commented code demonstrates how to specify an adapter
' and it's electrical delay, in situations where you are performing an
' Unknown Thru or Adapter Removal calibration. In most situations, the
' PNA is able to correctly determine an adapter's electrical length
' at the end of the calibration. However, there are scenarios where
' the PNA cannot correctly calculate the length -- such as when the channel
' has a relatively small number of measurement points (for example, 201 or less)
' and the adapter is significantly long (for example, a cable that is several
' feet).
' In these cases, the ADAP commands (below) enable you to explicitly specify
the adapter you are using.

Send these commands prior to the "sens:corr:coll:guid:init" command.

Create adapter and return the adapter number

```
"','"& selectedConn2 & ":")
```

The adapterNum string contains a '+ character.

Here we convert to integer to remove that.

```
adapterNum = CStr( CInt(adapterNum) )
```

Specify that this adapter has 10 nanoseconds electrical delay (coaxial).

```
scpi.Execute "sens:corr:coll:guid:adap" & adapterNum & ":del 10E-9"
```

Text description of adapter

```
scpi.Execute "sens:corr:coll:guid:adap" & adapterNum & ":desc 'My adapter'"
```

Select to use this adapter specifically between ports 1 and 2

```
scpi.Execute "sens:corr:coll:guid:adap" & adapterNum & ":path 1,2"
```

End of adapter block

Query the list of acceptable cal kits and

'ECal module characterizations for Port 1.

```
```

Format the list with linefeed

characters in place of the commas

```
kitList = FormatList(kitList)
```

```

Perform Guided TRL Calibration

This VBScript file performs a 2-Port Guided TRL calibration on 2-port PNA analyzers. (See an example of TRL cal on a 4-port PNA.) This program does the following:

- Clear old measurements from the PNA
- Create a new S22 measurement
- Set an instrument state
- Select the connectors and cal kit
- Initiate a Guided calibration
- Display a prompt as each new standard must be connected
- Save the calibration to a newly created cal set.

**Note:** This program runs without error on all PNA code revisions 7.21 and higher.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as TRL.vbs. Learn how to setup and run the macro.

```vbs
Dim App
Dim Parser
Dim Chan
Dim txtDat
Dim step
Dim parserTxt
Dim prompt
Set App = CreateObject("AgilentPNA835x.Application")
' Clear old measurements
App.Reset
' Create a new Measurement
Set Parser = App.SCPIStringParser
Parser.Parse "DISPlay:WINDowl:STATE ON"
Parser.Parse "CALCulate:PARameter:DEFine:EXT 'MyMeas',S12"
Parser.Parse "DISPlay:WINDowl:TRACe1:FEED 'MyMeas'"
' Initialize state
Set Chan = App.ActiveChannel
```

3053
Chan.StartFrequency = 18.0e9
Chan.StopFrequency = 20.0e9
Chan.IFBandwidth = 1000
' Begin a guided calibrations
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'APC 3.5 male'"

Perform an Unguided ECal

This VBScript program performs an Unguided Full 2-Port ECal.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

See Sense:Correction commands.

See other SCPI Examples

Set pna = CreateObject("AgilentPNA835x.Application")
Set scpi = pna.ScpiStringParser
'
Preset the analyzer
scpi.Execute "SYSTem:PRESet"
'
Start frequency of 10 MHz
scpi.Execute "SENSe:FREQuency:STARt 10E6"
'
Stop frequency of 9 GHz
scpi.Execute "SENSe:FREQuency:STOP 9E9"
'
Select the preset S11 measurement
scpi.Execute "CALCulate:PARameter:SELect 'CH1_S11_1'"
'
Read the information about the Agilent factory
characterization data of ECal module #1 on the USB bus
module1Info = scpi.Execute("SENSe:CORRection:COLLect:CKIT:INFormation? ECAL1,CHAR0")
'
Prompt for the ECal module
MsgBox "Description of ECal Module #1:" & Chr(10) & Chr(10) & module1Info & _Chr(10) & Chr(10) & "Make port connections to the ECal module, then press enter"
'
ECal full 1 port and 2 port
Choose a Calibration Type (comment out one of these)
scpi.Execute "SENSe:CORRection:COLLect:METHod refl3"
scpi.Execute "SENSe:CORRection:COLLect:METHod SPARSOLT"
'
Specify to have the PNA automatically determine which port of the ECal module is connected to which port of the PNA.
scpi.Execute "SENSe:CORRection:PREFerence:ECAL:ORIentation ON"
'
Alternatively, if you are measuring at very low power levels where the PNA fails to sense the module's orientation, you may need to turn off the auto orientation and specify how the module is connected (as in these next two commented lines of code -- "A1,B2" would indicate Port A of the module is connected to Port 1 and Port B is connected to Port 2).
scpi.Execute "SENSe:CORRection:PREFerence:ECAL:ORIentation OFF"
scpi.Execute "SENSe:CORRection:PREFerence:ECAL:PMAP ECAL1,'A1,B2'"
'
Acquire and store the calibration terms. *OPC? causes a "+1" to be
' returned when finished. CHAR0 indicates to use the Agilent factory
characterized data within the ECAL module (as opposed to a user characterization).

x = scpi.Execute("SENSe:CORRection:COLLect:ACQuire ECAL1,CHAR0;*OPC?"")
' Note: if you have set up a slow sweep speed (for example, if
you’re using a narrow IF bandwidth), and while this calibration is
being acquired you wish to have your program perform other operations
(like checking for the click event of a Cancel button) and you’re
NOT using the COM ScpiStringParser, you can use the optional
ASYNchronous argument with the ACQuire command as shown here below
instead of sending that command in the way shown above. The SCPI
parser then will return immediately while the cal acquisition
proceeds (i.e., the parser will NOT block-and-wait for the
cal to finish, so you can send additional commands in the meantime).
So you can do "*ESR?" or "*STB?" queries to monitor the status register
bytes to see when the OPC bit gets set, which indicates the cal has
finished. That type of OPC detection works for all of the PNA’s SCPI
parsers except the COM ScpiStringParser.
An alternative to querying the status register, is to setup an SRQ handler
if your IO Libraries supports that.
When an SRQ event occurs, a call back will automatically
"SENSe:CORRection:COLLect:ACQuire ECAL1,CHAR0,ASYNchronous;*OPC"
MsgBox "Done with calibration."
Perform Unknown Thru or TRL Cal

The following program performs either a 2-port SOLT Unknown Thru Cal or a 2-port TRL Cal. The 85052C Cal Kit used in this program contains both types of standards. This program can be run on 2-port or 4-port PNA's. When run on a multiport (4 or more ports) PNA, which does not have a reference receiver per port, a Delta Match Cal is required.

See example of Delta Match Cal.
See the Guided Cal commands

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Unknown.vbs. Learn how to setup and run the macro.

```vbs
Sub PerformUnknownThruOrTRLCal()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Set scpi = pna.ScpiStringParser

    ' Specify connectors for Ports 1 and 2
    scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'APC 3.5 female'
    scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT2 'APC 3.5 male'

    ' If your PNA has 3 or 4 ports, uncomment one or both of these next two lines, to explicitly specify this is a 2-port cal.
    ' scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT3 'Not used'
    ' scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT4 'Not used'

    ' Specify cal kit for Ports 1 and 2
    scpi.Parse "SENS:CORR:COLL:GUID:CKIT:PORT1 '85052C'

    ' Since the 85052C cal kit contains SOLT standards and also TRL standards, these next two lines set cal and thru method
    scpi.Execute "SENS:CORR:COLL:GUID:PATH:CMEThod 1,2,"SOLT"
    scpi.Execute "SENS:CORR:COLL:GUID:PATH:TMEThod 1,2,"UNKN"

    ' To set up the cal as TRL, comment the previous line and uncomment this next line. The TMEThod is set by default
    scpi.Execute "SENS:CORR:COLL:GUID:PATH:CMEThod 1,2,"TRL"

    ' Initiate the calibration
    scpi.Parse "SENS:CORR:COLL:GUID:INIT"

    ' Query the list of ports that need delta match
    portList = Split(retStr, ",")

    ' If portList contains just one element and it's value is 0, then that indicates none of the ports being calibrated require delta match data.
    ' Note: if each testport on the PNA has it's own reference receiver (R channel), then delta match is never needed, so portList will always be just 0.
    lowerBound = LBound(portList)
    If (UBound(portList) <> lowerBound) Or (CInt( portList(lowerBound) ) <> 0) Then
```

---

3061
Delta match data is required for at least one port.
For this example, we assume a Global Delta Match Cal has previously been
performed so the Global Delta Match CalSet exists.
The Global Delta Match CalSet is used when the APPL command is invoked
without a specific calset ID (GUID).
scpi.Parse "SENS:CORR:COLL:GUID:DMAT:APPL"
End If

' Query the number of calibration steps
retStr = scpi.Parse("SENS:CORR:COLL:GUID:STEP?")
numSteps = CInt(retStr)

' Measure the cal standards
For i = 1 To numSteps
retVal = MsgBox(prompt, vbOKCancel)
If retVal = vbCancel Then Exit Sub
retStr = scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i) & ";*OPC?")
Next

' Compute the error coefficients and save the cal to CalSet, and turn it on
scpi.Parse "SENS:CORR:COLL:GUID:SAVE"
MsgBox "Cal is done!"
End Sub

Setup Fast CW and FIFO

This example program does the following:

- Setup an A/R and B/R measurement
- Turn ON point averaging
- Set external edge triggering (commented out)
- Set FIFO and Fast CW
- Write data into FIFO data buffer
- Read FIFO data buffer

**IMPORTANT** - Because the IFBW is set to 600 kHz, data will NOT be sent to the FIFO after each acquisition. [Learn more.]

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as FIFO.vbs. [Learn how to setup and run the macro.]

[See the SCPI FIFO commands.]

Setup Markers using SCPI

This VBScript program does the following:

- Preset the PNA
- Return active channel number and measurement string
- Create a marker
- Set X-axis value
- Read X, Y-axis values
- Set marker to trace Min
- Read X, Y-axis values

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Markers.vbs. Learn how to setup and run the macro.

See all Marker SCPI commands.

Setup Noise Figure Port Mapping

This program demonstrates how to change source and receive ports when measuring noise figure. It assumes that option 029 ("Fully Corrected Noise Figure") is installed.

If only option 028 ("Noise figure measurements using standard receivers") is installed, switching ports is simpler, since only one noise receiver selection is available.

This program can be run as a macro in the PNA. To do this, copy the code into a text editor file such as Notepad and save on the PNA hard drive as NF.vbs. Learn how to setup and run the macro.

See the Noise figure commands.

option explicit
dim app, hostname, parser

Setup Sweep Parameters using SCPI

This Visual Basic program sets up sweep parameters on the Channel 1 measurement. To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

```vbnet
GPIB.Write "SYSTem:PRESet"
'
Select the measurement
GPIB.Write "CALCulate:PARameter:SELection 'CH1_S11_1'"
' Set sweep type to linear
GPIB.Write "SENSe1:SWEep:TYPE LIN"

' Set IF Bandwidth to 700 Hz
GPIB.Write "SENSe1:BANDwidth 700"

' Set Center and Span Freq's to 4 GHz
GPIB.Write "SENSe1:FREQuency:CENTer 4ghz"
GPIB.Write "SENSe1:FREQuency:SPAN 4ghz"

' Set number of points to 801
GPIB.Write "SENSe1:SWEep:POINts 801"

' Set sweep generation mode to Analog
GPIB.Write "SENSe1:SWEep:GENeration ANAL"

' Set sweep time to Automatic
GPIB.Write "SENSe1:SWEep:TIME:AUTO ON"

' Query the sweep time
GPIB.Write "SENSe1:SWEep:TIME?"
SweepTime = GPIB.Read
```
Setup the Display using SCPI

This Visual Basic program:

- Sets data formatting
- Turns ON the Trace, Title, and Frequency Annotation
- Autoscales the Trace
- Queries Per Division, Reference Level, and Reference Position
- Turn ON and set averaging
- Turn ON and set smoothing

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

GPIB.Write "SYSTem:PRESet"

'Select the measurement
GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"

'Set the Data Format to Log Mag
GPIB.Write ":CALCulate1:FORMat MLOG"

'Turn ON the Trace, Title, and Frequency Annotation
GPIB.Write "DISPlay:WINDow1:TRACe1:STATe ON"
GPIB.Write "DISPlay:WINDow1:TITle:STATe ON"
GPIB.Write "DISPlay:ANNotation:FREQuency ON"

'Autoscale the Trace
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:Scale:AUTO"

'Query back the Per Division, Reference Level, and Reference Position
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:PDIVision?"
Pdiv = GPIB.Read
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:RLEVel?"
Rlev = GPIB.Read
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:RPOSition?"
Ppos = GPIB.Read

'Turn ON, and average five sweeps
GPIB.Write "SENSe1:AVERage:STATe ON"
GPIB.Write "SENSe1:AVERage:Count 5"

'Turn ON, and set 20% smoothing aperture
GPIB.Write "CALCulate1:SMOothing:STATe ON"
GPIB.Write "CALCulate1:SMothing:APERture 20"
Show Custom Cal Windows during a Guided Calibration

This VBScript program shows how to send commands that allow you to view specific 'custom' windows, and sweep specific channels, during a UI (Cal Wizard) or remote calibration.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as CalWindow.vbs. Learn how to setup and run the macro.

These commands are used to show and sweep windows and channels:

- `SENS:CORR:COLL:DISP:WIND`
- `SENS:CORR:COLL:SWE:CHAN`
- `SENS:CORR:COLL:DISP:WIND:AOFF`
- `SENS:CORR:COLL:SWE:CHAN:AOFF`
- `SENS:CORR:COLL:GUID:PACQuire`

```vbs
Dim app
Dim scpi
' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
' A comment
'Preset the analyzer
'This creates an S11 measurement in channel 1, window 1
scpi.Execute "SYST:PReset"
' Create and turn on window 2
scpi.Execute "DISPlay:WINDow2:STATE ON"
'Define an S21 measurement in channel 2
scpi.Execute "CALCulate2:PARameter:DEFine:EXT 'MyMeas',S21"
'Associate ("FEED") the measurement name ('MyMeas') to WINDow2
'and give the new TRACe a number (1).
scpi.Execute "DISPlay:WINDow2:TRACe1:FEED 'MyMeas'"
```

See Other SCPI Example Programs
'The following lines are all you need in order to:
'show and sweep the custom Cal windows during a UI Calibration
'If sending ONLY these commands, make sure you know the
'correct window and channel numbers to show and sweep.
'Flag windows 1 and 2 to show during Ch1 calibration
scpi.Execute "SENS:CORR:COLL:DISP:WIND1 ON"
scpi.Execute "SENS:CORR:COLL:DISP:WIND2 ON"
'Flag channels 1 and 2 to sweep during Ch1 calibration
scpi.Execute "SENS1:CORR:COLL:SWE:CHAN1 ON"
scpi.Execute "SENS1:CORR:COLL:SWE:CHAN2 ON"

' The following code performs a remote guided Cal on Ch1.
' From a remote cal, the Cal window does not normally show and sweep
' after the previous standard has been acquired.
' This shows how to include the PACquire (preview) to view and sweep the Cal Window.
' The Custom window also shows and sweeps due to the flag commands above.
' The flags are cleared at the end of this section.

'Specify the DUT connectors
scpi.Execute "sens:corr:coll:guid:conn:port1 "APC 3.5 female"" 
scpi.Execute "sens:corr:coll:guid:conn:port2 "APC 3.5 male"" 
'Select the Cal Kit for each port being calibrated.

Next
' Conclude the calibration
scpi.Execute "sens:corr:coll:guid:save"
MsgBox "Cal is done!"

' Remove the Custom Window flags
scpi.Execute "SENS:CORR:COLL:DISP:WIND:AOFF"
' Remove the channel sweep flags
Perform a Sliding Load Calibration using GPIB

This Visual Basic program does a **only** the sliding load portion of a Calibration.
To run this program, you need:

- An established **GPIB interface connection**
- A measurement and calibration routine to call this sub-program
- STAN3 set up as a sliding load standard

See Other SCPI Example Programs

Sub slide()
'Measure the sliding load for at least 5 and no more than 7 slides
'Note that "SLSET" and "SLDONE" must be executed before the actual acquisition of a slide
MsgBox "Connect Sliding Load; set to Position 1; then press OK"
GPIB.Write "SENS:CORR:COLL SLSET"
GPIB.Write "SENS:CORR:COLL STAN3;"

MsgBox "Set Sliding Load to position 2; then press OK"
GPIB.Write "SENS:CORR:COLL SLSET"
GPIB.Write "SENS:CORR:COLL STAN3;"

MsgBox "Set Sliding Load to position 3; then press OK"
GPIB.Write "SENS:CORR:COLL SLDONE"
GPIB.Write "SENS:CORR:COLL STAN3;"
End Sub
Socket Client

The following C# example demonstrates how to send SCPI commands to the PNA via a TCP socket connection and how to use a TCP 'control' connection. If the command is a query, the program will read the instrument's response. You can add or replace the SCPI commands in this program with your own.

Learn how to enable Sockets communication on the PNA.

For both of the following methods, first copy the example text below into a Notepad file and name it SocketClient.cs.

To run using Microsoft Visual Studio 2003 or 2005

1. From the Visual Studio File menu, select New, then Project.
2. In the New Project window, select the following items (noting the location of the file folder it is creating for you) then click OK.

- Project Type: Visual C#
- Template: Console Application
- Project Name: SocketClient

1. Copy SocketClient.cs into the folder that was created in the previous step.
2. In the Solution Explorer window pane, right-click Class1.cs (if Visual Studio 2003) or Program.cs (if Visual Studio 2005). Select Delete to delete that file.
3. In the Solution Explorer, right-click SocketClient, and select Add, then Existing Item....
4. Browse to select SocketClient.cs and click OK.

You should then be able to build the project, and test the resulting SocketClient.exe from a command prompt (shell) window.

To run using Mono

Mono is a cross-platform version of .NET. You can download a free version of Mono at http://www.mono-project.com. Once downloaded and installed:

1. Run the Mono command prompt (shell) window.
2. Navigate to the directory where the example SocketClient.cs is stored.
3. Type: MCS SocketClient.cs (builds the .exe and saves in that same folder.)
4. Type mono SocketClient.exe <PNA name or IP address>

This example was compiled and tested successfully with Mono version 1.1.13. It was run on a PC using the Red
Hat version 9.0 distribution of the Linux operating system. It was also run on a PC using Windows XP. This program has not been tested with other versions of Mono, or on other operating systems.

**To run with Agilent T&M Toolkit**

Agilent T&M Toolkit 2.0 is the first version to support communication using Sockets.

Use the following to address the Sockets port: `TCPIP0::<PNA name or IP address>::5025::SOCKET`

```csharp
using System;
using System.Net;
using System.Net.Sockets;

// This C# "Console Application" example program demonstrates SCPI
// communication with an Agilent TCP socket-enabled instrument that
// supports socket "control connections" (such as PNA network analyzers,
// which have support for control connections in their socket
// implementation as of PNA Firmware A.08.33.01).
namespace CSharpSocketClient
{
    /// <summary>
    /// The class supporting the main entry point for the application.
    /// </summary>
    /// <summary>
    class MainClass
    {
        static AsyncCallback m_pCallbackFunc;
        static string m_AsyncReply;

        /// <summary>
        /// The main entry point for the application.
        /// </summary>
        /// <summary>
        [STAThread]
        static int Main(string[] args)
        {
            try
            {
                if (args.Length != 1)
                {
                    Console.WriteLine("\n");
                }
            }
        }
    }
}
```
Console.WriteLine("Usage -- with Microsoft's .NET runtime:");
Console.WriteLine("SocketClient servernameoraddress");
Console.WriteLine("Example: SocketClient 192.168.0.1");
Console.WriteLine("\n");
Console.WriteLine("Usage -- with Mono's (www.mono-project.com) .NET runtime:");
    Console.WriteLine("mono SocketClient.exe servernameoraddress");
    Console.WriteLine("Example: mono SocketClient.exe 192.168.0.1");
    return 1;
}

string server = args[0];
Int32 port = 5025; // default socket port number for the PNA

// Create the primary client socket instance
    Socket client = new Socket(AddressFamily.InterNetwork, SocketType.Stream,
                              ProtocolType.Tcp);

// Get the DNS IP addresses associated with the instrument.
    // (if 'server' string contains the IP address rather than DNS name, this still works)
    IPHostEntry hostInfo = Dns.Resolve(server);
    IPAddress[] IPaddresses = hostInfo.AddressList;
    if (IPaddresses.GetLength(0) < 1)
        return 1;

// Create an endpoint to use for opening the socket connection
    IPEndPoint endpoint1 = new IPEndPoint(IPaddresses[0], port);
// Open the connection to the server instrument
    client.Connect(endpoint1);
    if(!client.Connected)
        return 1;

// Query the instrument's ID string.
    string id = Parse(client, "*IDN?");

// Clear the instrument's Status Byte
Parse(client, "*CLS");

// Enable for the OPC bit (bit 0, which has weight 1) in the instrument's
// Event Status Register, so that when that bit's value transitions from 0
to 1
// then the Event Status Register bit in the Status Byte (bit 5 of that
byte)
// will become set.
Parse(client, "*ESE 1");

// Enable for bit 5 (which has weight 32) in the Status Byte to generate an
// SRQ when that bit's value transitions from 0 to 1.
Parse(client, "*SRE 32");

// Ask the instrument for the number of a port on which a 'control'
// socket connection can be opened.
string controlPortNumStr = Parse(client, "SYSTem:COMMunicate:TCPip:CONTrol?
");
Int32 controlPortNum = System.Convert.ToInt32(controlPortNumStr);

// Create the client "control connection" socket instance
Socket controlClient = new Socket(AddressFamily.InterNetwork,
SocketType.Stream, ProtocolType.Tcp);

// Create an endpoint to use for opening the control connection
IPEndPoint endpoint2 = new IPEndPoint(IPaddresses[0], controlPortNum);
// Connect to the server instrument via the port number that was returned
by the instrument.
controlClient.Connect(endpoint2);
if(!controlClient.Connected)
    return 1;

// Start the control connection listening for an SRQ message.
BeginListeningForAsyncReply(controlClient);

// Now send a preset command to the instrument, accompanied by '*OPC' such
// that when that operation is complete an SRQ event will be generated
// which posts the Status Byte message on the control connection.
Parse(client, "SYSTem:PRESet;*OPC");

    // Normally at this point you would want to have your program do other things
    // right here until the SRQ callback occurs, instead of just idling here waiting
    // for it.
    do {} while (m_AsyncReply == null);

    // Now that the SRQ has occurred, we can issue a Device Clear via the control connection.
    Parse(controlClient, "DCL");

    // The instrument will respond back with "DCL" (and linefeed character appended
    // on the end) via the control connection when it has finished processing the
    // Device Clear request. Note that this 'Response' method uses the synchronous
    // form of 'Receive', so it could potentially time out if the instrument were
    // to take a long time to process the Device Clear. So alternatively the 'BeginListeningForAsyncReply' could be used for this instead of 'Response'.
    string deviceClearResponse = Response(controlClient);

    // Close both of the socket client sessions.
    controlClient.Close();
    client.Close();
} catch (ArgumentNullException e)
{
    Console.WriteLine("ArgumentNullException: {0}", e);
} catch (SocketException e)
{
    Console.WriteLine("SocketException: {0}", e);
}
Console.WriteLine("/n Press Enter to continue...");
Console.Read();
return 0;
}

{
    SocketPacket socPkt = (SocketPacket)asyn.AsyncState ;
    Int32 byteCount = socPkt.thisSocket.EndReceive(asyn);
    m_AsyncReply = System.Text.Encoding.ASCII.GetString(socPkt.data, 0, byteCount);
    Console.WriteLine("Received: {0}", m_AsyncReply);
}
}
Last Modified:

28-Aug-2008   Updated with new TCPIP command
This Visual Basic program demonstrates two methods of reading the analyzer's status registers:

- **Polled Bit Method** - reads the Limit1 register continuously.
- **SRQ Method** - enables an interrupt of the program when bit 6 of the status byte is set to 1. The program then queries registers to determine if the limit line failed.

To run this program, you need:

- An established [GPIB interface connection](#)
- A form with two buttons: Poll and SRQ Method
- A means of causing the limit line to fail, assuming it passes initially.

```vbnet
Private Sub Poll_Click()
' POLL THE BIT METHOD
' Clear status registers
GPIB.Write "*CLS"

' Loop FOREVER
Do
  DoEvents
  GPIB.Write "STATus:QUEStionable:LIMit1:EVENt?"
  onn = GPIB.Read
Loop Until onn = 2
MsgBox "Limit 1 Failed"
End Sub

Private Sub SRQMethod_Click()
' SRQ METHOD
GPIB.Write "SYSTem:PRESet"
GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"
' slow down the trace
GPIB.Write "SENS:BWID 150"

' Setup limit line
GPIB.Write "CALC:LIM:DATA 2,3e9,6e9,-2,-2"
GPIB.Write "CALC:LIMit:DISP ON"
GPIB.Write "CALC:LIMit:STATe ON"

' Clear status registers.
GPIB.Write "*CLS;*wai"
' Clear the Service Request Enable register.
GPIB.Write "*SRE 0"
' Clear the Standard Event Status Enable register.
GPIB.Write "*ESE 0"
```
' Enable questionable register, bit(10) to report to the status byte.
GPIB.Write "STATus:QUEStionable:ENABle 1024"

' Enable the status byte register bit3 (weight 8) to notify controller
GPIB.Write "*SRE 8"

' Enable the onGPIBNotify event
GPIB.NotifyMask = cwGPIBRQS
GPIB.Notify
End Sub

----------------------------------------------------
Private Sub GPIB_OnGPIBNotify(ByVal mask As Integer)
' check to see what failed
' was it the analyzer?
GPIB.Write "*STB?"
onn = GPIB.Read
If onn <> 0 Then
' If yes, then was it the questionable register?
GPIB.Write "STATus:QUEStionable:EVENt?"
onn = GPIB.Read
' Determine if the limit1 register, bit 8 is set.
If onn = 1024 Then
' If yes, then was it trace 1?
GPIB.Write "STAT:QUES:LIMIT1:EVEN?"
onn = GPIB.Read
If onn = 2 Then MsgBox ("Limit Line1 Failed")
End If
End If
End Sub
Transfer Data using GPIB

The following RMB examples transfer data to and from a remote PC using the \texttt{MMEM:TRANSfer} command.

Transferring data FROM the PNA -- TO a remote PC:

\begin{verbatim}
30  ! Set up I/O paths
40  ! Network analyzer address
50  ! File to be stored on local computer
60  ! First time -- need to create the file.
70  ! After file name, number records set to 0 (ignored by WinOS)
80  ! Use "PURGE" command to delete if desired.
90  CREATE "mytestdata.s2p",0
100 ASSIGN @File TO "mytestdata.s2p"
110  ! TRANSFER the data (download)
120  ! Analyzer has file 'testdata.s2p' in default directory
130 OUTPUT @Na;"`:MMEM:TRANS? ""testdata.s2p"
135  ! Now read the bytes coming back from the analyzer in four steps
138  ! (1) Read and dump the first character - '#'
140  ENTER @Na USING ":#;A";A$
141  ! (2) Read the next character which is the number of digits in the file size
150  ENTER @Na USING #:A;Digit$
155  ! (3) Use the value of the number of digits to read back the file byte size
160  ! Create query string using this number of digits
165  Img$="#,"&Digit$&"A"
170  ENTER @Na USING Img$;Byte$
175  ! (4) Read the file contents into a buffer and store the buffer contents to a local file
180  ! Allocate a buffer for holding the data
190  ALLOCATE Dat$[VAL(Byte$)]
195  ! Set up a different image for filling the buffer
200  Img$=Byte$&"A"
205  ! Retrieve the actual file data
210  ENTER @Na USING Img$;Dat$
220  ! Now save the file locally.
230  OUTPUT @File;Dat$
\end{verbatim}
Transferring data FROM the remote PC - TO the PNA:

40 ! Set up I/O paths
50 !
60 ! Network analyzer address
70 ASSIGN @Na TO 716
77 ! File to be retrieved from local computer
78 ASSIGN @File TO "mytestdata.s2p"
79 !
120 ! TRANSFER the data
123 !
230 ! Allocate a buffer for holding the data
240 ALLOCATE Dat$[26236]
250 !
260 ! Get data from the file and fill Dat$
270 ENTER @File;Dat$
280 !
325 ! Data to be transferred to analyzer file 'testupld.s2p'
326 ! in default directory.
327 !
328 ! A specific block transfer designator must follow the
329 ! file name:
330 ! '#' specifies a block transfer.
331 ! '6' specifies 6 digits to follow.
332 ! '026236' matches the buffer size allocated above
333 ! not counting <NL><END> (new line and end of file).
430 OUTPUT @Na;":MMEM:TRAN "'testupld.s2p'",#6026236",Dat$
520 END
Triggering the PNA using SCPI

To understand how to trigger the PNA using SCPI, it is very important to understand the PNA trigger model. Here is a very simple explanation. These three separate functions control PNA triggering:

1. **Trigger:Source** - Where the trigger signals originate:
   - Internal Continuous
   - Internal Manual (Single)
   - External - a trigger source that is connected to the PNA rear panel.

2. **Trigger:Scope** - what gets triggered:
   - Global - each signal triggers all channels in turn.
   - Channel - each signal triggers ONE channel.

3. Channel settings (Sense<ch>:Sweep:Mode) How many triggers will each channel accept before going into hold.
   - HOLD - channel will not trigger.
   - CONTinuous - channel triggers indefinitely.
   - GROups - channel accepts the number of triggers specified with the last SENS:SWE:GRO:COUN <num>.
   - SINGle - channel accepts ONE trigger, then goes to HOLD.
   - Point trigger  SENS1:SWE:TRIG:POINt

When controlling the PNA using SCPI, a SINGLE trigger is used to ensure that a complete sweep is taken. This example demonstrates how to Single trigger the PNA using the following two methods:

- **Simplest Triggering**  This method sets the Trigger Source to Internal Continuous - a stream of trigger signals. Each channel is configured to ACCEPT only a single trigger signal, then HOLD. This method can also be used when an External trigger source sends a continuous stream of trigger signals.

- **Advanced Triggering** This method SENDS a single trigger from the Source, which can be from either Internal (using INIT:IMM) or External triggering. Each channel is configured to accept an unlimited number of triggers. This method is the only way to perform point triggering. When you require some channels to accept continuous triggers and other channels to accept single triggers, see INIT:IMM Advanced to learn how.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text
editor file such as Notepad and save it on the PNA hard drive as Trigger.vbs. Learn how to setup and run the macro.

**Measurement setup example:** This section of code can be used at the start of both methods. It sets up:

- S11 traces on two channels
- 10 data points
- Sweep time of 2 seconds - this is slow enough to allow us to watch as each trace is triggered.

```vbs
Dim app
Dim scpi
' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
'============================================
'Setup the PNA
'Preset the analyzer
scpi.Execute ("SYST:FReset")
' Create and turn on window/channel 1
scpi.Execute ("DISPlay:WINDow1:STATE ON")
'Define a measurement name, parameter
scpi.Execute ("CALCulate1:PARameter:DEFine:EXT 'MyMeas1',S11")
'Associate ("FEED") the measurement name ("MyMeas") to WINDow (1)
scpi.Execute ("DISPlay:WINDow1:TRACe1:FEED 'MyMeas1'")
' Create and turn on window/channel 2
scpi.Execute ("DISPlay:WINDow2:STATE ON")
'Define a measurement name, parameter
scpi.Execute ("CALCulate2:PARameter:DEFine:EXT 'MyMeas2',S11")
'Associate ("FEED") the measurement name ("MyMeas") to WINDow (2)
scpi.Execute ("DISPlay:WINDow2:TRACe2:FEED 'MyMeas2'")
'Set slow sweep so we can see
scpi.Execute ("SENS1:SWE:TIME 2")
scpi.Execute ('SENS2:SWE:TIME 2")
'set number of points to 10
scpi.Execute ("SENS1:SWE:POIN 10")
scpi.Execute ("SENS2:SWE:POIN 10")
```
'Put both channels in Hold
scpi.Execute("SENS1:SWE:MODE HOLD")
scpi.Execute("SENS2:SWE:MODE HOLD")
'================================

'Pick Single Send or Single Accept
resp=Msgbox("Single Send? - Click No for Single Accept", 4, "PNA Trigger Demo")
If resp=6 Then
    SingleSend()
Else
    SingleAccept()
End If

Simple Triggering  The following example sends a continuous stream of trigger signals and each PNA channel is set to ACCEPT only a signal trigger signal, then HOLD.

- This example can be used to configure External triggering where the trigger source sends a continuous stream of trigger signals. Configure the type of trigger signal that the PNA responds to using the **CONTrol:SIGNal** command. The command in this example sets the PNA to respond to HIGH TTL signals at the rear-panel BNC1 trigger IN connector. This command also automatically sets Trigger Source to External Trigger.

- The **TRIG SCOPE** (Global or Channel) setting is NOT necessary with a continuous stream of trigger signals. The example program directly controls when each channel is triggered.

- Point triggering can NOT be used with a continuous stream of trigger signals because in point triggering the channel will accept as many triggers as necessary to complete ONE full sweep. Use the single SEND example for point triggering.
Sub SingleAccept()
' PNA sends continuous trigger signals
scpi.Execute("TRIG:SOUR IMMediate")
' Uncomment the following to set External triggering
'scpi.Execute("CONT:SIGN BNC1,TILHIGH")
AcceptOne()
End Sub

Sub AcceptOne()
' The following command makes the channel immediately sweep
'*OPC? allows the measurement to complete before the controller sends another command
scpi.Execute("SENS1:SWE:MODE SINGle;*OPC?")
' You could do something to ch2 here before sweeping it
scpi.Execute("SENS2:SWE:MODE SINGle;*OPC?")
resp=Msgbox("Another trigger?", 1, "PNA Trigger Demo")
If resp=1 Then
AcceptOne()
End If
End Sub

Advanced Trigger
This example section performs Single Send triggering. Here, single triggering is accomplished by SENDING one trigger signal from the Trigger source and each channel is setup to accept unlimited trigger signals. See the INIT:IMM command for more details.

- Using this method, it is possible to change Trigger:Scope to Global or Channel. Set trigger scope to channel if there is some code to execute between channel measurements. Similarly, this method can be used to set Point triggering. Use this method if there is some code to execute between data point measurements.

- In addition, this method can also be used to perform External triggering if the external trigger source is capable of SENDING single triggers. See the CONTrol:SIGNal command to set the type of signal to which the PNA will respond.

- If the external source can only send a continuous stream of trigger signals, then the Single Accept section must be used.

Sub SingleSend()
' Set Source Internal - Manual Triggering
scpi.Execute("TRIG:SOUR MANual")
'If using an External trigger source that is capable of
'sending SINGLE trigger signals, then uncomment the following.
'This command automatically sets trigger source to External
'scp.i.Execute ("CONT:SIGN BNC1,TILHIGH")

'Setup Trigger Scope
'WHAT gets triggered
'Pick one using comments
'Set Channel triggering
'scp.i.Execute ("TRIG:SCOPe CURRent")
'Set Global triggering (Default)
scp.i.Execute ("TRIG:SCOPe ALL")

'Set Channel Settings
'The channels respond to UNLIMITED trigger signals (Default)
scp.i.Execute ("SENS1:SWE:MODE CONTinuous")
scp.i.Execute ("SENS2:SWE:MODE CONTinuous")

'To do Point trigger on one or more channels, uncomment the following.
'Point trigger automatically sets Trig:Scope to Current/Channel
'scp.i.Execute ("SENS1:SWE:TRIG:POINt ON")
'scp.i.Execute ("SENS2:SWE:TRIG:POINt ON")
IntTrig()
End Sub

Sub IntTrig()
'If External triggering, replace this Sub with code
'to single trigger the External Trig Source
Dim resp
'*OPC? allows the measurement to complete before the controller sends another
'command
scpi.Execute ("INITiate:IMMediate;*OPC?")
resp=Msgbox ("Another trigger?", 1, "PNA Trigger Demo")
If resp=1 Then
IntTrig()
End If
End Sub

Perform an Unguided Cal on Multiple Channels

This VBScript program performs an Unguided Calibration simultaneously on two channels. This could be used in the following cases:

- If you need more than the current number of data points per trace, so the additional points must be added to a different channel.
- If you need several channels with independent settings, but you want to calibrate all channels with a minimal number of standard connections. This would be especially critical for on wafer calibration.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

```vbscript
Dim app
Dim scpi
Dim NumberOfActiveChannels

Upload and Download a Segment List

This VBScript program creates two segments, then uploads the segment data to the PNA. The second part downloads the segment list from the PNA. The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

See all Segment SCPI commands.

Create and Upload a Segment List

```vbs
Option Explicit
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
' Preset the PNA
app.Preset
Dim scpi
Set scpi = app.ScpiStringParser
' In case of a measurement receiver PNA like N5264A
' which has no source ports, "SOURce:CATalog?" will
' return an empty list (just a pair of quotation marks)
Dim srcPortNames
srcPortNames = Split( scpi.Execute("SOURce:CATalog?"), ",")
Dim numberOfSrcPorts
If Left( srcPortNames(0), 2 ) = Chr(34) & Chr(34) Then
    numberOfSrcPorts = 0
Else
    numberOfSrcPorts = UBound(srcPortNames) + 1
End If
' Building up a string consisting of the sweep segment data
' we want to set up. This example will create two segments.
Dim segData
' Set state of first segment to be ON (1 = ON, 0 = OFF),
' 101 points, start freq of 10 MHz, stop freq of 1 GHz
segData = "1,101,10E6,1E9"
' If you want to include one or more of: IFbandwidth, Dwell Time
```
' or Port Power, remove the comments from these next two lines
'TurnOnOptions 1 'Call the subroutine
'segData = AddOptionalSettings(segData, numberOfSrcPorts)
' Set state of second segment to be ON, 201 points,
' start freq of 1 GHz, stop freq of 3 GHz
segData = segData & ",1,201,1E9,3E9"
' Uncomment this line below only if you uncommented the
' AddOptionalSettings line above for the first segment.
'segData = AddOptionalSettings(segData, numberOfSrcPorts)

Uploading a Source Power Cal using SCPI

Programming the PNA using COM or using SICL/VISA over LAN (as in this example) leaves the PNA free to control GPIB devices as needed. This Visual Basic program demonstrates:

- Uploading a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations

Other SCPI Example Programs

To run this program, you need:

- Your PC and PNA both connected to a LAN (if using VISA LAN server / client).
- The SICL and VISA components of Agilent’s I/O Libraries software installed on your PC (both are included when you install the software, unless you already have another vendor’s VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor’s VISA.
- The module visa32.bas added to your VB project.
- A form with two buttons: cmdRun and cmdQuit.
- A VISA interface configured on your remote PC to control the PNA. This could be GPIB interface or a VISA LAN Client.

' Session to VISA Default Resource Manager
Private defRM As Long
' Session to PNA
Private viPNA As Long
' VISA function status return code
Private status As Long
Private Sub Form_Load()
defRM = 0
End Sub
Private Sub cmdRun_Click()

' String to receive data from the PNA.
' Dimensioned large enough to receive scalar comma-delimited values
' for 21 frequency points (20 ASCII characters per point)
Dim strReply As String * 420
Dim strPower As String, strCalPower As String
Dim strStimulus, strCalValue
Dim strResult As String

' Open the VISA default resource manager
status = viOpenDefaultRM(defRM)
If (status < VI_SUCCESS) Then HandleVISAError

' Open a session (viPNA) to the PNA at "address 16" on the VISA
' interface configured as "GPIB0" on this PC.
status = viOpen(defRM, "GPIB0::16::INSTR", 0, 0, viPNA)
If (status < VI_SUCCESS) Then HandleVISAError

End
End Sub
GPIB Fundamentals

The General Purpose Interface Bus (GPIB) is a system of hardware and software that allows you to control test equipment to make measurements quickly and accurately. This topic contains the following information:

- The GPIB Hardware Components
- The GPIB / SCPI Programming Elements
- Specifications
- GPIB Interface Capability Codes

Note: All of the topics related to programming assume that you already know how to program, preferably using a language that can control instruments.

Other Topics about GPIB Concepts

The GPIB Hardware Components

The system bus and its associated interface operations are defined by the IEEE 488 standard. The following sections list and describe the main pieces of hardware in a GPIB system:

Early PNA models had only ONE GPIB connector. These models could control other GPIB devices using one of, or a combination of, the following methods:

- Use the SCPI `SYST:COMM:GPIB:RDEV:` commands.
- Use VISA or SICL over LAN to accomplish this. See an example.
- Use USB / GPIB Interface

Note: Current PNA models have dedicated Controller and Talker/Listener GPIB ports. See how to configure these ports.

Controllers

Controllers specify the instruments that will be the talker and listener in a data exchange. The controller of the bus must have a GPIB interface card to communicate on the GPIB.

- The Active Controller is the computer or instrument that is currently controlling data exchanges.
- The System Controller is the only computer or instrument that can take control and give up control of the GPIB to another computer or instrument, which is then called the active controller.

Talker / Listener Instruments and GPIB Addresses

- Talkers are instruments that can be addressed to send data to the controller.
- **Listeners** are instruments that can be addressed to receive a command, and then respond to the command. All devices on the bus are required to listen.

Every GPIB instrument must have its own unique address on the bus. The PNA address (default = 716) consists of two parts:

1. **The Interface select code** (typically 7) indicates which GPIB port in the system controller is used to communicate with the device.

2. **The primary address** (16) is set at the factory. You can change the primary address of any device on the bus to any number between 0 and 30. To change the analyzer address click **System / Configure / SICL-GPIB**.

A secondary address is sometimes used to allow access to individual modules in a modular instrument system, such as a VXI mainframe. The PNA does NOT have a secondary address.

**Cables**

GPIB Cables are the physical link connecting all of the devices on the bus. There are eight data lines in a GPIB cable that send data from one device to another. There are also eight control lines that manage traffic on the data lines and control other interface operations.

You can connect instruments to the controller in any arrangement with the following limitations:

- Do not connect more than 15 devices on any GPIB system. This number can be extended with the use of a bus extension.

- Do not exceed a total of 20 meters of total cable length or 2 meters per device, whichever is less.

- Avoid stacking more than three connectors on the back panel of an instrument. This can cause unnecessary strain on the rear-panel connector.

**The GPIB / SCPI Programming Elements**

The following software programming elements combine to become a GPIB program:

- **GPIB / SCPI Commands**
- **Programming Statements**
- **Instrument Drivers**

**GPIB Commands**

The GPIB command is the basic unit of communication in a GPIB system. The analyzer responds to three types of GPIB commands:

1. **IEEE 488.1 Bus-management Commands**

These commands are used primarily to tell some or all of the devices on the bus to perform certain interface operations.
All of the functions that can be accomplished with these commands can also be done with IEEE 488.2 or SCPI commands. Therefore, these commands are not documented in this Help system. For a complete list of IEEE 488.1 commands refer to the IEEE 488 standard. Examples of IEEE 488.1 Commands

- CLEAR – Clears the bus of any pending operations
- LOCAL – Returns instruments to local operation

2. IEEE 488.2 Common Commands

These commands are sent to instruments to perform interface operations. An IEEE 488.2 common command consists of a single mnemonic and is preceded by an asterisk ( * ). Some of the commands have a query form which adds a “?” after the command. These commands ask the instrument for the current setting. See a complete list of the Common Commands that are recognized by the analyzer. Examples of IEEE 488.2 Common Commands

- *OPC – Operation Complete
- *RST – Reset
- *OPT? – Queries the option configuration

3. SCPI Commands

The Standard Commands for Programmable Instruments (SCPI) is a set of commands developed in 1990. The standardization provided in SCPI commands helps ensure that programs written for a particular SCPI instrument are easily adapted to work with a similar SCPI instrument. SCPI commands tell instruments to do device specific functions. For example, SCPI commands could tell an instrument to make a measurement and output data to a controller. Examples of SCPI Commands:

```plaintext
CALCULATE:AVERAGE:STATE ON
SENSE:FREQUENCY:START?
```

For more information on SCPI:

- The Rules and Syntax of SCPI Commands provides more detail of the SCPI command structure.
- SCPI Command Tree is a complete list of the SCPI commands for the analyzer

**Programming Statements**

SCPI commands are included with the language specific I/O statements to form program statements. The programming language determines the syntax of the programming statements. SCPI programs can be written in a variety of programming languages such as VEE, HP BASIC, or C++. Example of a Visual Basic statement:

```plaintext
GPIB.Write "SOURCE:FREQUENCY:FIXED 1000 MHz"
```

**Note about examples**

**Instrument Drivers**

Instrument drivers are subroutines that provide routine functionality and can be reused from program to program. GPIB industry leaders have written standards for use by programmers who develop drivers. When programmers write drivers that comply with the standards, the drivers can be used with predictable results. To comply with the
standard, each instrument driver must include documentation describing its functionality and how it should be implemented.

**GPIB Specifications**

**Interconnected devices** - Up to 15 devices (maximum) on one contiguous bus.

**Interconnection path** - Star or linear (or mixed) bus network, up to 20 meters total transmission path length or 2 meters per device, whichever is less.

**Message transfer scheme** - Byte-serial, bit-parallel, asynchronous data transfer using an interlocking 3-wire handshake.

**Maximum data rate** - 1 megabyte per second over limited distances, 250 to 500 kilobytes per second typical maximum over a full transmission path. The devices on the bus determine the actual data rate.

**Address capability** - Primary addresses, 31 Talk and 31 Listen; secondary addresses, 961 Talk and 961 Listen. There can be a maximum of 1 Talker and up to 14 Listeners at a time on a single bus. See also previous section on GPIB addresses.

**GPIB Interface Capability Codes**
The IEEE 488.1 standard requires that all GPIB compatible instruments display their interface capabilities on the rear panel using codes. The codes on the analyzer, and their related descriptions, are listed below:

- **SH1** full source handshake capability
- **AH1** full acceptor handshake capability
  - **T6** basic talker, serial poll, no talk only, unaddress if MLA (My Listen Address)
- **TEO** no extended talker capability
  - **L4** basic listener, no listen only, unaddress if MTA (My Talk Address)
- **LEO** no extended listener capability
- **SR1** full service request capability
- **RL1** full remote / local capability
- **PPO** no parallel poll capability
- **DC1** full device clear capability
- **DT1** full device trigger capability
- **C1** system controller capability
- **C2** send IFC (Interface Clear) and take charge controller capability
- **C3** send REN (Remote Enable) controller capability
C4 respond to SRQ (Service Request)

The Rules and Syntax of SCPI

Most of the commands used for controlling instruments on the GPIB are SCPI commands. The following sections will help you learn to use SCPI commands in your programs.

Branches on the Command Tree

Command and Query

Multiple Commands

Command Abbreviation

Bracketed (Optional) Keywords

Vertical Bars (Pipes)

MIN and MAX Parameters

Other Topics about GPIB Concepts

Branches on the Command Tree

All major functions on the analyzer are assigned keywords which are called ROOT commands. (See GPIB Command Finder for a list of SCPI root commands). Under these root commands are branches that contain one or more keywords. The branching continues until each analyzer function is assigned to a branch. A root command and the branches below it is sometimes known as a subsystem.

For example, under `SOURcE:POWer` are several branch commands.

Sometimes the same keyword, such as `STATE`, is used in several branches of the command tree. To keep track of the current branch, the analyzer's command parser uses the following rules:

- **Power On and Reset** - After power is cycled or after `*RST`, the current path is set to the root level commands.

- **Message Terminators** - A message terminator, such as a `<NL>` character, sets the current path to the root command level. Many programming language output statements send message terminators automatically. Message terminators are described in Sending Messages to the Analyzer.

- **Colon (:)** - When a colon is between two command keywords, it moves the current path down one level in the command tree. For example, the colon in `:SOURCE:POWER` specifies that `POWER` is one level below `SOURCE`. When the colon is the first character of a command, it specifies that the following keyword is a root level command. For example, the colon in `:SOURCE` specifies that source is a root level command.

**Note:** You can omit the leading colon if the command is the first of a new program line. For example, the following two commands are equivalent:

```
SOUR:POW:ATT:AUTO
:SOUR:POW:ATT:AUTO
```
Whitespace characters, such as `<tab>` and `<space>`, are generally ignored. There are two important exceptions:

- Whitespace inside a keyword, such as `:CALCULATE`, is not allowed.
- Most commands end with a parameter. You must use whitespace to separate these ending parameters from commands. **Always refer to the command documentation**. In the following example, there is whitespace between `STATE` and `ON`.

```
CALCULATE1:SMOOTHING:STATE ON
```

**Comma (,)** - If a command requires more than one parameter, you must separate adjacent parameters using a comma. For example, the `SYSTEM:TIME` command requires three values to set the analyzer clock: one for hours, one for minutes, and one for seconds. A message to set the clock to 8:45 AM would be `SYSTEM:TIME 8,45,0`. Commas do not affect the current path.

**Semicolon (;)** - A semicolon separates two commands in the same message without changing the current path. See **Multiple Commands** later in this topic.

**IEEE 488.2 Common Commands** - Common commands, such as `*RST`, are not part of any subsystem. An instrument interprets them in the same way, regardless of the current path setting.

### Command and Query

A SCPI command can be an **Event command**, **Query command** (a command that asks the analyzer for information), or both. The following are descriptions and examples of each form of command. GPIB Command Finder lists every SCPI command that is recognized by the analyzer, and its form.

<table>
<thead>
<tr>
<th>Form</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event commands</strong> - cause an action to occur inside the analyzer.</td>
<td><code>:INITIATE:IMMEDIATE</code></td>
</tr>
<tr>
<td><strong>Query commands</strong> - query only; there is no associated analyzer state to set.</td>
<td><code>:SYSTem:ERRor?</code></td>
</tr>
<tr>
<td><strong>Command and query</strong> - set or query an analyzer setting. The query form appends a question mark (?) to the set form</td>
<td><code>:FORMat:DATA ! Command</code>  <code>:FORMat:DATA? ! Query</code></td>
</tr>
</tbody>
</table>

### Multiple Commands

You can send multiple commands within a single program message. By separating the commands with semicolons the current path does not change. The following examples show three methods to send two commands:

1. **Two program messages**:

```
SOURCE:POWER:START 0DBM
SOURCE:POWER:STOP 10DBM
```
2. **One long message.** A colon follows the semicolon that separates the two commands causing the command parser to reset to the root of the command tree. As a result, the next command is only valid if it includes the entire keyword path from the root of the tree:

```
SOURCE:POWER:START 0DBM; :SOURCE:POWER:STOP 10DBM
```

3. **One short message.** The command parser keeps track of the position in the command tree. Therefore, you can simplify your program messages by including only the keyword at the same level in the command tree.

```
SOURCE:POWER:START 0DBM; STOP 10DBM
```

### Common Commands and SCPI Commands

You can send Common commands and SCPI commands together in the same message. (For more information on these types of commands see [GP-IB Fundamentals](#).) As in sending multiple SCPI commands, you must separate them with a semicolon.

**Example** of Common command and SCPI commands together

```
*RST; SENSE:FREQUENCY:CENTER 5MHZ; SPAN 100KHZ
```

### Command Abbreviation

Each command has a long form and an abbreviated short form. The syntax used in this Help system use uppercase characters to identify the short form of a particular keyword. The remainder of the keyword is lower case to complete the long form.

<table>
<thead>
<tr>
<th>Short form</th>
<th>Long form</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOUR - Short form</td>
<td>SOURce - Long form</td>
</tr>
</tbody>
</table>

Either the complete short form or complete long form must be used for each keyword. However, the keywords used to make a complete SCPI command can be a combination of short form and long form.

The following is **unacceptable** - The first three keywords use neither short or long form.

```
SOURc:Powe:Atten:Auto on
```

The following is **acceptable** - All keywords are either short form or long form.

```
SOUR:POWer:ATT:AUTO on
```

In addition, the analyzer accepts lowercase and uppercase characters as equivalent as shown in the following equivalent commands:

```
source:POW:att:auto ON
Source:Pow:Att:Auto on
```

### Optional [Bracketed] Keywords

You can omit some keywords without changing the effect of the command. These optional, or default, keywords are used in many subsystems and are identified by brackets in syntax diagrams.

**Example** of Optional Keywords

The **HCOPY** subsystem contains the optional keyword **IMMediate** at its first branching point. Both of the following commands are equivalent:
Vertical Bars | Pipes

Vertical bars, or "pipes", can be read as "or". They are used in syntax diagrams to separate alternative parameter options.

Example of Vertical Bars:

SOURce:POWer:ATTenuation:AUTO <on|off>

Either ON or OFF is a valid parameter option.

MIN and MAX Parameters

The special form parameters "MINimum" and "MAXimum" can be used with commands that specify single frequency (Hz) and time (seconds) as noted in the command documentation. Note: Also with these commands, kHZ, MHz, and GHz are accepted as suffixes/units.

The short form (min) and long form (minimum) of these two keywords are equivalent.

- MAXimum refers to the largest value that the function can currently be set to
- MINimum refers to the smallest value that the function can currently be set to.

For example, the following command sets the start frequency to the smallest value that is currently possible:

SENS:FREQ:START MIN

In addition, the max and min values can also be queried for these commands.

For example, the following command returns the smallest value that Start Frequency can currently be set to:

SENS:FREQ:START? MIN

An error will be returned if a numeric parameter is sent that exceeds the MAX and MIN values.

For example, the following command will return an "Out of range" error message.

SENS:FREQ:START 1khz

Configure for GPIB, SCPI, and SICL

The following settings are used to configure the PNA for remote control using SCPI commands.

### How to Configure for SICL / GPIB Operation

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>PNA Menu using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SYSTEM</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then [<strong>Configure</strong>]</td>
<td>2. then <strong>System</strong></td>
</tr>
<tr>
<td>3. then [<strong>SICL/GPIB</strong>]</td>
<td>3. then <strong>Configure</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>SICL/GPIB/SCPI</strong></td>
</tr>
</tbody>
</table>

**SICL / GPIB** dialog box help

**GPIB**

**Talker/Listener Address**  Sets the PNA address used to send and receive GPIB/SCPI commands to the system controller (external computer).

Use the National Instruments interface or the ACE (Agilent Connection Expert) interface to change the
System Controller address. Use the PNA as the system controller of external devices. Learn about the PNA as controller.

See the rear panels of the PNA-X or PNA ‘C’ models.

**SICL**

**SICL Enabled** When checked, the analyzer is capable of running GPIB programs on its computer to control analyzer functions. The programs must be run from a GPIB-capable programming environment (VEE, Visual Basic). This mode does not allow control of external GPIB instruments. To uncheck this box, exit the PNA application - (Click File, then Exit). The PNA restarts with the SICL enabled box unchecked unless **Automatically Enable on Startup** is checked.

Learn more about Configuring for VISA and SICL.

**Address** Sets the PNA address.

**Automatically Enable on Startup** When checked, SICL Enabled is automatically selected when starting the PNA application.

**LAN Sockets/Telnet**

Provides ability to communicate with the PNA from a PC that uses a Windows, or non-Windows, operating system.

- These settings are checked by default. If you have security concerns, clear these check boxes.

- These settings remain after the PNA is shutdown and restarted.

**Sockets Enabled** When checked, provides the ability to control the PNA from a remote SCPI program using port number 5025. See the C# example that illustrates how this is done.

**Telnet Enabled** When checked, provides the ability to send single SCPI commands from a remote Windows, or non-Windows, PC to the PNA using port number 5024.

How to send single SCPI commands using Telnet:

1. On the remote PC, click **Start**, then **Run**

2. Type: `telnet <computer name> 5024`
   where `<computer name>` is the full computer name of the PNA. See how to find the computer name of the PNA.

3. A Telnet window with a **SCPI>** prompt should appear on the remote PC screen.

4. From the SCPI prompt:

   - Type single SCPI commands
   - If an invalid SCPI command is sent, the prompt will disappear. Press **Enter** or **Ctrl C** to recover the SCPI prompt.
     - To exit the telnet window click **X** in the upper-right corner.
     - To get a normal telnet prompt, press **Ctrl ]** (closing bracket).
To close the normal telnet window, type Quit and press Enter.

**SCPI Monitor / Input**

**GPIB Command Processor Console** Launches a window that is used to send single SCPI/GPIB commands from the PNA keyboard.

*Note:* Press Control+Z, then enter, to close the console window.

*Note:* The Status Register system can NOT be used from the GPIB Console.

- Type a valid command, with appropriate arguments and press enter.
- Use the arrow keys to recall previous commands.
- The console window may launch behind the PNA application. Press Control+Tab to bring the console window to the top.

**Monitor GPIB Bus** Enables monitoring activity on the GPIB.

**Show GPIB Bus Monitor Window** Shows and hides the window monitoring GPIB activity.

**Local and Remote Operation**

The analyzer LCL and RMT (Local and Remote) operation labels appear in the lower right corner of the status bar.

*Note:* The status bar is NOT visible when the analyzer is preset. See [how to make the status bar visible](#).

- **LCL** appears when NOT under SCPI control
- **RMT** appears when under SCPI control. The RMT label does NOT appear when under COM control. Remote operation disables the front panel keys except for the Macro/Local key.

To return to Local (front panel) operation, press the Macro / Local key

Sending the GPIB "GTL" (go to local) command also returns the analyzer to Local operation.

Sending the GPIB "LLO" (local lockout) command disables the front panel Local button.

Getting Data from the Analyzer

Data is sent from the analyzer in response to program queries. Data can be short response messages, such as analyzer settings, or large blocks of measurement data. This topic discusses how to read query responses and measurement data from the analyzer in the most efficient manner.

Response Message Syntax

Clearing the Output Queue

Response Data Types

Transferring Measurement Data

Note: Some PCs use a modification of the IEEE floating point formats with the byte order reversed. To reverse the byte order for data transfer into a PC, use the FORMat:BORDer command.

Other Topics about GPIB Concepts

Response Message Syntax

Responses sent from the analyzer contain data, appropriate punctuation, and message terminators. <NL><^END> is always sent as a response message terminator. Most programming languages handle these terminators transparent to the programmer.

Response messages use commas and semicolons as separators in the following situations:

- a comma separates response data items when a single query command returns multiple values

  FORM:DATA? 'Query
  ASC, +0 'Analyzer Response

- a semicolon separates response data when multiple queries are sent within the same messages

  SENS:FREQ:STAR?;STOP? --Example Query
  +1.23000000000E+008; +7.89000000000E+008<NL><^END> 'Analyzer Response

Clearing the Output Queue

After receiving a query, the analyzer places the response message in it's output queue. Your program should read the response immediately after the query is sent. This ensures that the response is not cleared before it is read. The response is cleared when one of the following conditions occur:

- When the query is not properly terminated with an ASCII carriage return character or the GPIB <^END> message.

- When a second program query is sent.
When a program message is sent that exceeds the length of the input queue

- When a response message generates more response data than fits in the output queue.
- When the analyzer is switched ON.

**Response Data Types**

The analyzer sends different response data types depending on the parameter being queried. You need to know the type of data that will be returned so that you can declare the appropriate type of variable to accept the data. For more information on declaring variables see your programming language manual. The GPIB Command Finder lists every GPIB command and the return format of data in response to a query. The analyzer returns the following types of data:

- **Numeric Data**
- **Character Data**
- **String Data**
- **Block Data**

**Numeric Data**

All numeric data sent over the GPIB is ASCII character data. Your programming environment may convert the character data to numeric data for you. Boolean data (1 | 0) is a type of numeric data.

**Character Data**

Character data consists of ASCII characters grouped together in mnemonics that represent specific analyzer settings. The analyzer always returns the short form of the mnemonic in upper-case alpha characters. Character data looks like string data. Therefore, refer to the GPIB Command Finder to determine the return format for every command that can be queried.

**Example** of Character Data

```
MLOG
```

**String Data**

String data consists of ASCII characters. String parameters can contain virtually any set of ASCII characters. When sending string data to the analyzer, the string **must** begin with a single quote (') or a double quote (" ) and end with the same character (called the delimiter).

**Note**: The analyzer responds best to all special characters if the string is enclosed in single quotes. If quotes are not used, the analyzer will convert the text to uppercase. The analyzer may not respond as you expect.

The analyzer always encloses data in double quotes when it returns string data.

**Example** of String Data

```
GPIB.Write "DISP:WINDow:TITLe:DATA?"

"This is string response data."
```

**Block Data**
Block data is used to transfer measurement data. Although the analyzer will accept either definite length blocks or indefinite length blocks, it always returns definite length block data in response to queries unless the specified format is ASCII. The following graphic shows the syntax for definite block data:

```
<num_digits> specifies how many digits are contained in <byte_count>
<byte_count> specifies how many data bytes will follow in <data bytes>
```

**Example** of Definite Block Data

```
#17ABC+XYZ<nl><end>
```

Where:

- `#` - always sent before definite block data
- `1` - specifies that the byte count is one digit (7)
- `7` - specifies the number of data bytes that will follow, not counting <NL><END>
- `ABC+XYZ` - Data
- `<NL><END>` - always sent at the end of block data

**Transferring Measurement Data**

Measurement data is blocks of numbers that result from an analyzer measurement. Measurement data is available from various processing arrays within the analyzer. For more information on the analyzer’s data processing flow, see [Accessing Data Map](#). Regardless of which measurement array is read, transferring measurement data is done the same.

See an example.

When transferring measurement data, the **FORMat:DATA** command allows you to choose from the following two data types:

- **REAL**
- **ASCII**

The following graphic shows the differences in transfer times between the two:
REAL Data

REAL data (also called floating-point data) types transfer faster. This is because REAL data is binary and takes about half the space of ASCII data. The disadvantage of using REAL data is that it requires a header that must be read. See definite length block data. The binary floating-point formats are defined in the IEEE 754-1985 standard. The following choices are available in REAL format:

- **REAL,32** - IEEE 32-bit format - single precision (not supported by HP BASIC)
- **REAL,64** - IEEE 64-bit format - double precision

ASCII Data

The easiest and slowest way to transfer measurement data is to use ASCII data. ASCII data is sent if the data contains both numbers and characters (the setting of FORMat:DATA is ignored). ASCII data is separated by commas.

Synchronizing the PNA and Controller

In this topic, Synchronizing the PNA and Controller means to keep PNA and the controller working at approximately the same pace.

See Also
- Synchronize an External PSG Source
- Triggering the PNA using SCPI

The Problem
The controller sends commands to the PNA as fast as the GPIB bus will allow. The PNA stores these commands in the PNA Input queue. However, the PNA executes those commands at a slower rate than they are accepted. If left unchecked, the PNA input buffer will contain a long list of commands waiting to be executed.

At some point, the controller will send a query command which requires a response from the PNA. The controller will not send more commands until a response is received. It will wait for a response from the PNA for the amount of time set by the Timeout setting. If the PNA is working off a long list of commands in the input buffer, it may not execute and respond to the query command until the controller has quit waiting, or "timed out".

The Solution
The easiest way to keep the controller and the PNA "synched" is to send query commands often. This stops the controller from sending more commands until the PNA executes and responds to the query. This limits the number of commands that are waiting in the PNA input queue to be processed.

Although any query will stop the controller from sending more commands, a good practice is to send *OPC? Most of the time, as soon as this query is executed, it will immediately reply. The exception to this is the Overlapped command.

- **Sequential** commands are executed quickly and in the order in which they are received.

- **Overlapped** commands take longer to execute. Therefore, they allow the PNA to execute other commands while waiting. However, the programmer may want to prevent the analyzer from processing new commands until the overlapped command has completed. If the PNA is executing an overlapped command when a *OPC? is received, it will wait until the overlapped command is complete.

Note: The analyzer has two overlapped commands:

- **INITiate:IMMediate**
- **SENSe:SWEep:MODE GROUPS** (when INIT:CONT is ON)
- **Calibration Acquire commands using the ASYN argument**

Analyzer Queues
Queues are memory buffers that store messages until they can be processed. The analyzer has the following queues:
**Input Queue**

**Output Queue**

**Error Queue**

**Input Queue**

The controller sends statements to the analyzer without regard to the amount of time required to execute the statements. The input queue is very large (31k bytes). It temporarily stores commands and queries from the controller until they are read by the analyzer's command parser. The input queue is cleared when the analyzer is switched ON.

**Output Queue**

When the analyzer parses a query, the response is placed in the output queue until the controller reads it. Your program should immediately read the response or it may be cleared from the output queue. The following conditions will clear a query response:

- When a second query is sent before reading the response to the first. This does not apply when multiple queries are sent in the same statement.
- When a program statement is sent that exceeds the length of the input queue.
- When a response statement generates more data than fits in the output queue.
- When the analyzer is switched ON.

**Error Queue**

Each time the analyzer detects an error, it places a message in the error queue. When the `SYSTEM:ERROR?` query is sent, one message is moved from the error queue to the output queue so it can be read by the controller. Error messages are delivered to the output queue in the order they were received. The error queue is cleared when any of the following conditions occur:

- When the analyzer is switched ON.
- When the `*CLS` command is sent to the analyzer.
- When all of the errors are read.

If the error queue overflows, the last error is replaced with a "Queue Overflow" error. The oldest errors remain in the queue and the most recent error is discarded.

**Synchronization Methods**

The following common commands are used to synchronize the analyzer and controller. Examples are included that illustrate the use of each command in a program. See the SCPI command details to determine if a command is an overlapped command.

`*WAI`

`*OPC?`

`*OPC`
**WAI**

The *WAI command:

- **Stops the analyzer** from processing subsequent commands until all overlapped commands are completed.
- **It does NOT stop the controller** from sending commands to this and other devices on the bus. This is the easiest method of synchronization.

**Example** of the *WAI command

GPIB.Write "ABORT;:INITIATE:IMMEDIATE" 'Restart the measurement.
GPIB.Write "CALCULATE:MARKER:SEARCH:MAXIMUM" 'Search for max amplitude.
GPIB.Write "CALCULATE:MARKER:X?" 'Which frequency?

The following time line shows how the processing times of the three commands relate to each other:

```
 ABORT;:INITIATE:IMMEDIATE

   CALCULATE:MARKER:MAXIMUM

   CALCULATE:MARKER:X?
```

**INITIATE:IMMEDIATE** is an overlapped command; it allows the immediate processing of the sequential command, **CALCULATE:MARKER:SEARCH:MAXIMUM**. However, the **INITIATE:IMMEDIATE** is not considered complete until the measurement is complete. Therefore, the marker searches for maximum amplitude before the measurement completes. The **CALCULATE:MARKER:X?** query could return an inaccurate value.

To solve the problem, insert a *WAI command.

GPIB.Write "ABORT;:INITIATE:IMMEDIATE" 'Restart the measurement.
GPIB.Write "*WAI" 'Wait until complete.
GPIB.Write "CALCULATE:MARKER:MAXIMUM" 'Search for max amplitude.
GPIB.Write "CALCULATE:MARKER:X?" 'Which frequency

The time line now looks like this:

```
 ABORT;:INITIATE:IMMEDIATE

   *WAI

   CALCULATE:MARKER:MAXIMUM

   CALCULATE:MARKER:X?
```

The *WAI command keeps the **MARKER:SEARCH:MAXIMUM** from taking place until the measurement is completed. The **CALCULATE:MARKER:X?** query returns the correct value.

**Note**: Although *WAI stops the analyzer from processing subsequent commands, it does not stop the controller. The controller could send commands to other devices on the bus.

**OPC?**
The *OPC? query stops the controller until all pending commands are completed.

In the following example, the Read statement following the *OPC? query will not complete until the analyzer responds, which will not happen until all pending commands have finished. Therefore, the analyzer and other devices receive no subsequent commands. A "1" is placed in the analyzer output queue when the analyzer completes processing an overlapped command. The "1" in the output queue satisfies the Read command and the program continues.

Example of the *OPC? query

This program determines which frequency contains the maximum amplitude.

```
GPIB.Write "ABORT; :INITIATE:IMMEDIATE"! Restart the measurement
GPIB.Write "*OPC?" 'Wait until complete
Meas_done = GPIB.Read 'Read output queue, throw away result
GPIB.Write "CALCULATE:MARKER:MAX" 'Search for max amplitude
GPIB.Write "CALCULATE:MARKER:X?" 'Which frequency?
Marker_x = GPIB.Read
PRINT "MARKER at " & Marker_x & " Hz"
```

*OPC

The *OPC command allows the analyzer and the controller to process commands while processing the overlapped command.

When the analyzer completes processing an overlapped command, the *OPC command sets bit 0 of the standard event register to 1. This requires polling of status bytes or use of the service request (SRQ) capabilities of your controller. See Reading the Analyzer's Status Registers for more information about the standard event status register, generating SRQs, and handling interrupts.

**Note:** Be careful when sending commands to the analyzer between the time you send *OPC and the time you receive the interrupt. Some commands could jeopardize the integrity of your measurement. It also could affect how the instrument responds to the previously sent *OPC.

Example of polled bit and SRQ processes.

**When To Synchronize the Analyzer and Controller**

The need to synchronize depends upon the situation in which the overlapped command is executed. The following section describes situations when synchronization is required to ensure a successful operation.

**Completion of a Measurement**

**Averaged Measurements**

Completion of a Measurement

To synchronize the analyzer and controller to the completion of a measurement, use the ABORT;INITIATE:IMMEDIATE command sequence to initiate the measurement.

This command sequence forces data collection to start (or restart) under the current measurement configuration. A restart sequence, such as ABORT;INITIATE:IMMEDIATE is an overlapped command. It is complete when all operations initiated by that restart command sequence, including the measurement, are finished. The *WAI,*OPC? and *OPC commands allow you to determine when a measurement is complete. This ensures that valid measurement data is available for further processing.
Measurements with External Trigger

See Triggering the PNA using SCPI.

External Triggering

Averaged Measurements

Averaged measurements are complete when the average count is reached. The average count is reached when the specified number of individual measurements is combined into one averaged measurement result. Use synchronization to determine when the average count has been reached.

If the analyzer continues to measure and average the results after the average count is reached, use synchronization to determine when each subsequent measurement is complete.

17-Feb-2009  Added Cal ACQ to Overlapped commands
Calibrating the PNA Using SCPI

There are several ways to calibrate the PNA using SCPI depending on your measurement needs. As from the Cal Wizard, you can perform a Guided Cal, Unguided Cal, or ECal. This topic explains the differences in these calibration choices when using SCPI commands.

- **Guided Calibrations**
- **ECal**
- **Perform Computer Operations During Acquire**
- **Creating Cal Sets**
- **Applying Cal Sets and Cal Types**
- **Uploading Error Terms**
- **Unguided Cals and Calibration Classes**

**See SCPI Calibration Examples**

**Guided Calibrations**

- To perform a **Guided Calibration**, use ONLY `Sens:Corr:Coll:Guided` commands.
- To perform an **Unguided Calibration**, use ONLY `Sens:Corr` commands (NOT Guided).
- These commands calibrate the ACTIVE channel. Activate a channel by selecting a measurement on the channel to be calibrated using `Calc:Par:Select`.
- Full 1,2,3,4-port SOLT and TRL calibrations - No response cals.
- All of the advanced calibration features (Thru method, specify DUT connectors and Cal kits for each port, port pairings).
- A Cal Set is applied to the channel and saved at the completion of a guided cal according to the preference setting `SENS:CORR:PREF:CSET:SAVE`.

**ECal**

From the Cal Wizard or from a SCPI program, ECal is fast, accurate, and very repeatable. Unlike from the Cal Wizard, you can use SCPI to perform ECal using either the Guided or Unguided commands. The Unguided commands are easiest to use. However, the following situations require that you use the Guided commands.

- To maximize accuracy, all ECal calibrations on the PNA perform an Unknown Thru measurement of the ECal module Thru state **IF** the PNA model being used has **1 reference receiver per port**. If your PNA does **NOT** have 1 reference receiver per port, use Guided ECal commands and specify a Thru method.
If your ECal module connectors do NOT match the DUT connectors, and you choose not to perform a User Characterization, use Guided ECal commands and specify the Thru method.

**ECAL Notes:**

- When using either Guided or Unguided ECal commands under low power situations, use the Orientation settings. The Guided example shows the use of these commands. When using Unguided, they must appear before the Acquire command.
- The frequency range of the measurement must be within the range of the ECal module. Otherwise, the calibration will fail.
- Although we recently provided the command, you do NOT have to send the ECal module state command. The ECal algorithm switches ECal states automatically.
- All of these ECal choices are listed in the Programming Command Search function in this Help file.

See [Using ECal](#) to learn about all of the ECal features.

**Perform Computer Operations During Acquire**

During a calibration with slow sweep speeds, such as when using a narrow IF bandwidth, you may want to have your program perform other operations, such as checking for the click event of a Cancel button.

To do this, use the optional ASYNchronous argument with the ACQuire command as shown in several calibration example programs. The PNA parser returns immediately while the cal step measurement proceeds. It does NOT block commands and wait for the measurement step to finish. You can send *ESR? or *STB? queries to monitor the status register bytes to see when the OPC (operation complete) bit gets set, which indicates the cal measurement step has finished. Learn more about [status registers](#).

If your program is using the ScpiStringParser, then you can ONLY use *OPC? to detect when the OPC bit is set. When using the ASYN argument, set the timeout value in the IO settings to at least 5 seconds. There are intervals during the cal acquires when the PNA takes a several seconds to respond to additional commands, such as when the processor is calculating error terms.

The following Acquire commands have this argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:COLL:GUID:ACQuire (Guided Cal)</td>
<td>Guided 2-Port or 4-Port Cal</td>
</tr>
<tr>
<td>SENS:CORR:COLL:ACQuire (Unguided Cal)</td>
<td>Perform Unguided ECAL</td>
</tr>
<tr>
<td>SENS:CORR:COLL:SESS:ACQuire (FCA)</td>
<td></td>
</tr>
</tbody>
</table>

Learn more about [Synchronizing the PNA and Controller](#).
Creating Cal Sets

There are several ways to store guided cal data into a unique Cal Set. The following is probably the easiest. It does not require the name of an existing Cal Set and it allows you to name the Cal Set.

```
SENS:CORR:COLL:GUID:INIT  'start the cal with no cal set argument
'Sens the cal
SENS:CORR:COLL:GUID:SAVE  'create cal set with auto-generated name or to cal register
SENS:CORR:CSET:NAME 'MyCalSet'  'name the current cal set.
```

Applying Cal Sets and Cal Types

A Cal Set is applied to the channel and saved at the completion of a guided cal according to the preference setting `SENS:CORR:PREF:CSET:SAVE`.

When you select a Cal Set to apply to an uncalibrated channel, the PNA attempts to find the most comprehensive calibration type in the Cal Set and turn it ON. In addition, changing a measurement parameter (for example, from S11 to S21) will also initiate an attempt to apply the best Cal Type and turn correction ON.

There may be times when you do not want the most comprehensive Cal Type. For example, say there is a Full 2-port Cal Set applied, but there is only an S11 measurement displayed. If measurement speed is a concern, you can apply a Full 1-Port Cal Type from that same Cal Set and save time by not doing the extra background sweeps. Learn more about background sweeps.

If you change the measurement parameter, the PNA will reapply the Full 2-Port Cal Type.

See the SCPI and COM commands for Cal Sets and Cal Types.

Uploading Error Terms

There are two ways to upload error terms using SCPI: the old way and the recommended way. The old way will still works but requires a 'preference' setting.

**The old way is this:**

```
SENS:CORR:COLL:METHod <cal type>
SENS:CORR:COLL:SAVE
CALC:DATA SCORR[n]  < data to upload >
```

This technique, used in WinCal software, starts a calibration and immediately saves it without acquiring any standards. In PNA Rev 6.0, executing SAVE without acquiring data will return an error. To suppress the error and continue to use the above technique to upload error terms, send the following command to set the preference:

`SENS:CORR:PREF:SIMCal 1`

Or you can execute the script that is saved on the PNA at `C:/Program Files/Agilent/Network Analyzer/System/wincal32.reg`.

Setting this preference defeats some error checking when performing unguided cal using SCPI. This is not recommended unless needed for backward compatibility.

**The recommended way** is to upload error terms into a created or selected Cal Set:

```
SENS:CORR:CSET:CREATE or SENS:CORR:CSET:GUID
SENS:CORR:CSET:Data <term> <port> <port> <data>
```
This method puts error terms into a Cal Set, outside of a Guided or Unguided calibration session. The Cal Set can then be applied at any time.

See SENS:CORR:CSET commands.

**Unguided Cals and Calibration Classes**

- Use Sens:Correction commands.
- 1-port, 2-port, Response.
- Can select 2 sets of standards.
- TRL is NOT recommended.

The following describes how to perform an unguided calibration using SCPI. The objective here is to make clear the relationship between the physical port on which a standard is being measured, the actual device in the cal kit, and the SCPI command used to acquire the device.

Calibration standards classes are ‘categories’ of standard types. To perform a 2 port calibration, the cal wizard requires the following types of standards to be measured:

**3 reflection standards on the forward port:**

- Class S11A typically an open
- Class S11B typically a short
- Class S11C typically a load

**Likewise, 3 reflection standards are required for the reverse port:**

- Class S22A typically an open
- Class S22B typically a short
- Class S22C typically a load

**There is also a transmission standard that is measured in both directions:**

- Class S21T typically a thru

The following illustrates the relationship between cal kit physical standards and calibration classes. Here is a list of the physical devices in my calibration kit.

Standard #1 = "3.5 mm male short"
Standard #2 = "3.5 mm male open"
Standard #3 = "3.5 mm male broadband load"
Standard #4 = "Insertable thru standard"
When you perform a calibration remotely using SCPI, you don’t specify the device number directly. Rather, you specify the class you want to measure. Each device in the calibration kit is assigned to a class. And since more than one device can be assigned to the same class, each class contains an ordered list of devices. The class assignments are set using the Advanced Modify Cal Kit dialog or the SCPI command:

```
SENS:CORR:COLL:CKIT:ORDER <class>, <std>, <std>, <std>, <std>, <std>, <std>, <std>
```

The 85052B kit used in the example program has the following standard list for each class: The list was obtained by issuing the corresponding SCPI query:

```
SENS:CORR:COLL:CKIT:OLIST1?  S11A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST2?  S11B = +1,+7,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST3?  S11C = +6,+5,+3,+12,+13,+14,+0
SENS:CORR:COLL:CKIT:OLIST4?  S21T = +4,+8,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST5?  S22A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST6?  S22B = +1,+7,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST7?  S22C = +6,+5,+3,+12,+13,+14,+0
SENS:CORR:COLL:CKIT:OLIST8?  S12T = +4,+8,+0,+0,+0,+0,+0
```

When you perform the calibration, you acquire data by issuing the ACQuire command:

```
SENS:CORR:COLL:ACQ <class>[, <subst>]
```

For example:

```
SENS:CORR:COLL:SFOR 1
SENS:CORR:COLL:ACQ STANA, SST2
```

The SFOR command tells the wizard to make the next acquisition in the forward direction. The ACQuire command specifies that we are measuring the 2nd device in the list for STANA. And since we are measuring SFORward, then STANA refers to class #1 or S11A. The list of devices for this class are specified in the OLIST1 query above.

Alternately, you could modify the device order for the S11A class to move device #15 into the first position (SENS:CORR:COLL:CKIT:ORDER1). When the desired device is in the first position, you need not specify the order number in the ACQuire command. The default is the first device in the OLIST. This works well for two port network analyzers where the order for S11A,B,C classes is set up for port 1 and the order for S22A,B,C is set up for port 2. With the kit set up in the proper order, you eliminate the need to specify the substandard number.
See an example: Perform an Unguided 2-port Cal on a 4-port PNA.
The PNA as a USB Device

Beginning with PNA Rev. A.09.00, the PNA can be controlled as a USB Device using SCPI. This is done through the Agilent I/O Libraries which must be installed on your remote computer.

All data types, especially Binary block data, transfer MUCH faster using USB as compared to GPIB.

To communicate with the PNA as a USB device

1. Connect the PNA to the remote computer using the rear-panel device-side USB connector. This connector is available ONLY on PNA models with a 1.1 GHz CPU board, and the PNA-X.

2. The ‘Found New Hardware’ wizard is launched. Follow the prompts to install the PNA driver software.

3. The Agilent I/O Libraries will recognize the PNA as a Test and Measurement device and show the following dialog.

Note: The PNA is not a USB Mass Storage Device. Therefore, Windows Explorer does NOT recognize it as a USB device. You can NOT use Windows Explorer to transfer files to and from the PNA. For file transfer, use the SCPI command MMEM:TRANsfer.

Alias name Change this to a name that is easy to recognize. Once configured, use the Alias name to communicate with the USB device using applications such as VISA and SICL:

- VISA: viOpen (...,"UsbDevice1",...)
- SICL: iopen ("UsbDevice1")

For more information, see the Connectivity Guide in the Agilent I/O libraries.
Reading the Analyzer's Status Register

The PNA has several status registers that your program can read to know when specific events occur. There are two methods of reading the status registers in the analyzer: the Polled Bit method and the Service Request method.

- The Status Registers
- Setting and Reading Bits in Status Registers
- Polled Bit Method
- Service Request Method

See Also
IEE 482 Common commands
Example: Status Reporting
Status Commands

Other Topics about GPIB Concepts

Important Notes:

- A new **Limit Line Fail command** that makes it easy to determine if Limit Line testing has failed.
- **OPC?** can be used to easily determine when a channel has completed a sweep. This requires no interaction with the Status Register system. Most [PNA programming examples](#) use *OPC*.
- Most of the Status Register system can NOT be used with the [SCPIStringParser Object](#). However, *OPC?* can be used.

The Status Registers

Most of the status registers in the analyzer have sixteen bits. For simplicity, this topic will illustrate their use with 8-bit registers. Bits in registers represent the status of different conditions inside of the analyzer. In the following graphic, a register is represented by a row of boxes; each box represents a bit. Bit 3 is ON.

```
7 6 5 4 3 2 1 0
```

Each PNA Status Register is actually comprised of the following registers. [See an image of the PNA Status registers.](#)

- **Enable Registers** - When using the [SRQ method of polling](#), you first set bits in the enable register which tells the PNA which events to monitor. This is not necessary using the [Polled Bit method](#), as you can only monitor a single event. A *CLS (clear status) command will not clear the enable register. The *ESE and
*ESE? commands are used to set and query Enable bits, while *ESR is used to read and clear an Enable register. Learn how to set bits.

- **Condition Registers** - A condition register continuously monitors events in the PNA. Bits in the condition register change real time as conditions occur. These bits are not latched, so this register is used mainly for diagnostic purposes. The registers that only summarize lower level registers do NOT have a condition register.

- **Event Registers** - This is the register that is read to determine if an event has occurred. An event register latches the bits from the corresponding condition register. When an event register bit is set, subsequent changes to the corresponding condition register bit are ignored. The bit remains set until a query command such as *CLS clears the bit. Learn how to read the Event Register.

- **Positive and Negative Transition Registers** - Transition registers control what type of change in a condition register will set the corresponding bit in the event register.
  
  - **Positive** transitions (0 to 1) are only reported to the event register if the corresponding positive transition bit is set to 1.
  
  - **Negative** transitions (1 to 0) are only reported to the event register if the corresponding negative transition bit is set to 1.

  Setting both transition bits to 1 causes both positive and negative transitions to be reported.

Transition registers are read-write and are unaffected by *CLS (clear status) or queries. They are reset to their default settings at power-up and after *RST and SYSTem:PRESet commands. The following are the default settings for the transition registers:

- All Positive Transition registers = 1
- All Negative Transition registers = 0

This means that, by default, the analyzer will latch all event registers on the negative to positive transition (0 to 1).

The following is an example of why you would set transition registers:

A critical measurement requires that you average 10 measurements and then restart averaging. You decide to poll the averaging bit. When averaging is complete, the bit makes a positive transition. After restart, you poll the bit to ensure that it is set back from 1 to 0, a negative transition. You set the negative transition bit for the averaging register.

### Setting and Reading Bits in Status Registers

Both the Polled-Bit method and Service Request method require that you set and read status register bits. Most of the PNA status registers contain 16 bits, numbered 0 to 15. Each bit has a weighted value. The following example shows how to set the bits in a 8-bit status register.

<table>
<thead>
<tr>
<th>Bit</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>8</td>
<td>16</td>
<td>32</td>
<td>64</td>
<td>128</td>
</tr>
</tbody>
</table>

How to set bits 4 and 5 in the Standard Event Status Enable register:
Step | Example
---|---
1. Determine the weighted bit value for these bits weights 16 and 32 (respectively)
2. Add these values together $16 + 32 = 48$
3. Send this number as an argument in the appropriate command. (see Status Commands) STAT:QUES:LIMIT1:ENAB 48

The Polled Bit Method
With the Polled Bit Method, your program monitors a bit in the status register that represents the condition of interest to you. When the PNA sets the bit to 1, your program sees it and responds accordingly.

- If your program **periodically** monitors a bit in the status register, it is free to do other things as well. However, your program can respond only as fast as the bit is polled.
- If your program **continually** monitors a bit, it can respond immediately, but will be unavailable to do anything other than poll the bit.

**Advantage:** This method requires very little programming.

**Procedure:**

1. Decide which condition to monitor. The Status Commands topic lists all of the possible conditions that can be monitored in the analyzer.
2. Determine the command to be used to monitor the bit.
3. Determine how often to poll the bit until it is set.
4. Construct the routine to respond when the bit is set.

The Service Request (SRQ) Method
Your program enables the bits in the status registers representing the condition of interest. When the condition occurs, the PNA actively interrupts your program from whatever it is doing, and an event handler in your program responds accordingly. Do this method if you have several conditions you want to monitor or the conditions are such that it is not practical to wait for the condition to occur.

**Advantage:** This method frees your program to do other things until the condition occurs. The program is interrupted to respond to the condition.

**Disadvantage:** This method can require extensive programming depending on the number and type of conditions that you want to monitor.

**Procedure:**

1. Decide which conditions to monitor. The Status Commands topic lists all of the possible analyzer conditions that can be monitored.
2. Set the enable bits in the **summary** registers and the **status byte** register.
Enabling is like making power available to a light. Without power available, the switch can be activated, but the light won't turn ON. In the analyzer, without first enabling a bit, the condition may occur, but the controller won't see it unless it is enabled.

The condition, and the bit in the summary registers in the reporting path, must be enabled. This is like streams (conditions) flowing into rivers (summary registers), and rivers flowing into the ocean (controller). See the diagram of status registers in Status Commands.

Bit 6 of the status byte register is the only bit that can interrupt the controller. When any representative bit in the status byte register goes ON, bit 6 is automatically switched ON.

3. Enable your program to interrupt the controller. This is done several ways depending on the programming language and GPIB interface card you use. An example program is provided showing how this is done with in Visual Basic with a National Instruments GPIB card.

4. Construct a subroutine to handle the interrupt event. If you are monitoring more than one condition in your system, your event handler must determine which condition caused the interrupt. Use the *SPE command to determine the instrument that caused the interrupt, then poll the summary registers, then poll condition registers to determine the cause of the interrupt.

4-Jun-2009    Modified Polled Bit method
1-May-2009    Several edits
Configure for SCPI LAN using SICL / VISA

**PNA Supported Interfaces**

**Agilent I/O Libraries**

**SICL / VISA Programs Running on the PNA**

**Configure the PNA for SICL / VISA**

**Configure the External Controller**

---

**Other Topics about GPIB Concepts**

**PNA Supported Interfaces**

The PNA supports the following interfaces for SICL / VISA communication:

- **LAN** - as a remote GPIB interface. The PNA LAN is presented as a virtual GPIB interface. It does NOT support simple TCPIP-based control. Therefore, when configuring the Agilent IO libraries on your PC, add a **REMOTE GPIB** interface, which uses the LAN client interface.

- **GPIB** - requires that your external controller have a GPIB card.

**Note:** For optimum LAN interface performance, use **COM** to control the PNA. SCPI commands can be sent to the PNA using the COM **SCPIStringParser** object.

The following interfaces are **NOT** supported:

- **USB**
- **Serial**
Important Note:
To enable VISA or SICL communication over LAN, you must do the following:

1. On the PNA, click **System**, point to **Configure**, then click **SICL/GPIB**.

2. Check **SICL Enabled**. To automatically enable SICL when the PNA is booted, check **Automatically enable on Startup**.

3. Click **OK**.

The PNA is now ready to be controlled over LAN.

Learn more about this dialog box.

Agilent I/O Libraries
The Agilent I/O libraries includes the drivers to allow you to communicate with Agilent test instruments. Every PNA is shipped with the Agilent I/O libraries installed. We recommend you do NOT upgrade the Agilent I/O libraries on the PNA as unexpected results may occur. If you choose to upgrade the Agilent I/O libraries on the PNA, do NOT change the default folder path in the InstallShield Wizard.

To communicate with the PNA, the Agilent I/O libraries must also be installed on your external controller. To purchase the Agilent I/O libraries, or download a free upgrade, go to [www.agilent.com](http://www.agilent.com) and search for IO Libraries. Scroll to find Software, Firmware & Drivers.

SICL / VISA Programs Running on the PNA
You can run your SICL / VISA program on the PNA to control the PNA. Although the Agilent I/O libraries are already installed on the PNA, it is configured as the **Host**. You must also configure a SICL or VISA LAN **Client** interface on the PNA, specifying the LAN hostname of that same PNA.

If your program uses the COM interface to VISA, and is compiled on a PC with the Agilent IO Libraries Suite (version 14 or later), and the resulting executable is copied and run on the PNA, it will produce a “type mismatch error”. This is because the PNA has the ‘M’ version of Agilent I/O libraries. The following Visual Basic code is an example of how to avoid this error when communicating with the PNA from within the PNA:

```vbnet
Dim rm As IResourceManager
Dim fmio As IFormattedIO488
Set rm = CreateObject("AgilentRM.SRMCls")
Set fmio = CreateObject("VISA.BasicFormattedIO")
Set fmio.IO = rm.Open("GPIB0::22")
fmio.WriteString "*IDN?" & Chr(10)
MsgBox fmio.ReadString()
```

Controlling the PNA over LAN while controlling other instruments over GPIB
The PNA can NOT be both a controller and talker/listener on the same GPIB bus. Using SICL / VISA, you can use LAN to control the PNA, leaving the PNA free to use the rear-panel GPIB interface to control other GPIB devices.
Configure the PNA for SICL / VISA

1. On the PNA, click **System** then check **Windows Taskbar**

2. Click **Start** then point to **Program Files, Agilent IO Libraries**, then click **IO Config**

3. Select each GPIB Interface and click **Edit** to verify (or make) the default settings in the following table. These settings are REQUIRED when using a **82357A USB / GPIB** Interface with the PNA.

4. When complete, click **OK** to close the edit dialog.

5. Click **OK** to close the IO Config dialog.

<table>

Configure the External Controller

Please refer to the Agilent I/O libraries documentation to learn how to configure your controller to communicate with the PNA. These links can show you how to find the following PNA information:

- **PNA full computer name**
- **GPIB Address**
- **IP Address**

This **example program** can help test your VISA configuration.

Last Modified:

13-Aug-2008 Added GPIB4
Beginning in Dec. 2005, Agilent VEE Pro RunTime is installed on new PNAs. This means that programs written with Agilent VEE (.vxe files) can be run directly on the PNA. New PNA models with 1.1 GHz CPU have VEE 7.5 runtime with Agilent I/O Libraries suite 14.

PNAs without Agilent VEE installed can go to the Agilent VEE website and download Agilent VEE Pro 6.2 RunTime to the PNA and begin to run VEE programs directly on the PNA. This version does not require Agilent I/O Libraries suite 14. Do NOT upgrade to Agilent I/O Libraries suite 14 on the PNA.

With Agilent VEE Pro RunTime installed on the PNA, the following examples can be run directly on the PNA:

- Basic Control of the PNA

For more VEE examples, see the PNA support website.
For more information on Agilent VEE, see www.agilent.com/find/VEE
Basic Control using VEE

This VEE Pro 6.0 example does the following:

- Controls PNA windows and traces.
- Changes stimulus settings.
- Measures all four S parameters.
- Create markers and displays marker readout.

If this Help file is on a PNA and VEE Pro RunTime is installed, then:

1. Run the BasicControl.vxe example
2. Then click Open on the following dialog box to run the program.

Otherwise, you can modify the example program using VEE, save the VEE BasicControl.vee
Learn how to run this program as a Macro on the PNA.

The following dialog box will be visible on the PNA when the example program is running.

- Click Fwd to activate the Forward (S11 and S21) measurements.
- Click Rev to activate the Reverse (S22 and S12) measurements.
- Click Update Markers to sweep the PNA.
- Type values to change Marker Frequencies.
ECal with Confidence Check using VEE

This VEE Pro 6.0 example performs an ECal and subsequent ECal confidence Check. If this Help file is on a PNA and VEE Pro RunTime is installed:

- Run the .vxe example
- Then click Open on the following dialog box to run the program.

Or to modify the example program using VEE, save the VEE BasicControl.vee

Learn how to run this program as a Macro on the PNA.

The following dialog box will be visible on the PNA when the example program is running.

- Click Fwd to activate the Forward (S11 and S21) measurements.
- Click Rev to activate the Reverse (S22 and S12) measurements.
- Click Update Markers to sweep the PNA.
- Type values to change Marker Frequencies.
Interface Control

The Interface Control feature allows you to send remote commands and data to the following PNA rear-panel Interfaces: GPIB, Material Handler I/O, Test Set I/O, and Auxiliary I/O.

- Overview
- How to Access Interface Control Settings
- Interface Control Dialog Box
- Z5623A H08 Test Set Commands

Other System Configuration Topics

Overview

The Interface Control feature allows you to send data to control external equipment such as GPIB instruments, a material handler, test set, or other equipment, without needing to create a remote program. The PNA manages the timing and required interface setup. See Rear Panel Tour.

- A unique set of control data can be sent for each channel. In addition, a unique set of control data can be sent before the channel sweep starts, and after the sweep ends.
- Interface Control settings can be saved and recalled from the Interface Control dialog box, or with Instrument State Save and Recall.
- Interface Control settings can be copied to other channels using Copy Channels.
- Control data can only be WRITTEN to the interfaces, NOT READ from the interfaces.
- Control data is sent in the following order. This order cannot be changed.

1. GPIB Interface
2. Material Handler Interface
3. Test Set Interface
4. Aux Interface
5. Dwell Time
# How to access Interface Control settings

## Using front-panel HARDKEY [softkey] buttons

1. Press **TRACE/CHAN**
2. then **[Channel]**
3. then **[More]**
4. then **[Interface Control]**

## Using a mouse with PNA Menus

1. Click **Trace/Chan**
2. then **Channel**
3. then **More**
4. then **Interface Control**

## Interface Control dialog box help

See Interface Control Overview (scroll up)
An Instrument Preset will reset all of the fields to their default settings.

**Note:** If an error is encountered when sending Interface Control data, an error message is displayed on the PNA screen. The Channel Trigger State is set to Hold. You must fix the condition that caused the error, then change the Channel Trigger State to its original setting.

**Enable Interface Control** Enables and disables ALL Interface Control communication. When cleared (default setting) Interface Control is disabled and NO data is sent. To send data, the individual interfaces must also be enabled.

**Channel** Specifies the channel number for dialog settings. Each channel is configured individually. The list box shows the channels that currently have measurements. There must be at least one measurement present in order to make settings.

**Channel Label** Specifies the label to be displayed on the second status bar at the bottom of the PNA screen. This field is shared with External Testset control. The second status bar is automatically displayed when Interface Control is enabled.

Before Sweep Start - After Sweep End Tabs

Commands / data for all four interfaces can be sent both Before Sweep Start and After Sweep End. However, they are configured and enabled on separate tabs of the Interface Control dialog box. For example, to send GPIB commands both Before and After a PNA sweep, the Enable Control checkbox must be selected and commands entered on BOTH the Before Sweep Start and After Sweep End tabs.

**Before Sweep Start** The data is sent BEFORE the first trace on the channel begins sweeping.

**After Sweep End** The data is sent AFTER the last trace on the channel completes sweeping.

**GPIB Commands**

**Notes:**

- While using the rear-panel GPIB port with Interface Control, the PNA must be in GPIB System Controller mode. If the PNA is NOT in System Controller mode, an error message appears AND Interface Control is disabled. To correct this situation,
  
  1. Put the PNA in System Controller mode, and
  2. Re-enable Interface Control.

- GPIB instruments CAN be connected to the PNA using a USB/GPIB adapter. In this case, the PNA can be in talker-listener mode.

- GPIB Queries are NOT supported.

**Enable Control** Enables and disables sending commands out the GPIB interface.

**Multi-line edit control** Each line contains a GPIB command using the following syntax:

```
address command
```
Where:

- **address** a number between 0 and 31. The PNA will look through all of the GPIB interfaces for an instrument connected to the specified address. If an instrument with that address is not recognized, an error is returned.

- **command** a GPIB command, with or without enclosing quotes. Enclosing quotes are ignored.

Address and command are separated by at least one space.

Commands should be separated by a new line, or carriage return. For example:

```
19 ":init:cont off"
16 init:imm
```

The front-panel **Enter** key inserts a new line into the field.

The number of GPIB commands that can be entered is limited only by the available memory of the PNA. See [Z5326A H08 Test Set Commands](#).

### Material Handler I/O

**Enable Control** Enables and disables sending data out the **Material Handler I/O connector**.

**Ports A, B, C, D** Sends values to the respective Handler I/O port. Although ports C and D are normally bidirectional, ONLY Output mode is allowed using the Interface Control feature. It cannot read from these, or any other, ports.

### Test Set I/O

Note: The PNA has a separate interface for controlling the **E5091A Test Set**.

**Enable Control** Enables and disables sending data out the **External Test Set I/O connector**.

**Multi-line edit control** Each line contains a Write command using the following syntax:

```
address.value
```

Where:

- **address** any positive integer.
- **value** numeric character. Entries that require **alpha** characters should use the **GPIB interface**.

Address and value are separated by a period. For example:

```
18.2
27.3
```

Entries should be separated by a new line, or carriage return. The PNA front-panel **Enter** key inserts a new line into the field.

All entries are sent out the Test Set I/O port using the **WriteData Method**.

The number of entries is limited only by the available memory of the PNA.

### Aux I/O

**Enable Control** Enables and disables sending data out the **Auxiliary I/O connector**.

**DAC1, DAC2** Sets voltages on the Aux I/O connector pins 2 (DAC1) and pin 3 (DAC2).
**Dwell After Command**  Specifies a wait time, in milliseconds, after all commands to all interfaces are sent. Any positive integer is allowed. This is used to allow all external devices to settle before beginning a measurement. An erratic trace could indicate that more settling time is necessary.

**Reset All**  Sets ALL fields on ALL channels to their default values.

**Save and Recall**  Saves and recalls the contents of this dialog box. If the Interface Control dialog box is populated with settings during an Instrument State Save, the settings are automatically recalled with the Instrument State settings.

Interface control uses an *.xml file type. An example file is stored on the PNA hard drive. You can recall it into the dialog, or you can open and edit it with a word processor, such as Word Pad.

**OK**  Applies the settings and closes the dialog box.

**Cancel**  Does not apply changes that were made, and closes the dialog box.

---

**Z5623A H08 Test Set Commands**

The following table lists the commands that are used to control the popular Agilent Z5623A H08 Test Set. These commands can be entered into the GPIB Interface control.

**General Description**

This DB-25 male connector provides a variety of analog I/O, digital I/O, timing I/O, and supply lines. You can change the settings on the Auxiliary IO connector through SCPI and COM programming commands. The settings are NOT accessible through the front-panel keys or display menu.

**Note:** This connector does NOT exist on the PNA-X model. Instead, most of this functionality is present on the PNA-X Power IO connector.

**Note:** The AUX IO configuration settings REMAIN after an Instrument Preset and Hibernation. However, Preset will clear the DAC values. The settings will revert to their default settings ONLY after the PNA is restarted, or until they are changed by you. AUX IO settings are saved and recalled with Instrument State.

**ACOM (pins 1, 15)**

**Description**

Analog common (ground) - To be used with the Analog Out and Analog In lines.

ACOM and DCOM are connected to system ground at a star ground point inside the analyzer.

---

**Analog Out 1, 2 (pins 2, 3)**

**Description**
Two analog outputs programmable to +/-10V; \( I_{\text{out}} < 10 \text{mA} \); \( R_{\text{out}} = 100 \text{ ohms} \n\)
12-bit DACs with voltage resolution of approximately 5mV/count.

The DACs are set to constant values using SCPI or COM, and can be read using SCPI or COM commands.

Preset state for both pins is 0 volts.

**HW Details**

Looking into this output pin is a 100-ohm series resistor followed by two diodes tied to +/-15V for static protection, then the output or an op-amp.

The voltage output is provided by a 12-bit DAC with an op amp buffer.

Specifics:

- Maximum output current = 10mA
- Settling time = 3us

**Timing**

The DACs are set after the last data point is measured, during retrace. If the analyzer is in single sweep mode, the DACs are set as part of the presweep process, before the sweep is triggered.

---

**DCOM (pins 5, 17)**

**Description**

Digital common (ground).

Used with the digital input and output lines.

ACOM and DCOM are connected to system ground at a star ground point inside the analyzer.

---

**Pins 6, 7, 8**

**Description**

Reserved

---

**+5V (pin 9)**

**Description**

+5V nominal output (100mA max).

Protected by self-healing fuse:

---

**Pass/Fail Write Strobe (pin 10)**

**Description**

See Handler IO connector.

---

**Sweep End (pin 11)**

**Description**
See Handler IO connector.

**Pass/Fail (pin 12)**
**Description**
See Handler IO connector.

**Output Port Write Strobe (pin 13)**
**Description**
See Handler IO connector.

**Analog In (pin 14)**
Beginning with PNA Rev. A.07.21, voltages on this pin can be read using ADC receiver measurements. Learn more.
**Description**
Analog input, +/-10V range, Rin=100k ohm
Bandwidth = 40kHz (2-pole lowpass filter).
This analog input may be read using the SCPI or COM commands.
**HW Details**
Looking into this pin there is 1k-ohm series resistor followed by 100k-ohm resistor to ground, static protection diodes after the 1k resistor limit the signal to +/-15V, then a high impedance buffer and active filter limiting the bandwidth to 40kHz with a lowpass filter.

**Power Button In (pin 16)**
**Description**
Short this pin to ground to replicate a front panel power button key press.
**HW Details**
Looking into the pin there is a 215-ohm series resistor followed by a 10k pull-up to the 3V standby supply, static protection diodes to the 0V/5V and then connects to the front panel power key circuit.
CAUTION: Because this line is internally pulled up to 3V, it should not be driven by a TTL driver.
**Timing**
Grounding this line for 1us to 2 seconds will simulate pressing the front panel power button.
Grounding this line for >4 seconds will perform a hard reset (similar to a personal computer) and is not recommended.

**Ready for Trigger (pin 18)**
**Description**
TTL output.
Active Low signal indicates that system is ready for an external trigger.
Remains High if system is not in External Trigger mode.
Goes High after an External Trigger is acknowledged.
Goes Low after the system has finished with its measurements, the source has been set up, and the next data point is ready to be measured.

**HW Details**
Looking into this pin there is a 215-ohm series resistor followed by a 10k pullup, diodes to 0V/5V for static protection, then the output of an "ABT" TTL buffer.
This line is enabled only when the analyzer is in External Trigger mode.
Refer to External Trigger In (following pin) for more information.

**Timing**
Refer to [External Trigger In](following pin)

---

**External Trigger In (pin 19)**

**Description**
This input accepts level trigger signals (High / Low) on all PNA models, or edge trigger signals on some PNA models.
The external trigger configuration is set from the front panel, [SCPI](#) or [COM](#).
For more information, see [External triggering](#).
A single trigger is achieved by asserting the external trigger for a period from 1us to 50us. Continuous triggering is achieved by holding the external trigger in the "asserted" mode (either Low or High).

**HW Details**
Looking into this pin is a 215-ohm series resistor followed by a 4.64k pullup, 1000pF to ground and then a "FAST" TTL buffer input.

**Timing**
A level trigger width should be between 1us and 50us.

---

**Footswitch In (pin 20)**

**Description**
TTL input.
A Low level input such as shorting this line to ground using a footswitch (where the input stays low for >1us) will be latched.
The latched status may be read using the [SCPI](#) or [COM](#) commands.
Only one footswitch press can be latched (remembered) by the system.
Reading the latch status will reset it if Footswitch In has returned to a high level.
**HW Details**

Looking into this pin is a 215-ohm series resistor followed by a 4.64k pullup to 5V and 1000pF to ground. This line is an input to a "FAST" TTL buffer.

**Timing**

Footswitch In must be Low for at least 1us.

---

**+22V (pin 21)**

**Description**

+22V nominal output (100mA max).

Protected by self-healing fuse.

---

**In/Out Port C0-C3 (pins 22-25)**

**Description**

See [Handler IO connector](#).

---

Last Modified:

23-Mar-2009    Added links to ADC Meas from pin 14
External Test Set I/O Connector

General Description

This DB-25 female connector is used to control external test sets. The external test set bus consists of 13 multiplexed address and data lines, three control lines, and an open-collector interrupt line. The Test Set IO is not compatible with the 8753 test sets.

You can change the settings on the External Test Set IO connector through SCPI and COM programming commands. The settings are NOT accessible through the front-panel keys or display menu.

Notes:

- The External Test Set pin settings are NOT affected by Instrument State Save/Recall or Instrument Preset.
- At PNA Power Up and return from Hibernation, the External Test Set bus data lines, address lines, and control lines are set HIGH, and no strobe lines are pulsed.

Caution: Do not mistake this connector with a Parallel Printer port. A printer may be damaged if connected to this port.

**SEL0-SEL3 (pins 1,15,16,18)**

**Description**
Selects addresses of test sets that are "daisy chained" to this port. The select code is set to zero at the PNA connector and is incremented by one as it goes through each successive external test set. Therefore, the first test set in the chain has address zero and so on, for up to 16 test sets.

**HW Details**
Connected to ground inside the PNA.

**Timing**
None

**Sweep Holdoff In (pin 2)**

**Description**
Input line used by the test set for holding off a sweep. Holding off a sweep is one way of introducing a delay that allows an external device to settle before the PNA starts taking data. You must write a program that will query the line and perform the delay. The program needs to query the line and keep PNA from sweeping while the line remains low. When a subsequent query detects that the line went high the program would then trigger the PNA to start the sweep.

Use either Single or External trigger mode to control the PNA sweep.

**HW Details**

This pin has a series 215-ohms resistor followed by 4.7k-ohm pull-up and then an “ABT” TTL buffered register.

**Timing**

This input is not latched by the PNA hardware. Therefore the input level must be held at the desired state by the test set until it’s read by your program.

---

**AD0-AD12 (pins 3-6, 9-11, 17, 19-23)**

**Description**

Thirteen lines are used to output data addresses or input / output data. Several SCPI and COM commands are available for reading and writing to these lines. You can choose to use commands where the PNA provides the appropriate timing signals needed for strobing the addresses and data. Or you can choose to control the timing signal directly. The timing signals are RLW, LAS and LDS. If you decide to do direct control refer to the corresponding SCPI and COM command details. Close attention to detail is needed to insure the desired results.

After a write command, lines AD0-AD12 are left in the state they were programmed. Default setting for Mode is Read / Input).

After a read command, lines AD0-AD12 are left in input mode. While in this mode an external test set attached to the IO is free to set the level on each line.

**HW Details**

Each of these I/O pins has a series 215-ohm resistor followed by 4.7k-ohm pull-up resistor.

Write/Read is implemented by an output tri-state TTL buffer / latch for latching and enabling write data in parallel with a TTL input buffer for reading.

**Timing**

Output Address and data setup and hold times are 1us minimum.

---

![Timing Diagram](image)

**Address & Data I/O Write**
**Address & Data I/O Read** - Data must be valid for 1us before and after strobe

---

**GND (pins 7, 12)**

**Description**
Two ground pins used as ground references by the test set.

**HW Details**
Connected to digital ground.

**Timing**
None.

---

**LAS (Low Address Strobe) (pin 8)**

**Description**
This line has two behaviors that are command dependent. Refer to the SCPI and COM commands for further details.

In one behavior LAS is one of the lines used by the PNA to provide appropriate timing for writing Address and Data to the Test Set. In this case LAS is controlled automatically by the PNA and is intended to be used as the strobe for the Address. When LAS is low, lines AD0 - AD12 represent the Address. LAS will return to its normally high state when the transaction is finished.

In the second behavior the PNA will NOT provide appropriate timing. In this case LAS is controlled directly by the user through a SCPI or COM command. When the transaction is finished LAS is left set to the state it was programmed to until another command changes it. (Default for LAS is TTL High).

**HW Details**
This output pin is driven by a TTL latched buffer with a series 215-ohm resistor followed by 2.15k-ohm pull-up.

**Timing**
Strobe length, setup and hold times are all 1us minimum.
See the description for AD0-AD12 for more timing information.

---

**Interrupt In (pin 13)**

**Description**
Query this line with a SCPI or COM command.

**HW Details**
This line is a non-latched TTL input, has series 215-ohms followed by 4.64k-ohm pullup.

**Timing**
The Test Set must maintain at the desired TTL level until its read.

---

**LDS (Low Data Strobe) (pin 24)**

**Description**

This line has two behaviors that are command dependent. Refer to the External Test Set IO SCPI and COM commands for further details. (Default setting for LDS is TTL High)

In one behavior LDS is one of lines used by the PNA to provide appropriate timing for writing Address and Data to the Test Set. In this case LDS is controlled automatically by the PNA and is intended to be used as the strobe for the Data. When LDS is low, lines AD0 - AD12 represents Data. LDS will return to its normally high state when the transaction is finished.

In the second behavior the PNA will NOT provide appropriate timing. In this case LDS is controlled directly by the user through a SCPI or COM command. When the transaction is finished the LDS is left set to the state it was programmed to.

**HW Details**

This output pin is driven by a TTL latched buffer with a series 215-ohm resistor followed by 2.15k-ohm pull-up.

**Timing**

Strobe length, setup and hold times are all 1us minimum.

See the description for AD0-AD12 for more timing information.

---

**RLW (pin 25)**

**Description**

This line is the output for the Read Write signal. It has two behaviors that are command dependent. Refer to the External Test Set IO SCPI and COM commands for further details. (Default setting for RLW is TTL High)

---

**Warning:** Connecting a printer to this port will usually damage the printer.
In one behavior RWL is controlled automatically by the PNA during a Read Write operation. When RLW is low, lines AD0 - AD12 represent output Data. When RLW is high, the lines represent input Data.

In the second behavior the PNA does NOT provide the timing. The user must control it directly through the SCPI or COM command. In this case the line is left set to the state it was programmed to.

**HW Details**

This pin is a TTL latched output with a series 215-ohm resistor followed by 2.15k-ohm pull-up resistor.

**Timing**

Strobe length, setup and hold times are all 1us minimum.

See the description for **AD0-AD12** for more timing information.
Material Handler I/O Connector

This rectangular 36-pin female connector provides communication signals between the PNA and a material parts handler. You can change the settings on the Material Handler IO connector using SCPI and COM commands. The settings are NOT accessible through the front-panel keys or display menu.

- **Overview - Controlling a Material Handler**

- **Pin Assignments**

- **Pin Descriptions**

- **Timing Diagrams**

- **Input Output Electrical Characteristics**

**Note:** On early PNAs this connector is labeled "GPIO". It is covered to indicate that the connector is not functional.

**Overview - Controlling a Material Handler**

The PNA is capable of interacting with an external material handler or part handler. This allows the PNA to be used in an automated test environment, where devices to be tested are inserted into a test fixture by a part handler, and sorted into pass/fail bins by the handler after testing is complete. By connecting the part handler to the PNA Auxiliary or Material Handler I/O ports, the PNA and part handler can synchronize their activities in a way that makes automated testing possible.

**PNA and Part Handler Preparation**

1. **Define the measurements** you want to make.

2. **Define limits** for each of the measurements.

3. Configure the PNAs Material Handler port so that it is compatible with your part handler. This usually involves setting the **handler logic**, **pass/fail logic**, **pass/fail scope**, and **pass/fail mode**. These settings are made remotely using SCPI or COM commands.

4. Use a cable to connect the PNA to your part handler.

5. Put the PNA in **External Trigger** mode.

6. Load parts in handler per manufacturer instructions.

**Note:** The Material Handler configuration settings REMAIN after an Instrument Preset and Hibernation. The settings will revert to their default settings ONLY after the PNA is restarted, or until they are changed by you. Material Handler settings are saved and recalled with Instrument State.

**Flow Diagram**

The following diagram and descriptions summarizes the events that occur during automated testing. 'DUT' refers to Device Under Test.
Text Descriptions

0. (Optional). The PNA sends values out the Material Handler and/or Auxiliary I/O connectors to configure external instruments. The A,B,C, and D ports of the Material Handler can be used to control devices used in testing, such as step attenuators, part handlers, or even the DUT itself. Also, the DAC1 and DAC2 lines on the Aux I/O connector can be used to provide bias voltages for devices and instruments. If you wish to use the Material Handler or Aux connectors for testing, you will need to write a program to send values out the various lines and ports, as there is no activity on these lines by default.

1. The part handler receives a Ready for Trigger signal from the PNA. This indicates that the PNA is properly configured and ready to take a measurement.

2. The part handler sends an External Trigger signal to the PNA. This signals that the part handler has settled, and allows the PNA to begin taking measurements.

3. The PNA takes measurements on all triggerable channels.

4. The Index line on the material handler goes to a Low state, which means that all required data has been collected by the PNA.

5. The part handler removes the DUT from the test fixture, and inserts a new DUT into the fixture. This operation is often referred to as part handler indexing. The device just tested is staged (removed from the fixture and prepared for binning), and the next part to be tested is put into the fixture. The removed DUT cannot be assigned to a Pass/Fail bin yet, as the Pass/Fail status is not available.

6. The PNA sends the Pass/Fail Status.

7. The PNA sends the Pass/Fail Strobe meaning that the Pass/Fail status has been determined.
8. The part handler reads the Pass/Fail Status line.

9. The part handler bins the staged part based on the Pass/Fail Status.

10. The test process repeats at step 1, waiting for Ready for Trigger from the PNA.

### Material Handler IO Pin Assignments

There are three different Handler IO pin assignment configurations depending on the PNA model:

- **Type 1** - All E835xA, E880xA, N338xA models. You can change the pinout configuration to Type 2 on these models. This requires opening the instrument and changing a connector internally. Refer to the procedure in the Service Guide, Chapter 7. You can download the Service Guide for your PNA model from our website: [http://na.tm.agilent.com/pna](http://na.tm.agilent.com/pna)  **Caution:** Changing this connection should be done by qualified service personnel.

- **Type 2** - E8362x, E8363x, E8364x and N5230 Opt 220, 225, 420, 425, 520, 525;

- **Type 3** - All PNA-X and N5230 Opt 020, 025, 120, 125, 140, 145, 146, 245, 240, 245, 246.

See PNA models and options.

Shaded/bold indicates changes from Type 1

**Note:** A slash (/) preceding the signal names indicates that the signal uses negative (active low) logic. A low pulse is a logical 1.

Pin Descriptions

**Input1**
When this Input line receives a Low pulse from the material handler, data is latched on the OUTPUT1 and OUTPUT2 lines. See OUTPUT1|2 Data Output Write Timing

**Note: Type 1 and Type 2 Behavior:** The Input line responds to a High (rising edge) pulse.

The Input Line activity can be read:

```
SCPI                          COM
CONTro1:HANDle:INPut?
```

The current state of these latched TTL outputs may be set High or Low (Default setting) using the (non-user) SCPI put_Output (COM) commands.

The next state (following a negative edge on the INPUT1 line) may be pre-loaded to High or Low (Default setting) using the user commands.

For example, on the next negative pulse on the INPUT1 line, you want the OUTPUT1 line to go from 0 to 1. To do this:

```
CONT:HAND:OUTP1:DATA 0 'Force the OUTPUT1 line to 0
CONT:HAND:OUTP1:USER 1 'Set the OUTPUT1:USER buffer to 1, indicating the next state
```

**Output1, Output2**
See OUTPUT1|2 Data Output Write Timing

The current state of these latched TTL outputs may be set High or Low (Default setting) using the user commands.

For example, on the next negative pulse on the INPUT1 line, you want the OUTPUT1 line to go from 0 to 1. To do this:

```
CONT:HAND:OUTP1:DATA 0 'Force the OUTPUT1 line to 0
CONT:HAND:OUTP1:USER 1 'Set the OUTPUT1:USER buffer to 1, indicating the next state
```

```
SCPI                          COM
Write User Data               put_Output Method
CONT:HAND:OUTP<pin>:USER
Read last value written       get_Output Method
CONT:HAND:OUTP<pin>:USER
Write non-user data            put_Output Method
CONT:HAND:OUTP<pin>:DATA
Read last value written       get_Output Method
CONT:HAND:OUTP<pin>:DATA
```
Output Ports A and B
These two general purpose, 8-bit output ports are used to write data to the material handler. When any line changes state, all output lines are latched to the I/O connector as the Output Write Strobe goes Low.

The default state for data is Low.

See Data Output Write Timing Diagram

Set Port Logic:
The logic for the data lines can be set to either: Positive (1 = High) or Negative (1 = Low). This setting affects all data ports. They cannot be set independently.

```
SCPI
CONTrol:HANDler:LOGic
COM
PortLogic Property
```

Combine to read or write data to Port F:
Ports A and B can be virtually combined to write data to one 16-bit I/O port F.

```
SCPI
CONTrol:HANDler:F <num>
COM
put Port (F)
```

Input/Output Ports C and D
These two general purpose 4-bit Input/Output ports are used to write data (Output) or read data (Input). These lines could be used to write to an external device such as a step attenuator.

When any line changes state, all output lines are latched to the I/O connector as the Output Write Strobe goes Low. See Data Output Write Timing

The four lines of Port C are connected internally to the Auxiliary IO connector.

Set Input | Output Mode:
Each port may be independently defined as Output or Input.

```
SCPI
CONTrol:HANDler:C:MODE
COM
PortMode Property

CONTrol:HANDler:D:MODE
```
Set Port Logic:
The logic for the data lines can be set to either: Positive (1 = High) or Negative (1 = Low). This setting affects all data ports. They cannot be set independently.

SCPI

CONTrol:HANDler:LOGic

COM

PortLogic Property

Read or write data:
Ports C and D can be virtually combined to read or write data to one 8-bit I/O port E. When combined, both C and D ports must be set to either INPUT or OUTPUT mode.

SCPI

CONTrol:HANDler:<port>[:DATa]>

COM

gget Port(x)

put Port(x)

Port C Status, Port D Status
These two output lines indicate the Read / Write mode of the C and D ports.

- A Low level indicates that the associated port is in INPUT mode (read only).
- A High level indicates that the associated port is in OUTPUT mode (write only).

These logic of these status outputs cannot be changed.
See Input/Output Ports C and D to learn how to set I/O Mode
See Data Output Write Timing

Output Port Write Strobe
This Output line goes Low to write data from Ports A and B and Ports C and D when a change is detected on any of the data lines.
These logic of this strobe output cannot be changed.
This line is shared with Auxiliary IO connector.
See Data Output Write Timing
**External Trigger**

When trigger source is set to external, this Input line accepts a trigger signal from the material handler. This usually means that a part is in place and ready to be tested.

*See Trigger Timing Diagram*

---

**Index**

A Low signal on this Output line indicates to the material handler that the measurement is complete. This usually means that the handler can connect the next device. However, measurement data is not available until data is calculated. *See Trigger Timing Diagram*.

**Set Function:**

This line also serves as a data line. Set the function using the following commands:

```
SCPI

CONTrol:HANDler:INDex:STATe

COM

IndexState
```

---

**Ready for Trigger**

When this output line goes low, it indicates to the material handler that the PNA is ready for a trigger signal. Available only on Type 3 PNA Models (Pin 17). See also *Aux IO connector*.

*See Trigger Timing Diagram*

*See Pass/Fail Timing Diagram*

**Set Function:**

This line also serves as a data line. Set the function using the following commands:

```
SCPI

CONTrol:HANDler:RTRigger:STATe

COM

ReadyForTriggerState
```
Pass/Fail State
This Output line indicates to the handler whether the limit test has passed or failed.
Pass/Fail state is valid only when the limit test function is ON and while Pass/Fail strobe line is Low. See Pass/Fail Timing Diagram
This line is shared with the Auxiliary IO connector.

Set Pass / Fail Logic:

- Positive Logic: High=Pass, Low=Fail. (Default setting)
- Negative Logic: High=Fail, Low=Pass.

SCPI

CONTrol:HANDler:PASSfail:LOGic

PassFailLogic Property

Set Default Conditions:

- **PASS**- the line stays in PASS state. When a device fails, then the line goes to fail after the Sweep End line is asserted.
- **FAIL**- the line stays in FAIL state. When a device passes, then the line goes to PASS state after the Sweep End line is asserted.
- **No Wait**- the line stays in PASS state. When a device fails, then the line goes to fail IMMEDIATELY. (Default setting)

SCPI

CONTrol:HANDler:PASSfail:MODE

PassFailMode Property

Set Pass / Fail Scope:

- **Channel scope**: The line resets to the default state after the measurements on a channel have completed.
- **Global scope**: The line resets to the default state after the measurements on all triggerable channels have completed. (Default setting)

SCPI

CONTrol:HANDler:PASSfail:SCOPe

PassFailScope Property
**Pass/Fail Write Strobe**
A Low pulse indicates that Pass/Fail line is valid and the Pass / Fail State is output to the material handler. This line is shared with the Auxiliary IO connector.

The Pass/Fail Strobe is fixed in duration and timing. However, when the strobe occurs depends on the Pass/Fail Mode and Pass/Fail Scope (Channel or Global) settings. See Pass/Fail State

See Pass/Fail Timing Diagram

---

**+5V**
+5V nominal output (100mA max).
Protected by self-healing fuse.

---

**Sweep End**
This output line indicates the status of the PNA sweep. The sweep includes sweeping the source and taking data.

- **Low** (falling edge) indicates that the specified sweep event has finished. This does NOT indicate that all calculations have finished.
- **High** indicates that the specified sweep event is active.

See Trigger Timing Diagram
This line is shared with the Auxiliary IO connector.

**Set Sweep Event Mode:**

- **Sweep**: indicates that a single source sweep has finished. (Default setting)
- **Channel**: indicates that a single channel has finished.
- **Global**: indicates that all enabled channels have finished.

```scpi
CONTrol:HANDler:SWEepend
```

SweepEndMode Property
**Timing Diagrams**

**Trigger Timing**

- **/ External Trigger (to PNA)**
- **/ Index (from PNA) meas. complete**
- **/ Sweep End (from PNA) sweep complete**
- **/ Ready for Trigger (from PNA)**

All signals are active low.

**T1 = 1 μs**  External Trigger pulse width

**T2 > 10μs**  Sweep End pulse width (both High and Low)

**Pass / Fail Timing**

- **Pass / Fail Status (from PNA)**
- **/ Pass /Fail Write Strobe (from PNA)**
- **/ Ready for Trigger (from PNA)**

**T1 = 1 μs**  Pulse width and response time of Pass / Fail Strobe

**T2 > 10 μs**  Ready for Trigger lag
Ports A-F Data Output Write Timing

\[ T1 = 1 \, \mu s \] Write Strobe response time
\[ T2 = 1 \, \mu s \] Write Strobe pulse width

OUTPUT1|2 Data Output Write Timing

The old state to new state transition can be either low to high (as shown) or high to low.
\[ T1 = 0.6 \, \mu s \] Output1|2 response time
\[ T2 = 1 \, \mu s \] Input1 Strobe pulse width

Input / Output Electrical Characteristics

All Material Handler I/O Input and Output lines are TTL compatible.

Input and Output lines

Lines carrying information IN (or bidirectional) to the PNA from the material handler.

---

**Noise Figure Receiver Characterization**

Select method

**Misc Commands**

Read CalSet stimulus values

Write CalSet stimulus values

Copy mechanical settings from specified channel

Return a measurement handle of the trace object

Read the PNA port which is connected to the DUT input.

Read the PNA port which is connected to the DUT output.

Read the window number of the selected trace.

Read the trace number of the selected trace.

---

**Source / Role Commands (for apps)**

Returns the roles for which sources can be used for the channel.

Set and returns the source to be used in the specified role.
### IMD and IM Spectrum Tone Power settings

### Miscellaneous

**Use Last Result for Source Power Cal**

```
SOUR:POW:ALC:MODE:REC:LSPC LastLevelingAsSPC
```

**Selectively delete a channel**

```
SYSTem:CHANnels:DELeTe Remove Method RemoveChannelNumber
```

### Guided Power Cal

**Perform Power Cal**

```
```

**Match-correction ON/OFF**

```
SENS:CORR:METHods:MATCh MatchCorrectPower
```

### Cal Set Items

**Set or get name-value pair from calset**

None Item

**Remove name-value pair from calset**

None RemoveItem

**Enumerate name-value pair items in the calset.**

None EnumerateCalSets

---

The following are new programming commands for **PNA release A.09.22**  See What's New

**Returns the error correction state for the measurement.**

```
CALC:CORR:INDicator? ErrorCorrectionIndicator
```

**Calibrating specific channels**

```
SENS:CORR:COLL:GUID:CHAN:MODE N/A
```

### Port Mapping - Noise Figure Opt 028

**Write port mapping**

```
SENSe:NOISe:PMAP SetPortMap
```

**Read input port mapping**

```
SENSe:NOISe:PMAP:INPut? DeviceInputPort
```

**Read output port mapping**

```
SENSe:NOISe:PMAP:OUTPut? DeviceOutputPort
```

### Description

**IMD-X for Converters**
### Create or Change a Custom (Application) Measurement

Create a custom measurement

Change a custom measurement

Return handle to a converter object

### Configure a Mixer

Calculate Input and Output frequencies

X-axis display

Discard Changes

Load a mixer setup

Save a mixer setup

Apply mixer settings

Assign a source to mixer input or LO.

Read all assigned roles

Read the source assigned to a role.

### Set Input

Input start frequency

Input stop frequency

Input power level

Numerator - Input Frac.Mult

Denominator - Input Frac.Mult

Input to Swept or fixed

Input fixed frequency

### Set LO

Recall a previously-configured external source. This is the only external LO configuration command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

COM versus SCPI

There are two methods you can use to remotely control the PNA: COM and SCPI. The following topics can help you choose the method that best meets your needs:

- **Software Connection**
- **Physical Connection**
- **Programming Languages**

### Other Topics about COM Concepts

**Software Connection**

**COM** uses a binary protocol, allowing you to directly invoke a PNA feature. This is more efficient than SCPI. For example, the following statement calls directly into the PNA, executing the routine GetIDString.

```python
PNA.GetIDString()
```

**SCPI** is a text based instrument language. To retrieve the ID string, you would send the following text string to the PNA:

```text
IbWrite("*IDN?")
```

The PNA SCPI parser would first decode this text string to determine that the user has asked for the PNA to identify itself. Then the parser would call the COM method GetIDString().

### The Physical Connection

**Internal Control**

With either COM or SCPI, the best throughput is attained by using the PNA’s internal PC to execute your test code. However, if your test code uses too much system resources (CPU cycles and/or memory), this will slow the PNA’s performance.

Using the SICL I/O Libraries, you can also connect to the PNA from a program running on the PNA.

**External Control**

You can control the PNA from a remote PC using either COM or SCPI.

**COM** - (Component Object Model) can be used to access any program like the PNA (835x.exe) or library (.dll) that exposes its features using a COM compliant object model. These programs or libraries are called "servers". Programs (like your remote program on your PC) that connect to and use the features of these servers are called “clients.”

With COM, the server and the client do not need to reside on the same machine. DCOM, or distributed COM, makes the location of the server transparent to the client. When you access the PNA from a remote computer, you are using DCOM. In this case, the mechanical transport is a LAN (local area network).

However, using COM can add additional complexity:

- There are some DCOM security issues that may be a problem for you. Learn more.
Using the default interface when compiling type libraries results in code that will only run with the latest firmware. Learn more.

**SCPI** - Using a GPIB interface card in a remote computer, you can connect to the instrument using a GPIB cable. There are some constraints on the length of this cable and the number of instruments that can be daisy-chained together.

Using the Agilent SICL I/O libraries, you can connect to the instrument over a LAN connection.

(LAN or INTERNAL) You can send SCPI commands using COM with the `ScpiStringParser` object.

If you have legacy code written in SCPI for another network analyzer, you may be able to leverage that code to control the PNA. However, the PNA uses a different platform than previous Agilent Network Analyzers. Therefore, not all commands have a direct replacement. See the PNA Code Translator Application.

**Programming Languages**

You can program the PNA with either COM or SCPI using several languages. The most common include:

**Agilent VEE** - With this language you can send text based SCPI commands and also use automation. VEE 6.0 or later is recommended.

**Visual Basic** - This language has great support for automation objects and can be used to drive SCPI commands. The use of VISA drivers for your GPIB hardware interface will make the task of sending SCPI commands easier.

**C++** - This language can do it all. It is not as easy to use as the above two, but more flexible.

24-Mar-2009 Updated
Remotely Specifying a Source Port

In the 'not-too-distant past', it was a simple task to specify a PNA source port. It was either port 1 or port 2. Now, for the following reasons, it is not so simple:

- **Internal 2nd sources** are now offered on various PNA models. However, some source ports do not have a port number. One example is the second source on the PNA-X 2-port model (option 224). Learn more about Internal Second Sources.

- **External sources** can now be controlled by the PNA as though they are internal sources. External sources do not have a source port number, but use String names as identifiers.
  
  - **For FCA ONLY**: Once configured using the Configuration dialog, an external source can be selected remotely and controlled by the PNA by specifying the LOName using SCPI or COM.
  
  - **All other uses for External sources**: The external source must be configured and selected from the External Source dialog. You can then save an Instrument State file, then recall that state file remotely.

- **Multiport test sets**…choose between ports 1 through port N, where N is the number of ports on the test set. You still use a port number, but this port number refers to a logical port. The Port mapping feature maps the logical port to a physical port. Learn more about Multiport test sets.

- **iTMSA (Opt 460)** When this option is present, the string names for balanced source ports are returned with the appropriate COM and SCPI commands. For example, "SE Port 1" is used to access 'Single-ended Port 1".

**Source Port String Names**

The PNA User Interface (UI) makes it easy to configure and select the sources and ports. Remotely however, string names are used now, in addition to port numbers, to specify a Source port.

**COM** - The existing COM commands specify source ports as numbers and they are still used. It is necessary to learn the port number from the string using the GetPortNumber Method. Port numbers are assigned dynamically depending on whether external sources are selected and the number of ports of the PNA.

- **SourcePortNames Property**

- **GetPortNumber Method**

- **SourcePortCount Property**

An example:

```vbs
dim app
set app = CreateObject("Agilentpna835x.application")
dim channel
set channel = app.Channel
dim portnum
portnum = Channel.GetPortNumber("Src2 Out1")
app.CreateMeasurement 1,"A",portnum
```
SCPI - ALL of the existing SCPI commands that specify a source port are extended to also allow the source port to be specified using string names. For example, send the following command to set the power on Src2 Out1:

- **SOUR:POW 5, “Src2 Out1”**
- Use **Source:Cat?** to list the available source port string names.

---

23-May-2008   Added iTMSA option
24-Apr-2008   Several edits
5-Nov-2007   MX New topic
Shut Down or Restart the PNA Remotely

To Shut down, send this command:

```plaintext
Shutdown -s -t: 00
```

To Restart, send this command:

```plaintext
Shutdown -r -t: 00
```

These will wait 00 seconds before executing the command.

1. Paste the command into a Notepad file.

2. Save the file as `shutdownPNA.bat` anywhere on the PNA, preferably in the C:/Windowns/system 32 directory.

3. To call the file using GPIB, issue this SCPI command:

```plaintext
Diag:batch 'shutdownPNA.bat'
```

If you have placed the file somewhere on the PNA other than the system32 directory, include the full path to the batch file; such as:

```plaintext
Diag:batch 'C:/Program Files/Agilent/Network analyzer/Documents/shutdownPNA.bat'
```

For variations on this command, on any Windows computer:

Click **Start**, then **Run**, then type **cmd**, then **OK**.

At the prompt, type **shutdown**.

22-May-2009   New topic
Frequency Converter Application (Option 083)

FCA includes both Scalar (SMC) and Vector (VMC) measurements and calibrations.

In this topic:

- What's New in FCA
- FCA Options Explained
- Comparison of VMC and SMC
- Requirements and Limitations
- How to make SMC or VMC Measurements
  - Create a Measurement
  - Make Measurement Settings
    - Sweep Tab
      - Segment Sweep
    - Power Tab
    - Mixer Setup Tabs (separate topic)
    - Select X-axis Display
    - Save Trace Data
    - Avoid Spurs

See Also

- SMC Measurements and Calibrations
- VMC Measurements and Calibrations
- Configure an External LO Source
- SMC with a Booster Amp
- Characterize Adaptor Macro
- Measure a DUT with an Embedded LO

- For a detailed understanding of FCA, see our Mixer Measurements App Notes.
Examples

- How to make a VMC Measurement
- How to make an SMC Measurement

Other Application topics

What's new in FCA
Rev A.09.33

- New configuration dialogs
- Segment Sweep
- Power Sweep
- Save CSV Trace Data

FCA Options Explained

- Option 083 provides FCA which includes Scalar Mixer (SMC) and Vector Mixer (VMC) Measurements.

- Option 082 provides ONLY SMC measurements. This is the ONLY FCA option that is allowed on the N5230C.

- Option 084 provides Embedded LO measurements. This option requires one of the Converter Applications.

- See all PNA-X Options and Configurations.

Comparison of SMC and VMC
| Overview | Scalar Mixer Calibration  
See Hardware setup | Vector Mixer Calibration  
See Hardware setup |
|---|---|---|
| Provides highest Scalar accuracy for measurements of conversion loss/gain.  
**Optionally measures phase**  
Combines SOLT and power-meter calibration.  
Simpler setup than Vector Mixer Calibration. | Provides unparalleled accuracy for measurements of relative phase and absolute group delay.  
Uses combination of SOLT standards and a reciprocal mixer/filter pair during calibration.  
More complicated setup and calibration procedure than Scalar Mixer Calibration.  
After calibration, both reciprocal and non-reciprocal mixers and converters can easily be measured. |
| Measurements Offered | Both forward and reverse directions.  
DUT can be connected to any PNA ports. | Amplitude response VC21  
Phase response  
Group delay  
DUT input must be connected to PNA port 1.  
DUT output can be connected to any other PNA port. |
| Equipment Required | Power meter and sensor | Reference mixer  
Calibration mixer/filter combination (must be reciprocal  \( S_{21} = S_{12} \)) |
| Common equipment for both SMC and VMC | |  
• Mechanical cal kit or ECal module |

**Requirements and Limitations**

The following PNA-X features are **NOT** available with FCA:

- Analog Sweep ([Stepped sweep](#) mode only)
- [Log frequency](#) sweeps
- [Unratioed receiver measurements](#) (A, B, R)
- ECal User Characterization
- **Time Domain**
- **Balanced measurements**
How to make SMC or VMC Measurements

The following is an overview of how to make an FCA measurement:

1. DECIDE to use either a SMC or VMC measurement. See a comparison of these two measurement types.
2. CREATE an SMC or VMC Measurement.
3. SETUP the measurements.
4. CALIBRATE your SMC or VMC measurement.

Create an SMC or VMC Measurement

1. On the PNA-X front panel, press Meas then [Measurement Class]
2. Select SMC or VMC, then either:
   - OK delete the existing measurement, or
   - New Channel to create the measurement in a new channel.
3. The default SMC or VMC measurement is displayed.
4. See SMC measurements or VMC measurements to learn about the parameters that are offered in each.
**How to make SMC or VMC settings**

To provide quicker access, use the Setup softkey. [Learn how.](#)

### Using front-panel HARDKEY [softkey] buttons

1. Press **Freq**
2. then [Mixer Setup]

### Using a mouse with PNA Menus

1. Click **Stimulus**
2. then **Freq**
3. then **Mixer Setup**

---

**Valid Mixer Configuration / Sweep Type Combinations**

Configuring the SMC and VMC Setup dialog can be challenging at first. **RED** messages like this one appear at the bottom of the Setup dialog to notify you of an invalid setup.

Unsupported mixer configuration and sweep type

At least one range (Input, LO, or Output) MUST be Fixed.

The following are the **Valid Mixer Configurations**:

<table>
<thead>
<tr>
<th>Sweep Type</th>
<th>Input</th>
<th>LO</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>Swept</td>
<td>Swept</td>
<td>Fixed</td>

<td>Fixed</td>
<td>Swept</td>
<td>Swept</td>
</tr>
<tr>
<td>CW Time</td>
<td>Fixed</td>
<td>Fixed</td>
<td>Fixed</td>
</tr>
</tbody>
</table>

---

3228
**Tips**

Although you will soon become comfortable navigating these tabs, at first it may be best to complete the dialog in the following order:

1. For 2-stage mixers, select **Mixer Setup** settings.
2. Select **Sweep tab** settings.
3. Select **Mixer Frequency** settings.
4. Select **Power** settings.
5. Select **Mixer (LO) Power** settings.

The following FCA settings are common to VMC and SMC:

**Sweep Tab - SMC and VMC** dialog box help

**Sweep Type**

- **Linear** Sweep frequency. Measurements are displayed on a standard grid with ten equal horizontal divisions. Learn how to [select the range to display on the X-Axis](#).
- **CW Time** All ranges are set to a Fixed (CW) frequency, and the data is displayed versus time.
- **Segment Sweep** Sweep user-defined segments. [Learn more](#).
- **Power** Sweep Input or LO power.

**X-axis Point Spacing** (Available only with Segment Sweep) - [Learn about this feature](#)

**Avoid Spurs** - [Learn about this feature](#).

**Number of Points** [Learn about this feature](#).

**IF Bandwidth** [Learn about this feature](#).

**Phase Reference Point** (SMC ONLY) [Learn about this feature](#).
**Power Tab - SMC and VMC dialog box help**

**Note:** Set LO Power on the **Mixer (LO) Power tab**.

Configures Input and Output power settings for an FCA measurement. Use the **Mixer Power tab** to set LO power.

**Power ON (All channels)** Check to turn RF Power ON or clear to turn power OFF for all channels.

**Port Powers Coupled** Check to set the same power level at the DUT Input and Output ports. The LO power is NOT coupled. Clear to set power levels independently for each test port. Uncouple power, for example, to apply more power in the reverse direction than in the forward direction. Learn more about **Setting Independent Port Power**

**DUT Input / Output Port**

Select the PNA port that is connected to the DUT Input and Output. For **VMC**, the DUT input must always be connected to PNA port 1 because of the need for a reference mixer on port 1.

**Power Level** Set the power level to the DUT Input port. To set power at the Output port, clear the **Port Powers Coupled** checkbox.

**Source Attenuator Auto** Check to automatically select the correct attenuation to achieve the specified input power. Clear, then select attenuator setting that is used achieve the specified Power Level. Learn more about **Source Attenuation**.

All PNA channels in continuous sweep must have the same attenuation value. Learn more.

**Receiver Attenuator** Specifies the receiver attenuator setting for the DUT port.

**Source Leveling** Choose from: **Internal** (normal operation), **Open Loop** (used only for Wideband Pulse measurements), or **Receiver - R1** for **Receiver Leveling**.

**DUT Input and Output Port Power Sweep**

Available when Power (sweep) is selected on the **Sweep tab**.

**Input Start** and **Stop Power** To set Start and Stop power at the Output port, clear the **Port Powers Coupled** checkbox.
Note: If your DUT requires more input power than this setting allows below 3.2 GHz, use the PNA-X Hi-power mode, available from the RF Path Configuration dialog. The disadvantage to this is higher harmonic content.

**Power Points**  Number of power points to measure.

**Power Step (Size)**  Calculated value from current Start, Stop, and Points settings. This setting can NOT be changed directly.

**Path Configuration**  click to launch the RF Path Configuration dialog.

The following tabs are shared with all Mixer / Converter Applications:

- **Mixer Frequency tab**
- **Mixer (LO) Power tab**
- **Mixer Setup tab**

**Mixer Frequency tab - SMC and VMC Setup**

Learn about this dialog
FCA Segment Sweep
The following settings appear on the Mixer Frequency tab when Segment Sweep is selected on the Sweep tab.
How to configure a segment:

1. Click **Add**. Click **Delete** to remove a segment and renumber all subsequent segments.

2. State is **ON** by default. Click **OFF** and that segment will not be included in the sweep.

3. Configure **Frequency settings** for Input, LO, and Output ranges.

   - For each segment, the same **sweep requirements** apply as a standard (non-segment) sweep. For example, at least one range MUST be Fixed (Start = Stop frequencies).

   - The Input, Output, and LO frequencies of segments ARE allowed to overlap other segments.

   - All segments must sweep in either the forward (Start<Stop) or reverse (Start>Stop) directions. Mixed sweep directions are NOT allowed.

   - The following settings can be set independently for each segment:
     - **Number of Points** - Total number of points for all segments is limited to the **Max allowed by the PNA**.
     - **IF Bandwidth**
     - **Port Powers**: (Input, Output, LO 1, LO2). These settings override the settings on the **Power tab**.

   - The following settings apply to **ALL** segments:
     - Number of Converter/Mixer Stages (1 or 2).
     - LO Source Selections
     - **All Input and LO Multipliers and Dividers**
     - **Source and Receiver Attenuator Settings**
• **Source Leveling**

• **Avoid Spurs**

• **Nominal Incident Power** (SMC only)

• **X-Axis Display** (Input, LO1, LO2, Output) There must be at least two data points for this setting to be available.

• **X-Axis Point Spacing** (vs Normal point spacing).

• **SMC + Phase**

  • Mixer Segment sweep data can be saved to a *.S2PX file (NOT *.S2P).
  
  • Mixer Segment setup information is saved to a *.MXRX file. [Learn more](#).

---

### Apply and Interpolate FCA Cal Sets

In general, when a Cal Set covers a wider frequency range than the channel, the PNA will offer to interpolate the Cal Set when it is applied. [Learn more](#). However, with FCA measurements the LO frequency range may also be considered.

- **VMC measurements** ALWAYS CONSIDER the LO frequency range and performs interpolation if possible. If the LO frequency range of the measurement is NOT within the LO frequency range of the Cal Set, then the Cal Set can NOT be applied.

- **SMC measurements** ALWAYS IGNORE the LO frequency range. Therefore, if the Input and Output frequency ranges of the measurements are within those of the Cal Set, then the Cal Set is interpolated if necessary and applied. For example, this would allow you to perform ONE SMC calibration with Input range = the PNA frequency span, LO at 0 Hz, and Output range + the PNA frequency span. This Cal Set could be applied to ALL SMC measurements. [Learn more about applying SMC Cal Sets](#).

These same general concepts apply to **segment sweeps**. However, if ALL applicable frequency ranges (SMC: Input and Output and VMC: Input, Output, and LO) are NOT within those ranges of the measurement for ONE segment, then the Cal Set is NOT applied for ANY segment.

---

### Select X-axis Display for FCA Measurements

Click **Response**, then **Measure**, then **Select X-axis**, then **Input**, **LO**, or **Output**

When **Sweep Type = Linear**, you can choose to show the frequency range of any of the swept parameters on the X-axis.

For example, the following image shows an SMC Fixed Output response with the **Input frequency range** on the X-axis:

- Output: 100 MHz (data trace)
- **Input**: 2 GHz to 23 GHz (X-axis)
LO: 1.9 GHz to 22.9 GHz (not shown)
Marker annotation shows Output power at Input frequency.

Save Trace Data
You can save your FCA measurement data in several standard formats.
Click File, then Save Data As to save your FCA data.
The following shows how CSV and SNP files are saved.

Mixer Trace Data
When you select Mixer Trace Data, the FCA data is saved to a CSV file in the following format:

#MIXER TRACE FILE,A.01.00
SegIndex, InputFreq, OutputFreq, LO1Freq, InputPower, LO1Power, SC21 Mag (dB), SC21 Phase (Deg)

SNP Format
Each record contains 1 stimulus value and 4 parameters (total of 9 values) as follows:
Stim Real(p1) Imag(p1) Real(p2) Imag(p2) Real(p3) Imag(p3) Real(p4) Imag(p4)
where pX is the parameter depending on measurement type:

<table>
<thead>
<tr>
<th>Measurement Type</th>
<th>p1</th>
<th>p2</th>
<th>p3</th>
<th>p4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalar</td>
<td>S11</td>
<td>SC21 (FWD)</td>
<td>SC12 (REV)</td>
<td>S22</td>
</tr>
<tr>
<td>Vector</td>
<td>S11</td>
<td>VC21</td>
<td>VC12</td>
<td>S22</td>
</tr>
<tr>
<td>Mixer Characterization</td>
<td>Directivity</td>
<td>Source Match</td>
<td>Reflection Tracking</td>
<td>M21</td>
</tr>
</tbody>
</table>
If correction is OFF, data is only saved for the active parameter. Zeros are saved for all other parameters.

If correction is ON, data is saved for all of the parameters.

All files contain the following Header Information: Brackets [ ] contain parameters.

# [S2P data here]

Avoid Spurs

On the Mixer Setup dialog box, check Avoid Spurs

The Avoid Spurs feature of the Frequency Converter Application attempts to prevent unwanted mixing products from appearing on the PNA screen. The Avoid Spurs feature does not significantly impact measurement speed.

**Note:** The Avoid Spurs feature is OFF by default for FCA calibrations. For highest accuracy, make measurements with the Avoid Spurs feature at the same state (ON or OFF) as was used when calibrating.

Description

A spur, or spurious signal, is a term used to describe the unwanted product of two signals mixing together. When you configure the mixer setup dialog box for a desired Output, the PNA computes the frequencies of potential unwanted signals. By manipulating internal PNA hardware, these signals are avoided and do not appear on the PNA display. This means you do not need to use external filters to prevent spurious signals from appearing on the PNA display.

The time required for the PNA to compute the frequencies of unwanted spurious signals MAY be noticeable depending on the number of data points in your measurement. However, once computed, the time required for the PNA to avoid the spurs is usually insignificant.

Limitations

The Avoid Spurs utility cannot avoid every spur. However, when there is a choice of spurs to avoid, it will avoid the largest spur.

The Computation of Avoided Spurs

The Avoid Spur computer avoids the following spurs:

- LO, and its interaction with internal PNA components, and 16 of its harmonics.
- Input frequencies and 16 of its harmonics.
- Undesired Image frequencies (Sum or Difference) and 16 of its harmonics.

Last modified:

- **27-Apr-2011** Removed Copy Channels limitation
- **9-Dec-2010** Updated for A.09.33
- **26-Aug-2010** Add link to Cal 2-stage SMC+Phase
- **25-Mar-2010** Add SMC with phase, Data Save As, GAV
- **5-Feb-2010** Add Speed SMC
- **3-Sep-2008** Removed legacy content
- **1-May-2008** Updated for selectable ports
- **5-Oct-2007** Added link to embedded LO
Scalar Mixer/Converter Measurements (SMC)

SMC Setup and Calibration is very similar to VMC. See FCA Overview to learn about the features that are common to these two applications.

The following information is unique to SMC:

- SMC Hardware Setup
- Create an SMC Measurement
- SMC Parameters Offered
- The SMC Mixer Setup dialog
- SMC + Phase
- SMC Calibration

Programming Commands

SMC Hardware Setup
SMC requires a **power meter/sensor**, **two sources**, and a **Cal Kit or ECal module**

- Your DUT can be connected to any PNA ports. [Learn more.](#)
- When using PNA-X with Internal Second Source, the external source is NOT necessary. [Learn which PNA ports can be used for the LO.](#)
- Connect **External Source** to the PNA GPIB Controller port. Learn how to [Configure an External LO Source](#)
- See the rear panels of the [PNA-X](#) or [PNA ’C’](#) models.
Use either a GPIB power meter or USB power sensor.

**How to configure two power sensors** to cover the SMC measurement frequency range.

Using a dual channel power meter, with both sensors connected:

1. At the SMC **Select DUT Connectors** dialog, click **Source Cal Settings**
2. At **Source Calibration Settings** dialog, click **Power Meter Config**
3. At **Power Meter Settings** dialog, click **Sensors**
4. At **Power Sensor Settings** dialog, clear the "Use this sensor only..." checkbox for both sensors.
5. Then enter the **Min** and **Max Frequencies** for both sensors.

During the SMC Cal, you will be prompted to connect each sensor at the appropriate time.

---

**Create an SMC Measurement**

1. On the PNA-X front panel, press **Meas** then **[Measurement Class]**
2. Select **SMC**, then either:
   - **OK** delete the existing measurement, or
   - **New Channel** to create the measurement in a new channel.

3. An SC21 measurement is displayed.

**SMC Parameters Offered**

To select additional parameters to display, click **Trace**, then **New Trace**, then select a parameter from the list.

---

**Important Note:** Connecting your DUT to the PNA:

**RF** and **IF** terminology is NOT used in FCA because the PNA does not know how the DUT is labeled or how it will be used. Instead, the general terms **INPUT** and **OUTPUT** are used.

- **INPUT** - The DUT port being stimulated with frequencies before conversion.
- **OUTPUT** - The DUT port outputting converted frequencies.

**INPUT** and **OUTPUT** Frequencies are specified using the **Mixer Setup dialog box**.
The DUT input and output can be connected to any PNA ports.

**Note**: Although there are MANY configuration possibilities, the following images and descriptions show ONLY a DUT connected to PNA ports 1 and 2.

Legend:
- **Black** are ratioed measurements (test port/reference receiver).
- **Green** are unratioed measurements (either a test port OR reference receiver).

</tbody>
</table>

The following SMC Mixer Setup dialog tabs are presented:

- **Sweep Tab** (shared with VMC)
- **Power Tab** (shared with VMC)
- **Mixer Freq Tab** (shared with all converter apps)
- **Mixer Power Tab** (shared with all converter apps)
- **Mixer Setup Tab** (shared with all converter apps)

SMC + Phase

Beginning with PNA Rev.A.09.20, you can optionally measure phase with SMC. This feature is available ONLY with Opt 083 on a PNA-X or N522x model.

A Reference Mixer is NOT required as it is with VMC. Instead, during an SMC calibration, the phase delay through a characterized Cal Mixer is measured and compared to the known delay. The difference between the measurement and the known delay is used to correct all subsequent SMC phase measurements.

Comparing SMC+Phase with VMC Phase Measurements

SMC phase measurements do NOT require a reference mixer, and are therefore easier to make than VMC phase measurements. Also the SMC calibration mixer is only required to have a known delay value, although an S2P characterization file provides more accurate results.

- When measuring converters with an embedded LO, SMC with phase can provide results that are as stable and free from sweep-to-sweep jitter as VMC.

- When measuring converters with an external LO that is shared with the reference mixer (as shown in the VMC Setup diagram), VMC provides results that are more stable than SMC+Phase.
How to enable Phase with SMC

On the **Sweep tab**, check **Enable Phase**.

To View Phase (using any parameter): click **Response**, then **Format**, then select the format of interest (phase, unwrapped phase, group delay, and so forth).

<table>
<thead>
<tr>
<th>Phase Settings dialog box help</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Phase Settings dialog box" /></td>
</tr>
</tbody>
</table>

**Enable Phase with SMC**  Check to perform phase measurements. You can also enable phase measurements during calibration.

**Phase Reference Point**

The SMC Phase measurement technique provides for a coherent phase relationship from one frequency to the next in each sweep. However, the phase measurement of the first data point is random from sweep to sweep. This initial phase offset does not impact measurements such as group delay or deviation from linear phase. However, in order to keep a phase trace from appearing random, all phase data in the sweep is normalized against a single point. This results in a stable, normalized phase trace.

For this normalization, select the measurement point that has the best signal-to-noise ratio. The phase at the selected point will always be zero. This selection applies for both the measurement and the calibration sweeps. The Reference Point is fixed at the middle point when **segment sweep** is selected.

**How to improve the stability of SMC+Phase measurements**

Stable phase measurements are attained by increasing **Sweep Averaging**, and sometimes lowering the IFBW, until you attain the desired compromise between sweep time and trace jitter (the amount of random phase change at a single data point). For SMC + phase, the default IFBW is 10 kHz, and 1 average. During calibration, the Averaging factor is temporarily multiplied by 4 to ensure an accurate phase calibration.

The following procedure shows how to view and improve phase jitter:

1. Create an SMC + Phase channel (Click Response, Measurement Class).
2. Enable Phase with SMC (See above) On the phase trace (to follow) notice that the only point that has NO jitter is the data point that you selected as the Phase Reference point.
3. Change the measurement to **IPWR**: (Click Response, Measure, IPWR)
4. Change Format to Phase. (Click Response, Format, Phase)
5. Normalize the trace. (Click Marker/Analysis, Memory, Normalize) Learn more about Normalization.
6. Autoscale the trace. (Click Response, Scale, Autoscale).
7. Optionally monitor the jitter with **Trace Statistics** (Std Dev)
8. Increase Averaging and possibly lower IFBW to improve jitter. (Click Response, Avg, then Average and IFBW).

9. After the adjustments are made, change the measurement back to your measurement of interest.

10. When measuring a new DUT, restart Averaging.

**How to Calibrate a 2-stage (LO) SMC+Phase Measurement**

When calibrating a dual-stage SMC+Phase measurement for group delay using a characterized mixer, the channel setup requires frequency values for two LOs, but the characterized-thru mixer uses only one LO. The frequencies of LO1 and LO2 are different. There are two ways to overcome this challenge:

1. Before the calibration, set the LO that is provided by an external source to uncontrolled. Then manually set the frequency of this external source to the LO frequency that gives the same input and output frequencies, and the same sweep direction, as the dual-stage setup. Perform the calibration under this condition. After the calibration, return the LO to controlled so that its frequency will be properly set during the measurement of the DUT.

2. Configure a 1-stage mixer setup, with the LO set to the frequency that gives the same input and output frequencies and the same sweep direction as the dual-stage setup. Perform the calibration under this condition. Save the calibration data as a user calset. Configure the dual-stage case, and apply the 1-stage calibration.

**Speed Up SMC Measurements**

Using default SMC settings, any calibrated SMC measurement requires four sweeps. However, you can reduce the number of sweeps required by selecting one or more of the following settings.

- **Use Nominal Incident Power**
- **Apply Cal Set or Cal Type**
- To speed up a Swept LO measurement when using an external source for the LO, use **Hardware List (BNC)** Trigger setting. Learn more.

**Use Nominal Incident Power**

Click **Response**, then **Measure**, then **Use Nominal Incident Power**

Each data sweep of a fully corrected SMC transmission measurement actually requires FOUR data sweeps. When you clear **Use Nominal Incident Power**, the reference receiver (R1 or R2) does not measure incident power. Instead, the incident power is assumed to be at the level that was set with the **Source Power Calibration** that is done as part of every SMC measurement. The degradation in accuracy is very negligible if the input or output of your test device is well-matched.

This selection eliminates sweeps ONLY when both **Include Input Match** AND **Include Output Match** is cleared on the Cal Type dialog. Learn more.

**Apply a Cal Set or SMC Cal Type**

You can create an FCA measurement and apply an existing Cal Set as you can with any PNA measurement. Learn
about Cal Sets. In addition, from a Cal Set, you can apply a specific SMC Cal Type to an existing SMC measurement.

**How to apply an SMC Cal Type**

1. Create an SMC measurement
2. Calibrate or apply an existing SMC Cal Set, then...

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then [Manage Cals]
3. then [Correction Methods]

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Cal**
3. then **Manage Cals**
4. then **Correction Methods**

**Correction Method** dialog box help

By default, each SMC calibration requires FOUR sweeps. Clearing boxes will eliminate sweeps and speed up your SMC measurements. The difference in speed is most noticeable when making fixed input or fixed output measurements with an external LO source.

**Include input match correction** Check to perform a sweep to measure and correct for INPUT match. Clear this box if the input of your mixer is well-matched to the PNA, or if your setup does not permit a valid S11 measurement.

**Include output match correction** Check to perform a sweep to measure and correct for OUTPUT match. Clear this box if the output of your mixer is well-matched to the PNA, or if your setup does not permit a valid...
Include SC12 Sweep  Check to perform a reverse sweep to measure SC12.

- When checked (default setting), a calibrated SMC measurement sweeps in both forward (SC21) and reverse (SC12) directions.
- Clear this checkbox to eliminate sweeps in the reverse direction. This means that the following measurements will NOT be corrected: SC12, RevOPwr, RevIPwr.

Corrected Parameters  Lists the parameters that can be corrected given the boxes that are currently checked. These parameters may not be currently measured.

Calibration Type  Shows the type of SMC Cal that will be applied given the boxes that are currently checked.

Learn about Use Nominal Incident Power

How many sweeps can be eliminated?

<table>
<thead>
<tr>

<td>Removes 1 when Nominal is checked*</td>
</tr>
<tr>
<td>Check &quot;Use Nominal Incident Power“</td>
<td>Remove IPwr, RevIPwr</td>
<td></td>
<td>May remove up to 2*</td>
</tr>
</tbody>
</table>

ALL cleared and check Nominal Incident Power | OPwr, SC11 | 1 Total |

*S11 shares a sweep with IPwr and S22 shares a sweep with RevIPwr. Therefore, when Include Input Match or Include Output Match is checked, then checking Nominal incident power does nothing.

*SMC measurement* sweeps can NOT be eliminated.

SMC Calibration Overview

The SMC Calibration Wizard guides you through this process.

1. Connect a power meter / sensor to PNA Port 1. At each step of the input and output frequency, the PNA measures:
• input match of the power sensor
• source power of the PNA

2. Perform two 2-port SOLT calibrations: one over the INPUT frequencies and one over the OUTPUT frequencies of the DUT. (If your DUT is a linear device, the calibration uses only the INPUT frequency range.) Use either a mechanical calibration kit or an ECal module.

SMC Cal Wizard

The following dialog boxes are presented during SMC Calibration.

Indented steps are optional.

- Calibration Setup
  - Waveguide/In-fixture/On-Wafer Setup
- Select DUT Connectors and Cal Kits
  - Modify Frequency Cal
  - Specify how the ECal module is connected
- Power Cal Settings
- SMC Cal Steps
- Calibration Completed
- Specify Adapter Delay

How to Perform a SMC Calibration

1. Create an SMC measurement, then...

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>CAL</strong></td>
<td>1. Click <strong>Response</strong></td>
</tr>
<tr>
<td>2. then <strong>Start Cal</strong></td>
<td>2. then <strong>Cal Wizard</strong></td>
</tr>
<tr>
<td>3. then <strong>Cal Wizard</strong></td>
<td></td>
</tr>
</tbody>
</table>
SMC Calibration Setup dialog box help

Allows you to review and change the settings for your SMC calibration.

Waveguide/In-fixture/On-Wafer Setup  Click Next to launch the following Setup dialog box.

Independent power cal for input and output ports (no thru)  Check if a Thru standard is NOT available. During the power cal, you will be prompted to connect the power sensor to the Input, then the Output port.

Additional Power Cal Steps

Enable LO1 / LO2 Power Cal  Check when LO1 / LO2 is controlled (on the Mixer Setup tab) to perform a Power Cal on the LO source(s).

Phase Correction

Enable Phase Correction  Check to enable Phase measurements.

During an SMC calibration, the phase delay through a characterized Cal Mixer is measured and compared to the known delay. The difference between the measurement and the known delay is used to correct the SMC phase measurements.

Using an *.S2P file (which characterizes the delay across the measurement frequency range) is more accurate than using a single known delay value.

Use an *.S2PX file when making segmented SMC + Phase measurements. Learn more.

The following are two methods to characterize the Cal Mixer over the SMC measurement frequency range:

1. Use the Mixer Characterization Wizard. The Cal Mixer has the same requirements as the VMC Cal Mixer. Learn more.

2. In a calibrated VMC channel, measure the group delay of the calibration mixer, then save to an *.S2P or *.S2PX file. However, a characterized mixer is required to calibrate the VMC channel.

To start the Mixer Characterization Wizard, click Response, then Cal, then Mixer Characterization Wizard. Learn more about Phase Correction for SMC measurements.
Waveguide/In-fixture/On-Wafer Setup dialog box help

This dialog box appears ONLY if you checked the Waveguide/In-fixture/On-Wafer Setup box in the previous Cal Setup dialog.

Allows you to embed or de-embed circuit networks on the input and output of your mixer under test.

For Network1 (Input) and Network2 (Output) select Embed, De-embed, or None.

Browse  Click to navigate to the .S2P file that models the network to embed or de-embed.

Reverse port positions for input/output  Check to cause the Fixture/Adapter to be configured with Port 2 connected to the PNA and Port 1 to be connected to the DUT. The image in the dialog is updated to reflect that change.

Enable Extrapolation  Check (default setting) to apply a simple extrapolation when the S2P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. A warning message is also displayed when extrapolation is necessary.

To Embed or De-embed

- When you have a 2 port network that needs to be connected between the Cal reference plane and the DUT during the measurement, but it is NOT present during the calibration, then that network has to be De-Embedded from the port in question during the calibration. In other words, De-Embedding in FCA calibration extends the calibration reference plane to include the two port network.

- When you have a 2 port network that is included as part of the calibration reference plane but has to be disconnected during the measurement, then that 2-port network has to be Embedded for the port in question during the calibration. In other words, Embedding in FCA calibration retracts the calibration reference plane to exclude the two port network during the measurement.

Notes

- Characterize Adaptor Macro can be used to create the S2P file.

- Interpolation is performed when more frequencies are included in the file than in the channel, and the data points do not exactly match those of the measurement.
Select DUT Connectors and Cal Kits dialog box help

Allows you to specify the connector type and Cal Kit for each DUT port.

**Port n** For each listed PNA port, specify the DUT connector type and gender, and the Cal Kit to use.

**Note:** If your DUT connectors are:

- Waveguide  Change the system impedance to 1 ohm before performing a calibration. See Setting System Impedance.

- Not listed (male and female)  Select **Type A** as the connector type. Type A requires a calibration kit file containing the electrical properties of the standards used for calibration (see Calibration kits).

- Unspecified (like a packaged device)  Select **Type B** as the connector type. Type B requires a calibration kit file containing the electrical properties of the standards used for calibration (see Calibration kits).

**Modify Cal**  Check, then click **Next**, to start the Modify Frequency Cal dialog.

**Source Cal Settings**  Click to start the Source Cal Settings dialog.

Modify Frequency Cal dialog box help

**Thru Cal Method**  For each Thru connection, choose the Thru method. Learn more about these choices.

**Cal Type/Stds**  Click to start the Modify Calibration Selections dialog box.

The following selections are available ONLY if using an ECal module.

**Do orientation**  When this box is checked (default) the PNA senses the ECal model and direction in which the ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box.
to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range. If you have an **E8361A** or **E836xB** PNA and do an ECal completely within 10 - 20 MHz OR 60 - 67 GHz, you may need to do orientation manually. There may not be sufficient power to orient the ECal module at those frequencies.

**View/Detect ECal Characterizations**  Appears only if an ECal module is selected for use. Click to invoke the [View ECal Modules and Characterizations](#) dialog box. Displays a list of ECal modules that are connected to the PNA.

### Power Cal Settings dialog box help

![Power Cal Settings dialog box](image)

**Note:** A **Use Power Table** checkbox (not shown) is available when a mmWave SMC measurement is active. [Learn more](#).

**Power Cal at:** Select the source port for which a Power Calibration will be performed. The source and receiver correction will be transferred to all other sources and receivers involved in the S-parameter measurements.

**Use Multiple Sensors**  (NOT available with mmWave SMC measurements.) Check this box when you want to use more than ONE power sensor to cover the measurement frequency range. The dialog is replaced with the **Multiple Sensors** dialog (see following image). When "Use Multiple Sensors" is cleared (default setting), connect only ONE sensor to the PNA.

**Power Meter Settings**  Click to start the standard [Power Meter Settings dialog](#).

**De-embed (power sensor) adapter**  When the power sensor connector is NOT the same type and gender as the DUT connector for the specified port, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the reference plane.

- **Clear**  this box to NOT compensate for the added adapter.
- **Check**  this box to perform extra calibration steps to measure and correct for the adapter.

Then select the **Power Sensor Connector** type and gender of the power sensor. "Ignored" does NOT compensate for the added adapter, just as if the checkbox were cleared.

When this connector matches the DUT connector for the same port, then the PNA assumes that there is no adapter. Extra cal steps are NOT required and the Cal Kit selection is not available.

Otherwise, select the **Cal Kit** to be used to calibrate at the adapter.

See [Accuracy Settings](#) below.
Specify how the ECal module is connected dialog box help

This dialog box appears when the Do orientation checkbox in the previous Modify Frequency dialog box is cleared.

Click the ECal Port that is connected to each PNA port.

SMC Calibration Steps dialog box help

Power Level at which to perform the Power Cal.

It is usually best to set power level to 0 dBm at the power sensor because the power sensor is calibrated at that level. Lower power levels will yield a slower and noisier calibration.

If an external component is used between the PNA-X test port and the calibration reference plane, then adjust the power level so that the power at the sensor is about 0 dBm if possible.

The current source attenuation value is shown on the dialog.

LO Power Cal (Optional) When enabled, perform a Source Power Cal at the DUT LO connector. An LO must already be selected. Learn how. The power level of the LO source calibration is set on the (LO) Power Tab.
**Calibration Completed** dialog box help

**Finish**  
Save to the channel's calibration register.

**Save As User Cal Set**  
Starts the **Save as User Cal Set** dialog box AND save to the channel's calibration register.

**Cancel**  
Calibration is NOT applied or saved.

Learn about **Calibration Registers**.

Learn about **User Cal Sets**.

---

**Specify delay** dialog box help

This dialog appears ONLY when **Adapter Removal** or **Unknown Thru** calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Adapter delay**  
To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here. The required precision value is the accuracy that is required to characterize the delay value.

**Nominal phase offset**  
(Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

**For SMC calibrations**, this dialog box appears twice: once for the input frequencies and once for the output frequencies. The values can be slightly different.
8-Jun-2011  Clarify 'stable phase measurements'
1-Jun-2011  Add *.S2Px
25-Oct-2010  Combined SMC info to one topic and added fixturing features
26-Aug-2010  Add link to Cal 2-stage SMC+Phase

5-Oct-2007  Added link to embedded LO
VMC Measurements

VMC Setup and Calibration is very similar to SMC. See FCA Overview to learn about the features that are common to these two applications.

The following information is unique to VMC:

- VMC Hardware Setup
- Create a VMC Measurement
- VMC Parameters Offered
- The VMC Mixer Setup dialog
- VMC Calibrations

See Also

- Embedded LO
- How to make a VMC Fixed Out measurement

VMC Hardware Setup
DUT Input (RF) must be connected to PNA port 1.
DUT Output (IF) can be connected to any other PNA port.

Notes:

- When using a PNA-X with Internal Second Source, the external source is NOT necessary.
- See note regarding LO power out both second source ports
- Learn which PNA ports can be used for the LO.
- Measure a DUT with an Embedded LO

Reference Mixer

The Reference mixer provides a phase reference for the measurements. The reference mixer is connected in the reference receiver path of the network analyzer, between the source out and receiver R1 in ports, as shown below.

The reference mixer is considered part of the test system setup like the test cables. It remains in place during the entire calibration and measurement process. The reference mixer is switched in and out of the measurement path by the PNA as needed. See how to manually switch the reference mixer.
The reference mixer does not need to be reciprocal and does not have to match the calibration mixer or the mixer-under-test in performance. The only requirement of the reference mixer is that it cover the same frequency range as the mixer under-test. In general, it is valuable to select a reference mixer that can be used with a variety of different setups. For example, a broadband mixer can be used in place of several narrow-band alternatives.

A low pass filter on the output of the reference mixer can be used to suppress the LO leakage signal that comes out of the reference mixer output. It is not strictly needed, but ensures that the PNA will not have any source unlock or unlevel errors due to the LO leakage.

- Connect the Reference Mixer INPUT to PNA Ref 1 Source out
- Connect the Reference Mixer OUTPUT to PNA Rcvr R1 In

**Calibration Mixer/Filter**

The Calibration mixer/filter is characterized either before or during a VMC calibration. It is used during the VMC calibration as the THRU standard. The calibration mixer/filter combination must meet the following requirements:

- The mixer must be reciprocal over the frequency range of the mixer under test. This means that it has the same magnitude and phase response in the up-converting and down-converting directions (C21 = C12) as shown in the following diagram.

![Diagram](image)

- If the Input and Output frequency ranges are overlapping, the mixer must have Input to Output Isolation greater than 10 dB more than the conversion loss in the overlapping range.

- The filter must reject the undesired mixing product, and pass the desired mixing product, at the output of the cal mixer. This requirement can be made easier by characterizing the mixer/filter as a downconverter. Learn more.

**Note:** With a corrected VC21Swept LO measurement, the phase data is displayed relative to the phase of the calibration mixer that was used during the VMC calibration. In addition, Group delay display format is NOT valid.

See an example of a Fixed Output VMC Measurement

**Important note: Orientation of Reference mixer and Calibration mixer/filter**

The reference mixer is ALWAYS connected in the same orientation as the DUT, since the output frequency of the
reference mixer has to match that of the DUT. The same applies to the calibration mixer/filter if it is characterized as part of a full VMC cal.

If you characterize the calibration mixer/filter separately, you can characterize it as either an upconverter or downconverter. Learn more.

**LO Source**

**Note:** When using a PNA-X with Internal Second Source, the external source is NOT necessary.

- See note regarding LO power out both second source ports
- Learn which PNA ports can be used for the LO.
- Connect External Sources to the PNA GPIB Controller port.
- See the rear panels of the PNA-X or PNA 'C' models.
- Learn how to Configure an External LO Source

**Create a VMC Measurement**

1. On the PNA-X front panel, press Meas then **[Measurement Class]**

2. Select **VMC**, then either:
   - **OK** delete the existing measurement, or
   - **New Channel** to create the measurement in a new channel.

3. A VC21 measurement is displayed.

4. To select additional parameters to display, click **Trace**, then **New Trace**, then select a parameter from the list.

**VMC Parameters Offered**

**Important Note:** Connecting your DUT to the PNA:

RF and IF terminology is NOT used in FCA because the PNA does not know how the DUT is labeled or how it will be used. Instead, the general terms INPUT and OUTPUT are used.

- **INPUT** - The DUT port being stimulated with frequencies before conversion.
- **OUTPUT** - The DUT port outputting converted frequencies.

INPUT and OUTPUT Frequencies are specified using the Mixer Setup dialog box.

The DUT input is always connected to PNA port 1. However, the DUT output can be connected to any other PNA
port.

- VC21, VC31, or VC41 Conversion Loss/Gain (default) - stimulus at Input, response at Output
- S11 - stimulus and response at Input
- S22, S33, or S44 - stimulus and response at Output
- R1 (or R) - stimulus at Input, measures absolute power at the R1 receiver (uncorrected)
- B, C, or D - stimulus at Input, measures absolute power at the output receiver (uncorrected)
- Reverse conversion loss is NOT offered because of the reference mixer.

Calibration Setup dialog box help

Waveguide/In-fixture/On-Wafer Setup Check to embed or de-embed circuit networks on the input and output of your mixer under test. Starts the following dialog box.

Additional Power Cal Steps - Used ONLY for SMC Cals
Waveguide/In-fixture/On-Wafer Setup dialog box help

This dialog box appears ONLY if you checked the Waveguide/In-fixture/On-Wafer Setup box in the previous Cal Setup dialog.

Allows you to embed or de-embed circuit networks on the input and output of your mixer under test.

For Network1 (Input) and Network2 (Output) select Embed, De-embed, or None.

Browse  Click to navigate to the .S2P file that models the network to embed or de-embed.

Reverse port positions for input/output  Check to cause the Fixture/Adapter to be configured with Port 2 connected to the PNA and Port 1 to be connected to the DUT. The image in the dialog is updated to reflect that change.

Enable Extrapolation  Check (default setting) to apply a simple extrapolation when the S2P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. A warning message is also displayed when extrapolation is necessary.

To Embed or De-embed

- When you have a 2 port network that needs to be connected between the Cal reference plane and the DUT during the measurement, but it is NOT present during the calibration, then that network has to be De-Embedded from the port in question during the calibration. In other words, De-Embedding in FCA calibration extends the calibration reference plane to include the two port network.

- When you have a 2 port network that is included as part of the calibration reference plane but has to be disconnected during the measurement, then that 2-port network has to be Embedded for the port in question during the calibration. In other words, Embedding in FCA calibration retracts the calibration reference plane to exclude the two port network during the measurement.

Notes

- Characterize Adaptor Macro can be used to create the S2P file.

- Interpolation is performed when more frequencies are included in the file than in the channel, and the data points do not exactly match those of the measurement.
What is Calibration Mixer Characterization? For a brief explanation, see Calibration Mixer.

Select Mixer Characterization Method

**Perform Characterization (requires a reference mixer)** Performs a Mixer characterization in addition to the VMC calibration. The mixer characterization file will be saved at the end for use in subsequent VMC calibrations. Choose this selection if you do NOT already have a mixer characterization file to load.

**Load characterization from file** Loads an S2P calibration mixer characterization file. Click **Browse** to locate the file.

**Note:** Load an *.S2PX file for SEGMENTED VMC measurements. [Learn more.]

- The frequency range of the S2P file MUST be the same, or larger than, the frequency range of the FCA measurement. If the S2P file frequency range is larger, or the data points do not exactly match those of the measurement, interpolation will be performed.

- The VMC calibration requires that the calibration mixer be connected in the same orientation as that in which it was characterized. The direction in which it was characterized is not part of the file that is recalled. You have to remember and connect it appropriately.

"Invalid Mixer Characterization File" is displayed if the frequency range of the S2P file is smaller than those of the measurement.

**Note:** A Mixer Characterization Cal can be performed separately. [Learn how.]
**Measurement Direction dialog box help**

This dialog box appears ONLY if your settings in the Mixer Setup dialog box indicate that your DUT is being tested as an upconverter (input < output). It allows you to characterize the Calibration Mixer / Filter as a downconverter (input > output) or an upconverter.

The following example shows why you would choose to characterize the calibration mixer as a downconverter. Consider a DUT being used as an upconverter. The input frequency is 70 MHz, the LO is 20 GHz, and the selected (+) output frequency is 20.07 GHz. If we chose (-) in the mixer setup dialog, the output frequency would be 19.93 GHz.

- **Characterize as upconverter**  A very sharp cutoff filter is required to reject the undesired output of 19.93 GHz and pass the desired 20.07 GHz.

- **Characterize as downconverter**  The input frequency is 20.07 GHz; the LO is 20 GHz. The sum (+) output is 40.07 GHz and the diff (-) output is 70 MHz. These are very easy to separate with a low-pass filter. The original frequencies are always used in the downconversion process, so be sure to choose a filter that will pass 70 MHz and reject 40.07 GHz.

See connection diagrams.

**Select DUT Connectors and Cal Kits dialog box help**

Allows you to specify the connector type and Cal Kit for each DUT port.

**Port n**  For each listed PNA port, specify the DUT connector type and gender, and the Cal Kit to use.

**Mixer Out Port**  Output port of the image filter that is connected to the calibration mixer / filter combination. Specify the Cal Kit / standards to use for the measurement of the calibration mixer / filter combination.

**Note:**  When selecting a cal kit for the Mixer Out Port, be sure that the kit has standards with connectors that can mate to the mixer output port. If you choose an ECal, the ECal must have at least one port that can mate to the mixer output port.

**Note:**  If your DUT connectors are:

- **Waveguide**  Change the system impedance to 1 ohm before performing a calibration. See Setting System Impedance.

- **Not listed** (male and female)  Select Type A as the connector type. Type A requires a calibration kit file containing the electrical properties of the standards used for calibration (see Calibration kits).
- **Unspecified** (like a packaged device) Select **Type B** as the connector type. Type B requires a calibration kit file containing the electrical properties of the standards used for calibration (see Calibration kits).

**Modify Cal** Check to start the Modify Cal dialog. If performing a Mixer Characterization Cal at the same time as VMC Cal, two Modify Cal dialogs will be presented, one after the other.

---

**Modify Frequency Cal** dialog box help

For VMC calibrations - NOT for Mixer Characterization.

**Thru Cal Method** For each Thru connection, choose the Thru method. Learn more about these choices.

**Cal Type/Stds** Click to start the Modify Calibration Selections dialog box.

The following selections are available ONLY if using an ECal module.

- **Do orientation** When this box is checked (default) the PNA senses the ECal model and direction in which the ECal module port is connected to the PNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

  Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range. If you have an **E8361A** or **E836xB** PNA and do an ECal completely within 10 - 20 MHz OR 60 - 67 GHz, you may need to do orientation manually. There may not be sufficient power to orient the ECal module at those frequencies.

- **View/Detect ECal Characterizations** Appears only if an ECal module is selected for use. Click to invoke the View ECal Modules and Characterizations dialog box. Displays a list of ECal modules that are connected to the PNA.
Specify how the ECal module is connected dialog box help

This dialog box appears when the Do orientation checkbox in the previous Modify Frequency dialog box is cleared.
Click the ECal Port that is connected to each PNA port.

Modify Mixer Cal dialog box help

Mixer Characterization ONLY. The Thru standard is not measured. Therefore, the Thru Cal Method choices are not available.

View / Detect ECal Characterizations Available ONLY if using an ECal module. Invokes the Select ECal Module and Characterization dialog box.

Select the ECal Port to be connected to the Output of the Calibration Mixer dialog box help

Select the ECal Port to be connected to the output of the image filter of the Calibration Mixer / Filter combination. See connection diagram of Calibration Mixer / Filter combination.
**Measure Calibration Standards** dialog box help

Prompts for standards to be measured. Connect the standard, then click **Measure**.

**Measure**  Measures the mechanical standard and continue to the next calibration step.

**[ReMeasure]**  Replaces Measure after standard has been measured. Allows you to remeasure a standard.

**Done**  Click to proceed to the **Calibration Complete** dialog. Available only after all measurements for the calibration are complete.

**Back**  Returns to the previous dialog box.

**Next**  Does NOT make a measurement. Proceeds to the next required step.

**Cancel**  Exits the Calibration Wizard.

---

**Vector Mixer Cal Steps** dialog box help

Connect the Open, Short, and Load standards to the image filter output, then click **Measure**.

This portion of the calibration characterizes the calibration mixer.

The connection is different depending on if the calibration mixer is an upconverter being characterized as a down converter.

**Note:**

The following are simplified connection diagrams - the reference mixer and LO signals must also be connected. These images assume that the DUT output is connected to PNA port 2.

As a **Downconverter**, (The PNA automatically switches to make the S22 measurement on the device.)

As an **Upconverter**
Done  Click to proceed to the Calibration Complete dialog. Available only after all measurements for the calibration are complete.

Save Mixer Characterization dialog box help

Allows you to save the characterization data of your calibration mixer. When performing another VMC calibration using the same calibration mixer, this S2P file can then be recalled.

Browse  Navigate to the location where you want to save the characterization data of your calibration mixer. Either use the default file name or enter a custom file name.

Next  Saves the mixer characterization file and continues with the next step in the full system calibration routine.

Finish  Replaces Next if you are only characterizing the calibration mixer instead of performing a full system calibration. Saves the mixer characterization file and exits the mixer characterization routine.
**Calibration Completed** dialog box help

**Finish**  
Save to the channel's calibration register.

**Save As User Cal Set**  
Starts the [Save as User Cal Set dialog box](#) AND save to the channel's calibration register.

**Cancel**  
Calibration is NOT applied or saved.

Learn about [Calibration Registers](#).

---

**Specify delay** dialog box help

This dialog appears ONLY when [Adapter Removal](#) or [Unknown Thru](#) calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Adapter delay**  
To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here. The required precision value is the accuracy that is required to characterize the delay value.

**Nominal phase offset** (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

**For FCA calibrations**, this dialog box appears twice: once for the input frequencies and once for the output frequencies. The values can be slightly different.

---

Last Modified:

21-Oct-2010    MX New topic
How to make a VMC Fixed Output Measurement

The following is a step-by-step example illustrating how to measure a mixer in swept LO mode using FCA Vector Mixer Calibration.

There are fewer components required for SMC as compared to VMC, and fewer measurement steps. You can now make relative phase measurements with SMC. Also, ONLY SMC (not VMC) can measure the reverse conversion loss of the mixer.

This procedure can also be used for making fixed LO measurements, which is quite similar. Although the LO source is still required, the physical triggering cables that connect the PNA and External Source are not required.

Required Equipment

- PNA-X or PNA 'C' models
  - with option 083 (FCA)
  - with PNA Rev A.09.33 or above

**Note:** This example has been updated to show keystrokes for the FCA User Interface available with PNA Rev. A.09.33 and above.

- GPIB External Source (Agilent ESG or PSG works best). This source is NOT necessary when using PNA-X with Internal Second source.
- Reference Mixer (see requirements)
- Calibration Mixer/Filter (see requirements)
- Power splitter - Not necessary when using PNA-X with Internal Second source.
- ECal module with connectors that match the Input and Output connectors of the DUT. You can use adapters to make the ECal module match the DUT connectors, but first perform an ECal user-characterization with the adapters attached. ECal makes the FCA calibration much easier.

Cables and adapters

- **Optional** GPIB Power meter and sensor (for LO power calibration)

The example mixer

The example device is a mixer with the following characteristics:

- LO and Input Frequency Range: 2 GHz to 4.2 GHz
- Output Frequency Range: DC to 1.3 GHz

We will measure:

- Fwd Conversion Loss (VC21)
- Input match (S11)
- Output match (S22)
- Rev Conversion Loss is NOT possible because of the reference mixer.

**VMC Setup**

Connect the devices as shown in the following diagram:

**Note:** This setup can also be used for SMC measurements, allowing you to make VMC and SMC measurements simultaneously on separate channels. The Reference Mixer is automatically switched during SMC measurements. The Cal Mixer/Filter is not used.

- When using a PNA-X with an Internal Second Source, the external source is NOT necessary.
  - See note regarding LO power out both second source ports
  - Learn which PNA ports can be used for the LO.
- The low-pass filter on the output of the Reference Mixer is recommended, but NOT required. [Learn more.]
- When using 4-port models, the mixer input must be connected to PNA port 1. The mixer output can be connected to any other PNA port.

**Make Connections on the Instrument rear panels:**

1. Connect the Source to the PNA GPIB Controller port using a GPIB cable.
2. Using two BNC cables, connect the Source and PNA Trigger connectors as shown in the following image. This is not necessary when making fixed LO measurements, or using a PNA-X with Internal Second Source.
3. Using a BNC cable, connect the PNA **10 MHz Reference Output** to the Ext. Source **10 MHz Reference Input**.

![Rear Panel Connectors Diagram]

**Create the Measurement**

**For this document:**

- Front-panel hardkeys are formatted as "Press TRACE"
- Front-panel softkeys are formatted as "Press [S11]
- Menus are formatted as "Click System"

1. Connect the DUT.
2. Press **P RESET** to make sure you are starting with a known state.
3. Press **Meas** then **[Measurement Class]**, then **Vector Mixer/Converter** then **OK**. At the **Confirm...** dialog, click **OK**. An S11 trace is created.
4. Press **[VC21]** to replace the S11 trace.
Configure the Mixer settings

1. Press **Freq** then [Mixer Setup] to start the Mixer Setup dialog.
2. On the **Sweep tab**, no changes from the default settings are required. The Avoid Spurs feature is useful for eliminating spurs in test setups with excessive LO leakage.
3. On the **Power tab**, change the DUT Input Port Power Level to -17 dBm.
4. On the **Mixer Frequency tab**, enter the frequency values as shown in the following image:

   a. You can enter the Input and the Output frequencies, then click **Calc LO**.
   b. If **Input > LO** is NOT checked, the PNA assumes you want the Input < LO frequencies, and higher LO frequencies are calculated as a result.

External Source Configuration

When using a PNA-X with Internal Second Source, the external source is NOT necessary.

- See note regarding LO power out both source ports
- Learn which PNA ports can be used for the LO.

1. On the **Mixer Setup tab**, click **Add Source** to start the External Source Configuration dialog. Learn how to configure an external source.
2. On the External Source Configuration dialog, click **Device Properties**.
   a. Click **Hardware List (BNC)**, which is the fastest measurement method. This method requires the BNC Trigger cables that connect the PNA and source. If not available, **Software CW** can be used, but measurements are much slower.
   b. If necessary, select the Interface (usually **GPIB**), then **Refresh**, then select the **Available IO Configuration**.
   c. Click **OK** to close the Device Properties dialog, then **OK** to close the External Source Configuration dialog.
3. Next to LO1, select the configured external source name.

Complete Mixer Setup
1. On the **Mixer Power tab**, change LO1 Power to 0.00 dBm. This setting specifies the power out of the external source (not at the DUT) unless an LO power cal is performed.

2. When the settings are valid, the **Save**, **Apply** and **OK** buttons are available to click. To save the mixer settings in a file so you can recall them easily, click **Save...**, then type a descriptive filename. Then click **OK**.

3. Click **OK** to close the VMC Setup dialog.

4. To change the X-axis values from the default Output selection (800 MHz), click **Response**, then **Measure**, then **Input**.

5. The trace is updated as the external source steps in frequency. It should look something like the following image. Because of the reference mixer, the uncorrected VMC measurement can look like it has gain.

![Image of trace](image.png)

### Problems?

**Not sweeping:**

- On the PNA, press **TRIGGER**, then **Continuous** to start the PNA sweeping. Watch for error messages on the PNA and source.

**Problems communicating with the source:**

- Press **SYSTEM** then **Configure** then **External Device**. On the External Device Configuration dialog, select the external source, then click Device Properties. Next to Trigger Mode: select **Software CW trigger**, then close the dialog. Again, press **TRIGGER**, then **Continuous** to start the PNA sweeping. If this works, then something is wrong with **Hardware (BNC)**. Check the trigger cables on the rear panel.

- As a last resort, try rebooting the PNA. First, save the entire setup to a `.csa` file. When the PNA preset measurement appears, recall the `.csa` file to resume at this step.

If the source is sweeping, and the PNA Input is sweeping, but there is still no output.
- Check power levels at the LO and Input.
- Check the DUT by making a fixed LO measurement which is much easier.

**Perform a VMC Calibration**

1. Disconnect the DUT.
2. Connect the ECal module to a PNA USB port.
3. Press **Cal**, then **[Start Cal]**, then **[Cal Wizard]**. Because the VC21 measurement is active, the Cal Wizard automatically begins a VMC Calibration.
4. At the **Calibration Setup** dialog, click **Next**. Or check **Enable LO1 Power Cal** to perform a **Source Power Cal** to specify the LO Power at the DUT. This requires a power meter or USB power sensor be connected.
5. At the **Calibration Mixer Characterization** dialog, click **Next**. We will perform characterization of the Calibration mixer as part of the VMC cal. Later we will save the Calibration mixer characterization so that, in future VMC calibrations that use this same frequency range, we can recall the Calibration mixer characterization by clicking **Load Characterization from file**.
6. At the **Select DUT Connectors and Cal Kits** dialog, for **Port 1** select the connector type and gender of your DUT INPUT. For **Port 2** select the connector type and gender of your DUT OUTPUT. Then select ECal as the Cal Kit to use for each connector. Click **Next**.
7. At the **Select the ECal Port to be Connected** dialog, ensure that **Port A** is selected for **Port 1**, then click **Next**.
8. At the **Vector Mixer Calibration Step 1 of 3** dialog, connect the ECal module Port A to the Port 1 cable, and Port B to the Port 2 cable. Then click **Measure**. This portion of the calibration gathers the linear (non-frequency-translating) error terms of the test setup at the input and output frequencies.
9. At the **Vector Mixer Calibration Step 2 of 3** dialog, connect the following, then click **Measure**. This portion of the calibration will connect reflection standards to characterize the S-parameters of the calibration mixer/filter.
   - Port 1 cable to the Input of the calibration mixer.
   - LO cable to the LO port of the calibration mixer.
   - ECal module to the Output of the calibration mixer/filter.
10. At the **Vector Mixer Calibration Step 3 of 3** dialog, disconnect the ECal module and connect the Port 2 cable to the output of the calibration mixer/filter, then click **Measure**. This step completes the calibration using the characterized mixer/filter as a Thru standard.
11. At the **Save Mixer Characterization** dialog, click **Browse**, then type a unique filename and click **OK**. Then click **Next**. This saves the Calibration Mixer characterization to an S2P file. This file can be recalled for subsequent VMC calibrations.
12. At the **Calibration completed** dialog, you can choose to save the VMC calibration as a User Cal Set. Otherwise, click **Finish** to complete the VMC calibration. Correction is turned ON and applied to the VMC trace that we set up earlier.

**What is happening?**

When an external source is sweeping, the measurements are much slower. When correction is ON, you will see that there are times when nothing is happening on the screen. This is because there are background measurements being made but not displayed.

This is exactly the same as when full 2-port correction is applied to an S-parameter. All four parameters are measured, then correction is applied, then all four measurements are updated. This occurs much faster when there is no external source. With a VMC measurement, there is no VC12 (reverse transmission measurement), so there are only three background measurements. With correction OFF, the traces are updated as the data is measured. You can see this taking place by creating the following measurements.

**Create S11 Input and S22 Output Match**

1. Press **M**EAS then [S11] and [S22] to add these measurements to the same channel.

2. While the source is sweeping, watch the source port indicator on the front of the PNA. First, the port 1 indicator will light for two sweeps, then the port 2 indicator will light for 1 sweep while all 3 traces update.

3. Press **CAL**, then [Correction OFF]. Notice that the relevant traces will update as the sweep is occurring.

The following image shows the corrected Conversion Loss (VC21), Input Match (S11), Output Match (S22) and the uncorrected Conversion Loss (VC21), which is a memory trace.

How to make an SMC Fixed Output Measurement

The following is a step-by-step example illustrating how to measure a 1-stage mixer in swept LO mode using FCA Scalar Mixer Calibration.

There are fewer components required for SMC as compared to VMC, and fewer measurement steps. You can now make relative phase measurements with SMC. Also, ONLY SMC (not VMC) can measure the reverse conversion loss of the mixer.

This procedure can also be used for making fixed LO measurements, which is quite similar. Although a second source is still required, when using an external source, the physical triggering cables between the PNA and External Source are not required.

Required Equipment

- PNA-X or PNA 'C' models
  - with option 083 (FCA) or option 082 (SMC)
  - with PNA Rev. A.09.33 or above.

Note: This example has been updated to show keystrokes for the FCA User Interface available with PNA Rev. A.09.33 and above.

- GPIB External Source. Not necessary when using PNA-X with Internal Second source.
- ECal module with connectors that match the Input and Output connectors of the DUT. You can use adapters to make the ECal module match the DUT connectors, but first perform an ECal user-characterization with the adapters attached. ECal makes the FCA calibration much easier.
- GPIB or USB power meter / sensor
- Cables and adapters

Note: This procedure refers to an External Source to control the LO. If using a PNA-X with an Internal second source, an external source is not necessary. Connect the LO directly to the second source output.

The example mixer

The example device is a down-converter mixer with the following characteristics:

- LO and Input Frequency Range: 2 GHz to 4.2 GHz
- Output Frequency Range: DC to 1.3 GHz

We will measure:

- Fwd Conversion Loss (SC21)
- Input Match (S11)
- Output Match (S22)
- Reverse Conversion Loss (SC12)

**SMC Setup**

Connect the devices as shown in the following diagram:

![Diagram of SMC Setup](image)

The DUT can be connected to any PNA ports. [Learn more.](#)

This procedure uses DUT input to PNA port 1 and output to PNA port 2.

This procedure refers to an External Source to control the LO. If using a PNA-X with an [Internal second source](#), an external source is not necessary. Connect the LO directly to the second source output (port 3 or port 4 on a PNA-X).

**Make Connections on the rear panels:**

1. If using a GPIB power meter, connect the power meter to the external source GPIB connector. If using a USB power meter, connect it to any unused USB port.

2. If using a PNA-X with an [Internal second source](#), the following three steps are not necessary. Connect the LO directly to the second source output.
3. Using a GPIB cable, connect the PNA GPIB controller port to the external source GPIB connector.

4. Using two BNC cables, connect the Source and PNA Trigger connectors as shown in the following image. This is not necessary when making fixed LO measurements.

5. Using a BNC cable, connect the PNA **10 MHz Reference Output** to the Ext. Source **10 MHz Reference Input**.

![Rear Panel Connectors](image)

**Create the Measurement**

**For this document:**

- Front-panel hardkeys are formatted as “Press **TRACE**”
- Front-panel softkeys are formatted as "Press [S11]"
- Menus are formatted as "Click **System**"

1. Connect the DUT.

2. On the PNA, press System, then [Configure], then [Power Meter Settings].

3. Under Interface, select **GPIB**, then enter the power meter address. Or select **USB**, then select the USB power meter that is connected to the PNA.

4. Press Preset to make sure you are starting with a known state.

5. Press Meas then [Measurement Class], then **Scalar Mixer/Converter**, then **OK**. At the **Confirm...** dialog, click **OK**. An S11 trace is created.

**Configure the Mixer settings**

1. Press Freq then **Input** to start the Mixer Setup dialog.
2. On the Mixer Frequency tab, enter the Mixer setup values as shown in the image below.

![Mixer Frequency Tab](image)

Notes:

- To provide quicker access to the Mixer Setup dialog, use the Setup softkey. [Learn how.](#)
- Rather then enter ALL of the frequency settings, you can enter the Input and the Output frequencies, then click **Calculate LO**.
- If **Input>LO** is NOT checked, the PNA assumes you want the Input < LO frequencies, and higher LO frequencies are calculated as a result.
- The LO power level setting specifies the power out of the external source; not at the DUT) unless an LO power cal is performed.
- When the settings are valid, the background color around the **Apply** button is available.

**Configure the LO Source**

1. On the Mixer Setup tab:

2. Change LO1 to either an internal PNA source or a pre-configured external source.

3. To configure an external source:
   
a. Click **Add Source** in the upper-right corner of the Mixer Setup dialog.
   
b. Complete the **External Source Configuration** dialog.
   
c. If there is a problem communicating with the source, the PNA will display an error. [See Problems?](#)
   
d. Click **OK** to return to the Mixer Setup dialog.
   
e. The new external source is now available as an LO1 selection.

4. Save the mixer settings in a file so you can recall them easily. Click **Save...**, then type a descriptive filename, such as “FixedOutputMixer”.

5. The trace should begin to sweep as the external source steps in frequency. It should look something like this:
Problems?

Not sweeping:

- On the PNA, press Trigger, then **Continuous** to start the PNA sweeping. Watch for error messages on the PNA and source.

Problems communicating with the source:

- Press System then **Configure** then External Source. On the Select Sources dialog, click Configure. Select your LO source. Click **Software CW trigger**, then close the dialog. Again, press Trigger, then **Continuous** to start the PNA sweeping. If this works, then something is wrong with **Hardware (BNC)**. Check the trigger cables on the rear panel.

- Can the PNA communicate with the power meter? If not, there is something wrong with the GPIB or USB communication.

- As a last resort, try rebooting the PNA. First, **save the entire setup to a .csa file**. When the PNA preset measurement appears, recall this .csa file and continue at this step.

If the source is sweeping, and the PNA Input is sweeping, but there is still no output.

- Check power levels at the LO and Input.

- Check the DUT by making a fixed LO measurement - much easier.

Tip: You can optionally calibrate the LO Power level at the DUT using a standard **Source Power Calibration**. Select the source port in the Source Power Cal dialog.

Perform an SMC calibration

1. Disconnect the DUT.

2. Connect the ECal module to a PNA USB port.
3. Press Cal, then [Start Cal], then [Cal Wizard]. Because the SC21 measurement is active, the Cal Wizard automatically begins an SMC calibration.

4. At the Calibration Setup dialog, click Next.

5. At the Select DUT Connectors and Cal Kits dialog, for DUT Port 1 select the connector type and gender of your DUT INPUT. For DUT Port 2 select the connector type and gender of your DUT OUTPUT. Then select ECal as the Cal Kit to use for each connector. Click Next.

6. At the Scalar Mixer Calibration Step 1 of 2 dialog, connect the power sensor to the Port 1 test cable, then click Measure. The data will be used to correct for input mismatch errors.

7. At the Scalar Mixer Calibration Step 2 of 2 dialog, connect the ECal module Port A to the Port 1 cable, and Port B to the Port 2 cable. Then click Measure. This portion of the calibration gathers the linear (non-frequency-translating) error terms of the test setup at the input and output frequencies.

8. At the Calibration completed dialog, you can choose to save the SMC calibration as a User Cal Set. Otherwise, click Finish to complete the SMC calibration. Correction is turned ON and applied to the SMC trace.

What is happening?
When an external source is sweeping, the measurements are much slower. When correction is ON, you will see that there are times when nothing is happening on the screen. This is because there are background measurements being made but not displayed.

This is exactly the same as when full 2-port correction is applied to an S-parameter. All four parameters are measured, then correction is applied, then all four measurements are updated. This occurs much faster when there is no external source. With correction OFF, the traces are updated as the data is measured. You can see this taking place by creating the following measurements.

Create S12 Upconverter, S11 Input and S22 Output Match

1. Press Meas then [S11], [SC12], and [S22] to add these measurements to the same channel.

2. While the source is sweeping, watch the source port indicator on the front of the PNA. First, the port 1 indicator will light for two sweeps, then the port 2 indicator will light for 2 sweeps. During the last sweep, all 4 traces update.

3. Press Cal, then [Correction OFF]. Notice that the relevant traces update as the sweep is occurring.

With the SC12 measurement you can see the reciprocity of the mixer.

Note: With the recent improvements to FCA, this step is MUCH easier than before. SMC forward and reverse measurements can now reside in the same channel and are calibrated automatically at the same time.
Last Modified:

- 4-Apr-2011  Updated for A.09.33
- 14-Apr-2010  Added N5230A/C and Opt 082
- 6-Apr-2009  Updated for PNA-X
- 5-May-2008  Modified for selectable ports
- 17-Apr-2008  Added 10 MHz ref image
Embedded LO Measurements

The Embedded LO feature allows you to make VMC, SMC, IMDx, IMx Spectrum, GCX, and NFX measurements of mixers that have a FIXED LO inside the DUT.

**Note:** This feature is available as Opt 084, and must be enabled.

Measurements of these devices are challenging for a couple of reasons:

1. The VMC measurement process requires the use of a reference mixer that has the same LO frequency as the DUT. A separate internal or external source must be used for the reference mixer LO. This LO must be controlled by the PNA. A PNA with an internal second source is much faster.

2. All Embedded LO measurements require the PNA receivers to be tuned to the correct frequency to measure the mixer output, which is highly dependent on the exact LO frequency.

How the PNA measures the embedded LO

The nominal frequency of the embedded LO is input into the Mixer Setup dialog. This is used as a starting point for the measurement.

Before each DUT measurement sweep, background sweeps are made to determine the frequency of the embedded LO to a configurable degree of accuracy.

Background sweeps...

- **Broadband** Sweep - rough measurement of the embedded LO frequency, made around a selectable data point over a selectable frequency span. The input signal to the DUT is tuned to a selectable CW frequency. The B receiver is swept across a selectable span around the anticipated output frequency. The difference between the frequency of the found signal and the desired output frequency is then applied as an adjustment.

- **Precise** Sweep The B receiver is measured at the selectable data point. Measurements of phase versus time are made, from which the exact offset frequency is computed, until either the tolerance value or maximum iterations are met.

- For VMC measurements, the reference mixer frequency is updated as the embedded LO frequency is determined.

How to measure a DUT with an Embedded LO

1. Create a VMC, SMC, IMDx, IMx Spectrum, GCX, or NFX measurement.

2. In the mixer setup dialog, enter the nominal frequency of the embedded LO as the LO frequency.

3. Perform a calibration as usual.

4. Launch and complete the Embedded LO Mode dialog box (below)

For VMC (FCA App) ONLY:
The LO source for the Reference Mixer can be either:

- An **Internal** source when using a **PNA-X that has two sources**.
- An **External** source:
  
  - Must be controlled by the PNA. [Learn how.](#)
  - Must be locked to the PNA using the **10 MHz reference**.

**During Calibration** - The LO source is shared between the Reference Mixer and the Calibration Mixer/Filter. This requires a splitter when using an external source, as shown in the following image.

**During the Measurement** - Only the Reference Mixer uses the LO source. Terminate the LO source port that is no longer used by the Calibration Mixer/Filter to ensure that the match seen by the Reference Mixer LO port does not change after the calibration, as shown in the following image. This precaution is not necessary when using the internal second source (ports 3 and 4) of the PNA-X.
For SMC, IMDx, IMxSpectrum, and NFX measurements:
No unique setup is required for embedded LO measurements.

How to Launch the Embedded LO Mode dialog box

Using front-panel HARDKEY [softkey] buttons

1. Not Available

Using a mouse with PNA Menus

1. Click Response
2. then Measure
3. then Embedded LO
The Tuning Settings balance LO measurement speed versus accuracy. You can see that accuracy is becoming compromised when noise starts to appear on the measurement trace.

Scroll up to learn more about the Embedded LO measurement process.

**Embedded LO Mode On** Check to enable measurement of the Embedded LO.

**Tuning Point** Select, or specify, the data point in the mixer sweep that will be used to find the embedded LO frequency. If a marker is enabled, that data point can be used. For broadband and Precise sweeps, choose a point in the mixer sweep where noise is least likely to be found. This is generally the center of a sweep or the center of a filter if used.

**LO Frequency Delta** The absolute difference between the measured embedded LO frequency and the LO setting that is entered in the Mixer Setup dialog. This value is updated each time the embedded LO frequency is measured. Entering a value is a way to change the LO frequency on the mixer setup without invalidating the calibration.

- **Reset** Set the LO Frequency Delta back to 0 Hz.
- **Find Now** The PNA finds and measures the actual LO frequency using the current dialog settings. This data is displayed in the Status box.

**Tuning Settings** These settings determine the amount of time spent versus the degree of accuracy to which the LO Frequency is measured. You can see that accuracy is becoming compromised when noise starts to appear on the measurement trace.

- **Reset** Set all Tuning Settings back to the defaults.
- **Broadband and Precise** Do the entire tuning process for each background sweep.
**Precise only**  Does NOT perform broadband tuning on each sweep. Use this setting when the embedded LO is stable.

**Disable tuning**  Only the previously measured LO Frequency Delta is applied to the reference mixer LO and PNA receivers.

**Sweep Span**  Narrowing the sweep span limits the number of data points that are measured in the broadband sweep and makes the measurement faster.

**Max Iterations**  The maximum number of Precise sweeps to make. When this number is reached, the final measurement is used.

**Tolerance**  When two consecutive Precise measurements are made within this value, the final measurement is used. If this is not achieved within the Max Iterations value, then the last measurement is used. This is the best of the ‘Tunings settings’ to change to improve accuracy.

**Tuning IFBW**  IF Bandwidth used for Broadband and Precise tuning sweeps. The larger the IFBW, the faster the sweep, but the signal may not be found.

**Tune every**  Set the interval at which tuning is performed before a measurement sweep. ‘Tune every 3 sweeps’ means that every third measurement sweep is preceded by tuning sweeps. If the embedded LO drifts, or if regularly changing DUTs, use ‘Tune every 1 sweep’.

**Status**  Allows textual and graphical representation of the Embedded LO measurement sweeps.

**Clear**  Removes the text information currently being displayed.

**Graph**  Launches the following graphical (spectrum analyzer type) display sweeps of the latest embedded LO measurement.
Embedded LO Diagnostic dialog box help

Presents a graphical (spectrum analyzer type) display of the latest embedded LO measurement. Click Previous and Next to view available Broadband and Precise sweeps. The LO Frequency is displayed in the Marker annotation.

SMC with a Booster Amp

If your mixer measurement requires more source power on the input than the PNA can provide, a booster amplifier can be used to provide the additional power. This topic describes how to configure and make a calibrated SMC measurement using a booster amplifier.

Connect

Connect the booster amplifier between the Source-Out and Coupler-Thru connectors on the front-panel as shown in the following diagram. Your PNA block diagram may not look like this.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>SOURCE OUT</td>
<td>h</td>
<td>RCVR B IN</td>
</tr>
<tr>
<td>b</td>
<td>RCVR R1 IN</td>
<td>i</td>
<td>CPLR ARM</td>
</tr>
<tr>
<td>c</td>
<td>SOURCE OUT</td>
<td>j</td>

</tr>
</tbody>
</table>

Measurement and Calibration Setup

In the following procedure:
Test Port power is the power level out of the source.

Corrected power is the power level you require at the mixer input and output.

This procedure assumes you will apply stimulus power to the mixer input to make SC11 and SC21 measurements, and to the output of the mixer to make SC22 and SC12 measurements.

1. Determine the gain of the booster amplifier. If the gain has significant slope across the input and output range of the mixer, see Booster Amp with a Gain Slope.

2. Determine the corrected power for both the input (port 1) and output (port 2) of the mixer.

3. Calculate the Test Port power for both ports by subtracting the gain of the amplifier from both the input and output corrected power levels.

For example, the following values assume a 25 dB booster amp on port 1 as in the diagram above.

<table>
<thead>
<tr>
<th>Corrected Power</th>
<th>Amp Gain</th>
<th>Test Port Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port 1 (input)</td>
<td>0 dBm</td>
<td>- 25 dB</td>
</tr>
<tr>
<td>Port 2 (output)</td>
<td>-20 dBm</td>
<td>- 25 dB</td>
</tr>
</tbody>
</table>

4. On the PNA Power dialog, clear the Port Power Coupled checkbox, which allows different power levels for each port.

5. Enter the calculated Test Port Power values for each port.

6. During the SMC Cal Wizard Select DUT Connectors and Cal Kits dialog, click View/Modify Source Cal Settings to invoke the Source Calibration Settings dialog.

7. In Power Offset, enter the booster amplifier gain.

Booster Amp with a Gain Slope

SMC calibration takes place over the entire input and output range of the mixer. Therefore, the booster amplifier will also be subjected to the entire input and output frequency range of the mixer.

To compensate for a gain slope, you might have to experiment with the source attenuator setting, power-offset value, and initial power value to get a combination that will not cause the PNA source to go unleveled during or after the cal.

For example, assume the booster amp gain is 30 dB at the low end, and 20 dB at the high end. If you enter 30 dB for the power offset value, the PNA might run out of ALC range when the actual gain drops to 20 dB. The PNA will try to increase its source power to account for the 10 dB gain drop. Therefore, pick a power offset value that is in the middle of the amplifier gain band (25 dB).

If possible, select a PNA attenuator setting that puts the ALC approximately in the middle of its range at the desired corrected power with the mid-band gain. This condition means the ALC can set the power higher and lower to account for the gain slope, without unleveling.
If the gain slope is too large, then there may not be a setting that prevents a source unlevel. In this case, a flatter booster amp must be used.

Frequency Offset Mode

Frequency Offset Mode (FOM) provides the capability to have the PNA Sources tune to frequencies that are different (offset) from the PNA Receivers.

PNA Option 080 provides you with the hardware and basic software capability to make Frequency Offset Measurements. This topic discusses the PNA settings that are relevant to making these types of measurements. See Frequency Converting Device Measurements for more information on making specific device measurements.

- Frequency Offset Dialog Box

Frequency Offset dialog box help
The following are major changes to FOM:

- Stimulus and Response are now called Sources and Receivers.
- Sources and Receivers settings can be made in two ways:
  1. By **Coupling** to the Primary (Channel) settings. This is the only method used in previous releases.
  2. By **Uncoupling** and setting Sources and Receivers values independently. This is the new, simplified method.

- External sources appear here and can be controlled from this dialog. Learn more.

**Note:** Source2 supplies power for ports 3 and 4. **Turn Source2 power ON** using the Power and Attenuators dialog. This (Frequency Offset) is the only dialog for controlling the frequency of Source 2. Learn more about Source2.

**Frequency Offset (ON/OFF)** Enables Frequency Offset Mode on ALL measurements that are present in the active channel.

When FOM is NOT enabled, all frequencies are the same as the active channel.

**Tip:** First make other settings on this dialog box, then click **Frequency Offset** ON.

**Primary** The current Active Channel settings. When a Source or Receiver is coupled to the Primary settings, its Sweep Type is the same as that of the Primary. The frequency settings of the coupled range are mathematically derived from the Primary settings using the Multiplier, Divisor, and Offset values. With this approach, only the Primary settings need to be changed in order to affect change in the coupled Sources and Receivers. Changes to the Primary channel settings occur when Frequency Offset is checked ON. **See example using Primary and Coupled setting.**

**Tip:** Primary settings are ONLY used when Sources and Receivers are Coupled. It is often easier to Uncouple, then set Sources and Receivers independently.

Source and Source2 if available. Learn more about Internal Second Source.

**Receivers** All receivers that are used in the channel, including Reference receivers, are tuned to the specified frequency settings.

**Mode**

- **Coupled** Source and Receiver settings are mathematically derived from the Primary settings using Multiplier, Divisor, and Offset values. Learn more.
- **Uncoupled** Source and Receiver settings are entered independently, without reference to Primary settings. When Uncoupled, Source and Receiver Ranges can use separate sweep types.

**Sweep Type** Click to change the type of sweep for each range. Only available for Primary and Uncoupled Sources and Receivers.
Unsupported Sweep Type combinations

- Power Sweep and Segment Sweep can NOT be used together.
- Uncoupled Log Sweep yields invalid data whenever the sources are offset from the receivers.
- Coupled Log Sweep is allowed only for the following two conditions:
  1. The offset = 0, the multiplier = 1, and the divisor = 1.
  2. The multiplier = 0

Settings  To change settings, click in the appropriate Settings cell, then click Edit.

- If coupled, invokes the Coupled dialog.
- If uncoupled or Primary invokes the Uncoupled settings dialog.

X-Axis  Select the settings to be displayed on the X-Axis.

X-Axis Point Spacing  Only available when a Segment Sweep Type is selected as the X-Axis display. Learn more.

Note:  When Frequency Offset is enabled, ALL receivers on the channel, including the reference receivers, tune to the new offset frequencies. Therefore the source and reference receiver will be at different frequencies. Therefore, FOM measurements that include a reference receiver, which includes all S-parameters, display invalid data.

To measure and display measurements at both the source and receiver frequencies, you must use two channels. Use Equation Editor to calculate the conversion loss. See a calibrated FOM conversion loss example.

Learn how to calibrate frequency offset measurements.
Coupled settings dialog box help

Coupled Formulas:

Range Start = \[\text{Primary Start} \times (\text{Multiplier} / \text{Divisor})\] + Offset
Range Stop = \[\text{Primary Stop} \times (\text{Multiplier} / \text{Divisor})\] + Offset

Where:

Offset  Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency. Range is +/- 1000 GHz. Offsets can be positive or negative.

Multiplier  Specifies (along with the divisor) the value to multiply by the stimulus. Range is +/- 1000.

- Negative multipliers cause the stimulus to sweep in decreasing direction. For downconverter mixer measurements, this would be for setups requiring the Input frequency to be less than LO frequency. See an example.
- 0 (zero) as the multiplier nulls the Primary setting. Then the Offset value adds to zero.

Divisor  Specifies (along with the multiplier) the value to multiply the stimulus. Range is 1 to 1000.

Primary (Linear Frequency)

Primary and Uncoupled settings dialog box help

This dialog will vary depending on the sweep type:

Linear and Log frequency

Uncoupled Log sweep yields invalid data whenever the sources are offset from the receivers.

Select Start/Stop or Center/Span

Frequency  Enter values

Points  (Primary only) Enter number of data points for the sweep.

Power

CW Freq  Enter frequency in Hz.
Points  (Primary only) Enter number of data points for the power sweep.
**CW Time**
- **CW Freq**  Enter frequency in Hz.
- **Sweep Time**  Enter time to complete one sweep. Enter 0 for the fastest sweep.

**Segment Sweep**  Edits are made exactly like the standard segment table.

**For Advanced Users:** Uncoupled Segment Sweep offers great flexibility in configuring measurements. In segment sweep mode:

- The **OK** button is NOT available until the total number of data points for all segments matches the number of Primary data points.
- **Independent IF Bandwidth** and **Independent Sweep Time** are available ONLY on the Primary (channel) and the Uncoupled **Receivers** - NOT Sources.
- **Independent Power** is available ONLY on the Primary (channel) and the Uncoupled **Sources** - NOT Receivers.

**Setup Examples**

Although the Frequency Offset settings can be used with many types of devices, these examples include mixer terminology.

See a Mixer Compression and Phase (AM-PM) Measurement using FOM.

See a calibrated FOM conversion loss example.

1. **Fixed LO - Upconverter**

- **Swept Stimulus (Mixer Input):** 1000 MHz - 1200 MHz
- **Fixed LO:** 1500
- **Swept Response (Mixer Output):** 2500 MHz to 2700 MHz

Make the following settings on the FOM dialog

**Source:** Uncoupled
- **Sweep Type:** Linear
- Click Settings, then Edit. In the Source dialog:
  - Start Frequency = 1000 MHz
  - Stop Frequency = 1200 MHz

**Receiver:** Uncoupled
- **Sweep Type:** Linear
- Click Settings, then Edit. In the Receiver dialog:
  - Start Frequency = 2500 MHz
  - Stop Frequency = 2700 MHz
LO Settings
Set external source to CW - 1500 MHz.

Source2: Uncoupled (Only with Second PNA Internal Source)
- Sweep Type: CW Time
- Click Settings, then Edit. In the Source2 dialog:
  - CW Frequency = 1500 MHz

2. Fixed LO - Downconverter (Input < LO)

- Swept DECREASING Stimulus (Mixer Input): 1100 MHz to 1000 MHz
- Fixed LO: 2500 MHz
- Swept INCREASING Response (Mixer Output) 1400 MHz to 1500 MHz

Make the following settings on the FOM dialog
- **Primary**: Not used
- **Source** (Input): Uncoupled
  - Sweep Type: Linear
  - Click Settings, then Edit. In the Source dialog:
    - Start Frequency = 1100 MHz
    - Stop Frequency = 1000 MHz
- **Receiver** (Output): Uncoupled
  - Sweep Type: Linear
  - Click Settings, then Edit. In the Receiver dialog:
    - Start Frequency = 1400 MHz
    - Stop Frequency = 1500 MHz

LO Settings
Set external source to CW - 2500 MHz.

Source2: Uncoupled (Only with Second PNA Internal Source)
- Sweep Type: CW Time
- Click Settings, then Edit. In the Source2 dialog:
  - CW Frequency = 2500 MHz

3. Swept LO - Fixed Output - Upconverter

Swept External LO measurements in Frequency Offset Mode can be very difficult. The external LO source must be synchronized with the swept output or input (as in this case). See Synchronizing and External Source Control to see how this is done. The Frequency Converter Application Opt 083 performs makes these measurements easily.
- **Swept Stimulus (Mixer Input)**: 1000 MHz to 1100 MHz
- **Swept LO**: 1500 MHz to 1400 MHz
- **Fixed Response (Mixer Output)**: 2500 MHz

Make the following settings on the FOM dialog

**Source**: Uncoupled
- Sweep Type: Linear
- Click Settings, then Edit. In the Source dialog:
  - Start Frequency = 1000 MHz
  - Stop Frequency = 1100 MHz

**Receiver**: Uncoupled
- Sweep Type: CW Time
- Click Settings, then Edit. In the Receiver dialog:
  - CW Frequency = 2500 MHz

**LO Settings**

- If using external source, set to sweep from 1500 - 1400 MHz.
- If using **Source2 (Second Internal Source)**: set to Uncoupled, then:
  - Sweep Type: Linear
  - Click Settings, then Edit. In the Source2 dialog:
  - Start Frequency = 1500 MHz
  - Stop Frequency = 1400 MHz

---

**4. Power Sweep for Mixers**

To measure the gain compression of a mixer, the input power to the mixer is swept. The input and output frequencies are fixed but offset from one another.

This is a good use of Coupled settings because the same compression test can be performed at several different frequencies. With coupled Source and Receiver ranges, the Primary (channel) frequency can be easily changed from the front panel. The coupled source and receiver frequencies will update accordingly.

- **Swept Input Power**: -10 dBm to 0 dBm
- **Fixed Input Frequency**: 1500 MHz
- **Fixed LO**: 500 MHz
- **Fixed Output**: 2000 MHz

Make the following settings on the FOM dialog
Primary:
Sweep Type: Power Sweep
Click Settings, then Edit. In the Primary dialog:
CW Frequency = 1500 MHz

Source: Coupled
Default settings make CW Frequency: 1500 MHz (same as Primary)

Receiver: Coupled
Default settings make Sweep Type: CW Time
Click Settings, then Edit. In the Receiver dialog:
Offset = 500 MHz

LO Settings

- If using external source, set to CW: 500 MHz.
- If using Source2 (Internal Second Source), set to Coupled, then:
  Sweep Type: Power Sweep
  Click Settings, then Edit. In the Source2 dialog:
  CW Frequency = 500 MHz

---

Test Set Reference Switch

PNA models with option 081 and all PNA-X models have a switch in the test set that allows you to bypass the port 1 reference receiver through the front panel Reference 1 connectors. This switch lets you easily switch between standard S-Parameter measurements and measurements using a reference mixer. You could use this feature to make standard S11 measurements and converter transmission measurements relative to a reference ("golden") mixer.

Note: The Frequency Converter Application Option 083 simplifies the task of making extremely accurate phase measurements on MOST frequency converting devices.
How to access the Test Set dialog box

Using front-panel HARDKEY [softkey] buttons

1. Press TRACE/CHAN
2. then [Channel]
3. then [Hardware Setup]
4. then [Path Config]

PNA Menu using a mouse

1. Click Channel
2. then Hardware Setup
3. then Path Config

Test Set dialog box help

Note: This feature is available on PNA 'C' models with Option 081 (external reference switch) and all PNA-X models.

R1 Input Path

Internal: bypass R1 Loop  Connects the port 1 source directly to the R1 receiver.

External: flow through R1 Loop  Allows direct access to the R1 receiver through the Reference 1 front-panel connectors.

See specifications which include a block diagram of reference switch.

Frequency Converting Device Measurements

Many frequency offset measurements can be made using the PNA with option 080. The following is a list of some of those measurements and how they are made.

- Conversion Loss
- Conversion Compression
- Return Loss and VSWR
- Isolation
- Harmonic Distortion

See Also: Frequency Offset Measurement Accuracy
Frequency Offset Measurement Accuracy

This topic discuss methods that can be used to make accurate frequency offset measurements.

- **Calibrations**
- **Mismatch Errors**
- **Accurate and Stable LO**

<table>
<thead>
<tr>
<th>See other Mixer Measurement topics</th>
</tr>
</thead>
</table>

**Calibrations**

With Frequency Offset measurements, the stimulus and response frequencies are different. Standard calibration error terms are calculated using reference measurements. Therefore, traditional calibration methods such as full 2-port SOLT cannot be used with frequency offset.

*Source and Receiver Power calibrations* can be used to calibrate your Frequency Offset measurements.

*Frequency Converter Application* (option 083) offers fully calibrated scalar and vector frequency offset measurements.

**Source Power calibration:**

- Sets accurate power level at stimulus frequencies regardless of the receiver that will be used in the measurement.
- Can be copied to other channels with copy channels feature.
- Can be interpolated.

**Receiver Power Cal:**

- Requires a source cal to have already been performed and applied.
- Cannot be copied to other channels.

**Therefore:**

- Start by performing a source power cal over the combined stimulus and response frequencies.
- **Copy the channel** to other needed channels and the source power cal is copied.
- Change the frequency range of the copied channel to response frequencies.
- Perform a receiver cal at the response frequencies on individual channels.
- Change the frequency range to stimulus frequency and switch frequency offset ON.
- On Status Bar, ensure that source and receiver cals are ON (source cal will be interpolated).

See Frequency Offset Conversion Loss Measurements to see a step-by-step example.

Mismatch Errors
Mismatch errors result when there is a connection between two ports that have different impedances. With S-parameter measurements, these mismatches are measured and mathematically removed during a full 2-port calibration. This is much more difficult with frequency offset measurements. A much easier solution is to use high-quality attenuators on the input and output of the mixer.

By adding a high-quality attenuator to a port, the effective port match can be improved by up to twice the value of the attenuation. For example, a 10-dB attenuator, with a port match of 32 dB, can transform an original port match of 10 dB into an effective match of 25 dB. However, as the match of the attenuator approaches the match of the original source, the improvement diminishes.

**Note:** The Frequency Converter Application (option 083) uses calibration techniques that correct for mismatch errors.

The larger the attenuation, the more nearly the resulting match approaches that of the attenuator, as shown in the following graphic. However, excessive attenuation is not desired because that will decrease the dynamic range of the measurement system.

Accurate and Stable LO
When using frequency offset mode, if the LO signal is not accurate and stable, the output signal will not be at the expected response frequency. As a result, the output signal can fall on the skirts of the PNA receiver IF filter, or fall completely outside of the receiver filter passband.

Also, the LO power level is critical in mixer measurements. Be sure to monitor these power levels closely.
Conversion Loss (or Gain)

- What is Conversion Loss?
- Why Measure Conversion Loss?
- How to Measure Conversion Loss

**What is Conversion Loss?**
Conversion loss is defined as the ratio of the power at the output frequency to the power at the input frequency with a given LO (local oscillator) power. This is illustrated in the graphic below. A specified LO power is necessary because conversion loss varies with the level of the LO, as the impedance of the mixer diode changes.

![Conversion Loss Diagram](image)

**Why Measure Conversion Loss?**
Conversion loss (or gain in the case of many converters and tuners) is a measure of how efficiently a mixer converts energy from the input frequency to the output frequency. If the conversion loss response of a mixer or converter is not flat over the frequency span of intended operation, valuable information may be lost from the resulting output signal.

**How to Measure Conversion Loss**
Conversion loss is a transmission measurement. It is measured by applying an input signal (stimulus) and an LO signal at specific known power levels, and measuring the resulting output signal level. Because the output frequency is different from the input frequency, frequency offset mode (option 080) must be used for this measurement.
Note: This measurement is made much easier if your PNA has the Frequency Converter Application.

Equipment Setup

Example: A calibrated Conversion Loss (Down-converter) measurement

Swept Input with Fixed LO = Swept Output

- RF Input: 3.1 - 3.3 GHz
- LO: 2.2 GHz
- IF Output: 900 - 1100 MHz

PNA setup and calibrate on channel 1

1. On channel 1 create an unratioed R measurement over the ENTIRE input and output frequency span (.9 - 3.3 GHz). This will be the base source power cal that will be copied to the R and B channel measurements.
2. Perform a source calibration using a power meter. This makes the power level at the input of the mixer very accurate.

Setup Reference measurement on channel 2

1. Copy channel 1 to channel 2 which will display the reference input to the mixer. The channel 1 source power cal is copied with the other channel settings.
2. Change measurement to R1 unratioed.
3. Change RF Input frequency to 3.1 - 3.3 GHz. The source power cal becomes interpolated.
4. Perform receiver power cal. Do not need to make physical connections. The PNA source is internally connected to the R1 receiver. Makes the R receiver read the source power level.
**Setup B measurement on channel 3**

1. Copy channel 1 to channel 3. This channel will display the output of the mixer. The channel 1 source power cal is copied with the other channel settings.

2. Change measurement to B unratioed.

3. Change IF Output frequency to .9 - 1.1 GHz. This causes the source power cal becomes interpolated.

4. Connect thru line from port 1 to port 2.

5. Perform receiver power cal. This makes the B receiver read the source power at the IF Output frequencies.

6. **Turn OFF receiver power cal.** This prevents an error when changing to input frequencies (next step).

7. Change RF Input frequency to 3.1 - 3.3 GHz. This changes the channel back to the mixer RF Input frequencies.

8. **Enable Frequency Offset.**

9. Change Offset to (-2.2 GHz). This tunes the B receiver to the IF Output frequencies .9 to 1.1 GHz. **Note:** The minus sign indicates a down-converter measurement.

10. Turn ON receiver power cal.

**Measure the Mixer**

1. Connect the mixer.

2. Adjust **scale** to suit your needs.

3. Enable **markers** to read power levels for each trace.

The display below shows:

- Ch3 B receiver (bottom trace) absolute output power.

- Ch2 R1 receiver measurement (top trace) absolute input power to the mixer.

With this method, the conversion loss math (B/R1) can be performed with **Equation Editor** (not shown). The B/R1 ratio measurement is not supported with receiver power Cal turned on. However, conversion loss (C21) measurements can be made directly and are much easier using the Frequency Converter Application, FCA (Opt 083).
**Conversion Compression**

- What is Conversion Compression?
- Why Measure Conversion Compression?
- How to Measure Conversion Compression
- Measurement Accuracy Considerations

---

**What is Conversion Compression?**

Conversion compression is a measure of the maximum input signal level for which a mixer will produce linear operation. It is very similar to the gain compression experienced in amplifiers.

To understand conversion compression, you must first understand conversion loss. This is the ratio of the mixer output level to the mixer input level. This value remains constant over a specified input power range. When the input power level exceeds a certain maximum level, the constant ratio between input and output power levels begins to change. The point at which the ratio has decreased 1 dB is called the 1-dB compression point. This is illustrated in the graphic below.

![Diagram of IF Conversion Loss Ratio (dB) vs. Input Signal RF showing 1 dB compression point and ratioing shows compression point.]

**Why Measure Conversion Compression?**

Conversion compression is an indicator of the dynamic range of a device. Dynamic range is generally defined as the difference between the noise floor and the 1-dB compression point.

**How to Measure Conversion Compression**

The equipment and setup used to measure conversion compression are essentially the same as for measuring...
conversion loss and is illustrated in the following graphic.

The PNA performs a power sweep using frequency-offset mode and the resulting display shows the mixer's output power as a function of its input power. The 1-dB compression point (or others such as 3-dB) can be determined using markers.

---

**Measurement Accuracy Considerations**

**Equipment Setup Considerations**

- The couplers in the PNA have very good directivity. If the return loss of the DUT is bad, the reflected signal gets sampled by the PNA and can result in errors. This relates to error in DUT gain. To increase the accuracy, an attenuator can be added between the PNA's source port and the DUT's input port. Normally a 6- to 10-dB attenuator is sufficient. Addition of this attenuator, however, decreases the available drive to the DUT.

- With high drive levels the PNA can be driven into compression resulting in measurement error. With excessive drive levels, the PNA can be damaged. Add an attenuator between the output of the DUT and the receiver input of the PNA to avoid these problems.

**Calibration Considerations**

- Source power calibration can be used to provide a high level of accuracy for this measurement.
Isolation Measurements of Frequency Converting Devices

- What is Isolation?
- Why Measure Isolation?
- How to Measure Isolation

See other Frequency Converting Device Measurements

What is Isolation?
Isolation is a measure of the leakage, or feedthrough, from one port to another. The more isolation a mixer provides, the lower the amount of feedthrough. Isolation is measured at the same frequency as the stimulus, not the converted or shifted frequency. Therefore, Frequency Offset capability is not necessary for these measurements.

Three main isolation terms are of interest for mixer measurements:

- LO-to-OUT isolation ($V_{LO}$)
- LO-to-IN isolation ($V_{LO}$)
- IN-to-OUT feedthrough ($V_{IN}$)

Why Measure Isolation?
Any unwanted signal "leaking" through the device will mix with the desired output signal creating intermodulation products, adding to intermodulation distortion. These unwanted signals may be difficult to filter out.

How to Measure Isolation
Use the following setups to measure the isolation of a mixer:
Note the following:

- The Input to Output isolation is very dependent on the LO power level. Isolation should be measured with the LO power at its normal operating level.

- Each of the ports not being tested should be terminated with an impedance typical of actual operation. This may not always be the characteristic impedance, Z₀ (usually 50 or 75 ohms). For example, if the OUT port of a mixer is intended to be directly connected to a filter, then this filter should be used when measuring the LO-to-IN feedthrough.
Measuring Converters vs. Mixers

Measuring IN-to-OUT feedthrough of a converter is identical to that of a mixer. The IN-to-OUT feedthrough is generally very small for a converter due to the inclusion of an IF filter in the device. Because of this, the measurement may require the PNA to have increased *dynamic range*.

Measuring LO leakage (LO-to-OUT and LO-to-IN) of a converter requires a different technique because the LO port is typically not accessible:

- The PNA can be tuned to the frequency of the LO signal and either the OUT or IN port connected to the PNA receiver port. The PNA source port is not connected.

- A spectrum analyzer can be connected to either the OUT or IN port and tuned to the frequency of the LO signal.
Harmonic Distortion

- What is Harmonic Distortion?
- Why Measure Harmonic Distortion?
- How to Measure Harmonic Distortion
- Measurement and Accuracy Considerations

What is Harmonic Distortion?

Harmonics are multiples of any signal appearing at the mixer input and also multiples of the LO input. The distortion of the mixer's output characteristics caused by these harmonics is referred to as harmonic distortion. Harmonic distortion is caused by non-linearities in the device.

Harmonics are NOT signals created by two or more signals interacting (mixing); these signals are known as intermodulation products, which result in intermodulation distortion.

Why Measure Harmonic Distortion?

- It can degrade the performance of devices connected to the output of the mixer.
- The harmonics can also mix with other signals present in the mixer, adding to the intermodulation distortion of the mixer.

How to measure Harmonic Distortion

The harmonics can be measured using the PNA with Frequency Offset (option 80). The frequency of the LO to the mixer is set to zero and multiplier of the RF input is used to set the IF frequency (the harmonic). The equipment setup is shown below.

Since harmonics are specified in dBc, the fundamental RF and both the second and third harmonics are measured and the differences calculated. Multiple channels can be used to do this.

1. Connect the equipment.
2. Setup the measurement for calibration. See also Measurement and Accuracy Considerations.

   Use three channels and frequency offset mode:
   - Channel 1 = F1 to F2
   - Channel 2 = F1 to 2F2 (frequency offset mode, multiplier = 1)
   - Channel 3 = F1 to 3F2 (frequency offset mode, multiplier = 1)
Perform a source power calibration and receiver power calibration over the entire frequency range. See Measurement and Accuracy Considerations.

- Reduce the frequency span and increase the frequency offset multiplier on Channels 2 and 3:
  - Channel 2 = F1 to F2 (frequency offset mode, multiplier = 2)
  - Channel 3 = F1 to F2 (frequency offset mode, multiplier = 3)
  **Note:** Because the frequency span has been changed from that used for calibration, the source and receiver calibrations will be interpolated.

- Connect the DUT, make the measurement, and calculate the harmonic response:
  - Set up markers on Channels 1, 2 and 3, and determine the difference between the marker values to get the dBc value of each harmonic.
    - Channel 1 - Channel 2 = 2nd harmonic (dBc)
    - Channel 1 - Channel 3 = 3rd harmonic (dBc)
  **Note:** Be sure to set the markers to the appropriate stimulus. Channel 2 markers should be set to twice the frequency of Channel 1 markers. Channel 3 markers should be set to three times the frequency of Channel 1 markers.

**Measurement and Accuracy Considerations**

**Equipment Setup Considerations**

- A filter must be used at the input of the mixer to remove the PNA source harmonics.
Return Loss and VSWR

- What are Return Loss and VSWR?
- Why Measure Return Loss and VSWR?
- How to Measure Return Loss and VSWR

See other Frequency Converting Device Measurements

What is Return Loss and VSWR?

Return loss and VSWR are both linear reflection measurements, even when testing frequency conversion devices, because the reflected frequency is not converted. These measurements are essentially the same as for filters and amplifiers. Learn more about Reflection Measurements.

Why Measure Return Loss and VSWR?

Devices which have poor return loss and VSWR result in loss of signal power or degradation of signal information.

How to Measure Return Loss and VSWR

Setup the PNA measure return loss and VSWR as you would any two-port device. Connect your frequency converting device as shown in the following diagrams:

RETURN LOSS AND VSWR OF MIXER INPUT PORT

RETURN LOSS AND VSWR OF MIXER OUTPUT PORT
RETURN LOSS AND VSWR OF MIXER LO PORT
**FIFO (Opt 118) and other Antenna Features**

The following features, used with the PNA-X models and the N5264A, were designed specifically for Antenna applications.

- **Fast Sweep Features (Opt 118)**
  - FIFO Buffer and Fast CW
  - FIFO Buffer and Fast Groups
  - FIFO Buffer and Fast Segments

- **Other Useful Antenna Features**
  - Point Averaging
  - Point Sweep
  - Trace Triggering

- **See Also**
  - N5264A
  - Pulsed Measurements
  - Frequency (Security) Blanking
  - External Triggering

---

**Fast Sweep Features (Opt 118)**

The following features allow you to **very quickly** measure and download data to a remote computer.

- **Fast CW, Fast Groups**, and **Fast CW Segments** all work ONLY with the FIFO Data Buffer.

- These features can be used ONLY with **SCPI or COM commands**. COM is faster than SCPI when using **DataInCompactForm**. Otherwise, SCPI is faster than COM.

- These features are all demonstrated in the following example program:

  Download and install the **FIFO Tester** - a C# program that uses either the COM or SCPI interface to download data to, and read data from, the FIFO buffer. Source code is also provided. See [http://na.tm.agilent.com/pna/apps/applications.htm](http://na.tm.agilent.com/pna/apps/applications.htm)
The FIFO Data Buffer

The FIFO (First-IN, First-OUT) data buffer is a circular buffer that allows very fast Read-Write access.

- When enabled, all the data gathered is placed into a 4 GB FIFO buffer.
- You can write to, and simultaneously read from, the FIFO buffer.
- A maximum of 1 million data points can be read for each query.
- REAL / IMAGINARY pairs is the ONLY supported format for the FIFO buffer.
- A preset or instrument state recall will turn off the FIFO buffer collection.
- When more than one measurement is present, data from each measurement is stored in the FIFO buffer in the following order. These measurements are separated into lines for easier reading.
  - R, A, B, C, D,
  - R/R, A/R, B/R, C/R, D/R,
  - R/A, A/A, B/A, C/A, D/A,
  - R/B, A/B, B/B, C/B, D/B,
  - R/C, A/C, B/C, C/C, D/C,
  - R/D, A/D, B/D, C/D, D/D

Fast CW

In Fast CW mode the PNA display is not updated. There is no background computation or other ‘interference’ from the PNA computer. Therefore, data is acquired real-time.

The following requirements must be met before sending the Fast CW command.

- FIFO is ON
- A single channel is being measured. Other channels can be in Hold.
- All measurements are acquired in a single sweep.

**IMPORTANT - Fast CW and IF Bandwidth setting**

- IF Bandwidth of **10 kHz and lower** - Data is transferred immediately to the FIFO after every acquisition.
- IF Bandwidths **greater than 10 kHz** - Data is transferred to the FIFO in groups. A triggered acquisition is NOT placed into the FIFO buffer until either the total number of points is completed, or an intermediate group of points is finished. The number of points within a group differs for each IF Bandwidth setting.

Notes:
• See example programs in SCPI and COM.
• Fast CW sets the number of data points, overwriting the standard channel setting.
• When exiting Fast CW, the FIFO data buffer is cleared.
• External trigger signals are allowed only through the rear-panel Trig In connector - NOT the Aux1 and Aux2 In connectors.
• An error message appears if triggering is sent to the PNA faster than it can respond.

**Fast Groups with FIFO Data Buffer**

With this speed optimization feature, interaction with Windows or other PNA 'overhead' calls are suspended, allowing very fast and predictable measurement timing.

Fast Groups is automatically enabled when the following **requirements** are met:

• FIFO is ON
• A single channel is being measured. Other channels can be in Hold.
• All measurements are acquired in a single sweep.
• Group trigger is enabled with count > 1.

**Notes:**

• Fast CW can **NOT** be used with Fast Groups.
• Fast Groups and Fast CW Segments were designed to be used together, but not required.
• The FIFO Tester example program demonstrates this feature.

**Fast CW Segments with FIFO Buffer**

In this optimization feature, each CW segment (where the start and stop frequency is identical) within a channel is measured at speeds as fast as the Fast CW mode sweep.

Fast CW Segments is automatically enabled when the following **requirements** are met:

• FIFO is ON
• Start and stop frequency of a segment is identical.
• External trigger signals are allowed only through the rear-panel Trig In connector - NOT the Aux1 and Aux2 In connectors.

**Notes:**

• Fast CW can **NOT** be used with Fast CW Segments.
• The sweep can include non-CW segments, but these are not acquired in Fast mode.
Fast Groups and Fast CW Segments were designed to be used together, but not required.

The FIFO Tester example program demonstrates this feature.

In Fast CW Segments, when data is not being acquired in real-time, the following message appears: 
**Caution: Sweep time jitter. Try reducing the number of segments.** To avoid this error, reduce the number of segments in the channel.

### Other Antenna Features

**Point Averaging**

This feature is selected on the Average dialog.

When selected, each data point is measured the specified number of averages before stepping to the next data point. When point trigger is selected, only one trigger is required for each data point regardless of the number of averages.

**Point Sweep**

This feature is selected on the Sweep Setup dialog.

In Point Sweep mode, the PNA measures both the forward and reverse parameters at each frequency point before stepping to the next frequency. The display trace is updated as each data point is measured. Point sweep is the same as stepped sweep mode of the 8510 and 8530.

**Trace Triggering**

This feature is selected under Trigger Mode on the Trigger dialog.

Available ONLY when Point Sweep is selected. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.

Trace triggering is NOT permitted when a channel is using a 2 port (or more) S-Parameter calibration.

### Other Useful Antenna Features

- Many compression parameters to choose from, including gain, input power at compression, output power at compression, input match, and compression level.
- Several compression methods to choose from, including deviation from linear gain, deviation from max gain, back-off, and X/Y, and compression from saturation.
- Three acquisition methods to choose from: Power per Freq, Freq per Power, and SMART Sweep
- SMARTCal Calibration Wizard to guide you through Full 2-Port or Enhanced Response calibration, plus Source Power calibration.
- Compression Analysis allows traditional power sweep view at a selected frequency.
- Receiver Leveling provides continuous source power accuracy.
- Supports Wideband and Narrowband Pulse measurements using the new integrated Pulse setup dialogs.

Requirements

- PNA-X or N522x with Opt 086 (software option only) must be enabled.
- When performing an optional calibration:
  - ECal module or Calibration Kit
  - Power meter/sensor

Limitations with GCA

- Number of points limited to 20,001 for two-dimensional acquisitions, 10,000 points for SMART Sweep.
- Standard CW power sweep is NOT supported in a Gain Compression channel.
- No Independent IFBW, Independent power levels in segment table.
- Stepped sweep mode only.
- Linear, Log, and Segment frequency sweep modes only.

The following PNA Features are NOT Available in a Gain Compression channel:

- Unratioed receiver measurements (A, B, R)
- ECal User Characterization
- Some Fixturing Features
• FOM or FCA
• External Test Set Control (Option 551)
• Interface Control
• IF Path Configuration
• Time Domain
• Balanced measurements
• Point and Sweep trigger
• Save Auto Formatted Citifile data.

Gain Compression Application Concepts

What is Gain Compression
An amplifier has a region of linear gain, where the gain is independent of the input power level. This gain is commonly referred to as small signal gain. As the input power is increased to a level that causes the amplifier to approach saturation, the gain will decrease. The 1 dB gain compression is defined as the input power level that causes amplifier gain to drop 1 dB relative to the linear gain.

You can quickly measure the gain compression using a compression marker on a power sweep trace.

Terms used in GCA

Linear Power Level The specified input power that yields linear gain (also known as 'small-signal gain') in the amplifier.

Reference gain The measured gain that is used as a reference for determining compression level. The Compression Method that is used could cause this value to be different.

Compression level The specified amount of gain reduction from the reference gain.

Target gain The gain at the specified compression level. Although this term does not appear in GCA, it is important to understand when discussing the various compression parameters.

For example, when using Compression from Linear Gain method with the following settings:

• Linear gain (measured at Linear Input power) = 10.2 dB
• Compression level (specified) = 1 dB
• Target gain = 9.2 dB

This is called ‘Target’ gain because GCA will search for the closest measured gain to 9.2000 dB. It may not measure this gain exactly.

**Compression point** The operating point at which the measured gain is closest to the Target Gain. All [compression parameters](#) report data for this operating point.

**Understanding the GCA Displayed Traces**

One of the most important concepts to remember with GCA is that, each frequency data point represents many measurements using different input power levels.

Some things to notice about how GCA displays **compression** data:

1. The X-axis values are ALWAYS frequency. Imagine behind each frequency data point, a traditional power sweep curve with corresponding measurements and calculations to find the specified compression point.

2. The Y-axis values are always reported at the **compression point**. The value that is displayed depends on the **compression** parameter that you choose. The S-parameters that are displayed in a GCA channel are always measured at the **linear and reverse** power level.

**Example:** Five of the six GCA compression parameters are displayed in the above image. The missing trace, DeltaGain21 is discussed below.

• Markers are placed at 4.549 GHz for all of the parameters.

• **Tr 3 Compln21** (Input power at the compression point) shows the marker value to be **-5.4117 dBm**. This is the power into the DUT that was required to achieve the compression point. Notice that this is about the same input power required to achieve the specified compression at ALL frequencies.
• Tr 5 CompGain21 (Gain at the compression point) shows the marker value 9.6443 dB. This is the measured gain at the compression point.

• To see the gain at a different input power at this frequency, use the Compression Analysis feature.

Gain Compression Parameters
There are several Gain Compression parameters, as well as standard S-parameters and ADC parameters, that can be measured in a GCA channel.

How to add GCA Parameters
First, create a GCA channel. Learn how. The default parameter is S21.

Using front-panel HARDKEY [softkey] buttons
1. Press Traces
2. then [New Trace]
3. then select a parameter

Using a mouse with PNA Menus
1. Click Trace/Chan
2. then New Trace
3. then select a parameter

Linear S-Parameters
For convenience, the standard S-parameters are offered in a GCA channel. S11 and S21 are measured at the specified Linear Input level. S22 and S12 are measured at the specified Reverse power level.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>When Measured</th>
</tr>
</thead>
<tbody>
<tr>
<td>S11</td>
<td>Input Match</td>
<td>Always</td>
</tr>
<tr>
<td>S21</td>
<td>Gain</td>
<td>Always</td>
</tr>
<tr>
<td>S22</td>
<td>Output Match</td>
<td>See Reverse</td>
</tr>
<tr>
<td>S12</td>
<td>Reverse Isolation</td>
<td>See Reverse</td>
</tr>
</tbody>
</table>

ADC Parameters
Four ADC analog-to-digital converter measurements are offered in a GCA channel:

• AI1 and AI2 are measured at the specified Linear Input level.

• CompAI1 and CompAI2 are measured at the specified compression point.

These DC measurements, along with Equation Editor, allow you to make PAE measurements at the Linear Input
level and compression point.

These measurements are made at pins 7 and 8 of the PNA Power IO connector. Learn more about ADC measurements.

Compression Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ComplIn21</td>
<td>Input power at the compression point.</td>
</tr>
<tr>
<td>CompOut21</td>
<td>Output power at the compression point.</td>
</tr>
<tr>
<td>CompGain21</td>
<td>Gain at the compression point.</td>
</tr>
<tr>
<td>CompS11</td>
<td>Input Match at the compression point.</td>
</tr>
<tr>
<td>RefS21</td>

</tr>
<tr>
<td>DeltaGain21</td>
<td>CompGain21 MINUS Linear Gain (in Log Mag format). This trace can be used to learn a lot about the DUT compression point. Learn more.</td>
</tr>
</tbody>
</table>

Note: The following table assumes: DUT Input = PNA port 1 and DUT Output = PNA port 2. When the Port mapping is different, the parameters in GCA are updated accordingly. For example, with Input = port 2 and Output = port 1, then "ComplIn12" would be displayed.

The raw data for these parameters are always measured.

Compression Methods

GCA offers the following methods to find the compression point of an amplifier using GCA:

Compression from Linear Gain

The Reference Gain is measured using the specified Linear (Input) Power Level. The Target Gain is calculated as the Linear Gain minus the specified Compression Level. For example 8.3 dB - 1 dB = 7.3 dB.

Compression from Max Gain

The linear region of an amplifier gain may not be perfectly linear. The highest gain value that is found at each frequency is used as the Reference (S21) Gain. The Target Gain is found in the same way as Compression from Linear Gain.

Compression from Saturation

This method is used to better find the compression point when measuring amplifiers with non-linear gain as shown in the following image:
The Max power out value * is found at each frequency. Then input power is lowered until the output power decreases by the specified 'From Max Pout' value. This is the compression point.

**Backoff and X/Y method**

These two compression methods are very similar.

- Both methods specify a difference in input power (X axis) between the linear region and compression point.
- For the Y-axis difference:
  - **Backoff method** specifies Compression Level which is a difference in Gain.
  - **X/Y method** specifies Delta Y which is a difference in Output Power.

GCA searches for these points differently for **2D sweeps** and **SMART sweep**.

The following images show how Backoff and X/Y method is calculated at ONE frequency.
The compression point (yellow circle) is where 10 dB more input power yields only 9 dB more output power than at the reference point (blue circle).

**Acquisition Modes**

The GCA offers three modes for data acquisition: Two 2D sweep modes, and SMART sweep.

To see a traditional power sweep at a single frequency, use the Compression Analysis feature. Learn more.

**2D (two-dimensional) Sweeps**

This is the easiest method to understand, and the least efficient for finding the compression point. Both 2D sweep modes work as follows:

1. All GCA measurements begin by measuring S-parameters at the specified Linear Power level. Reverse parameters are measured ONLY if Full 2-port calibration is applied or if a reverse parameter is displayed. Learn more about Cal choices.

2. Gain measurements are then made at ALL of the specified frequency and power values. Although these are conceptually 2-Dimensional sweeps, a single sweep is constructed in firmware. See Data Points Limit.

3. After data has been measured, a search is performed to find the compression point. You can choose to interpolate between the two measured points closest to the target gain. Learn more.

As each sweep is performed, dots are plotted next to the Ch indicator in the lower left corner of the display to indicate progress for the current sweep.

**Note:** For Backoff and X/Y compression method, GCA does not verify that the specified Start - Stop power range is at least the size of the specified Backoff or X value. The closest compression point is always reported.

**2D Sweep Modes**
- **2D Sweep Power per Frequency** - Input power is stepped from Start to Stop at each specified frequency. From the following example you can see that the device is exposed to the highest power level (p3) at the first frequency (f1). This could heat the device early in the measurement and affect compression results.

The following examples show (frequency, power) values for three frequency points and three power points, resulting in a total of 9 measurements:

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>f1</td>
<td>p1</td>
<td>f2</td>
<td>p1</td>
<td>f3</td>
<td>p1</td>
<td>f4</td>
<td>p1</td>
<td>f5</td>
<td>p2</td>
</tr>
</tbody>
</table>

- **2D Sweep Frequency per Power** - Frequency is swept from start to stop at each specified power level as follows:

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>f1</td>
<td>p1</td>
<td>f2</td>
<td>p1</td>
<td>f3</td>
<td>p1</td>
<td>f4</td>
<td>p1</td>
<td>f5</td>
<td>p2</td>
</tr>
</tbody>
</table>

**Viewing and Saving 2D Data**

It is NOT possible to plot ALL of the 2D measurement data on the PNA display. However, it can be saved to a *.csv file and then read into an Excel spreadsheet. The initial S-parameter measurement data is not saved to this file. Learn more.

You can also view on the PNA all power sweep information at a selected frequency using the Compression Analysis feature.

**SMART Sweep**

SMART Sweep is usually the fastest and most accurate method to measure Gain Compression. Unlike the 2D acquisition modes which measure all of the specified frequency / power points, SMART Sweep performs a series of power search iterations. At each frequency, an 'intelligent guess' of input power is made to find the compression level that is within tolerance. This guess is further refined with each successive power search iteration sweep.

SMART Sweep continues to iterate until one of the following conditions occur:

1. **ALL data points are within tolerance.** When the compression level for a data point achieves the specified tolerance, it continues to be measured and input power changed to improve the measurement within tolerance.

2. The specified compression level can NOT be achieved for the remaining frequencies that are not in tolerance. Either the Start power is too high or the Stop power is too low.

3. **Maximum iterations have been achieved.** If a measured gain is not within the specified tolerance before the specified Max number of Iterations has been reached, then the last power reading is used as the compression point.
The Iteration Counter, Dots, and Bangs(!)

Next to the Ch indicator, in the lower left corner of a GCA window, the following annotation appears:

- An **iteration counter** is incremented each time input power is adjusted.
- A **dot** appears when another 10% of the frequency points are within tolerance.
- ! (bangs) are displayed after the last iteration. Each bang represents 10% of the data points that are NOT within tolerance.

---

SMART Sweep and Compression Method

The intelligent guess process works differently depending on the compression method. This is important because Backoff and X/Y compression methods subject the DUT to significant changes in input power during an iteration sweep. This can affect the DUT and the measurement results.

Learn more about Backoff and X/Y compression methods.

ALL GCA measurements begin by measuring S-parameters at the specified Linear Power level. Reverse parameters are measured ONLY if Full 2-port calibration is applied or if a reverse parameter is displayed. Learn more about Cal choices.

- **Backoff and XY** Because both compression methods specify the separation between the "linear" region and the "compressed" region, each iteration requires a single sweep at two **dramatically** different power levels over the same frequency range. The first half of the sweep measures the DUT at the Backoff or X power level. The second half of the sweep measures the DUT at the compressed power level, specified by the **Start and Stop** power range. At the beginning of the second half, the power level rises by the Backoff or X value. The specified **Settling Time** is applied at this point to allow the DUT time to react to this significant change in power level. **Safe Sweep** does NOT minimize this change in input power. However, Safe Sweep with Backoff and XY methods **DOES** prevent the DUT from being exposed to too much input power.

- **Compression From Linear Gain** After the reference gain is measured at the linear input power, the next iteration measures the DUT at a higher power level which attempts to push the DUT well into compression. Subsequent sweeps, depending upon the compression level of the DUT, either increases or decreases the power in order to reach the desired compression level. Usually, by the third iteration sweep, a curve-fit algorithm is utilized to precisely find the compression point.

**Note:** The DUT can be subject to significant changes in power from one iteration sweep to the next. This can be minimized by the use of **SAFE Sweep** and careful selection of the corresponding settings.

- **Compression from Max Gain** The maximum gain that is found at each frequency is stored and used to calculate the compression point. SMART Sweep does NOT perform extra iterations to search for the maximum possible gain of the amplifier at each frequency.

- **Compression from Saturation** The maximum power out that is found at each frequency is stored and used to calculate the compression point. SMART Sweep does NOT perform extra iterations to search for the maximum possible power out of the amplifier at each frequency.
Using the Gain Compression Application

The following is a general procedure for performing a GCA measurement. The challenge with GCA is configuring a measurement that yields the true compression performance of YOUR DUT. This requires knowledge of the Gain Compression settings and knowledge of the DUT.

See specific dialog boxes below.

1. Disconnect the DUT if preset or default power levels may damage the PNA or DUT.
2. **Preset** the PNA, or configure a suitable **User Preset** that will be safe in case the DUT is connected.
3. Create a GCA channel. **Learn how.** The default trace is S21.
4. Start **GCA Setup dialog** and configure the measurement settings based on the DUT, adapters, attenuators, booster amplifiers, and fixtures to be used in the measurement.
5. Save the **instrument state** (optional).
6. Connect DUT and apply bias and RF power as appropriate. The default measurement for a GCA channel is S21 (amplifier gain). Inspect the gain measurement to ensure the DUT is operating as expected.
7. Add GCA compression parameter traces. **Learn how.**
8. Adjust the measurement settings to yield satisfactory compression parameters. See **GCA Measurement Tips.**
9. Start and complete the **GCA Calibration wizard.**

**How to start the Gain Compression Setup dialog**

To provide quicker access, use the Setup softkey. **Learn how.**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **FREQ**
2. then **[Gain Compression Setup]**

**Using a mouse with PNA Menus**

1. Click **Stimulus**
2. then **Frequency**
3. then **Gain Compression Setup**

**Frequency tab - Gain Compression** dialog box help
Configures the frequency settings over which Gain compression is to be measured, as well as the measurement method.

**Sweep Type**

Choose a method in which to sweep frequency: Linear, Log, and Segment Sweeps. This setting applies to all data acquisition modes.

**Notes**

- Log and Segment Sweep are NOT available on GCX.
- CW Sweep is NOT available in GCA. However, to see a traditional power sweep at a single frequency, use the Compression Analysis feature.
- To use CW Sweep in GCX, set all ranges to Fixed on the Mixer Frequency tab. This has the same effect as setting all ranges to Start = Stop Frequency.

**Segment Sweep Notes (GCA ONLY)**

- The segment table shown on the dialog is ‘READ-ONLY’.
- Learn how to Create and edit the Segment Sweep table.
- Independent IFBW and Power are NOT available.
- X-axis point spacing is available beginning with A.09.10.

**Data Acquisition Mode**

Specifies HOW the gain compression data is collected.

**SMART Sweep**

- At each frequency, input power is ‘intelligently’ adjusted to find a measured gain equal to the target gain.
- Faster and more accurate than 2D sweeps to measure Gain Compression point at a number of frequencies.
- Learn ALL about SMART Sweep
2D (two-dimensional) Sweeps

- **Sweep Power per Frequency**  Performs a series of power sweeps at each successive frequency.
- **Sweep Frequency per Power**  Performs a series of frequency sweeps at each successive power level.
- **Learn ALL about 2D sweeps**

**Sweep Settings**

Click each to learn more about these settings.

- **Number of points**  Number of frequency points to measure. The Frequency points may be limited due to the number of specified Power points. See Data Points Limit.

- **IF Bandwidth**  Set this value to yield acceptable trace noise when measuring gain at the linear power level. This level of noise contributes directly to the accuracy of compression point. A lower value (narrower IFBW) allows for more accurate, but slower, measurements. See GCA Measurement Tips to see how to best set IFBW.

- **Start / Stop, Center / Span**  frequencies. Set the frequency range over which to measure Gain compression.

**Data Points Limit**

The maximum number of measurement data points depends on Acquisition method and Compression method as follows:

<table>
<thead>
<tr>
<th></th>
<th>SMART sweep</th>
<th>2D sweep</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Compression method</strong></td>
<td>Number of frequency points is reduced to ensure the total number of data points does not exceed the specified limit.</td>
<td>Number of power points is reduced to ensure the total number of data points does not exceed the specified limit.</td>
</tr>
</tbody>
</table>
| Compressed from linear gain | Data points = freq points  
Max = 20,001 | Data points = (freq. points) * (power points)  
Max power points = 2,001  
Max data points = 20,000 |
| Compressed from max gain | Data points = freq points  
Max = 20,001 | |
| X/Y and Backoff | Data points = 2 * freq points  
Max = 20,001 | |

**Note:** Although the dialog box will allow you to enter any number of frequency or power points, the values are checked when OK or Apply is pressed. If a limit is exceeded, the relevant data points are reduced to the maximum allowable number without warning.
Power tab - Gain Compression dialog box help

Configures RF power and Power Sweep settings for Gain Compression measurement.

**Power ON (All channels)** Check to turn RF Power ON or clear to turn power OFF for all channels.

**Input Port**
- **Select** the PNA port that is connected to the DUT Input.
- **Linear Power Level** The input power that yields the linear gain of the DUT. The linear gain is used as the reference gain when calculating the **Compression from Linear Gain**. Input match is also measured at this power level.
- **Source Attenuator** Specifies the attenuator setting associated with the port connected to the input of the DUT. This attenuator will affect the range of available power into the DUT. All PNA channels in continuous sweep must have the same attenuation value. Learn more about Source Attenuation.

**Output Port**
- **Select** the PNA port that is connected to the DUT Output.
- **Reverse Output Power** Sets power level into the output of the DUT for reverse sweeps. Port power is automatically uncoupled.
  
  Reverse power is applied to the DUT ONLY under the following conditions. Otherwise, this setting is ignored.
  
  - When Linear Output Match or Linear Reverse Isolation parameters are requested.
When Full 2-port correction is used, you can perform a full 2-port cal and downgrade to an Enhanced Response Cal to prevent reverse power from being applied to the DUT. Learn more.

**Source Attenuator** Specifies the attenuator setting for the port connected to the DUT output. This setting will affect the range of available power at the DUT output port.

**Receiver Attenuator** Specifies the attenuator setting for the receiver associated with the DUT output port.

**Source Leveling** Specifies the leveling mode. Choose from: Internal (normal operation) or Open Loop (used only for [Wideband Pulse measurements](#)).

### Power Sweep

**Power Points** Number of power points to measure for 2D acquisition modes. The Power Points may be limited due to the number of frequency data points. See Data Points Limit. This setting is NOT available in SMART Sweep, which uses only enough power points to find the specified compression level.

**Start** and **Stop Power**

- **2D sweep** In Backoff, X/Y, and Compression from Max Gain methods, sets the range of power levels that are applied to the DUT to find BOTH the Reference Gain and Compression point. Make sure this range is wide enough to include both. For example, if the Backoff level is 10 dB, then the power range must be greater than 10 dB. Otherwise, GCA will report a compression value using the closest reference gain and compression point, which may be inaccurate. In Compression from Linear Gain, the reference gain is measured at the Linear Power Level, so the Start and Stop power levels are used to find the compression point.

- **SMART sweep** Sets the range of power over which GCA will search for the compression point. The reference gain is found using the Linear Power Level, Backoff, and X values, depending on the Compression Method. To reduce the number of iterations that are required to find the compression point, limit the Start / Stop power range to the input levels that will achieve compression. Do not include the linear region.

**Note:** If your DUT requires more input power to achieve compression below 3.2 GHz, use the PNA-X Hi-power mode, available from the [RF Path Configuration](#) dialog. The disadvantage to this is higher harmonic content.

**Power Step (Size)** Calculated value from current Start, Stop, and Points settings. This setting can NOT be changed directly.

**Path Configuration** click to launch the [RF Path Configuration](#) dialog.

---

**Compression tab - Gain Compression** dialog box help
Compression Method
Learn ALL about these Compression Methods

- **Compression from Linear Gain**  The specified compression level is measured from the linear gain. The linear gain is measured using the **Linear Power Level** that is specified on the Power tab.

- **Compression from Max Gain**  The specified compression level is measured from the maximum gain level. In SMART sweep, the Max Gain value is updated as each iteration occurs. To increase the chances of measuring the actual maximum gain of the amplifier, Safe Sweep should be invoked using low Coarse and Fine increments.

- **Compression from Back Off**  This compression method uses the Compression Level and Back Off values for finding the compression point.

- **X/Y Compression**  This compression method uses the specified parameters (X and Y) as the criterion for finding the compression point.

- **Compression from Saturation**  Similar to Compression from Max Gain, except the specified compression level is measured from the maximum power out level. Use this method to better find the compression point when measuring amplifiers with non-monotonic gain. In SMART sweep, the Max power out value is updated as each iteration occurs. To increase the chances of measuring the actual maximum power out of the amplifier, Safe Sweep should be invoked using low Coarse and Fine increments.

2D Sweep - Compression Point Interpolation
When a 2D Sweep is selected (on the Frequency tab), check this box to calculate and display interpolated compression traces.

The **Target gain** is calculated using a complex linear ratio between the two closest measured values. All compression parameters are then interpolated using this same ratio.

Clear the box to display compression parameters for the closest compression point, either high or low, to the level specified in the Compression Method setting.

SMART Sweep
Learn ALL about Smart Sweep.

**Tolerance**  Specifies an acceptable range for measuring the compression level. Reducing this value can
significantly increase the number of iterations that are required to find the compression point.

**Maximum Iterations** Specifies the maximum number of power search iterations SMART Sweep is allowed. Reducing this value can cause SMART sweep to terminate before all compression levels are found to within the specified tolerance.

**Show Iterations** When checked, the compression parameter traces are updated at the completion of each power search iteration. When cleared, compression parameter traces are updated when SMART Sweep completes the power search iteration process.

**End of Sweep Condition** Specifies the power level applied to the DUT at the completion of a GCA measurement.

GCA performs numerous power and frequency sweeps on the DUT during the overall measurement process. This setting has no affect on these intermediate sweeps. This setting only applies at the end of the very last sweep in the GCA channel.

In addition, this setting applies ONLY to the GCA channel. All other channels operate independently of this setting. Therefore, the power applied to the DUT after all channels have been measured may be different from this setting.

Choose from:

- **Default** Use the default PNA method. [Learn more.](#)
- **RF OFF** RF power is turned off when GCA completes a measurement cycle.
- **Start Power** RF power is set to the start power level.
- **Stop Power** RF power stays at the stop power level.

**Settling Time**

Used ONLY in SMART Sweep when Back Off or X/Y compression algorithms are selected.

This setting allows additional dwell time when the input power changes from the back-off level to the compression level. [Learn more.](#)
Safe Sweep Mode dialog box help

For use with SMART Sweep ONLY.

When enabled, Safe Sweep increases the input power to the DUT by the specified amounts, allowing the compression point to be achieved gradually. While this will increase the number of iterations required to achieve compression, it also minimizes the possibility of driving the DUT too far into compression.

**Note:** Safe Sweep does NOT minimize the dramatic change in input power with Backoff and XY method. However, Safe Sweep with Backoff and XY methods DOES prevent the DUT from being exposed to too much input power. Learn more.

**Safe Mode (Enable)** Check to enable Safe Sweep.

**Coarse Increment** Sets the maximum change in input power, up or down, which will be applied to the DUT from one iteration to the next. Default = 3.0 dB.

Without Safe Sweep, the maximum change in input power can be the entire Backoff or X value when using these compression methods.

**Fine Increment** Once the Fine Threshold has been achieved, this becomes the maximum change in input power, up or down, which will be applied to the DUT. Default = 1.00 dB

**Fine Threshold** Specifies the compression level in which Safe Sweep changes from the COARSE to the FINE increment. Default = 0.5 dB. This means that, by default, the PNA uses the Fine Increment adjustment when compression reaches 0.5 dB.

**Max Output Power** To protect the PNA from damage, when the PNA port that is connected to the DUT Output measures the specified value, the input power to the DUT is no longer incremented at that frequency. In these cases, the compression point would probably not be achieved.

Compression Analysis

Compression Analysis changes the current trace into a power sweep trace at a specified CW frequency. The current parameter and acquisition method is unchanged. For example, with a CompGain21 trace displayed and SMART Sweep selected, enable Compression Analysis. The trace becomes a power sweep trace at the specified CW frequency. The Y-axis displays S21 Gain at each X-axis power point.

When Smart sweep is used, a complete power sweep is not performed, but only the data points that are required to find the compression point. To see a traditional power IN vs power OUT compression sweep, use one of the 2-D acquisition methods.

You can create PNOP or PSAT markers on a CompOut trace with Compression Analysis mode ON. Learn more.
How to perform Compression Analysis

With any compression parameter (such as CompGainS21) displayed:

Using front-panel HARDKEY [softkey] buttons

1. Press Analysis
2. then [Compression Analysis]

Using a mouse with PNA Menus

1. Click Marker/Analysis
2. then Compression Analysis

Programming Commands

Compression Analysis dialog box help

Notes: When an S21 or S11 trace is active, any compression parameter (such as CompGainS21) must also be displayed.

Compression Analysis is NOT allowed for S12 or S22 traces.

Scroll up to learn more about Compression Analysis.

Analysis Frequency: CW  Enter a frequency to use for the compression analysis trace.

Compression Analysis Check to perform compression analysis. A compression trace is displayed at the Analysis (CW) Frequency.

Use Discrete Frequencies  Check to allow Analysis Frequencies at only the discrete points where data is measured. Clear to allow Analysis CW Frequencies that are interpolated from the data points. Then select ANY CW frequency between the start and stop frequencies of the GCA channel.

X-Axis
**Use Measured Pin**  The X-axis displays the actual power that is applied to the DUT after match correction and R-channel drift correction.

**Use Source Pwr Settings**  The X-axis displays the power level of the stimulus.

---

**Saving GCA Data**

Beginning with PNA release A.08.20, GCA data can be saved to a *.csv file in both 2D and SMART Sweep modes (previously only 2D modes). Also, a Delta Gain column has been added to the data.

---

**How to save GCA data**

With a GCA [Compression] trace active:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SAVE</strong></td>
<td>1. Click <strong>File</strong></td>
</tr>
<tr>
<td>2. then <strong>[Save Data As]</strong></td>
<td>2. then <strong>Save Data As</strong></td>
</tr>
<tr>
<td>3. *<em>File Type = GCA Sweep <em>.csv</em></em></td>
<td>3. *<em>File Type = GCA Sweep <em>.csv</em></em></td>
</tr>
</tbody>
</table>

---

**Notes**

- This data type can be read by spreadsheet programs, such as Microsoft Excel.
- Data from the last **complete** sweep is saved to the specified *.csv file.
- If calibration is turned **ON** when the file is saved, then all data is calibrated. Otherwise, raw data is saved.
- All *.csv data saves include a reference power level sweep at the beginning of each frequency data.
The data are organized by frequency / Power IN (as shown above) regardless of the method used to acquire the data. The above image shows SMART Sweep data with 5 iterations and 3 frequency points. The yellow highlight is added here for readability.

**GCA Measurement Tips**

There are many settings in the Gain Compression Application. Here are a few tips when using GCA to learn as much as possible about the compression characteristics of your DUT in the most efficient manner.

**DUT Compression Characteristics and GCA**

Although GCA provides excellent results with a wide variety of amplifiers, it works best with amplifiers which have a monotonic compression curve. In some cases where the compression curve is not monotonic, for example if the amplifier gain expands before it compresses, the correct compression level may not be found.

To help a SMART sweep find the correct compression point, limit the Start and Stop power levels around the anticipated compression point. [Learn more.](#)

The following two power-sweep traces are examples of non-monotonic gain:
**DeltaGain**

A DeltaGain trace is the best way to see how closely GCA is actually measuring to the desired compression level. In addition, you can view the phase of DeltaGain to see the phase deviation between the compressed gain and the reference gain. DeltaGain is calculated as:

- DeltaGain = Measured Gain (watts) / Ref Gain (watts)
- In LogMag format: DeltaGain = (Measured Gain) - (Ref Gain)

With SMART Sweep, DeltaGain (in LogMag format) shows how soon certain frequencies achieve the specified tolerance. Learn more.

Some other settings which may be helpful:

- Trigger source: Manual allows you to analyze data and make adjustments while allowing the device to cool.
- Construct Limit Lines around the compression point at the tolerance level.

The following image shows a DeltaGain21 trace using SMART Sweep. The Limit Lines were added manually.

In the above image:
| Relevant Settings | Method = Compression From Linear Gain  
|                  | Compression level = 1  
|                  | Iteration Tolerance = 0.05 dB.  
|                  | Maximum Iterations = 10  |
| Displayed Results | A data point on -1.00 indicates that, at that frequency, the exact compression level (1 dB) was measured.  
|                  | Several frequencies did not achieve the specified tolerance (0.05 dB) before the Max Iterations (10) was reached.  
|                  |   - FAIL and red data points outside the limit lines.  
|                  |   - Nine dots (....) indicate that 90% of the data points achieved the specified compression level.  
|                  |   - one ! indicates that 10% of the data points did not achieve compression.  
|                  |   - Learn more about the Iteration Counter and annotation.  |

**SMART Sweep Tips**

- Compression from Linear Gain is the easiest compression method to understand and control in SMART Sweep. [Learn more.](#)
- If SMART Sweep requires more than twenty iterations, this is an indication that something is wrong. Try changing the Tolerance setting, Frequency Range, Start / Stop power range, IF bandwidth, or [Dwell Time](#).
- If the number of iterations required to achieve the desired compression level changes significantly from one set of measurements to the next, this could be due to other effects, such as heating. Try increasing the dwell time or using a [wideband pulse](#) measurement configuration.
- If the DUT should not be significantly overdriven into compression, or the changes in the input power should be limited, use [Safe Sweep](#) mode with Deviation from Linear Gain compression method.

**Single Frequency Macros**

**Note:** Beginning with PNA rev. A.09.00, the Compression Analysis feature provides an easier method of viewing a traditional power sweep at a single frequency than the GCA macros. However, the Macros are still maintained on the PNA hard drive.

The macros perform a single power sweep on the DUT using a standard channel with corresponding stimulus settings. The macro can show measurement differences from the compression analysis traces due to bias/thermal/settling effects of the DUT. So, the macro can help confirm a DUT is exhibiting some type of settling behavior which will need to be handled in some way.

Also, the macro is a great GCA programming example.

With a 2D sweep (NOT SMART Sweep) a script that is stored on the PNA hard drive automatically creates a traditional power sweep measurement in a standard channel using the same stimulus setting as the GCA channel. Use a marker in the GCA channel to specify the frequency for the measurement.
The script has two modes of operation:

1. **View Mode** displays all of the previous 2D sweep data at that frequency.
2. **Measure Mode** performs a new measurement at that frequency.

Both modes create a new S-Parameter channel using the same stimulus settings as the GCA channel, including port power, attenuator, IF Bandwidth, and dwell settings. The new channel does not support calibration or pulse characteristics.

To see noise on a measurement, use the **Measure** macro in continuous sweep. Adjust the IFBW and averaging until the noise versus sweep speed meets your needs.

To see other effects of your DUT at a specific frequency, use the **View** macro and the **Measure** macro with 2D sweep mode. Both macros present data using a standard channel. The View macro shows 2D data at a specific frequency, while the Measure macro shows freshly-measured data at the same frequency. Ideally, the data from these two would be identical. However, changes in your DUT behavior due to heating or other effects can cause these to be different. If significant differences exist, try:

- Using the 2D Frequency per Power setting rather than Power per Frequency
- Adjusting the dwell time
- Adjusting IFBW
- Use a [wideband pulse configuration](#)

**How to setup the Macros**

Each macro must be setup separately.

1. Press **Macro**, then **Macro Setup**.
2. Select a blank line, then click **Edit**.
3. In **Macro Title**, type a short description such as Meas GCA or View GCA.
4. Click **Browse**, then navigate to C:/Program Files/Agilent/Network Analyzer/Applications/GCA/GCA.vbs
5. In Macro run string parameters:
   1. Type **M** for the Measure macro or **V** for View macro.
   2. Optional: Supply the following additional parameters in any order:
      - To run the program from a remote computer, specify the full computer name of the PNA.
      - Channel in which to create the measurement. If not specified, Measure is created in Ch30 and View is created in Ch31.
      - Example: Run string parameters for the Measure macro run from a remote computer in Channel 5.—-M MyPNA 5.
6. Click **OK**.

**How to run the Macros**

On a GCA channel:

1. Create a 2D sweep. Either Power per Freq or Freq per Power. Both macros always create a power sweep at the frequency of interest.

2. Create a CompIn trace.

3. On the CompIn trace, right-click and select **Add Marker**. Drag the marker to the frequency of interest.

4. Press **Macro**, then select either by the short description you provided in Step 3.

---

Gain Compression for Converters (GCX)

Gain Compression is measured on Converters in the same manner as it is measured in Amplifiers. Also, the Mixer/Converter setup is very similar to that of SMC (Scalar Mixer Converter application).

In this topic (unique for GCX):

- **Requirements and Limitations**
- **Using GCX**
- **Create a GCX Measurement**
- **Valid Mixer Configuration / Sweep Type Combinations**
- **Measurement Parameters offered in GCX**
- **GCX Calibration**

The following **Gain Compression for Amplifiers** information is relevant for learning about GCX:

- **Gain Compression Concepts**
- **Understanding the GCA Displayed Traces**
- **Compression Methods**
- **Acquisition Modes**
- **Compression Analysis**
- **Saving GCA Data**
- **GCA Measurement Tips**

The following dialog setup tabs are shared with other applications:

- **Frequency tab** (GCA topic)
- **Power tab** (GCA topic)
- **Compression tab** (GCA topic)
  - **Safe Sweep Mode dialog** (GCA topic)
- **Mixer Frequency tab** (separate topic)
- **Mixer Setup tab** (separate topic)
- **Mixer (LO) Power tab** (separate topic)
Requirements and Limitations
GCX requires Option 086 (Gain Compression) and FCA (either Option 082 or 083).

Limitations:

- Number of points limited to 20,001 for two-dimensional acquisitions, 10,000 points for SMART Sweep.
- Linear and CW sweep ONLY - No Power, Log, or Segment sweep. Learn more.
- GCX does NOT provide any built-in image rejection techniques. You should provide image rejection hardware if necessary.
- Stepped sweep mode only.

The following PNA features are NOT available with Gain Compression on Converters:

- ECal User Characterization
- Time Domain
- Balanced measurements
- Save Formatted Citifile data.
- Save SnP data.
- Interface Control
- Port extensions
- Some Fixturing Features
- External Test Set Control (Option 551)
- Integrated Narrowband or Narrowband Pulse App

Using GCX
The following is a general procedure for performing a GCX measurement. The challenge with GCX is configuring a measurement that yields the true compression performance of YOUR DUT. This requires knowledge of the Gain Compression and Mixer settings, and knowledge of the DUT.

See specific dialog boxes below for details.

1. Disconnect the DUT if preset or default power levels may damage the PNA or DUT.
2. Preset the PNA, or configure a suitable User Preset that will be safe in case the DUT is connected.
3. Create a GCX channel. Learn how. The default trace is SC21.

4. Start the GCX Setup dialog and configure the measurement settings based on the DUT, adapters, attenuators, booster amplifiers, and fixtures to be used in the measurement. To start the dialog, click Stimulus, then Frequency, then GCX Setup. Learn about the setup dialogs.

5. Save the instrument state (optional).

6. Connect the DUT. Inspect the measurement to ensure the DUT is operating as expected.

7. Add GCX compression and mixer parameter traces. Learn more.

8. Adjust the measurement settings to yield satisfactory compression results. See GCA Measurement Tips.

9. Start and complete the GCX Calibration wizard.

## Create a GCX Measurement

1. On the PNA front panel, press Meas then [Measurement Class]

2. Select Gain Compression Converters, then either:
   - OK delete the existing measurement, or
   - New Channel to create the measurement in a new channel.

3. A default SC21 measurement is displayed. To select additional parameters to display, click Trace/Chan, then New Trace, then select a parameter from the list. Learn more about GCX Parameters.

### How to start the Gain Compression for Converters Setup dialog

To provide quicker access, use the Setup softkey. Learn how.

<table>

**GCX Setup Dialogs**

All of the GCX Setup tabs are shared with other applications.

- **Frequency tab**
- **Power tab**
- **Compression tab**
  - Safe Sweep Mode dialog
- **Mixer Frequency tab**
- **Mixer Setup tab**
- **Mixer (LO) Power tab**

**GCX Calibration**

A GCX Cal is conceptually the same as a Gain Compression Calibration. This includes the ability to perform or downgrade to an Enhanced Response Cal. Learn how.

The following Guided Cal Wizard pages are unique to GCX:
**GCX Calibration Setup** dialog box help

**Waveguide/In-fixture/On-Wafer Setup**  Starts the following dialog box.

**Independent power cals for input and output ports (no thru)**  Check if a Thru standard is NOT available. During the power cal, you will be prompted to connect the power sensor to the Input, then the Output port.

**Additional Power Cal Steps**

**Enable LO1 / LO2 Power Cal**  Check when LO1 / LO2 is controlled (on the **Mixer Setup** tab) to perform a Power Cal on the source.

**Note:** Phase Correction is NOT allowed for GCX measurements.

---

**Waveguide/In-fixture/On-Wafer Setup** dialog box help

This dialog box appears ONLY if you checked the **Waveguide/In-fixture/On-Wafer Setup** box in the previous **Cal Setup** dialog.

Allows you to embed or de-embed circuit networks on the input and output of your mixer under test.

For Network1 (Input) and Network2 (Output) select **Embed**, **De-embed**, or **None**.

**Browse**  Click to navigate to the .S2P file that models the network to embed or de-embed.

**To Embed or De-embed**

- **De-Embed**  when there is a 2-port network that needs to be connected during the measurement, but it is NOT present during the calibration. An example might be when you do not have standards for a characterized test fixture, so you calibrate without the fixture, and make measurements with the DUT in the fixture. De-Embedding during the calibration extends the calibration reference plane to include the 2-port network.

- **Embed**  when there is a 2-port network that to be disconnected during the measurement, but is present during the calibration. An example might be when a characterized adapter is required during the calibration but NOT present during measurements of the DUT. Embedding during the calibration retracts
the calibration reference plane to exclude the 2-port network during the measurement.

**Notes**

- **Characterize Adaptor Macro** can be used to create the S2P file.
- The S2P file for Network1 (on the input of the mixer), must cover the Input frequency range. The S2P file for Network2 (on the output of the mixer), must cover the Output frequency range.
- The frequency range of the S2P file must be the same, or larger than, the frequency range of the measurement. If more frequencies are included in the file, and the data points do not exactly match those of the measurement, interpolation will be performed.
- As in the image on the dialog (above), in all cases:
  - Port 1 of each network is assumed to be connected to the PNA.
  - Port 2 of each network is assumed to be connected to the DUT.

---

**Select DUT Connectors and Cal Kits dialog box help**

Allows you to specify the connector type and Cal Kit for each DUT port.

**Port n**

For each listed PNA port, specify the DUT connector type and gender, and the Cal Kit to use.

**input pwr sensor**

Specify the connector type of the power sensor. Select **Ignored** to not compensate for the effects of the adapter that may be necessary to connect the power sensor to the input reference plane.

**output pwr sensor**

Available when **Independent power cals for input and output ports** is checked on the GCX Calibration Setup dialog. Specify the connector type of the power sensor. Select **Ignored** to NOT compensate for the effects of an adapter that may be necessary to connect the power sensor to the output reference plane.

**De-embed input power sensor adapter**

Check to measure, then remove the effects of the adapter that is used to connect the power sensor to the calibration reference plane.

**Source Cal Settings**

Click to start the **Source Cal Settings** dialog. These settings allow you change ALL Source Cal and Power Meter settings.

**Note:** If your DUT connectors are:

- **Waveguide** Change the system impedance to 1 ohm before performing a calibration. See **Setting System Impedance**.
- **Not listed** (male and female) Select **Type A** as the connector type. Type A requires a calibration kit file containing the electrical properties of the standards used for calibration (see [Calibration kits](#)).

- **Unspecified** (like a packaged device) Select **Type B** as the connector type. Type B requires a calibration kit file containing the electrical properties of the standards used for calibration (see [Calibration kits](#)).

**Modify Cal** Check, then click Next, to start the Modify Frequency Cal dialog.

---

**Last Modified:**

Calibration Programming commands

How to start a GCA Calibration

Using front-panel HARDKEY [softkey] buttons | Using a mouse with PNA Menus
---|---
1. Press CAL | 1. Click Response
2. then [Start Cal] | 2. then Cal Wizard
3. then [Cal Wizard]

Overview - GCA Source Power Cal

The GCA Source Power Calibration is a little different from a standard Source Power Cal. Although GCA measurements are performed at many power levels, the GCA source power cal is performed at a single power level over the specified frequency span of your GCA measurement. The required source correction from that single power level is applied to all power levels. This method ensures that the 'absolute' power level being applied to the DUT is within the PNA-X source power linearity specification.

Although it is important for GCA to be able to set the absolute power level to the DUT, it is MOST important to be able to exactly measure the actual incident power. Therefore, during the GCA Source Power Cal, a receiver calibration is applied to the port 1 reference receiver, and indirectly to both test port receivers during the S-parameter calibration, correcting for impedance mismatch between the power meter and the PNA source, and the DUT and the PNA source.

Although the cal process is also at a single power level, the dynamic accuracy of the PNA-X receivers is typically about +/- .05 dB, which is comparable to the accuracy of Agilent's best power sensors. This allows GCA to very accurately measure and report ALL power levels that are actually applied to the DUT.

Full 2-port or Enhanced Response (ER) Cal
By default, a full 2-port calibration is performed as part of a GCA and GCX calibration. However, you can change to an Enhanced Response Cal. The following issues may help you decide between these two Cal types:

- **Accuracy**  A full 2-port correction is more accurate than ER when GCA measures linear gain. However, for non-linear measurements, ER yields identical compression values as a full 2-port cal, so this may not be a significant factor.

- **Measurement speed**  An ER correction only requires measurements in the forward direction. The reverse parameters (usually S22 and S12) are not measured unless requested. With a full 2-port cal applied, all four S-parameters are measured, which requires an additional reverse sweep. Learn more.

- **Ease**  A full 2-port cal is easiest with an ECal module. An ER Cal requires a Defined Thru or a Flush Thru Cal method. If these are possible, then an ER cal is easiest when using a mechanical Cal Kit.

- **High power**  The test port damage level of a standard PNA-X is +30 dBm. Therefore, external attenuation may be required on the output of high power amplifiers, which degrades calibration accuracy for reverse (full 2-port) measurements. In addition, the external attenuation improves the DUT output / load match error, which allows a better uncorrected response and makes an Enhanced Response Cal the better choice.

- **DUT limitations**  With an ER Cal applied, reverse measurements on the DUT are not performed unless requested.

**How to select Enhanced Response Cal**

At the Select DUT Connectors page of the GCA Cal Wizard:

1. Check **Modify Cal**, then click **Next**.
2. A **Defined Thru** or a **Flush Thru Cal** method must be selected.
3. Click **Cal Type/Stds**
4. Under Calibration type, select **EnhResp** (2 <= 1 refers to the receive port 2 and source port 1).

**Downgrade a Full 2-port Cal to Enhanced Response Cal**  if you prefer to perform a Full 2-port cal, but not perform reverse sweeps on the DUT.

To change the correction on the channel from Full 2-port to Enhanced Response:

1. Press **CAL**
2. then **[Manage Cal]**
3. then **[Correction Methods]**
4. Select **GCA EnhResp**, then **OK**
GCA Cal Wizard

Select DUT Connectors and Cal Kits - GCA Cal dialog box help

This is a standard Cal Wizard page except for the following:

**Power Sensor** Specify the connector type and gender of the power sensor. When the power sensor connector is not the same type and gender as the DUT Port 1 connector, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the port 1 reference plane during the Source Power Cal. Select the Cal Kit that will be used for that process.

Select **Ignored** (at the bottom of the DUT Connectors list) to NOT compensate for the adapter.

**Modify Cal** Check, then click **Next**, to Modify Cal (Standards AND Thru Method).

**Source Cal Settings** Click to launch the Source Cal Settings dialog.

Learn more about GCA Source Power Calibration
Gain Compression Calibration Step 1 dialog box help

**Power Level** at which to perform the Source Power Cal.

It is usually best to perform the Source Power Cal at 0 dBm because the power sensor is calibrated at that level.

However, if the Gain Compression measurement is performed entirely below or above 0 dBm, then perform the Source Power Cal at the **Stop** power which probably has the lowest level of measurement noise.

Learn more about GCA Source Power Calibration

The remaining Gain Compression Cal dialogs are the same as the standard SmartCal dialogs.

- 27-Sep-2010  Updated for GCX
- 26-Nov-2007  MX New topic
iTMSA (Integrated True Mode Stimulus Application)

This application is integrated into the PNA firmware as Option 460. A previous version of TMSA is run as a Macro on the PNA.

- **Features, Requirements, and Limitations**
- **True Mode Stimulus Concepts**
- **Using iTMSA**
  - Create a Measurement
  - Set Power Level
  - Calibrate
  - Ratioed Receiver Measurements

---

**Other PNA Applications**

**Notes:** When the first iTMSA measurement is created, an IFMUX Cal is performed, which takes a couple of minutes. If an IF board is replaced, this Cal should be performed again. To make this happen, delete C:/Program Files/Agilent/Network Analyzer/IFMUX.txt. When the next iTMSA measurement is created, the file will be recreated with new data.

**Features, Requirements, and Limitations**

**Features**

- A seamless extension of existing PNA Balanced Measurement, but with True Mode stimulus.
- True Mode Stimulus measurements are performed in a standard S-parameter channel.

**Requirements**

- 4-port PNA-X (opt 400) with Opt 460 (software option only): must be enabled.

**Limitations with iTMSA**

The following standard PNA features are NOT available with iTMSA measurements:

- External Test Set Control (Option 551)
- Interface Control
- Time Domain Pulse measurements in [Wideband Pulse](#) are NOT supported.
- [Unratioed reference receiver](#) measurements.
- [Segment Sweep](#)
- [Frequency Offset Measurements](#) (opt 080)
- [Receiver Calibration](#)

**True Mode Stimulus Concepts**

A balanced device is designed to receive input simultaneously across two ports. Standard PNA Balanced measurements apply stimulus to one port at a time, measures the responses, and calculates the theoretical balanced responses. [Learn more about balanced measurements](#).

True Mode Stimulus uses two PNA sources to apply either truly differential (180 degree out-of-phase) or truly common (in-phase) signals across the input of a balanced device. PNA receivers measure the single-ended response at the output of the device and calculate the balanced response.

When operating in non-linear regions, a device may respond differently to single-ended stimulus than to True Mode Stimulus. Thus, True Mode Stimulus capability allows you to understand when, and if, True Mode Stimulus is required.

For more detailed information on this measurement technique, see the following white papers (internet connection required):

- [New Methods & Non-Linear Measurements for Active Differential Devices](#)
- [New Measurement Results and Models for Non-linear Differential Amplifier Characterization](#)

**How iTMSA Works - Overview**

The following is an overview of how iTMSA gathers and displays True Mode Stimulus data:

1. **Initial sweep** is performed to gather the initial phase deviation between the two sources at the reference plane.

2. **Measurement** The phase deviation between the two sources is set to the required value and the response is measured. For a differential sweep, the phase deviation of the two sources is set to 180° at the reference plane. For a common sweep, the phase deviation is set to 0° at the reference plane.

A forward direction measurement requires 2 sweeps for differential and 2 sweeps for common. A reverse direction measurement requires the same. Therefore, a complete measurement in both directions requires 8 sweeps. The iTMSA traces are updated when all of the necessary data is gathered in each direction.

iTMSA computes the raw S parameters with the following matrix:
Using iTMSA

A Standard (default) S-Parameter channel is used for iTMSA measurements.

Legend:

- d1: differential stimulus in balanced port 1.
- d2: differential stimulus in balanced port 2
- c1: common stimulus in balanced port 1.
- c2: common stimulus in balanced port 2.

**Using iTMSA**

How to create an iTMSA trace:

1. Preset the PNA
2. Then do the following:

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Meas</strong></td>
<td>1. <strong>click Response</strong></td>
</tr>
<tr>
<td>2. then <strong>[Balanced Parameters]</strong></td>
<td>2. then <strong>Measure</strong></td>
</tr>
<tr>
<td>3. then press the <strong>Change</strong> button</td>
<td>3. then <strong>Balanced Parameters</strong></td>
</tr>
<tr>
<td></td>
<td>4. then press the <strong>Change</strong> button</td>
</tr>
</tbody>
</table>
Balanced DUT Topology / Logical Port Mapping (with iTMSA Option 460)

Learn about iTMSA.

Topology

Only the following topologies and port mappings are available in True Mode Stimulus:

- **BAL-BAL** DUT has two balanced ports. The PNA ports are restricted to the following:
  - Balanced Port 1 = PNA ports 1 and 3
  - Balanced Port 2 = PNA ports 2 and 4

- **SE-BAL** DUT has one single-ended port and one balanced port. For a **BAL-SE** (balanced - single-ended) DUT, select this topology, and then select **Reverse True Mode**. The PNA ports are restricted to the following:
  - Single-ended Port 1 = PNA port 1.
  - Balanced Port 2 = PNA ports 2 and 4.

Stimulus

- **Single Ended** Standard PNA mode. Each DUT port receives stimulus individually.
- **True Mode** Each balanced port receives true balanced stimulus in both forward and reverse directions.
- **Forward True Mode** Available ONLY in BAL-BAL topology. Only Balanced port 1 receives true balanced stimulus.
stimulus.

**Balanced Port Offset**

**Select Port**  Select the physical PNA port to receive a phase or power offset. Only port 3 and port 4 are available for Phase or Power offset.

**Phase Offset**  Specify offset within +/- 180° for the balanced INPUT port. This is in addition to the standard offsets, which are 180° offset for the differential stimulus sweeps, and 0° for the common stimulus sweeps.

**Offset (phase) as Fixture**

When unchecked, output calculations are performed and displayed as though there is only the standard offset. Although additional Phase Offset is applied to the stimulus, it is ignored in the calculations of balanced differential and common mode output signals.

When checked, output calculations are performed and displayed using the actual phase offset that is applied to the DUT. Use this setting to compensate for a component or fixture that may present a phase delay before the DUT.

**Power Offset**  Specify power offset. Range is +/- 2 dB. This is in addition to the power level that is specified using the Power and Attenuators dialog. Offset Power is NOT reflected on the power dialog nor on the X-Axis during a power sweep.

**Offset (power) as Fixture**

When unchecked, output calculations are performed and displayed as though there is no stimulus power offset.

When checked, output calculations are performed and displayed using the power offset that is applied to the DUT. Use this setting to compensate for a component or fixture that may present a magnitude loss before the DUT.

**Phase Sweep**

- Available only when **Sweep type** = CW.
- Only PNA port 3 OR port 4 are eligible for Phase sweep.
- Available ONLY for balanced pairs.

The phase of the selected port (3 or 4) is swept relative to the phase of the other port (1 or 2) in the balanced pair.

Phase Sweep is similar to phase offset, except that for each data point, the phase 'offset' is incremented.

For example, with the topology that is selected in the above image: (Bal-Bal) Logical port 1 = PNA ports 1 and 3. For a phase sweep with 7 data points, from 0° to 180°, the phase difference between port 1 and port 3 increments 30° with each data point:

<table>
<thead>
<tr>
<th>Data point</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delta phase</td>
<td>0°</td>
<td>30°</td>
<td>60°</td>
<td>90°</td>
<td>120°</td>
<td>150°</td>
<td>180°</td>
</tr>
</tbody>
</table>

**Enable Phase Sweep**  Check to enable phase sweep for the specified port.
**Sweep Phase** Choose EITHER PNA Port 3 OR Port 4 to sweep. Only ONE port can be phase swept.

**Start / Stop Phase** Enter phase values in degrees. Each sweep will start and stop at these settings.

**Offset (phase) as Fixture**

In the following image, the PNA phase sweep is shown as a phase shifter that is "virtually" located EITHER before the reference receiver (top) OR after the reference receiver (bottom) - NOT BOTH. This image is useful as a model ONLY.

**NOT checked** - The phase shift occurs at each data point and the reference receiver measurement sees the same phase shift as the DUT.

The response is measured as though a true phase sweep is stimulating the differential input to the DUT.

**Checked** - The phase shift occurs at each data point, but the reference receiver measurement does NOT see the shift.

Use this setting to compensate for a component or fixture that may present a phase shift before or after the DUT.

---

**One use for Phase Sweep**

Do the following to find best the best operating point:

1. Phase sweep port 3, from 0° to 180°. Note the peak of Sdd21. This finds the phase offset of the input differential port.

2. Set port 3 **fixed offset** to the phase that has the highest Sdd21.

3. Then, phase sweep port 4 (balanced port 2) to find the phase offset of the output differential port.

4. Then set the port 4 to fixed phase offset found.

This measures the best possible case Sdd21 for the DUT.

---

**Power and Attenuators Settings**

Set stimulus power levels using the standard PNA Power and Attenuators dialog.

To set power, press **STIMULUS**, then [Power and Attenuators]
Power and Attenuation (with True Mode Stimulus) dialog box help

When a True Mode Stimulus is selected in the Balanced DUT Topology dialog, the balanced ports are shown on the top rows of the dialog. The individual PNA port settings are displayed but can not be changed directly.

**Port Powers Coupled** Check to couple all power settings for Balanced Port 1 and Balanced Port 2. Clear this box to make independent power settings for these logical ports.

**State** Should be left in Auto for iTMSA measurements. [Learn more about his setting.](#)

**Port Power** Set power for the balanced port. Power for PNA ports, shown below balanced ports, are set to 3 dB less, or half power. [Power Offset](#) is made in addition to this setting, and on only PNA port 3 and port 4. Offset Power is NOT reflected on this dialog nor on the X-Axis.

**Start and Stop Power** Available when sweep type is set to power sweep.

**Auto Range** Check to allow the PNA to select the optimum attenuation value to achieve the specified test port power. Clear to manually set the attenuation for each port. Type or select the attenuation value in the adjacent Attenuator Control box. When the attenuator setting of a logical port is changed, then the attenuators of the PNA ports associated with that logical port change to the same value.

**Leveling Mode** Open Loop leveling is available only on ports 1 and 3. [Learn more.](#)

**Note:** The range of leveled power (ALC range) for balanced ports is 3 dB higher than it is for each individual PNA port. For example, if a PNA source port with 0 dB attenuation will supply leveled power from -30dBm to +15dBm, then the balanced logical port has a range of -27dBm to +18dBm. [Learn more about Leveled Power.](#)
- **Port 4** for BAL Port 2

Port 1 and Port 2 power levels are adjusted to these ports in the initial sweep.

**Receiver Measurements**

Any pair of receivers can be viewed as a ratio using the following dialog.

Unratioed measurements using reference receivers (an ‘R’ receiver as numerator and 1 as denominator) are NOT accurate.

To select these measurements, press **Meas**, then **[Receivers]**

---

Create / Change Receiver Measurements (with True Mode Stimulus) dialog box help

Click **Activate**

- For RATIOED measurements, Select a receiver for the Numerator and select a receiver for the Denominator.

- For UNRATIOED measurements, Select a test port receiver (A, B, C, or D) for the Numerator. Reference receiver measurements are NOT accurate. Select 1 for the Denominator.

For example, with a Bal-Bal topology, the above selections show a R3/R1 measurement. R (reference) receivers measure the stimulus to the DUT. An R3/ R1 trace shows the difference between the two sources that comprise logical port 1. With Log format, a power offset between the two sources is visible. With Phase format, a phase offset is visible.

**Source Port** Specifies whether a Differential stimulus or Common mode stimulus is used for the measurement.

- With Source Port 1 or 2 selected, then **Differential** stimulus is used for the unratioed measurement which causes **180° offset** between the sources.
  
  - Source Port 1 = Differential stimulus on BAL1 port
  
  - Source Port 2 = Differential stimulus on BAL2 port

- With Source Port 3 or 4 selected, then **Common** mode stimulus is used for the unratioed measurement which causes **0° offset** between the sources.
  
  - Source Port 3 = Common-mode stimulus on BAL1 port
  
  - Source Port 4 = Common-mode stimulus on BAL2 port

---

Noise Figure Options Explained (029, 028, H29)

See Also: PNA-X Noise Figure Options (PNA Configuration Guide) - Internet connection required
• **029** - (PNA-X ONLY) Includes two low-noise receivers and noise tuner bypass switch to enable noise figure measurements to 26.5 GHz. Also has Opt 028 capability.

• **028** - Uses standard PNA receivers to measure noise figure. A noise source is NOT required during calibration. Any two ports can be used. Use with DUTs that have sufficiently high gain and noise figure. Additional filtering may be necessary. Learn more.

• **H29** - Noise Figure on N5244A (43.5 GHz PNA-X model) and N5245A (50 GHz PNA-X model). Includes both:
  
  - Opt 029 (noise measurements to 26.5 GHz)
  

**Noise Figure Application Features**

• Cold noise method includes correction for imperfect system source match, for highly accurate noise figure measurements.

• Operates from 10 MHz to 50 GHz, with choice of low-noise receivers to 26.5 GHz or standard receivers to 50 GHz. (Opt 028)

• Opt 029 measures devices with Noise Figure values ranging from about 0 to 50 dB and devices with GAIN ranging from about -40 to +60 dB. Learn more.

• Measure noise figure of frequency translating devices. Learn more.

• During calibration, ENR values are interpolated for frequencies between the supplied data points.

**Noise Figure Application Requirements**

• Noise Tuner (ECal Module - N4691B m-f recommended). Not required for Scalar Noise Figure. Opt 029 provides an additional cable and adapter to connect the ECal module to the front-panel connectors. Learn more.

• Power Meter - Required when calibrating NFX (Noise Figure on Converters).

• Recommended: An accurate thermometer. Learn more.
**Noise Source**

Beginning with PNA Rev. A.09.41 a Noise Source is NOT required to calibrate the Opt 029 Noise Receivers. Instead, the Noise Receivers can be calibrated using a calibrated PNA source. [Learn more](#).

When using a Noise Source, the following requirements apply:

- **Agilent 346C Noise Source (recommended):** Covers the same frequency range as the PNA. NOT required with Opt 028. The 346B Noise Source can be used up to 18 GHz. The 346A can also be used, but requires more [averaging](#) for calibration.

- **An adapter may be necessary to connect the Noise Source to the PNA port 2 reference plane during calibration.** Cal Kit (or second ECal module) with same connector type and gender as DUT connectors.

**Limitations with the Noise Figure Application**

The following features are NOT supported in a Noise Figure channel:

- **FCA (opt 083) or Frequency Offset (opt 080).**

- **Analog sweep.** All frequency sweeps are STEPPED.

- **External Test Set Control** (Opt 550 or 551)

- **Receiver calibration.**

- **Enhanced Response Cal**

- **ECal User Characterization.**

- **Some Fixturing Features**

- **Auto Formatted Citifile** data.

- **Pulsed** Noise Figure measurements are supported with the following limitations:

  - Minimum 300 microsecond pulse width using 24 MHz noise bandwidth

  - Narrower noise bandwidths cause larger minimum pulse widths

  - A drop-out may occur at start of sweep and at 3 GHz. This is corrected by a 1 ms pulse width at 24 MHz Noise BW.

**Noise Concepts**

The following conceptual information is a short summary taken from the [Agilent Noise Figure App Note 57-1](#).

All electronic circuits have some degree of random noise. The most common form is thermal noise, which increases as the temperature of the circuit increases.
The signal-to-noise (S/N) ratio of components in a communications system is a very important parameter. To improve the S/N ratio, it is usually easier and more cost-effective to reduce noise than to increase signal power. In order to reduce noise, an accurate method to measure noise is required.

**Noise Figure**

Noise figure is the degradation in the signal-to-noise ratio as a signal passes through a device. For example, in the following images:

(a) At the INPUT of an amplifier:
The noise floor is -100 dBm, the signal is at -60 dBm, **40 dB** above the noise floor.

(b) At the OUTPUT of the same amplifier:
The gain has boosted the signal AND the noise floor by 20 dB.
The amplifier then added 10 dB of its own noise.
The output signal is now only **30 dB** above the noise floor.
Since the degradation in signal-to-noise ratio is 10 dB, the amplifier has a **10 dB noise figure**.

For consistency, noise measurements are calculated as if using a 1 Hz bandwidth, although measurements are almost always made at higher bandwidths.

The following formula shows the lowest possible noise power in dBm at 290° K (room temperature). The only way to measure noise lower than this is to make the measurement at a lower temperature.

- \( P = 10 \log(4.0 \times 10^{-21} \text{ watts} / 0.001 \text{ watt}) \)
- \( P = -174 \text{ dBm} / \text{ Hz} \)

**How the Noise Figure Application Works**

The goal of the Noise Figure application is to accurately measure the noise that is generated by the DUT. This may be done using special low-noise receivers or using the standard PNA receivers depending on whether the PNA has Options 029 or 028. Learn more. The low-noise receivers are calibrated using a characterized noise source. The standard receivers are calibrated using a power meter and a measurement of the receivers effective
noise bandwidth. Learn more about the noise calibration process.

Some noise measurement error is caused by a poor source match presented to the DUT input. Therefore, during every measurement, the Noise Figure Application uses an ECal module to present at least four different impedances at the input of the DUT. This “Noise Tuner” is connected to the PNA port 1 front-panel loops that are in the PNA internal source path (see block diagram below). From the measurements at various impedance states, the PNA calculates the noise out of the DUT as though the PNA were exactly 50 ohms. No assumptions are made regarding the input impedance of the DUT.

Here is how a Vector Noise Figure measurement is made using Option 029. The sweep numbers are annotated on the PNA display as they occur.

1. With the noise tuner in the THRU state, S-parameter measurements are made to accurately characterize the gain of the DUT. This requires sweeps in both forward and reverse directions. (sweep #1 and #2).

2. The noise measurements are performed next. PNA source power is turned OFF and the noise tuner is switched to the first impedance state.

3. At each frequency, the noise receiver samples a large number of readings in order to attain one valid measurement. If Noise Averaging is selected, the specified number of measurements are made and averaged together to obtain one noise measurement. This continues for all frequencies (sweep #3).

4. The next noise tuner impedance state is switched IN and the noise measurements in step 3 are repeated. This occurs until measurements are made at all impedance states. At least four impedance states must be used. (sweeps #4, #5, #6+)

5. Calibration error terms are applied and calculations made to simulate the measurement with a perfect 50 ohm input impedance. The sweep result is plotted on the PNA display.

6. The PNA begins sweeping again with step 1.

Scalar Noise Figure Measurements

Scalar Noise Figure measurements can be made beginning with PNA Rev. A.08.50.

As described above, the noise tuner is switched to at least four different impedance states before a sweep is plotted. These sweeps are NOT made in a Scalar Noise Figure measurement, resulting in much faster measurements. Of course, a Scalar Noise Figure measurement is NOT as accurate as a Vector Noise Figure measurement because Scalar Noise Figure measurements assumes that all impedances are 50 ohms. Measurement accuracy can be improved by adding an attenuator as close to the DUT input as possible. This improves the effective system source match. The effect of the attenuator loss is removed during the calibration process.

With Scalar Noise Figure, it is not necessary to connect the noise tuner. If a noise tuner remains connected, it is switched to the THRU state for Scalar Noise Figure measurements. This results is a small amount of loss which slightly degrades measurement accuracy. To increase measurement accuracy, manually switch the noise tuner switch to the INTERNAL position. Learn how.

Select Scalar Noise Figure at the first page of a Noise Figure calibration.

PNA-X Option 029 - Block Diagram with Noise Figure components
Noise Figure Components are shaded yellow

- At test port 1 front-panel loops, a **noise tuner bypass switch** connects the noise tuner (ECal module) in series with Source1 providing several different input impedances.

- At test port 2, a **switch** and **coupler** to route RF from the DUT output to **two noise receivers**. The appropriate receiver is automatically switched as required for frequency being measured.

**Making S-parameter measurements and the Noise Tuner Switch**

The default setting for the port 1 noise tuner bypass switch is EXTERNAL, as shown in the above diagram. This setting always provides incident power through the front panel loop. When an ECal module is connected, it may NOT be in the THRU state, which is necessary for accurate S-parameter measurements. This can be changed in any of the following ways:

- Set the switch to INTERNAL for the S-parameter channel using the **path configuration** dialog.

- Set the switch to INTERNAL for the S-parameter channel using the following commands:
  - **SCPI** - `SENS:PATH:CONF:ELEM:STAT Port1NoiseTuner, Internal`
  - **COM** - `PathConfiguration.Element(Port1NoiseTuner).Value = Internal`

- Set the switch default to INTERNAL using a **preference setting**.
Set the Noise Tuner (ECal module) to the THRU state using SCPI: CONT:ECAL:MOD:PATH:STATE.

**Noise Figure App vs Noise Figure Analyzer**

In comparing the PNA Noise Figure App measurements with the NFA Series Noise Figure Analyzer measurements, you may obtain different results. This is because the Noise Figure Analyzer assumes that the noise source has a perfect 50 ohm match. This assumption is often valid for low-ENR sources, but is NOT a good assumption for high-ENR sources, or when there are cables, adapters, switches, probes, etc. between the noise source and the DUT. Using advanced calibration methods, the PNA Noise Figure App calculates noise figure as though it were a perfect 50 ohm match.

In addition, the PNA measures the amplifier gain with vector error correction applied to reduce measurement uncertainty.

**Noise Power Parameters**

Several noise power parameters, as well as standard parameters, can be measured in the same Noise channel.

**How to add Noise Power Parameters**

1. Create a Noise Figure channel.
2. Then do the following:

   **Using front-panel HARDKEY [softkey] buttons**
   1. Press TRACES
   2. then **[New Trace]**
   3. then select a parameter

   **Using a mouse with PNA Menus**
   1. Click Trace/Chan
   2. then **New Trace**
   3. then select a parameter

**Noise Figure Parameters that are offered:**

- **Noise Figure (NF)** - Explained in Noise concepts.
- **Excess Noise Ratio** - Select when measuring the noise source. Compare with the ENR table to validate accuracy of the system. ENR is calculated as:

  \[
  \text{ENR (in dB)} = 10 \log_{10}(\frac{T_{\text{hot}} - T_{\text{cold}}}{T_0}), \text{ where } T_0 = 290K.
  \]

  Learn more about the ENR table and Noise Source. Learn more about Noise Source ENR measurements.

- **T-Effective** - The effective temperature, in Kelvin, of the measured noise level. For example:
290° K = -174 dBm/Hz.

$T_e$ is the unknown variable

$$P_{out} = kBG_d(T_{cold} + T_e)$$

Available Gain $G_a$ is a function of $S_{11}$, $S_{22}$, and $\Gamma_s$

The Noise Power parameters below are offered in the following two formats:

- **Available Noise Power** The calculated power that is based on an ideal impedance match at the output of the DUT. These parameters have always been offered in the PNA Noise Figure App.

- **Incident Noise Power** - An 'I' is appended to the end of the Available Noise Power parameter. The calculated power into a perfect 50 ohm noise receiver, regardless of the output impedance of the DUT.

**Noise Power Parameters**

- **SYSNPD / SYSNPD** - System Noise Power Density: Total noise power available at the ADC, including the noise contributed by both the DUT and the internal noise receiver. This is generally expressed as an absolute power measurement in dBm, but can also be expressed in Watts or Kelvin.

  $\text{dBm} = 10 \log_{10}(k \times T \times B \times 1000)$

  where:

  $k =$ Boltzmann’s constant

  $T =$ the measured noise temperature

  $B =$ bandwidth

  $1000 =$ conversion from milliwatts

- **SYSRNP / SYSRNPI** - System Relative Noise Power: The noise temperature of the combined DUT and receiver relative to 290 Kelvin. This is generally reported as a ratio in dB. Therefore a perfectly quiet device would render a trace at 0 dB.

  $\text{dB} = 10 \log_{10}(T/290)$
• **DUTNPD / DUTNPDI** - DUT Noise Power Density: When correction is ON, this trace exhibits the available noise power, best described as the maximum power available from the DUT where the impedance of the noise port is equal to the output match of the DUT. To be more precise, this occurs when the noise port match is equal to the conjugate of the output match of the DUT. The noise power contributed by the receiver is removed.

When correction is OFF, the trace exhibits what is more accurately described as delivered power. Delivered power is the power actually seen by the ADC. Any mismatch between the receiver and the DUT is ignored. The noise power contributed by the receiver is removed.

This measurement is generally expressed in dBm:

\[ \text{dBm} = 10 \log_{10} \left( \frac{\text{DUT Temperature} - \text{Receiver Temperature}}{B \times 1000} \right) \]

where:

- \( B \) = bandwidth
- \( 1000 \) = conversion from milliwatts

• **DUTRNP / DUTRNP** - DUT Relative Noise Power: This measurement is rendered as a ratio of the DUT temperature to 290 Kelvin. It is generally expressed in dB. The same comments apply with respect to available versus delivered power as described above for DUTNPD.

\[ \text{dB} = 10 \log_{10} \left( \frac{\text{DUT Temperature} - \text{Receiver Temperature}}{290} \right) \]

**Standard Parameters that are offered**

• **S-parameters**: S11, S21, S22, S12

• **Unratioed parameters** using the following notation: (Receiver, source port). These parameters REPLACE the active measurement. To do this (from front-panel ONLY), press **Meas**, then **[More]**, then **[ Receivers]**.

  - (R1,1), (R2,2), (A,1), (A,2), (B,1), (B,2)

**Using the Noise Figure Application**

Use the following general procedure to make Noise Figure measurements:

1. **Connect Tuner and Noise Source**.
2. **Create a Noise Figure Measurement**.
3. **Make Noise Figure Settings**.
4. For Opt 029 and H29, copy your Noise Source ENR file to the PNA C:/Program Files/Agilent/Network Analyzer/Noise folder.
5. **Perform Calibration**
6. Connect the DUT. Learn more about DUT input and output ports.

7. Measure Noise Figure.

8. **Optional** Click File, then Save to save Noise Figure data in the following formats: (available ONLY when NF correction is ON.)

   - *.CTI  Citifile
   - *.PRN
   - *.nco  Noise Correlation Matrix data in S2P format. See Noise Model.

See Also: Measurement Tips

**Connect Noise Tuner and Noise Source**

1. Connect the **noise source** to the 28V connector on the PNA rear panel. **NOT required for Opt 028.** The Noise Source is turned ON and OFF automatically as needed during a calibration. Connect the noise source to Port 2 reference plane when prompted during calibration.

2. Connect the **noise tuner** (ECal module). **NOT required for Scalar Noise Figure** measurements.

   a. On the PNA front panel, remove the **Port 1** jumper cable SOURCE OUT / CPLR THRU. Opt 028 allows Noise Figure measurements using any two PNA ports. Connect the noise tuner to the front-panel jumpers for the source (DUT input) port.

   b. Connect M-F tuner (N4691B-M0F) using the supplied cable (N5242-20137) and adapter (85052-60013).

   c. When using F-F ECal module (N4691B-00F), order a 3.5 mm M-M adapter (85052-60014).

**Create a Noise Figure Measurement**

1. On the PNA front panel, press **Meas**, then [Measurement Class]

2. Select **Noise Figure Cold Source**, then either:

   - **OK** delete the existing measurement, or
New Channel to create the measurement in a new channel.

3. A Noise Figure measurement is displayed. To select additional parameters to display, click Response, then Measure, then select a parameter from the list.

How to start the Noise Figure Setup dialog

To provide quicker access, use the Setup softkey. Learn how.

Using front-panel HARDKEY [softkey] buttons |
Using a mouse with PNA Menus

1. Press FREQ
2. then [Noise Figure Setup]
1. Click Response
2. then Measure
3. then Noise Setup

Noise Figure Setup dialog box help

Note: In this topic, the term Jitter is used to describe the trace-to-trace fluctuations in a measurement. In other topics, this is called 'trace noise'.

Bandwidth/Average

The following two settings work together to achieve the optimum balance of measurement accuracy versus speed:

**Noise Bandwidth** Increase the bandwidth to reduce the amount of trace noise on the noise power or noise figure measurement (jitter). However, a wider setting reduces the frequency resolution of the measurement. The noise bandwidth setting should always be smaller than the bandwidth of the DUT. The noise bandwidth setting is used only while measuring noise powers, and is independent from the IF bandwidth setting used to measure S-parameters. Noise figure is calculated from noise power and S-parameter measurements.

Note: The calibration and measurement should be performed using the SAME noise bandwidth. When the noise bandwidth is changed after calibration, noise figure measurements can change by 0.5 dB or more, depending on the DUT frequency range, gain, and noise figure.
Average Number  Increase the number of averages to reduce jitter. This also increases measurement speed. For maximum accuracy, use the following recommendations for the noise calibration. When using the noise receivers, 10 noise averages is recommended. When using the standard receivers, at least 100 averages are recommended.

During a measurement, the gain of the DUT helps overcome the noise of the PNA receivers, so the number of noise averages can be reduced to improve measurement speed with minimal or no degradation to measurement accuracy.

Noise Receiver

NA (Network Analyzer) Receiver (Opt 028) - Use a standard PNA receiver to measure noise figure.

- Connect the DUT to any PNA ports. For Vector NF measurements, connect the noise tuner to the source port.
- The sum of the gain and noise figure of the DUT must be at least 40 dB. This ensures that there is sufficient DUT noise power for the PNA to measure. Learn more.
- Additional filtering may be required. Learn more.

Noise Receiver (Opt 029) - Use internal low-noise receivers to measure noise figure.

- Opt 029 measures devices with Noise Figure values ranging from about 0 to 50 dB and devices with GAIN ranging from about -40 to +60 dB. Learn more.
- Amplifiers with higher gain can be measured by adding an attenuator to the output of DUT and using fixture de-embedding to remove the attenuator loss. An alternative for measuring high-gain devices is to use the standard receivers (Opt 028) as they have a higher compression level.

Receiver Gain

This setting is NOT available when Noise Receiver is set to NA (Network Analyzer) Receiver (Opt 028). With knowledge of your DUT gain, set the appropriate amount of receiver gain in order to optimize the power level at the noise receiver.

The following values reflect the SUM of the DUT gain (dB) PLUS NF (dB). For example: DUT gain = 20 dB; NF = 10 dB; SUM = 30 dB.

- Select High if the SUM is relatively low (<30 dB).
- Select Medium if the SUM is about average (20 dB to 45 dB).
- Select Low if the SUM is relatively high (>35 dB).

There is considerable overlap in these settings. Because all three gain settings are calibrated with each Noise Calibration, this setting can be changed after calibration to achieve the least amount of jitter without overpowering the noise receiver.

One of following messages appears when too much power is detected at the noise receiver:

- Compression in noise receiver: excess signal - The noise receiver is likely compressing. NF results
are possibly not accurate. Select a lower gain setting.

- **Compression in noise receiver: gain has been limited** - The gain has been limited to avoid damage to the receiver. NF results are NOT accurate. Select a lower gain setting.

- **ADC over-range in noise receiver: excess signal** - Often caused by a CW signal, an oscillation, or LO feedthru during an NF measurement. Find and correct the cause, or try a lower gain setting.

Only ONE gain setting can be used for the entire frequency range of your noise measurement. Therefore, it may be necessary to use two noise channels with different frequency ranges and gain settings to achieve the very highest noise figure accuracy.

**Ambient Temperature**

Enter the room temperature at the time of the measurement, in Kelvin. For best results, use a thermometer to read the temperature at the PNA test port 1 or the DUT input cable.

This ambient temperature number has an inverse relationship to the noise figure. When using the effective noise temperature (Te) format, a 3 degree increase in the ambient temperature will make the overall measurement result drop 3 degrees.

**Impedance States**

- **Noise Tuner** Displays the ECal module to be used as a noise tuner. Select the Noise Tuner during calibration on the Select Cal Method dialog.

- **Max Acquired Impedance States** Select the number of impedance states in which to make noise measurements. At least FOUR impedance states are required. Learn more

![Frequency Sweep Settings](image)

### Power Tab - Noise Figure dialog box help

#### Note:
S-parameter power settings are critical for accurate Noise Figure measurements. [See Noise Figure Measurement Tips](#).

Configures RF power settings for the S-parameter measurements that occur before noise measurements. Input power to the DUT is turned OFF during noise measurements.

These settings can also be made from the normal [Power setting](#) locations.

**Power ON (All channels)** Check to turn RF Power ON for all channels.

### DUT Input Port

- **Opt 028** - Select a PNA port to be connected to the DUT input.
- **Opt 029**
  - **Scalar Noise Figure** - Select a PNA port other than port 2.
  - **Vector Noise Figure** - The DUT input CAN be connected to any PNA port other than port 2. However, without a noise tuner bypass switch, measurements on other channels that use the same source port will always go through the noise tuner. The noise tuner must be connected to the source loop of the selected port.

#### Note: Input power levels are critical for accurate Noise Figure measurements. [Learn more](#).

**Power Level** The input power to the DUT during S-parameter measurements.

**Source Attenuator Auto** Check to automatically select the correct attenuation to achieve the specified input power. Clear, then select attenuator setting that is used achieve the specified Power Level. [Learn more about Source Attenuation](#).

All PNA channels in continuous sweep must have the same attenuation value. [Learn more](#).

**Receiver Attenuator** Specifies the receiver attenuator setting for port 1.

**Source Leveling** Specifies the leveling mode. Choose Internal. Open Loop should only be used when doing [Wideband Pulse measurements](#) (not available with Noise figure measurements).

### DUT Output Port

- **Opt 028** - Select a PNA port to be connected to the DUT output.
- **Opt 029** - Connect the DUT output to PNA port 2.

**Output Power** Sets power level in to the output port for reverse sweeps. Port power is automatically uncoupled. Reverse sweeps are always applied to the DUT when Full 2-port correction is applied. [Enhanced Response Cal](#) is NOT available for Noise Figure measurements.

**Source Attenuator** Specifies the source attenuator setting for reverse power.

**Receiver Attenuator** Specifies the receiver attenuator setting for the output port. [Learn more about Receiver Attenuation](#).

**Source Leveling** Specifies the leveling mode. Choose Internal.
Noise Path Configurator dialog box help

**Port 1 Noise Tuner Switch (Opt 029)** The orange line between CPLR THRU and SRC OUT represents the Noise Tuner. The **External** setting switches IN the Noise Tuner when making noise measurements.

**Port 2 Noise Receiver Switch (Opt 029)** allows you to make Noise Receiver measurements.

To prevent premature wear on the above two Noise switches, the PNA does not allow these switches to be thrown when sweeping a Noise channel and non-Noise channel. To make Noise Figure measurements and non-Noise Figure measurements in different channels and continuously trigger both, set these switches to the same state as the Noise channel:

- With the **non-Noise Figure channel** active, go to **Noise Path Configurator**.
- Set Noise Tuner switch to **External**. This routes source power to the front-panel loops, and to the Noise Tuner when connected. Use **CONT:ECAL:MOD:PATH:STATE** to set the internal state of the Noise Tuner to THRU, which creates a small amount of additional loss in the source path.
- Set Noise Receiver Switch to **Noise Receiver**.

**Noise Figure Measurement Tips**

**Note:** In this topic, the term **Jitter** is used to describe the trace-to-trace fluctuations in a measurement. In other topics, this is called 'trace noise'.

**Option 029**

*See Opt 028 (NF with Standard Receiver)*

- Measures devices with Noise Figure values ranging from about 0 to 50 dB and devices with GAIN ranging from about -40 to +60 dB.
- Highest Noise Figure accuracy is attained when the sum of device Noise Figure + GAIN is between 0 dB to
For highest Noise Figure accuracy and stability, there should be the least amount of electrical loss possible between the DUT output and PNA Port 2.

**Power level at the DUT Output - Opt 029**

S-parameters are used to measure the gain of the DUT before each series of noise measurements. Jitter in the S-parameter measurements corresponds directly to jitter in the noise measurements.

For best noise figure accuracy, the power level out of the DUT should be between 15 dB and 20 dB below the compression point of the DUT during the S-parameter portion of the noise figure measurement.

To reduce jitter, the power level at the B receiver (port 2) should be above approximately -20 dBm. Much below this level, S-parameter measurements have more jitter. Power must be below +10 dBm as the B receiver starts to compress at this point, although there is no warning or annotation that shows this condition is occurring in S-parameter measurements.

The best way to monitor power at the B receiver is to display a B,1 measurement. With your DUT in place and powered ON, change the input power to the device and note the power at the B receiver.

- For low-gain amplifiers, use 5 dB of source attenuation to improve the uncorrected match of port 1.
- For high-gain amplifiers, source and receiver attenuation may be required. Use the lowest possible attenuation values.

Attaining the optimum power level during calibration can also be challenging since calibration is performed without the DUT in place. Because of this, it is often necessary to set source power higher during the calibration than during the measurement. This will cause the 'CA' annotation on the status bar. Measurement results are accurate as long as the step attenuators and other configuration switches are in the same position and all receivers remain in their linear range (below +10 dBm).

It is best to find the optimum power and attenuation settings for both the calibration and subsequent noise measurements before performing a calibration.

**IF Bandwidth**

Jitter is further reduced by narrowing the IF bandwidth. If the calibration needs to be performed at a low source power, or with receiver attenuation due to high DUT gain, the IF bandwidth should be reduced during the calibration to reduce jitter. The IF bandwidth can then be increased to improve measurement speed. The CA annotation can be ignored when changing IFBW after calibration.

**Noise Settings**

See Noise Figure dialog box help for a complete description of these important settings.

**Temperature**

Noise Figure measurements are extremely sensitive to temperature. As such, there are two settings that require an accurate temperature measurement: At the DUT input, and at the Noise Source connector.

**Interference**

When measuring the noise figure of an unshielded device, like an amplifier on a printed-circuit board, it is very common to pick up interference from external signals such as cellular phones, wireless LAN, or mobile radios. This
interference shows up as non-repeatable spikes in the measurement, as shown below.

![Graph showing interference spikes](image)

Usually, the interference adversely affects the noise figure measurement only at the frequency where it occurs. However, if the interference is large enough and present all of the time, it can cause the noise receivers to compress, which results in inaccurate measurements at many frequencies. In this case, the noise figure measurements should be done in a shielded environment like a screen room.

**Option 028**

**Noise Figure of PNA receiver** - Option 028 gives you the flexibility to measure noise figure using a standard PNA receiver. For best measurement accuracy, the DUT excess noise power (gain plus noise figure in dB) should meet or exceed the noise figure of the receiver (typically about 40 dB, reference to the test port). For devices that do not meet this requirement, there are two alternatives:

1. Reverse the main arm and coupled arm of the test-port coupler (see following images). This increases the signal to the receiver port by about 15 dB, while lowering the available port power by the same amount. This is a good tradeoff for noise figure measurements, as it lowers the excess noise threshold mentioned above from 40 dB to about 25 dB.

   ![Block diagram](image)  
   ![Re-configured coupler](image)

   Re-configure the receiver port front-panel loops to a vertical orientation.

   Block diagram showing port 2 through coupler main arm to B receiver.
2. Add an low-noise amplifier (LNA) to the receiver loop (see following image). This boosts the noise power at the receiver by the gain of the LNA. The disadvantage is the possibility of measurement drift and receiver compression. Any change in the gain of the LNA will have an impact on measurements that use the receiver with the LNA, so frequent calibration may be required. Care should also be taken when setting the channel power (used during the gain portion of the measurement) to ensure that the added gain of the LNA does not cause receiver damage or compression. A filter is also required on the output of the LNA (not shown). Learn more.

Filtering Requirement (Option 028)
Opt 029 includes noise receivers with filtering to keep mixing-product noise out of the low-noise receivers. These filters are not available when measuring noise with the standard PNA receiver. Therefore, for best measurement accuracy, a filter should be used at the output of the DUT (or LNA preamp if used).

- A bandpass filter at the frequencies of interest can always be used.
- A lowpass filter can be used when the PNA is doing fundamental mixing (up to 26.5 GHz). The lowpass filter must pass the fundamental frequency of the measurement but suppress the third harmonic. A measurement at 1 GHz would need a lowpass filter with a cutoff below 3 GHz, while a 5 GHz measurement would need a filter with a cutoff below 15 GHz.
- A single highpass filter can be used when the PNA is doing 3rd harmonic mixing (from 26.5 to 50 GHz). Use a highpass filter with cutoff about 18 GHz.

Using Noise Figure Traces in Equation Editor
In a Noise Power trace, the underlying unit is noise temperature.

\[10 \times \log_{10} \left( \text{temperature} \times 1000 \text{mw/w} \times 1.38 \times 10^{-23}\right)\]

(1.38e-23 is Boltzmann's constant)

Any time you use Equation Editor on a Noise Power trace, the LogMag formatting will apply the above equation. Therefore, first select REAL format and then generate the equation.

Noise Model and the Noise Correlation Matrix
The noise wave model of any linear 2-port network may be represented by the following image:
This shows a noiseless 2-port network with noise waves \( a_{n1} \) and \( b_{n1} \) added to the input terminals. 

The noise correlation matrix relates to the noise waves as follows:

\[
C_t = \begin{bmatrix}
|a_{n1}|^2 & \bar{a}_{n1} \bar{b}_{n1} \\
\bar{b}_{n1} \bar{a}_{n1}^* & |b_{n1}|^2
\end{bmatrix} = \begin{bmatrix}
c_{11} & c_{12} \\
c_{21} & c_{22}
\end{bmatrix}
\]

Where:

- \(|a_{n1}|^2\) and \(|b_{n1}|^2\) are time-averaged noise power in 1 Hz bandwidth.
- \(\bar{a}_{n1} \bar{b}_{n1}\) and \(\bar{b}_{n1} \bar{a}_{n1}^*\) are time-averaged cross correlation terms, correlation of \(a_{n1}\) to \(b_{n1}\).

---

**Radio-Frequency Electromagnetic Field Immunity**

When a 3V/m-1 radio-frequency electromagnetic field is applied to an PNA with Opt 029 according to IEC 61000-4-3:1995, degradation of performance may be observed. When the frequency of the incident field matches the frequency of a measured noise figure or gain, the values displayed will deviate from those expected. This phenomenon will only affect that specific frequency, and the analyzer will continue to perform to the specification at all other frequency sample points.

The PNA with Opt 029 may be unable to calibrate a chosen frequency sample point if the frequency matches that of an incident electromagnetic field.

---

Noise Figure on Converters (NFX) - Opt 028 and Opt 029

This topic discusses Noise Figure on Converters:

- Requirements and Limitations
- How to Configure your Hardware
- NFX Parameters
- Create a NFX Measurement
- Valid Mixer Configuration / Sweep Type Combinations
  - Frequency tab
  - Power tab
  - Mixer Frequency tab (separate topic)
  - Mixer Power tab (separate topic)
  - Mixer Setup tab (separate topic)

The following general information (contained in Noise Figure Application for Amplifiers) is also relevant for NFX measurements:

- Noise Figure Options Explained (029, 028, H29)
- Features and Requirements
- Noise Concepts
- How the Noise Figure Application Works
- Scalar Noise Figure Measurements
- Perform Calibration
- Noise Figure Measurement Tips
- Noise Model and the Noise Correlation Matrix

### Other Application Topics

### Requirements and Limitations

Noise Figure on Converters requires Noise Figure (Option 0pt 028 or 029) and FCA (Opt 082 or 083).

Learn more about Noise Figure requirements.
Limitations

- Upconverters OR downconverters ONLY (not both).
- Image rejection is NOT provided in NFX.

The following PNA features are **NOT** available with NFX:

- Analog Sweep ([Stepped sweep](#) mode only)
- Log frequency sweeps
- ECal User Characterization
- Time Domain
- Balanced measurements
- Save [Formatted Citifile](#) data.
- Interface Control
- Some Fixturing Features
- External Test Set Control (Option 551)
- Pulse measurements
- See Frequency Limitations

**Embedded LO** measurements **ARE** supported in NFX. [Learn more.]

How to Configure your Hardware

The PNA-X is extremely versatile, and can be configured in many ways to make NFX measurements. While not all conceivable configurations are documented here, a few of the most common examples are provided to show the basic concepts.

**DUT Configuration**

[Learn more about connecting the DUT input and output to the PNA.](#)

The DUT LO can be connected to an external source OR [PNA internal second source (if available).](#)

Select an LO Source on the [Mixer Setup tab.](#)

**Note:** Noise that is present on the LO source will be directly transferred to the DUT output. This noise can NOT be calibrated out of the noise measurement. Therefore, choose a low-noise source for the LO, such as an Agilent ESG or PSG, which is better than the PNA internal source.

**External LO Source though Port 3 or Port 4 (4-port PNA-X only)**

- Connect the DUT LO to PNA-X Port 3 or Port 4.
- Connect external source to rear-panel J7 (Rear-panel load on below diagram) for Port 3; J3 for Port 4.
  - For Port 3, NO switching is required.
  - For Port 4, switch Port 4 Bypass Switch to Rear Panel.

**PNA-X Internal LO Source**

- SRC 2 Out 1 or Out 2 on front-panel or 2-port / 2-source PNA-X
- Port 3 or Port 4 on 4-port PNA-X

**Path Configurator - Default configuration on PNA-X option 423**

- By default, Internal source2 (Src2) is supplied at ports 3 and 4.
- Bypass switches must be in “Thru Path”

**NFX Parameters**

Several noise power parameters, as well as mixer parameters and unratioed parameters, can be measured in the same NFX channel.
How to add NFX Parameters

</tbody>
</table>

Noise Figure Parameters that are offered:

- **Noise Figure (NF)** - Explained in Noise concepts.
- **Excess Noise Ratio** - Select when measuring the noise source. Compare with the ENR table to validate accuracy of the system. ENR is calculated as:

  \[
  \text{ENR (in dB)} = 10 \log_{10} \left( \frac{T_{\text{hot}} - T_{\text{cold}}}{T_0} \right), \text{ where } T_0 = 290 \text{K.}
  \]

  Learn more about the ENR table and Noise Source. Learn more about Noise Source ENR measurements.

- **T-Effective** - The effective temperature, in Kelvin, of the measured noise level. For example:

  \[
  290^\circ \text{K} = -174 \text{dBm/Hz.}
  \]

  \( T_e \) is the unknown variable

  Available Gain \( G_a \) is a function of \( S_{11}, S_{22}, \) and \( \Gamma_s \)

  The Noise Power parameters below are offered in the following two formats:

  - **Available Noise Power** - The calculated power that is based on an ideal impedance match at the output of the DUT. These parameters have always been offered in the PNA Noise Figure App.
• **Incident Noise Power** - An 'I' is appended to the end of the Available Noise Power parameter. The calculated power into a perfect 50 ohm noise receiver, regardless of the output impedance of the DUT.

**Noise Power Parameters:**

• **SYSNPD / SYSNPDI** - System Noise Power Density: Total noise power available at the ADC, including the noise contributed by both the DUT and the internal noise receiver. This is generally expressed as an absolute power measurement in dBm, but can also be expressed in Watts or Kelvin.

\[
\text{dBm} = 10 \log_{10}(k \times T \times B \times 1000)
\]

where:

- \(k\) = Boltzmann's constant
- \(T\) = the measured noise temperature
- \(B\) = bandwidth
- 1000 = conversion from milliwatts

• **SYSRNP / SYSRNPI** - System Relative Noise Power: The noise temperature of the combined DUT and receiver relative to 290 Kelvin. This is generally reported as a ratio in dB. Therefore a perfectly quiet device would render a trace at 0 dB.

\[
\text{dB} = 10 \log_{10}(T/290)
\]

• **DUTNPD / DUTNPDI** - DUT Noise Power Density: When correction is ON, this trace exhibits the available noise power, best described as the maximum power available from the DUT where the impedance of the noise port is equal to the output match of the DUT. To be more precise, this occurs when the noise port match is equal to the conjugate of the output match of the DUT. The noise power contributed by the receiver is removed.

When correction is OFF, the trace exhibits what is more accurately described as delivered power. Delivered power is the power actually seen by the ADC. Any mismatch between the receiver and the DUT is ignored. The noise power contributed by the receiver is removed.

This measurement is generally expressed in dBm:

\[
\text{dBm} = 10 \log_{10}((\text{DUT Temperature} - \text{Receiver Temperature}) \times B \times 1000)
\]

where:

- \(B\) = bandwidth
- 1000 = conversion from milliwatts

• **DUTRNP / DUTRNPI** - DUT Relative Noise Power: This measurement is rendered as a ratio of the DUT
temperature to 290 Kelvin. It is generally expressed in dB. The same comments apply with respect to available versus delivered power as described above for DUTNPD.

\[ dB = 10 \log_{10} (\text{DUT Temperature} - \text{Receiver Temperature}) \]

**Mixer Parameters**

- **SC21**: Conversion Loss
- **SC12**: Reverse Conversion Loss
- **S11**: Input match
- **S22**: Output match
- **IPWR**: Input power to mixer/converter. Same as R1 (Source 1)
- **OPWR**: Output power to mixer/converter. Same as B (Source 1)
- **RevIPWR**: Power applied to mixer/converter Output. Same as R2 (Source 2)
- **RevOPWR**: Power measured at mixer/converter Input. Same as A (Source 2)

**Raw Receiver Parameters**

Specify a receiver to measure at LO1 frequencies with the notation:

- `<Receiver>LO1`
- For example: **ALO1** or **R1LO1**

Specify a receiver to measure using a source port, with the notation:

- `<Receiver>_<source port>`
- For example: **A_3** or **R1_1**

**Using the Noise Figure Application**

Use the following general procedure to make measurement with the Noise Figure App:

1. Connect Tuner and Noise Source.
2. Create a Noise Figure Measurement.
3. Make Noise Figure Settings.
4. For Opt 029 and H29, copy your Noise Source ENR file to the PNA `C:/Program Files/Agilent/Network Analyzer/Noise` folder.
5. Perform Calibration
6. Connect the DUT. Learn more.

7. Measure Noise Figure.

8. **Optional** Click File, then Save to save Noise Figure data in the following formats: (available ONLY when NF correction is ON.)

   - *.CTI Citifile
   - *.PRN
   - *.nco Noise Correlation Matrix data in S2P format. See Noise Model.

See Also: Measurement Tips

**Connect Noise Tuner and Noise Source**

1. Connect the **noise source** to the 28V connector on the PNA-X rear panel. **NOT required for Opt 028.** The Noise Source is turned ON and OFF automatically as needed during a calibration. Connect the noise tuner to Port 2 reference place when prompted during calibration.

2. Connect the **noise tuner** (ECal module). **NOT used for** Scalar Noise Figure **measurements.**

   a. On the PNA front panel, remove the **Port 1** jumper cable SOURCE OUT / CPLR THRU. Opt 028 allows Noise Figure measurements using any two PNA ports. Connect the noise tuner to the front-panel jumpers for the source (DUT input) port.

   b. Connect M-F tuner (N4691B-M0F) using the supplied cable (N5242-20137) and adapter (85052-60013).

   c. When using F-F ECal module (N4691B-00F), order a 3.5 mm M-M adapter (85052-60014).

![Image of connectors]

**Create a Noise Figure Measurement**

1. On the PNA front panel, press Meas, then **[Measurement Class]**

2. Select **Noise Figure Converters**, then either:

   - OK delete the existing measurement, or
• **New Channel** to create the measurement in a new channel.

3. A Noise Figure measurement is displayed. To select additional parameters to display, click **Response**, then **Measure**, then select a parameter from the list.

### How to start the Noise Figure Setup dialog

To provide quicker access, use the Setup softkey. [Learn how](#).

#### Using front-panel HARDKEY [softkey] buttons

1. Press **FREQ**
2. then **[Noise Figure Setup]**

#### Using a mouse with PNA Menus

1. Click **Response**
2. then **Measure**
3. then **Noise Setup**

### Valid Mixer Configuration / Sweep Type Combinations

### Power Tab - NFX Setup

---
Note: S-parameter power settings are critical for accurate Noise Figure measurements. See Noise Figure Measurement Tips.

Configures RF power settings for the S-parameter measurements that occur before noise measurements. Input power to the DUT is turned OFF during noise measurements.

These settings can also be made from the normal Power setting locations.

**Power ON (All channels)** Check to turn RF Power ON for all channels.

**DUT Input Port**

- Opt 028 - Select a PNA port to be connected to the DUT input.
- Opt 029 Scalar Noise Figure - Select a PNA port other than port 2.
- Opt 029 Vector Noise Figure - The DUT input CAN be connected to any PNA port other than port 2. However, without a noise tuner bypass switch, measurements on other channels that use the same source port will always go through the noise tuner. The noise tuner must be connected to the source loop of the selected port.

Note: Input power levels are critical for accurate Noise Figure measurements. Learn more.

**Power Level** The input power to the DUT during S-parameter measurements.

**Source Attenuator Auto** Check to automatically select the correct attenuation to achieve the specified input power. Clear, then select attenuator setting that is used achieve the specified Power Level. Learn more about Source Attenuation.

All PNA channels in continuous sweep must have the same attenuation value. Learn more.

**Receiver Attenuator** Specifies the receiver attenuator setting for the input port.

**Source Leveling** Specifies the leveling mode. Choose Internal.

**DUT Output Port**

- Opt 028 - Select a PNA port to be connected to the DUT output.
- Opt 029 - Connect the DUT output to PNA port 2.

**Output Power** Sets power level in to the output port for reverse sweeps. Port power is automatically uncoupled. Reverse sweeps are always applied to the DUT when Full 2-port correction is applied. Enhanced Response Cal is NOT available for Noise Figure measurements.

**Source Attenuator** Specifies the source attenuator setting for reverse power.

**Receiver Attenuator** Specifies the receiver attenuator setting for the output port. Learn more about Receiver Attenuation.

**Source Leveling** Specifies the leveling mode. Choose Internal.

Learn about the Load/Save *.mxr files, and other buttons across the bottom of all NFX Setup tabs.
Noise Path Configurator dialog box help

Port 1 Noise Tuner Switch (Opt 029) The orange line between CPLR THRU and SRC OUT represents the Noise Tuner. The External setting switches IN the Noise Tuner when making noise measurements.

Port 2 Noise Receiver Switch (Opt 029) allows you to make Noise Figure measurements using the internal low-noise receivers.

To prevent premature wear on the above two Noise switches, the PNA does not allow these switches to be thrown when sweeping between a Noise channel and non-Noise channel. To make Noise Figure measurements and non-Noise Figure measurements in different channels and continuously trigger both, set these switches to the same state:

- With the non-Noise Figure channel active, go to Noise Path Configurator.
- Set Noise Tuner switch to External. This routes source power to the front-panel loops, and to the Noise Tuner when connected. Use CONT:ECAL:MOD:PATH:STATE to set the internal state of the Noise Tuner to THRU, which creates a small amount of additional loss in the source path.
- Set Noise Receiver Switch to Noise Receiver.

NFx Noise Figure Setup dialog box help
Bandwidth/Average

The following two settings work together to achieve the optimum balance of measurement accuracy versus speed. Both settings can be changed after calibration to make faster measurements with minimal effect on calibration accuracy.

**Noise Bandwidth** Increase the bandwidth to make faster measurements. However, a wider setting reduces the frequency resolution of the measurement. More frequencies are essentially smoothed together to produce a flatter response, which could hide the actual noise performance of the DUT.

**Noise Averaging Factor** Increase the number of averages to reduce jitter. This also increases measurement speed. For maximum accuracy, increase the averaging factor for the noise calibration. It can then be reduced to improve measurement speed.

NA (Network Analyzer) Receiver (Opt 028) - Use a standard PNA receiver to measure noise figure.

- Connect the DUT to any PNA ports. For Vector NF measurements, connect the noise tuner to the source port.
- The sum of the gain and noise figure of the DUT must be at least 40 dB. This ensures that there is sufficient DUT noise power for the PNA to measure. Learn more.
- Additional filtering may be required. Learn more.

Noise Receiver (Opt 029) - Use internal low-noise receivers to measure noise figure.

- Measures noise figure values ranging from about 0 to 50 dB. Measures devices with gain ranging from about -40 to +60 dB.
- Converters with higher gain can be measured by adding an attenuator to the output of DUT and using fixture de-embedding to remove the attenuator loss. An alternative for measuring high-gain devices is to use the standard receivers (Opt 028) as they have a higher compression level.

Receiver Gain

This setting is NOT available when Noise Receiver is set to NA (Network Analyzer) Receiver (Opt 028).

With knowledge of your DUT gain, set the appropriate amount of receiver gain in order to optimize the power level at the noise receiver.

The following values reflect the SUM of the DUT gain (dB) **PLUS** NF (dB). For example: DUT gain = 20 dB; NF
= 10 dB; SUM = 30 dB.

- Select **High** if the SUM is relatively low (<30 dB).
- Select **Medium** if the SUM is about average (20 dB to 45 dB).
- Select **Low** if the SUM is relatively high (>35 dB).

There is considerable overlap in these settings. Because all three gain settings are calibrated with each Noise Calibration, this setting can be changed after calibration to achieve the least amount of jitter without overpowering the noise receiver.

One of following messages appear when too much power is detected at the noise receiver:

- **Compression in noise receiver: excess signal** - The noise receiver is likely compressing. NF results are possibly not accurate. Select a lower gain setting.
- **Compression in noise receiver: gain has been limited** - Damage to the receiver is possible, but not likely. NF results are NOT accurate. Select a lower gain setting.
- **ADC over-range in noise receiver: excess signal** - Often caused by a CW signal, an oscillation, or LO feedthru during an NFX measurement. Find and correct the cause, or try a lower gain setting.

Only ONE gain setting can be used for the entire frequency range of your noise measurement. Therefore, it may be necessary to use two noise channels with different frequency ranges and gain settings to achieve the very highest noise figure accuracy.

**Ambient Temperature**

Enter the room temperature at the time of the measurement, in Kelvin. For best results, use a thermometer to read the temperature at the PNA test port 1 or the DUT input cable.

This ambient temperature number has an inverse relationship to the noise figure. When using the effective noise temperature (Te) format, a 3 degree increase in the ambient temperature will make the overall measurement result drop 3 degrees.

**Impedance States**

- **Noise Tuner** Displays the ECal module to be used as a noise tuner. Select the Noise Tuner during calibration on the Select Cal Method dialog.

- **Max Acquired Impedance States** Select the number of impedance states in which to make noise measurements. At least FOUR impedance states are required. Learn more.

- **Enable Source Pulling for S-Parameters** (For mixers with low reverse isolation). When checked, during S22 (output match) measurements, the noise tuner is switched to present different impedance states to the DUT input. From these measurements, S22 is computed as though the input is seeing a 50 ohm match. This requires more sweeps. Check this box when the converter has low reverse isolation, as is the case when the NO output path is NOT padded with attenuation. Otherwise, clear this checkbox as S22 measurements will not be improved.

An accurate S22 measurement is essential when measuring S-parameters during an NFX calibration. Learn about the Load/Save *.mxr files, and other buttons across the bottom of all NFX Setup tabs.

Calibration for Noise Figure on Amplifiers and Converters (NFX)

This topic discusses calibration for both Noise Figure on Amplifiers and Noise Figure on Converters (NFX).

- **Overview**
- **How to Perform a Noise Figure Cal**
  - Select Calibration Method
  - Configure Noise Source
  - Select DUT Connectors and Cal Kits
  - Measure Standards Steps
  - Validate Noise Source Cal

See Also: Scalar Noise and TRL Cal

See Noise Figure or NFX Applications

**Overview**

Noise Figure results are NOT at all accurate without a Noise Figure calibration.

Noise Figure Calibration is very similar for both amplifiers and converters (NFX).

- NFX does NOT offer 'S-params ONLY' calibration.
- NFX includes an optional LO Power Cal.
- NFX and NF with a standard receiver includes a Power Sensor Cal on the source port.

The Noise Figure calibration process is different depending on whether a Noise Source is used to calibrate the noise receiver. In this discussion, the term 'noise receiver' is used to refer to the receiver that is used to measure noise. It can be a standard PNA receiver or the dedicated noise receivers that are supplied with Opt. 029.

**Calibrating the Noise Receiver using a Power Meter**

When Use Power Meter is selected on the Noise Cal Select Method dialog a noise source is NOT used to calibrate the noise receiver. Instead, a calibrated PNA source is used to calibrate the noise receiver.

1. A Source Power Cal is performed at the power level that is specified on the first measurement step of the calibration wizard.
2. A THRU connection is made from the calibrated source port to the noise receiver.
3. The gain bandwidth and noise level of the noise receiver is characterized. This lengthy process is performed
every time a Noise Figure calibration is performed.

4. During the noise measurements, noise averaging and noise bandwidth is automatically turned ON to the values that you specify. Learn more about Noise Averaging.

Calibrating the Noise Receiver using a Noise Source

See Noise Source requirements

A Noise Source is a device that generates two very consistent levels of noise over its operating frequency range:

- Hot (On) - the Noise Source is biased in order to provide a high level of noise.
- Cold (Off) - the Noise Source is unbiased to provide ambient temperature noise level.

These levels are measured by the Noise Source manufacturer and provided in table and electronic format with each Noise Source by serial number. The electronic file is known as the ENR (Excess Noise Ratio) file.

1. The Noise Source is connected to the noise receiver through test port 2. **Note:** For highest accuracy, the noise source should be connected as close as possible (the least amount of electrical loss) to the PNA port 2 connector. This causes the largest difference between the Noise Source HOT (on) and COLD (off) settings.

2. The Noise Source is measured by the noise receivers at each measurement frequency. The differences between the known ENR noise levels and the measured noise levels are the noise error terms. These values are removed from subsequent noise measurements.

3. During the Noise Source measurements, noise averaging and noise bandwidth is automatically turned ON to the values that you specify. Learn more about Noise Averaging.

Following the Noise Receiver Cal

- A 2-port S-parameter calibration is performed on the Noise Figure channel. This is because S-parameters are measured at each frequency step before a noise measurement. Also during the S-parameter cal, at least FOUR different impedance states are presented at port 2 in order to later characterize the noise generated by the noise receiver. This cal can be either a SOLT or TRL cal. See Scalar Noise and TRL Cal.

- After calibration, correction is automatically turned ON. The PNA status bar shows VNC_2P (for Vector) and SMC_2P (for Scalar).
How to Perform a Noise Figure Calibration

- Make the Noise Figure channel the active channel.
- Connect the Noise Figure Tuner to the PNA (for Vector Noise Figure cal).

Using front-panel HARDKEY [softkey] buttons

1. Press CAL
2. then [Cal Wizard]

Using a mouse with PNA Menus

1. Click Response
2. then Cal

The following Cal Wizard pages are unique to Noise Figure Calibration. The remaining pages that are presented are the same as those in the standard Cal Wizard SmartCal.

Select Calibration Method dialog box help

Calibration Method

- Vector Noise - Comprehensive Noise Figure calibration
- S-Parameter Only - Amplifiers ONLY. Does NOT calibrate the noise receivers.
- Scalar Noise - Calibration for Scalar Noise Figure measurements. Learn more.

Enable LO Power Cal - NFX ONLY. Check to cause the Cal Wizard to guide you through a Power Calibration on the LO source.

Note: NO correction is provided for an adapter that may be used to connect the power sensor to the LO source.

Noise Tuner

- Not available when Scalar Full is selected.
- Select from the ECal modules that are connected to the USB.
**Orientation**

**AutoOrient Tuner** Check to allow the noise tuner orientation to be auto-detected. When cleared, use the following two fields to provide manual orientation of the noise tuner.

**Tuner In (SOURCE OUT) / Tuner Out (CPLRTHRU):** Specify the ECal module labels that are connected to the PNA front panel jumper connectors. Learn how to connect the noise tuner.

**Detect Tuners** Click to re-detect the Noise Tuners (ECal modules) that are connected to the USB. If the ECal module is not detected, check the USB connection, then click this button. The label below the button indicates the total number of ECal modules that are connected to the USB.

**Receiver Characterization** - Learn more about this process

- **Use Noise Source** - A noise source is used to characterize the noise receiver.
- **Use Power Meter** - A calibrated PNA source is used to characterize the noise receiver. The PNA source is calibrated using a Power Meter/Sensor. This selection is made for you and can NOT be changed when **NA Receiver** is selected on the **Noise Figure Setup dialog**.

---

**Configure Noise Source (Opt 029) dialog box help**

**ENR File** Select the Noise Source ENR file. If not already there, copy your Noise Source ENR file to the PNA C:/Program Files/Agilent/Network Analyzer/Noise folder. Then click Browse to find the ENR file.

**Clear ENR List** Scroll to the bottom of the ENR list, then click to removes the selected ENR file. Then browse or select to find a new file.

**Edit ENR** Click to launch the **ENR Editor** dialog box which is used to change or create ENR files. This is NOT usually necessary.

**Temperature** Specify the current temperature at the Noise Source connector. The Noise source is kept ON during Noise Figure measurements. This results in the Noise Source being 4 to 5 degrees warmer than Ambient temperature, and a more accurate calibration. See **Noise Figure tips** to learn more about the significance of temperature.

See **Noise Source requirements**.
Click either Create or Edit to launch the same dialog box, shown below.

- **Edit** populates all fields with existing data which can then be edited and stored.
- **Create** has empty fields except for frequencies.

## Edit / Create ENR File dialog box help

### ENR Numeric Data
Use Previous and Next buttons to scroll to Entry # to edit. Type ENR value in dB, then press Enter.

Done Click when finished editing all values. Then click Store ENR File to save the file.

### Identifying Data
- **Model #** of the Noise Source. This can NOT be changed.
- **Serial #** of the Noise Source.
- **Temperature and Humidity** in which the Noise Source was calibrated. This is for information only. The ENR data is always normalized to 290 Kelvin.
- **KeyBd** launches a mouse-driven keyboard.
- **Store ENR File** Click to launch a dialog to save the new or edited ENR file.
Port 1 and Port 2

**DUT (Device Under Test) Connectors** Specify the connector and gender of the **DUT**.

**Cal Kits** Select the Cal Kit to be used to calibrate each test port. The list for each DUT Port displays kits having the same connector type as the DUT. Using incorrect calibration standards can significantly degrade measurement accuracy. [Learn more](#).

**Power Sensor** NFX Cal and **NF with a standard receiver ONLY**. Used to calibrate the source port.

**Noise Src** Used to calibrate the noise receivers (Opt 029). The Agilent 346C has an "APC 3.5 male" connector.

**Note:** For highest accuracy, the noise source should be connected as close as possible to the PNA port 2 connector. This causes the largest difference between the Noise Source HOT (on) and COLD (off) settings.

For both Cal devices (power sensor and noise source, specify the connector type and gender. When the Cal device connector is **NOT** the same type and gender as the DUT Port connector, then for optimum accuracy, extra cal steps are used to measure and correct for the adapter that is used to connect the Cal device to the reference plane.

Select **Ignored** (at the bottom of the DUT Connectors list) to NOT compensate for the adapter.

Select the Cal Kit that will be used for that process.

**De-embed power sensor adapter / noise source adapter** The PNA uses the connector type and gender of the DUT along with the connector type and gender of the cal device to determine if an adapter removal operation is taking place AND whether or not that removal operation requires an additional cal step.

However, the use of the connector type can, in special cases, hide the need for the extra cal step. Check the “De-embed...” box in these cases to inform the PNA that the extra step is needed.

Such a case is illustrated below where the noise source is connected close to test port 2 for higher accuracy. If unchecked, the PNA would assume in this case that the Noise Source is connected to the Thru standard at the port 1 (DUT input) reference plane.
**Source Cal Settings**  Click to launch the [Source Power Cal (for apps)](https://example.com) dialog. This dialog is used to set Power Meter / Sensor settings for both the Port 1 Power Cal, and the optional LO Power Cal.

**Modify Cal**  Check, then click **Next**, to Modify Cal (Standards AND Thru Method).

**Note:** Enhanced Response Calibration is NOT supported with Noise Figure.

---

**Measure Standards Steps** dialog box help

**Power Level** at which to perform the Power Cal.

- It is usually best to set power level to 0 dBm at the power sensor because the power sensor is calibrated at that level. Lower power levels will yield a slower and noisier calibration.
- However, with 20 dB of source attenuation (default NF setting), the PNA may not be capable of achieving this power level at higher frequencies. To check the max leveled power, view an R1 (port 1 reference receiver) trace over the frequency range of interest, then increase the power until roll-off appears. Power levels at the test port may be approximately 2 dB lower than at the R1 receiver.
- If an external component is used between the PNA test port and the calibration reference plane, then adjust the power level so that the power at the sensor is about 0 dBm if possible.
- The current source attenuation value is shown on the dialog.

**LO Power Cal (Optional)** When enabled, perform a Source Power Cal at the DUT LO input. An LO must already be selected. Learn how. The power level of the LO source calibration is set on the [NFX (LO) Power Tab](https://example.com).

**Connect Noise Source to the Port 2 measurement (reference) plane**

When the "De-embed Adapter.." boxes are checked, additional cal steps are required.

**Subsequent Steps**

- **Connect Port 1 to Port 2** - Connect port 1 reference plane to the port 2 reference plane using the required Thru standard or adapter.
- **Connect ECal to Ports 1 and 2** - Connect the ECal module between the port 1 reference plane and the port 2 reference plane.

**Validate Noise Source Cal**

To validate a Noise Source Calibration, connect the Noise Source to Port 2 and measure **ENR**.

Compare the measured values to the values in the ENR table.

**How to manually turn the Noise Source ON | OFF**
1. Press **POWER**

2. then **[Noise Source ON | OFF]**

Other IMD topics

Swept IMD (Intermodulation Distortion) Concepts

When a device or system is subjected to multiple input frequencies, the non-linearity of the DUT can generate undesired outputs at other frequencies. Typically, two input tones of equal power separated in frequency by a specified amount are used to stimulate the device while observing the resulting frequency spectra at the output. A variety of measurements can then be utilized to determine the intermodulation distortion characteristics of the device.

The frequencies of the resulting distortion products are predictable. While many mixing products can be generated, the high and low signals of the "odd order" products (3rd, 5th, and so forth) are close enough to the original two signals to potentially interfere with adjacent communication channels. With the exception of the 2nd order product, the higher "even order" products are usually far enough away to be of no interest.

The following image and table shows two equal-power main-tones and the nearby odd-order distortion products, as well as the 2nd order product (not shown in the image). Notice that the frequency separation between adjacent odd-order products is the same as the separation of the main tones (Delta F) frequency. For most devices, these distortion products become worse as the device is pushed further into compression.

![Diagram showing two main tones and odd-order intermodulation products.](image)

*Two main tones (f1 and f2) with odd order intermodulation products.*

The following table shows the calculations and example frequencies *(Blue text)* of the intermodulation products that are closest to the two main tones.
### Swept IMD Parameters

The following basic parameters, offered for both Amps and Converters, are expanded to over 150 by selecting specific product tones (2,3,5,7,9), the Low-side, High-side, or Average of these tones, measured at the Input or Output of the DUT.

- **Tone Power**
- **Tone Gain**
- **Intermodulation Distortion**
- **Intercept Point Parameters**
- **Composite Triple Beat (CTB)**
- **Composite Second-order Beat (CSO)**
- **Cross-Modulation Distortion**

Learn how to select these IMD parameters.

### Tone Power Parameters

Tone Power parameters measure the **absolute** power level of the main tones, odd-order product tones up to the 9th order, and the 2nd order product tones. These tone powers can be measured at the input and output of the
DUT. Because the tones come in pairs, the **Low tone**, **High tone**, and the **Average** of the two can be measured and displayed.

The Average Tone Power is calculated as follows:

\[
\text{Avg} = \frac{\text{High tone (dBm)} + \text{Low tone (dBm)}}{2}
\]

When measuring the 2nd order products, only the Low tone and High tones are allowed. When the main tones are separated by less than 10 MHz, the Low tone (f2-f1) is below the frequency range of the PNA.

**Tone Gain**

Tone Gain (in dB) calculates the main tone Output Tone power / Input Tone power. Because the tones come in pairs, Tone Gain can be calculated for the **Low tone**, **High tone**, and the **Average** of the two as indicated in the Average Tone Power calculation.

For IMDx for Converters, the Input and the Output tones are typically at different frequencies.

**Intermodulation Distortion Parameters**

IMD parameters measure the **difference** in power level between the specified product tone and the main tones. These IMD parameters are calculated from the Tone Power measurements. IMD parameters can measure the odd-order product tones up to the 9th order, and the 2nd product tones, at the DUT Input or Output. For each specified product, the difference between the **Low** product and main tone, difference between the **High** product and main tone, and difference between the **Averages** of the product and main tone can be measured and displayed.

Swept IMD supports IMD parameters which are calculated as follows:

\[
\begin{align*}
\text{IM}x\text{Lo} &= \text{Pwr}x\text{Lo} - \text{PwrMainLo} \\
\text{IM}x\text{Hi} &= \text{Pwr}x\text{Hi} - \text{PwrMainHi} \\
\text{IM}x &= \text{Pwr}x - \text{PwrMain} \\
\text{IM}x\text{LoIn} &= \text{Pwr}x\text{LoIn} - \text{PwrMainLoIn} \\
\text{IM}x\text{HiIn} &= \text{Pwr}x\text{HiIn} - \text{PwrMainHiIn} \\
\text{IM}x\text{In} &= \text{Pwr}x\text{In} - \text{PwrMainIn}
\end{align*}
\]

where:

- \( x \) = the IM product of interest (2, 3, 5, 7, 9)
- **Avg** is implied if **Hi** or **Lo** is not stated
- **Output** is implied when **In** is not stated

[Learn how to select IMD parameters.](#)

**Intercept Point Parameters**

As the main tone output power increases (black arrow), output power in the specified product tone increases at a predictable, and steeper, rate (green arrow). At some point, the power in the product tone will be equal to the power in the main tone. The power level at which this occurs is known as the intercept point. Measuring this point directly is typically not possible. Therefore, it is calculated by measuring the main tone power and the specified product tone power.
The Swept IMD App can display either the DUT Input power or DUT Output power that is required to achieve the theoretical intercept point. This is called either Input Referred (IIP) or Output Referred (OIP).

This measurement can be made for the 2nd, 3rd, 5th, 7th, and 9th order intercept points. In addition, the measurements can be made for either the Low tone, the High tone, or the Average of the two. However, for the 2nd order intercept point, only Low and High tone parameters are supported; not Average.

Swept IMD supports Intercept Point parameters which are calculated as follows:

\[
\begin{align*}
\text{OIP}_{x \text{Hi}} &= \frac{\text{PwrMain} - \text{IM}_{x \text{Hi}}}{x-1} \\
\text{OIP}_{x \text{HiIn}} &= \frac{\text{PwrMain} - \text{IM}_{x \text{HiIn}}}{x-1} \\
\text{OIP}_{x \text{Lo}} &= \frac{\text{PwrMain} - \text{IM}_{x \text{Lo}}}{x-1} \\
\text{OIP}_{x \text{LoIn}} &= \frac{\text{PwrMain} - \text{IM}_{x \text{LoIn}}}{x-1} \\
\text{OIP}_x &= \frac{\text{PwrMain} - \text{IM}_x}{x-1} \\
\text{OIP}_x &= \frac{\text{PwrMain} - \text{IM}_x}{x-1} \\
\text{OIP}_{x \text{In}} &= \frac{\text{PwrMainIn} - \text{IM}_{x \text{In}}}{x-1} \\
\text{IIP}_{x \text{Hi}} &= \frac{\text{PwrMainIn} - \text{IM}_{x \text{Hi}}}{x-1} \\
\text{IIP}_{x \text{HiIn}} &= \frac{\text{PwrMainIn} - \text{IM}_{x \text{HiIn}}}{x-1} \\
\text{IIP}_{x \text{Lo}} &= \frac{\text{PwrMainIn} - \text{IM}_{x \text{Lo}}}{x-1} \\
\text{IIP}_{x \text{LoIn}} &= \frac{\text{PwrMainIn} - \text{IM}_{x \text{LoIn}}}{x-1} \\
\text{IIP}_x &= \frac{\text{PwrMainIn} - \text{IM}_x}{x-1} \\
\text{IIP}_x &= \frac{\text{PwrMainIn} - \text{IM}_x}{x-1}
\end{align*}
\]

where:

- \( x \) = the IM product of interest (2, 3, 5, 7, 9)
- \( \text{PwrMain} \) = average power of the main tones at the DUT Input or Output
- \( \text{IM}_x \) = main tone power - product tone power (from above IMD parameter)
- \( \text{Avg} \) is implied if \( \text{Hi} \) or \( \text{Lo} \) is not stated
Learn how to select IMD parameters.

Composite Triple Beat (CTB)

From the NCTA Standard, composite triple beat is defined as the modulation beat of the target channel signal caused by triple beat resulting from the nonlinear characteristic of the DUT. Composite triple beat is expressed as the ratio of the target channel signal level to the maximum mean level of beat components dispersed around the carrier of that target channel.

Swept IMD supports two parameters of this type:

- CTB is based upon an approximation for the number of beats in mid-band
- CTBE is based upon an approximation for the number of beats at the band edge.

The equations for these two parameters are as follows:

<table>
<thead>
<tr>
<th>Equation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mid-Band CTB (dB) = -2(Pi - Ps) + 6 + 10Log(3N²/8) + CTB Offset</td>
<td>Mid-band CTB equation</td>
</tr>
<tr>
<td>Band Edge CTBE (dB) = -2(Pi - Ps) + 6 + 10Log(N²/4) + CTB Offset</td>
<td>Band edge CTBE equation</td>
</tr>
</tbody>
</table>

Where:

- **Pi** = Output power level at the third order intercept point (dBm): OIP3 (Lo | Hi)
- **Ps** = One of the following values based upon the Composite Normalization Mode:
  - For **PDBM** or **PDBMV** mode, Ps = CompositeNormalizedCTBPower
  - For **Number of Carriers** mode, Ps = PwrMain (AVG) – 10Log(N/2)
  - For **None** mode, Ps = PwrMain (AVG)
- **CTB Offset** = Offset value for CTB calculation
- **N** = Total number of carriers.

Note: CTB Offset and N values can ONLY be set using SCPI or COM commands.

Learn how to select IMD parameters.

Composite Second-Order (CSO)

From the NCTA Standard, composite second order is defined as the modulation beat of the target channel signal caused by second order beat resulting from the nonlinear characteristic of the DUT. Composite second order beat is expressed as the ratio of the target channel signal level to the maximum mean level of beat components dispersed around 0.75 MHz and 1.25 MHz above and below the carrier of that channel.

Swept IMD supports a CSO parameter which is calculated as follows:

<table>
<thead>
<tr>
<th>Equation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSO (dB) = (Pi - Ps) + 10Log(N) + CSO Offset</td>
<td>Composite second-order equation</td>
</tr>
</tbody>
</table>

Where:
• $P_i$ = Output power level at 2nd order intercept point: OIP2 (Lo | Hi)

• $P_s$ = One of the following values based upon the **Composite Normalization Mode**:

  - For **PdBm** or **PdBmV** mode, $P_s = \text{CompositeNormalizedCSOPower}$
  - For **Number of Carriers** mode, $P_s = \text{PwrMain (AVG)} - 10\log(\text{N}/2)$
  - For **None** mode, $P_s = \text{PwrMain (AVG)}$

• **CSO OFFSET** = Offset value for CSO calculation

• $N$ = Number of distortion products.

**Note:** **CSO OFFSET** and $N$ values can ONLY be set using **SCPI or COM commands**.

Learn how to select IMD parameters.

**Cross-Modulation Distortion**

From the NCTA Standard, cross modulation is defined as the distortion that causes modulated carrier components of undesired channels to amplitude-modulate the target channel carrier due to the nonlinear characteristic of the unit under test. Cross modulation distortion is expressed as the ratio of the target channel carrier level to the level of modulated components of the carrier of the target channel resulting from modulated signals of undesired channels.

Swept IMD supports an XMOD parameter which is calculated as follows:

$$XMOD=-2(P_i-P_s)+6dB+20\log(N)$$

Where:

• $P_i$ = Output power level at third order intercept point: OIP3 (Lo | Hi)

• $P_s$ = Power level of each carrier: PwrMain (AVG)

• $N$ = Total number of carriers.

Make Cross Modulation settings using **SCPI or COM commands**.

**How the IMD Application Works**

The IMD App. requires The following diagram illustrates how the PNA is configured to generate the two main tones. This shows a PNA-X with dual sources and the internal combiner. A 2-port or 4-port N522x model can also be used. Learn how to **Configure External Source and Combiner**.
2-port PNA-X generates the f1 and f2 main tones.

Depending on the specified parameters and sweep type, the sources and receivers are tuned to the appropriate frequencies in order to measure all of the required main and product tone powers. For example, an IM3 parameter requires the measurement of both main tones, and the 3rd order High and Low tone powers.

The Narrowband IF path is used for IMD measurements to help reduce spurious responses. Because the narrowband filter has a bandwidth of about 28 kHz, using an IFBW greater than 30 kHz does nothing to improve measurement accuracy. Learn how to set IFBW for IMD.

Limiting Stimulus Settings and Out of Range Product Tones

Because the main tones are generated by the PNA internal sources and external sources, the frequencies of the main tones must always be within the frequency range of the PNA or external source. Sweep parameter values are adjusted when necessary to ensure that f1 and f2 frequencies are within these limits.

However, the PNA DOES allow you to make settings that cause the selected IM products to fall outside the frequency range of the PNA. For example, with the main tones at 10 MHz and 15 MHz, the PNA will allow you to select the parameter IM3Lo (3rd low side product tone). However, the frequency of this product will be at 2f1-f2 or 5 MHz, which is below the frequency range of the PNA. In these cases, the trace data is set to zero, which converts to -200 dB in Log Mag format.

Limited Number of Acquisitions

The total number of acquisitions per sweep can not exceed 32,001 points. The number of acquisitions is determined by multiplying the number of trace points, by the number of tones frequencies, then by 2 (for both Input and Output frequencies). The PNA will automatically reduce the number of trace points to ensure the total number of acquisition points does not exceed 32,001.

How an IM Spectrum Channel Works

Before reading this topic, you should become familiar with IMD Concepts.
The IM Spectrum channel provides a traditional spectrum analyzer view of the intermodulation distortion behavior of a device. Unlike the Swept IMD channel, the main tones (F1 and F2) are fixed while the receiver is swept over a frequency range of interest in order to generate a display as shown below.

**IM Spectrum trace (bottom) with Swept IMD traces (top)**

A typical spectrum analyzer does NOT have a signal source. This one does. The signal source, or stimulus, settings for the F1 and F2 main tones can be set in either the IM Spectrum channel or the Swept IMD channel. These settings include the frequencies and power levels of the main tones.

**Receiver Settings**

The settings for the IM Spectrum receiver can be set ONLY in the IM Spectrum channel. These settings include how many tone products to view - which determines the center and frequency span - and the Resolution Bandwidth.

You can choose from several Resolution Bandwidths which also determines the number of data points used in the channel. The higher the Res BW, the fewer the number of data points. The formula for determining the number of points is:

$$N = \frac{\text{Span}}{\text{ResBW}} \times 3$$

The IM Spectrum channel performs multiple measurements for each data point in order to reject unwanted images which are generated by the PNA internally. This provides a high degree of confidence that signals captured in a trace are real and are not spurious responses generated in the measurement process.

**IM Spectrum Parameters**

You can select from three different IM Spectrum parameters.
1. The tones OUT of the DUT (default parameter).

2. The tones IN to the DUT (to be sure that the input signals are pure). **NOT supported** in IMx Spectrum

3. Reflected tones off the DUT input. **NOT supported** in IMx Spectrum

IMD Calibration

Saving Swept IMD Power Data

Other IMD (Opt 087) Topics

Features and Limitations

See requirements.

Features

- Fast and easy setup for the measurement of a variety of distortion related parameters up to 9th order.
- Measurement at both input and output of a DUT.
- Supports a variety of sweep-modes for the main-tones: center-frequency linear and segment sweep, tone-separation sweep, power sweep, or CW sweep (fixed main-tone).
- Make very fast, accurate measurements using the PNA sources with high-power, high linearity, and low harmonics.
- Supports calibration and correction of Swept IMD parameters.
- Independently set IFBW for measuring main-tones versus product tones.

Limitations

- 2-port non-frequency converters ONLY. For frequency converters, use Swept IMDx.
- DUT to PNA port mapping is limited. Port selections are made on the Power tab. Learn more.

The following features are NOT available with Swept IMD:
- **Number of points limited to 20,001**
- Analog Sweep (Stepped sweep mode only)
- Log frequency sweeps
- Unratioed receiver measurements (A, B, R)
- ECAl User Characterization
- Time Domain
- Balanced measurements
- Save Formatted Citifile data.
- Save SnP data.
- External sources
- Interface Control
- Port extensions
- Some Fixturing Features
- External Test Set Control (Option 551)
- Integrated Narrowband or Narrowband Pulse App
- See Frequency limitations in a Swept IMD channel.

### Create a Swept IMD Measurement

1. On the PNA front panel, press **Meas** then [Measurement Class]
2. Select Swept IMD, then either:
   - **OK** delete the existing measurement, or
   - **New Channel** to create the measurement in a new channel.
3. A Swept IMD measurement is displayed. To select additional parameters to display, click **Response**, then **Measure**, then select a parameter from the list.
How to start the Swept IMD Setup dialog

To provide quicker access, use the Setup softkey. Learn how.

Using front-panel HARDKEY [softkey] buttons

1. Press FREQ
2. then [Swept IMD Setup]

Using a mouse with PNA Menus

1. Click Stimulus
2. then Frequency
3. then Swept IMD Setup

Frequency tab - IMD Setup - dialog box help

Configures the Sweep Type and frequency range for SweptIMD and Swept IMDX measurements.

Sweep Type and Sweep Settings
**Sweep fc (center frequency)**

Maintaining a constant tone spacing (Fixed DeltaF) and tone power, fc is swept from Start fc to Stop fc. Center Frequency can also be specified as Center fc and Span fc.

At each fc, the receivers are tuned to all of the required frequencies to measure the power of the appropriate tones.

---

**Swept DeltaF (tone spacing)**

The specified fc (center frequency) and tone power is held constant. The tone spacing is increased from Start DeltaF to Stop DeltaF in the specified number of points.

---

**Power Sweep**

The main tone frequencies are specified as either f1 and f2, or as fc and DeltaF. These frequencies are held constant while the power of each main tone is varied from the Start-Power to Stop-Power in the specified number of power points. The power of each tone can be set (on the Power tab) individually or as a pair by checking Coupled Tone Power.

---

**CW**

The main tone frequencies and power levels are held constant. Measurements are taken for the specified Number of Points. The X-axis is number of points.

---

**Segment Sweep fc (Swept IMD ONLY)**

Same as Sweep fc except that the center frequencies are constructed using the standard segment table. Learn how.

---

**LO Power Sweep (Swept IMDX ONLY)**

The main tone frequencies and power levels are held constant. Measurements are taken for the specified number of points. The X-axis is LO Power.

---

**Segment Sweep Notes: (Swept IMD ONLY)**

- The segment table shown on the dialog is 'READ-ONLY'.
- Learn how to Create and edit the Segment Sweep table.
- Independent IFBW and Power are NOT available.
- X-axis point spacing is available beginning with A.09.10.

**Number of Points** Enter the number of data points for each sweep. See Limited Number of Acquisitions.

**IFBW**
The Narrowband IF path is used for IMD measurements to help reduce spurious responses. Because the narrowband filter has a bandwidth of about 28 kHz, using an IFBW greater than 30 kHz does nothing to improve measurement accuracy.

**Main Tone and IM Tone IFBW**  IF Bandwidth is specified separately for the main tones (f1 and f2) and for the intermodulation tones. This allows the higher-power main tones to be accurately measured at a higher - and faster - IFBW, while the lower-power product tones to be accurately measured a lower - and slower - IFBW.

**Reduce IF BW at Low Frequencies**  On the PNA, the trace noise becomes worse below 748 MHz. This is especially obvious between 10 MHz and 45 MHz. When this box is checked, the PNA uses a smaller IF Bandwidth than the selected value at frequencies below 748 MHz. Learn more about the selected values.

---

**Power tab - IMD Setup** -dialog box help

Configures RF power and Power Sweep settings for IMD measurements.

**Power ON (All channels)**  Check to turn RF Power ON or clear to turn power OFF for all channels.

**DUT Input Port**

- **Input Port**  Choose Port 1 or Port 3. An external combiner is required for Port 3.
- **Source Attenuator**  Specifies the port 1 attenuator. This attenuator affects the range of available power into the DUT Learn more about Source Attenuation.
- **Receiver Attenuator**  This attenuation setting protects the A receiver from damage.

**DUT Output Port**

- **Output Port**  Choose Port 2 or Port 4 (with limitations).
- **Source Attenuator**  This setting is used to improve the load match at the DUT output. Select 0 dB for power levels up to 10 dBm, and increase by 10 dB for every 10 dBm more output power.
**Receiver Attenuator** Specifies the attenuator setting for port 2. When the power into the receiver test port is around +10 dBm, the PNA receiver may be in compression. However, with receiver attenuation, lower input power levels may become too noisy to make accurate power measurements. In this case, lower IFBW for the IM tones to reduce noise. [Learn more about Receiver Attenuation.]

**Tone Powers**

**Coupled Tone Power** Check to set the same power level for each main tone using the f1 Power setting. Clear to set different f1 and f2 power levels.

**Fixed f1 Power** Specify the power level for f1 at either the DUT input or output depending on the Power Leveling setting. Choose a value between -30 dBm and +30 dBm. When “Coupled Tone Power” is checked, power is set for both f1 and f2 tones.

**Fixed f2 Power** Available when Coupled Tone Power is NOT checked. Specify the power level for f2 at either the DUT input or output depending on the Power Leveling setting. Choose a value between -30 dBm and +30 dBm.

**Start, Stop, and Step f1 and f2 Power** Available when Power Sweep is selected on the Frequency tab. Sets the Start and Stop power levels for f1 and f2, either individually or together with Coupled Tone Power checked.

**Power Leveling**

Because the gain of the amplifier can be different for the f1 and f2 tone frequencies, you can set tone power at either the input of the DUT (default setting) OR the output. The one that you do NOT select will NOT be equal or flat across the frequency span.

**Set Tone Power at Output** The specified f1 and f2 power levels are set at the DUT output. Receiver Leveling is used to accurately set the specified power level of each tone within the tolerance value that is set in the [Receiver Leveling dialog](#).

**Set Tone Power at Input** (Default) The specified f1 and f2 power levels are set at the DUT input.

  **Equalize at Output** Available when “Coupled Tone Power” is checked AND "Set Tone Power at Input" is selected.

  - When cleared (default setting), input power level accuracy is based ONLY on the source power cal that is performed during the IMD cal.
  - When checked, the average of the specified tone powers is set at the input, but amplifier gain differences are compensated for so that the output tones are equal and flat across the frequency span. Receiver Leveling is used to set EACH output tone to within the tolerance value that is set in the [Receiver Leveling dialog](#). This could result in the output tone power levels being different by twice the tolerance value.

Open Loop leveling should only be used when doing [Wideband Pulse measurements](#). Set to Open Loop on the [Power and Attenuators dialog](#).

**Path Configuration** click to launch the [RF Path Configuration](#) dialog.

**Highlighted Note: RF2 tone power offset to compensate for combiner loss.**

This message appears when the f2 tone is being supplied by an external source. The tone power has been increased on the external source to compensate for loss through the internal combiner. For example, if the tone power at the DUT should be 0 dBm, the power out of the source will be about 15 dB higher.
To accommodate single-source PNA models, an external source can be used for the f2 tone. Learn how to configure an external source and combiner to make Swept IMD and IMDx measurements.

**f1** Always uses PNA internal source 1.

**f2** Select a source to be used for the f2 tone. This selection is available when an external source is configured and the **Active** box is checked on the **External Source Configuration dialog**.

**Buttons**

**Add Source** Click to configure an external source using the **External Source Configuration dialog**.

**Path Configuration** Click to launch the **Path Configuration dialog** (PNA-X models only).

### How to add IMD Parameters

<table>
<thead>
<tr>
<th><strong>Using front-panel HARDKEY [softkey] buttons</strong></th>
<th><strong>Using a mouse with PNA Menus</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>TRACES</strong></td>
<td>1. Click <strong>Trace/Chan</strong></td>
</tr>
<tr>
<td>2. then <strong>[New Trace]</strong></td>
<td>2. then <strong>New Trace</strong></td>
</tr>
<tr>
<td>3. then select a parameter</td>
<td>3. then select a parameter</td>
</tr>
</tbody>
</table>

**IMD New Trace** dialog box help
Use this dialog to select IMD and IMDx parameters to measure and display.

Up to five parameters can be selected at a time, then click **Apply** to create those traces. Then select more without closing the dialog. There is no limit to the number of traces and windows allowed in the PNA.

**Note:** Calculations are NOT performed to determine if the frequency of a selected intermod (Order) product will be within the frequency range of the PNA. Measurements that fall outside of the frequency range of the PNA are displayed as -200 dB.

**Param Name** This name is built from the selected **Type**, **Tone Select**, **Order**, and **Measure At** settings. Once built, check to measure this parameter.

**Type**

Select the type of Swept IMD measurement to make.

The characters below (in parenthesis) are used in the Param Name.

- **Tone Power (Pwr)** Measures the absolute power of the specified (ordered) tone. [Learn more](#).

- **IMD Relative to Carrier (IM)** Measures the power of the specified (ordered) tone relative to the power of the f1 or f2 tone. [Learn more](#).

- **Input Referred Intercept Point (IIP)** From DUT measurements, calculates the theoretical power level at which the specified (ordered) intermod product will be the same power level as the carrier at the output of the DUT. The input power to the DUT at which this output power occurs is reported and displayed. [Learn more](#).

- **Output Referred Intercept Point (OIP)** From DUT measurements, calculates the theoretical power level at which the specified (ordered) product will be the same power level as the main tone at the output of the DUT. This value is reported and displayed. [Learn more](#).

- **CTB Band-Edge Distortion (CTBE)** Composite ‘Triple Beat’ Distortion - 3rd order DUT OUT only. [Learn more](#).
- **CTB Mid-Band Distortion (CTB)**  Composite 'Triple Beat' Distortion - 3rd order DUT OUT only. [Learn more.]
- **CSO Distortion (CSO)**  2nd order DUT OUT only. [Learn more.]
- **XMOD 3rd Order Crossmod (XMOD)**  3rd order DUT OUT only. [Learn more.]
- **Tone Gain (ToneGain)**  From tone power measurements, calculates the Output Tone power / Input Tone power for the specified tones. [Learn more. The Input and Output tones are different frequencies.]

**Tone Select**
Select the tone (High, Low, or Both) to be measured and displayed ([See image]).

- **High**  Measure and display the power of the specified (ordered) tone on the High side of the main tones.
- **Low**  Measure and display the power of the specified (ordered) tone on the Low side of the main tones.
- **Avg**  Measure the specified (ordered) tones on both the High and Low sides. Then calculate and display the Average power level.
- **Max**  Measure the specified (ordered) tones on both the High and Low sides. Then find and display the Maximum power level.
- **Min**  Measure the specified (ordered) tones on both the High and Low sides. Then find and display the Minimum power level.

Used to build the parameter name:
- **Hi, Lo, Max, and Min** are appended to the Param Name when selected.
- Nothing is appended to the Param Name when **Avg** (default setting) is selected.

**Important Notes - 2nd-order products**

- 2nd-order products are likely to be outside of the PNA frequency range. Trace data will show all will show **all zeros** (linear) or -200 dB (log magnitude).
- If either the High or Low side falls outside the frequency range of the PNA, then **Avg** is NOT allowed.
- When displaying 2nd-order traces, **Avg** is NOT allowed, even when both the Lo and Hi products are displaying valid data. This is because 2 Low and 2 High products are usually very different from one another.
- When performing a calibration that is meant to include 2nd-order products, be sure Include 2nd Order Products is checked in the first Calibration dialog box.

**Order**
Specify the intermodulation product to measure. Choose from 1, 2, 3, 5, 7, 9.
- **Main** is appended to the Param Name when 1 is selected.
- Otherwise, the tone number is appended to the parameter name.

**Measure At**

Measure the selected parameter at either:

**DUT Input**

- **In** is appended to the Param Name (ex: PwrMainIn).
- The input port reference receiver is used to measure the fundamental tones and the required products.

**DUT Output**

- Nothing is appended to the Param Name (ex: PwrMain).
- The output port measurement receiver is used to measure the fundamental tones and the required products.

**IMD Calibration**

**Overview**

1. At the first page of the IMD Cal Wizard, you tell the calibration routine the frequencies at which the calibration is to be performed. Optionally, you can choose to perform the source power cal at only the center frequency midway between the main tones. For IMDx ONLY, you can also choose to perform a source power cal of the LO source.

2. The PNA calculates an array of source and receiver frequencies that incorporate all the main tone frequencies (low and high) and all the product tone frequencies.

3. Using a power meter at port 1, a source and receiver calibration is performed to calibrate the R1 reference receiver to be a fast and ‘tunable’ power meter.

4. The R1 reference receiver is then used to perform a source power cal of the main tone frequencies: first the Source 1 / Low tone then the Source 2 / High tone. Both sources are left ON while each tone is measured in order to duplicate the impedance match under which the measurement will be performed.

5. Then a standard 2-port SOLT cal is performed at all frequencies using either an ECal module or mechanical standards. The 2-port cal is used to correct the source calibration R1 tracking terms for the match of the power sensor. It is also used to transfer the R1 tracking term to the B receiver.

**Notes**

- If the main tone frequencies change but are within the frequency range in which the calibration was performed, then the calibration becomes interpolated C*. This can occur by changing the
start/stop/center/span frequencies, the number of points, or the sweep type. Learn more about Interpolation.

- **Receiver calibrations** that are performed in a standard channel can be applied to a Swept IMD channel. However, **Source Calibrations** can NOT be applied.

**See Also**

IM Spectrum Calibration

---

**How to start a Swept IMD Calibration**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CAL**
2. then **[Start Cal]**
3. then **[Cal Wizard]**

**Using a mouse with PNA Menus**

1. Click **Response**
2. then **Cal Wizard**

---

**Select Tone Products - IMD Cal** dialog box help

**Calibration Mode**

Match corrected Response Cal  This selection performs a full IMD calibration as described in the above Calibration 'Overview'.

**Response ONLY (Normalization)** This IMD Cal does NOT correct for the mismatch of the power sensor. Choose this if you have a test configuration that does not easily accommodate making match measurements. Instead of a standard 2 port SOLT cal (Step 5 above), only the transmission tracking term is measured and used to transfer the R1 receiver tracking term (produced by the power sweep) to the B receiver.

**Note:** For the Response (Normalization) Cal, it is assumed that a zero-length THRU standard is being used to connect port 1 to port 2. If an adapter is used, there is NO compensation for delay or loss of the adapter. This can NOT be changed.

---

3434
Tone Power Cal

**Calibrate only at center frequencies** The source power cal portion is performed at only the center frequency, which is midway between the main tones. This cuts the source power calibration time (the slowest part of the calibration) in half. The measurement is interpolated although the C* annotation is not shown in the status bar.

**Calibrate at all frequencies** The source power cal portion is performed at all main tone frequencies.

**Enable LO Power Calibration** (IMDx ONLY) Check to perform a standard power calibration of the LO source as part of the calibration process.

Select Product Tones

**Max Product** Select the highest product that you will be measuring. The low and high frequencies for that product, and all lower 'odd' order products will be calibrated. For example, when 5th Order Product is selected, the frequencies for the Main Tones, and the Low and High order products for the 3rd and 5th order products will be included in the calibration.

**Include 2nd Order Products** Check to calibrate the 2nd-order products in the frequencies to be calibrated. The frequencies of these products are usually far from the main tones.

Select DUT Connectors and Cal Kits - IMD Cal dialog box help

If **Response Cal Only** is selected on the previous page, click View/Modify to change the Source Cal settings, or click Next> to continue.

Otherwise, this is a standard PNA Cal Wizard page except for the following:

**Power Sensor** When the power sensor connector is not the same type as the DUT Port 1 connector, then for optimum accuracy, an extra cal step is required to measure the adapter that is used to connect the power sensor to the port 1 reference plane during the Source Power Cal. Specify the connector type and the Cal Kit that will be used for that step. Select **Ignored** to NOT compensate for the adapter.

**Modify Cal** Check, then click Next, to Modify Cal (Standards AND Thru Method).

**View/Modify Source Cal Settings** Click to launch the Source Cal Settings (for Apps) dialog.

Learn more about IMD Calibration
Power Level at which to perform the Port 1 Source Power Cal.

It is usually best to perform the Source Power Cal at 0 dBm because the power sensor is calibrated at that level.

However, if a component is used between the PNA source and the calibration reference plane, then adjust the power level so that the power at the sensor is about 0 dBm if possible.

Learn more about IMD Calibration

The remaining dialog pages are the same as the standard Cal Wizard.

Saving Swept IMD Power Data

Swept IMD power data, Log Mag ONLY, can be saved to a *.csv file. This data type can be read by spreadsheet programs, such as Microsoft Excel. Data from the last complete sweep is saved to the specified *.csv file.

How to save Swept IMD (and IMDx) data

With a Swept IMD or IMDx channel active...

1. Press Save
2. then [Save Data As]
3. then, File Type = IMD Sweep Data (*.csv)

Using a mouse with PNA Menus

1. Click File
2. then Save Data As
3. then File Type= IMD Sweep Data (*.csv)

Notes:

- For every tone, six power levels are saved in this order: OUT Avg | OUT Lo | OUT Hi | IN Avg | IN Lo | IN Hi
- Power levels for the Main tones are always saved, regardless of the active measurement.
- All tones that are displayed are also saved. For example, any displayed 3rd order tone parameter causes the
3rd tone power levels to be saved.

- Only tone powers are saved. Calculated parameters, such as IMD Relative to Carrier (IM) are NOT saved.
- If calibration is turned ON when the file is saved, then all data is calibrated. Otherwise, raw data is saved.

This image shows the 6 Main tone power levels that are always saved.

In the power parameter labels, **Output** and **Avg** are implied as in the parameter selection. For example: **PwrMain** = Average Output power of the main tones.

---

**IM Spectrum for Amplifiers (Opt 087)**

Intermodulation Spectrum measurements can be made independently, or coupled with Swept IMD measurements. They are a distinct measurement class. Therefore, IM Spectrum measurements are always made in a separate channel.

- **Requirements and Limitations**
- **Create an IM Spectrum Channel**
- **Select IM Spectrum Parameters**
- **Start the IM Spectrum Setup dialog**
  - **Frequency tab**
  - **Power tab**
  - **Tracking tab**
  - **Configure tab**
- **Calibration**

**See Also**

- **IM Spectrum Concepts**
- **IMx Spectrum for Converters**
- **Swept IMD Measurements**
- **Programming commands**

**Requirements and Limitations with IM Spectrum**

The following PNA features are NOT available in an IM Spectrum channel:

- **Unratioed receiver measurements** (A, B, R)
- **ECal User Characterization**
- **FOM** or **FCA**
- **Time Domain**
- **Balanced measurements**
- **Save Formatted Citifile** data.
Create an IM Spectrum Channel

An IM Spectrum channel can be created independently from a Swept IMD channel or coupled with the stimulus settings of an existing Swept IMD measurement.

To create an independent IM Spectrum channel

1. On the PNA front panel, press **Meas** then **[Measurement Class]**

2. Select **IM Spectrum**, then either:
   - **OK** delete the existing measurement, or
   - **New Channel** to create the measurement in a new channel.

To create an IM Spectrum channel from an existing Swept IMD channel

1. With a Swept IMD channel active, press the **MARKER** key on the front panel.

2. Move the marker to the data point of interest. It can be moved later.

3. Press **[Marker Functions]** then **[Marker -> IM Spectrum]**

This creates or configures an existing IM Spectrum channel based upon the configuration of the Swept IMD channel.

Select IM Spectrum Parameters
**How to add IM Spectrum traces**

With the IM Spectrum channel active and a **Tr1 Output** trace displayed:

### Using front-panel HARDKEY [softkey] buttons

1. Press **TRACES**
2. then [New Trace]
3. then select a new parameter

### Using a mouse with PNA Menus

1. Click **Trace/Chan**
2. then **New Trace**
3. then select a new parameter

**IM Spectrum Setup Dialog**
How to start the IM Spectrum Setup dialog

To provide quicker access, use the Setup softkey. Learn how.

With an IM Spectrum measurement active:

### Using front-panel HARDKEY [softkey] buttons

1. Press **Sweep**
2. then **IM Spectrum Setup**

### Using a mouse with PNA Menus

1. Click **Stimulus**
2. then **Frequency**
3. then **IM Spectrum Setup**

---

**Programming Commands**

---

**Frequency tab - IM Spectrum dialog box help**

![IM Spectrum Setup dialog box](image)

**Note:** The number of data points in an IM Spectrum channel = 3 * SPAN / ResBW. This can NOT be changed directly.

Configures the Sweep Type and frequency range for IM Spectrum measurements.

**Sweep Type**

Provides several methods to tune the IM Spectrum receivers (NOT stimulus) to view the power spectrum of arbitrary frequency ranges or various distortion products.

- **Linear**  Allows the start/stop or center/span receiver frequencies to be set arbitrarily for f1 and f2. Enter the Response Settings below.

- **2nd Order**  Couples the receiver frequency range to f1 and f2 to provide a convenient means of observing the spectrum surrounding ONLY the high-side 2nd order harmonic where Center = (f1 + f2), Span = 3 * (f2 – f1). **Note:** The center frequency is NOT set on the main tones.

- **3rd Order**  Couples receiver frequency range to f1 and f2 to provide a convenient means of observing the spectrum surround the main-tones including the 3rd Order products where Center = (f1 + f2) / 2, Span = 4 * (f2 – f1).

- **Nth Order**  Couples receiver frequency range to f1 and f2, providing a convenient means of observing the
spectrum surrounding the main-tones for an arbitrary span where Center = \((f_1 + f_2) / 2\), and Span = \(N \times (f_2 - f_1)\). This allows you to set the span arbitrarily, but have the center frequency track the main tone frequencies.

**Resolution BW**

The IM Spectrum channel utilizes a set of Gaussian filters instead of the standard PNA IF filters in order to provide similar behavior to traditional spectrum analyzers.

The comprehensive list of filters that are available for IM spectrum are: 3 MHz, 1 MHz, 600 kHz, 300 kHz, 150 kHz, 100 kHz, 60 kHz, 10 kHz, 3 kHz, and 1 kHz.

**Note:** The 10 kHz Res BW filter can generate image signals which are not a product of the DUT. You can verify the integrity of a questionable signal by switching to the 3 kHz or 60 kHz filter and looking for the image signal in the same location.

Not all of these filters are available for all measurements. Narrower filters are available for use with narrower frequency spans, and wider filters are available for wider spans.

**Stimulus Settings**

Allows configuration of the main-tone frequencies. Available ONLY when Tracking is OFF.

- \(f_c\) (main-tone center frequency) = \((f_1 + f_2) / 2\)
- \(\Delta f\) (main-tone frequency separation) = \((f_2 - f_1)\).
- \(f_1\) = Low-side main-tone frequency
- \(f_2\) = High-side main-tone frequency

**Response Settings**

Allows configuration of the frequency range to sweep the receivers in terms of start/stop or center/span. Available for Linear sweep types ONLY.

- **Start Spectrum** = first frequency point of the power spectrum sweep
- **Stop Spectrum** = last frequency point of the power spectrum sweep
- **Center Spectrum** = \((\text{Start Spectrum} + \text{Stop Spectrum}) / 2\)
- **Span Spectrum** = \((\text{Stop Spectrum} - \text{Start Spectrum})\)
Learn about this dialog

These selections are NOT available when there is no Swept IMD channel.

Allows the IM Spectrum channel to use (track) the stimulus (Main Tone) settings of an existing Swept IMD channel.

**Tracking Enable**  Check to use the frequency and power stimulus settings from the specified IMD channel. When enabled, stimulus settings on the Frequency Tab are disabled and ALL stimulus settings, such as frequencies, power and attenuator settings, and calibration, are copied from the Swept IMD channel to the IM Spectrum channel.
In the top Swept IMD window the main tones are swept from 4 GHz to 6 GHz with some specified delta F tone separation. The marker is on the center data point at 5 GHz.

The bottom IM Spectrum window center frequency is the same as the above marker: 5 GHz, but it has a much narrower frequency range of +/- 500 kHz. The IM Spectrum channel sets the receiver to see the two main tones, plus the third, fifth, and seventh-order products.

**Step Mode**

When tracking is enabled, set the method by which the IM spectrum measurement tracks the IMD channel.

**Manual Step** When selected, IM Spectrum measurements occur at only the specified IMD channel data point. **Stimulus Point** specifies the data point, by number, in the Swept IMD channel which has the stimulus settings to use for the IM Spectrum sweep.

**Automatic Step** When selected, causes the IM Spectrum channel to sequentially setup each of the stimulus conditions through which the Swept IMD channel sweeps the DUT. Each sweep of IM Spectrum is performed using the next set of stimulus conditions.

For example, in the above image, the first Swept IMD data point is at 4 GHz. The first IM Spectrum sweep uses a center frequency of 4 GHz. The following IM Spectrum sweep would be at the second Swept IMD data point or 4.01 GHz, and so forth. After the last data point in the sweep is reached, the IM Spectrum channel begins again at the first Swept IMD data point. The only indication that Tracking is enabled is in Automatic mode, you can see the center frequency increment with each IM Spectrum sweep.
Configure tab- IM Spectrum Setup - dialog box help

To accommodate single-source PNA models, an external source can be used for the RF2 tone. Learn how to configure an external source and combiner to make Swept IMD, IMDx, IM Spectrum, and IM Spectrum for Converters measurements.

RF1  Always uses PNA internal source 1.
RF2  Available for selection when an external source is configured and Active.
Add Source  Click to configure an external source using the External Source Configuration dialog.
Path Configuration  Click to launch the Path Configuration dialog (PNA-X models only).

Calibration

A calibration of the IM Spectrum channel is NOT performed using a calibration wizard.

An IM Spectrum channel is calibrated from a Cal Set that is used on a Swept IMD channel. The Cal Set can be applied to the IM Spectrum channel using the Manage Cal Sets dialog (Learn how) or from the Marker =>IM Spectrum softkey (Learn how).

However, a Swept IMD channel with Sweep Type = Power Sweep can NOT be applied to a IM Spectrum channel. This is because a Cal Set for power sweep contains only a CW frequency and the IM Spectrum channel requires a swept frequency range. Zero Span is not supported in an IM Spectrum channel.

A calibrated IM Spectrum trace corrects the source and receiver power level accuracy of the displayed Tones. See Swept IMD Calibration

Last Modified:

27-Apr-2011  Removed Copy Channels limitation
16-Sep-2009  Fixed calibration

**Swept IMD for Converters (IMDx)**

- IMDx Concepts
- Requirements and Limitations
- How to Configure your Hardware
- Create a Swept IMDx Measurement
- Valid Mixer Configuration / Sweep Type Combinations
- Setup Dialog
- How to specify IMDx Parameters
- IMDx Calibration
- Saving IMDx Data (Swept IMD topic)

**Other IMD Topics**

**IMDx Concepts**

Conceptually, Swept IMD for Converters (IMDx) is like [IMD for Amplifiers](#), except that there are two sets of products on the DUT output.

This image shows the simplest measurement configuration: the Input, LO, and Output are all CW frequencies.

- **DUT INPUT** - two fundamental tones (f1 and f2)
- **DUT LO** - a single frequency.
• **DUT OUTPUT** - two sets of frequencies

With IMDx, you can view EITHER the High side or Low side products; NOT BOTH.
Make this selection on the **Mixer Frequency tab**.

- High side (Input **PLUS** LO and all ordered products)
- Low side (Input **MINUS** LO and all ordered products)

**Requirements and Limitations**

Swept IMDx requires **Swept IMD** (Opt 087) and **FCA** (either Opt 082 or 083).
The following PNA features are **NOT** available with Swept IMDx:

- Analog Sweep (**Stepped sweep** mode only)
- **Log frequency** sweeps
- Unratioed receiver measurements (A, B, R)
- **ECal User Characterization**
- **Time Domain**
- **Balanced measurements**
- Save **Formatted Citifile** data.
- Save SnP data.
- **Interface Control**
- **Port extensions**
- **Some Fixturing Features**
- **External Test Set Control** (Option 551)
- **Integrated Narrowband** or **Narrowband Pulse App**
- **See Frequency Limitations**

**Note:** Beginning with A.09.00, **Embedded LO** measurements are allowed in IMDx and IMSpectrum. Configure the measurement as you would with SMC. [Learn how](#).

**How to Configure your Hardware**

The PNA is extremely versatile, and can be configured in many ways to make IMDx measurements. While not all conceivable configurations are documented here, a few of the most common examples are provided to show the basic concepts.
**DUT Configuration**

- The DUT Input must be connected to PNA Port 1 which supplies the f1 and f2 tones.
- The DUT Output must be connected to PNA Port 2 which uses the PNA B receiver.
- See LO Source configuration below.

**Source Configuration**

Three sources are required to make IMDx measurements: Two sources are PNA internal; the third is an external source.

- **F1 tone** - Must come out PNA Port 1  Default is Src 1
- **F2 tone** - Must come out PNA Port 1 through the internal combiner. This source can come from an internal or external source.  Default is the internal Src 2.
- **LO** - Can come from internal or external source. Default is Not controlled, set to 0 Hz.

  - If using the internal Src 2 source, the f2 tone must come from an external source through the rear-panel.
  - If using an external source, it can be connected directly to the DUT, or through the PNA Port 3 or Port 4 using the Path Configurator.

**Configuration Examples**

Three configurations are shown below to illustrate how to use the Path Configurator to manually make switch settings.

IMDx and IMx Spectrum channels are ALWAYS configured using the default configuration switch settings shown in the image below. This is NOT the same default configuration that is used for an S-parameter channel. A manual switch setting is required whenever a custom configuration is used.

The manual switch setting, which must be done every time an IMDx or IMx Spectrum channel is created, can be saved using the Store button in the Path Configurator. Then save the entire IMDx setup as an Instrument State. This will load the custom Path Configuration when the Instrument State is recalled.
1. Default Configuration  No manual switching required.

- f1 - Internal Src1
- f2 - Internal Src2 through combiner in Normal
- LO - Connect external source directly to the DUT LO.

2. External LO though Port 3 or Port 4  (4-port PNA only)
Use this configuration to monitor LO power using R3 or R4. (Future parameters)

- f1 - Internal Src1
- f2 - Internal Src2 through combiner in Normal
- LO - Connect external source through the rear-panel ( J7 for Port 3; J3 for Port 4 ).
  
  - Connect the DUT LO to PNA Port 3 or Port 4.
  - For Port 3, NO switching is required.
  - For Port 4, switch Port 4 Bypass Switch to Rear Panel.

3. Internal LO through Port 3 or Port 4; External f2 through rear-panel  (4-port PNA only)
This configuration is commonly used for FCA measurements where the internal second source is used as the LO.

- f1 - Internal Src1
- f2 - External f2 through rear-panel J9. No switching required.
- LO - Internal Src2 through:
Create a Swept IMD Measurement

1. On the PNA front panel, press Meas then [Measurement Class]

2. Select Swept IMD, then either:
   - OK delete the existing measurement, or
   - New Channel to create the measurement in a new channel.

3. A Swept IMD measurement is displayed. To select additional parameters to display, click Response, then Measure, then select a parameter from the list.

How to start the Swept IMD Setup dialog
To provide quicker access, use the Setup softkey. Learn how.

Using front-panel HARDKEY [softkey] buttons

1. Press FREQ
2. then [Swept IMDx Setup]

Using a mouse with PNA Menus

1. Click Stimulus
2. then Frequency
3. then Swept IMDx Setup

Valid Mixer Configuration / Sweep Type Combinations

Configuring the IMDx Setup dialog can be challenging at first. RED messages like this one appear at the bottom of the IMDx Setup dialog to notify you of an invalid setup.

The following information can provide you with a 'mental model' of the VALID mixer configuration / sweep type combinations which can make it easier to setup your measurement.

The following are the Valid Mixer Configurations in table format:
<table>
<thead>
<tr>
<th>Sweep Type</th>
<th>Input</th>
<th>LO</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Swept Input (Fixed Tones)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sweep fc</td>
<td>Swept</td>
<td>Swept</td>
<td>Fixed</td>
</tr>
<tr>
<td></td>
<td>Swept</td>
<td></td>
<td>Swept</td>
</tr>
<tr>
<td>Fixed Input</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CW</td>
<td>Fixed</td>
<td>Swept</td>
<td>Swept</td>
</tr>
<tr>
<td>Sweep Delta F</td>
<td>Fixed</td>
<td>Fixed</td>
<td>Fixed</td>
</tr>
<tr>
<td>(Tone) Power Sweep</td>
<td>Fixed</td>
<td>Swept</td>
<td>Swept</td>
</tr>
<tr>
<td>LO Power Sweep</td>
<td>Fixed</td>
<td>Swept</td>
<td>Swept</td>
</tr>
</tbody>
</table>

The following is an explanation of the table:

- **SWEPT Input** (There is ONLY one: **Sweep fc**) - Sweeps the center frequency of the tones, but the tone spacing remains fixed.
  
  - Either the LO or Output MUST also be swept.
  
  - On the Mixer Frequency tab, select Start/Stop, or Center/Span for each range to be swept.

- **FIXED Input** - The center frequency of the tones is fixed. On the Mixer Frequency tab - Input range, select Fixed for the following sweep types:
  
  - **Sweep Delta F** Tone separation changes. The LO and Output frequencies are always fixed.
  
  - **Power Sweep** - Tone power changes. The LO and Output frequencies are always fixed.
  
  - **LO Power Sweep** - All frequencies are fixed as the LO power is swept.
  
  - **CW** - Tones do NOT change. The LO or Output frequencies CAN be swept.
Tips

Although you will soon become comfortable navigating these tabs, at first it may be best to complete the dialog in the following order:

1. On the Tone Frequency tab, set the Sweep Type and Tone Frequencies.

2. On the Mixer Frequency tab, set a valid mixer configuration.

   - Input center / fixed frequency CAN be set on both the Tone Frequency tab and the Mixer Frequency tab. When you set one, the other is updated automatically.

Setup Dialog

The following tabs are shared with the Swept IMD Setup dialog:

**IMDx Calibration**

Calibration for IMDx is exactly the same as [calibration for IMD](#) with the following exception:

- You can choose to perform a source power cal of the LO source. If the LO is a fixed frequency, this step is performed very fast.

The results of an IMDx calibration are very similar to the results that are achieved from an [SMC calibration](#).

---

**Last Modified:**

- 27-Apr-2011   Removed Copy Channels limitation
- 27-Sep-2010   Merged with Swept IMD and Mixer tabs
- 12-Apr-2010   Removed some fixturing limitations
- 11-Aug-2009   Added limited port mapping
- 13-Jul-2009   Added 2nd order notes

IMx Spectrum for Converters

IMx Spectrum measurements are a distinct measurement class and therefore always made in a separate channel. This topic discusses all aspects of an IMx Spectrum measurement.

- Requirements and Limitations
- How an IMx Spectrum Channel Works
- Create an IMx Spectrum Channel
- Select IMx Spectrum Parameters
- Start the IMx Spectrum Setup dialog
  - Frequency tab
  - Tone Power tab
  - Mixer Frequency tab (separate topic)
  - Mixer Power tab (separate topic)
  - Mixer Setup tab
- Calibration

See Also

- Swept IMD Measurements
- Programming commands

Requirements and Limitations

IMx Spectrum requires IMD (Opt 087) and FCA (either Opt 082 or 083). The following PNA features are NOT available in an IMx Spectrum channel:

- Unratioed receiver measurements (A, B, R)
- ECal User Characterization
- FOM or FCA
- Time Domain
- Balanced measurements
How an IMx Spectrum for Converters Channel Works

Before reading this topic, you should become familiar with IMD Concepts.

The IMx Spectrum channel provides a traditional Spectrum Analyzer view of the intermodulation distortion behavior of a converter output. Unlike the Swept IMDx channel, the main tones (F1 and F2) are fixed while the receiver is swept over a frequency range of interest in order to generate a display as shown below.

![IMx Spectrum trace (bottom) with Swept IMDx traces (top)](image)

A typical Spectrum Analyzer does NOT have a signal source. This one does. The signal source, or stimulus, settings for the F1 and F2 main tones can be set in either the IMx Spectrum channel or the Swept IMDx channel. These settings include the frequencies and power levels of the main tones.
Although the stimulus settings can be set in either the IMx Spectrum channel or the Swept IMDx channel, the receiver settings are set ONLY in the Frequency tab of the IMx Spectrum dialog. These settings include how many tone products to view, which determines the center and frequency span and the resolution bandwidth. You can also set a Linear sweep type, then enter an arbitrary receiver frequency range.

You can choose from several resolution bandwidths which also determines the number of data points used in the channel. The higher the Res BW, the fewer the number of data points.

The IMx Spectrum channel performs multiple measurements for each data point in order to reject unwanted images which are generated by the PNA internally. This provides a high degree of confidence that signals captured in a trace are real and are not spurious responses generated in the measurement process.

**Differences from IM Spectrum for Amplifiers**

An IMx Spectrum for Converters channel has the following important differences from an IM Spectrum channel for Amplifiers.

- In an IMx Spectrum channel, **all converter frequencies are fixed**. (Input, Output, LO, Tone Spacing, and Tone Power).
- The IMx Spectrum channel **CANNOT track** with the IMDx channel, as it can in IMD for Amplifiers.

**Create an IMx Spectrum Channel**

An IMx Spectrum channel can be created independently, or from an existing Swept IMDx channel.

**To create an independent IMx Spectrum channel**

1. On the PNA front panel, press **Meas** then **[Measurement Class]**
2. Select **IMx Spectrum**, then either:
   - **OK** delete the existing measurement, or
   - **New Channel** to create the measurement in a new channel.

**To create an IMx Spectrum channel from an existing Swept IMD channel**

This creates or configures an existing IMx Spectrum channel based upon the configuration of the Swept IMD channel at the Marker frequency.

1. With a Swept IMD channel active, press the **MARKER** key on the front panel.
2. Move the marker to the data point of interest. It can be moved again later.
3. Press **[Marker Functions]** then **[Marker -> IMx Spectrum]**

**Select IMx Spectrum Parameters**
How to add IMx Spectrum traces
With the IMx Spectrum channel active and a Tr1 Output trace displayed:

Using front-panel HARDKEY [softkey] buttons
1. Press TRACES
2. then [New Trace]
3. then select a new parameter

Using a mouse with PNA Menus
1. Click Trace/Chan
2. then New Trace
3. then select a new parameter

New Trace - IM Spectrum - dialog box help
Output Port 2, Incident

To accommodate single-source PNA models, an external source can be used for the RF2 tone.
Learn how to configure an external source and combiner to make Swept IMD and IMDx measurements.

**Converter Stages** Choose from 1 or 2 stage DUT (# of LOs).

**Converter Model**

- **f1** Always uses PNA internal source 1.

- **(DUT Input) Port N** Available for selection on 4-port PNA models. Select the PNA port (1 or 3) to connect to the DUT Input.

- **f2** Available for selection when an external source is configured and Active.

- **LO1 (and LO2 for 2-stage DUTs)** Select the source to use for the specified LO. Available for selection when an external source is configured and Active.

- **(DUT Output) Port N** Available for selection on 4-port PNA models. Select the PNA port to connect to the DUT Output.

**Hardware Configuration**

- **Add Source** Click to configure an external source using the External Source Configuration dialog.

- **Path Configuration** Click to launch the Path Configuration dialog (PNA-X models only).

**Calibration**

A calibration of the IMx Spectrum channel is NOT performed using a calibration wizard.

An IMx Spectrum channel is calibrated from a Cal Set that is used on a Swept IMDx channel. The Cal Set can be applied to the IMx Spectrum channel using the Manage Cal Sets dialog (Learn how) or from the Marker =>IMx Spectrum softkey (Learn how).

However, a Swept IMDx channel with **Sweep Type = Power Sweep** can NOT be applied to a IMx Spectrum channel. This is because a Cal Set for power sweep contains only a CW frequency and the IMx Spectrum channel requires a swept frequency range. Zero Span is not supported in an IMx Spectrum channel.
A calibrated IMx Spectrum trace corrects the source and receiver power level accuracy of the displayed Tones.

See Swept IMD Calibration
Learn how to apply a Cal Set to the IMx Spectrum channel

Time Domain

Time Domain allows you to view a device response as a function of time. The following are discussed in this topic:

- Overview
- How the PNA Measures in the Time Domain
- Calibration for Time Domain
- Transmission Measurements
- Measurement Response Resolution
- Measurement Range and Alias Responses
- How to make Time Domain Settings
- Gating
- Window Settings

**Note:** Time Domain measurements are only available on PNAs with Option 010. See [PNA Options](#). See the updated [App Note: Time Domain Analysis Using a Network Analyzer](#).

**Overview**

In normal operation, the PNA measures the characteristics of a test device as a function of frequency. With Time Domain (opt 010), the frequency information is used to calculate the inverse Fourier transform and display measurements with time as the horizontal display axis. The response values appear separated in time, allowing a different perspective of the test device's performance and limitations.

The graphic below compares the same cable reflection measurement data in both the frequency and time domain. The cable has two bends. Each bend creates a mismatch or change in the line impedance.

- The frequency domain S11 measurement shows reflections caused by mismatches in the cable. It is impossible to determine where the mismatches physically occur in the cable.

- The time domain response shows both the location and the magnitude of each mismatch. The responses indicate that the second cable bend is the location of a significant mismatch. This mismatch can be [gated out](#), allowing you to view the frequency domain response as if the mismatch were not present. Distance Markers can be used to pinpoint the distance of the mismatch from the reference plane.
How the PNA Measures in the Time Domain

Time domain transform mode simulates traditional Time-Domain Reflectometry (TDR), which launches an impulse or step signal into the test device and displays the reflected energy on the TDR screen. By analyzing the magnitude, duration, and shape of the reflected waveform, you can determine the nature of the impedance variation in the test device.

The PNA does not launch an actual incident impulse or step. Instead, a Fourier Transform algorithm is used to calculate time information from the frequency measurements. The following shows how this occurs.

A single frequency in the time domain appears as a sine wave. In the following graphic, as we add the fundamental frequency (F₀), the first harmonic (2F₀), and then the second harmonic (3F₀), we can see a pulse taking shape in the Sum waveform. If we were to add more frequency components, the pulse would become sharper and narrower. When the PNA sends discrete frequencies to the test device, it is in effect, sending individual spectral pieces of a pulse separately to stimulate the test device.

During an S11 reflection measurement, these incident signals reflect from the test device and are measured at the receiver. This is when the time domain transform calculations are used to add the separate spectral pieces together.

For example, consider a short length of cable terminated with an open. All of the power in the incident signal is reflected, and the reflections are 'in-phase' with the incident signal. Each frequency component is added together, and we see the same pattern as the simulated incident would have looked (above). The magnitude of the reflection is related to the impedance mismatch and the delay is proportional to the distance to the mismatch. The x-axis (time) scale is changed from the above graphic to better show the delay.

Alternately, the same cable terminated with a short also reflects all of the incident power, but with a phase shift of 180 degrees. As the frequency components from the reflection are added together, the sum appears as a negative impulse delayed in time.
**Calibration for Time Domain**

For simplicity, we have discussed incident signals reflecting off discontinuities in the test device. By far the most common network analyzer measurement to transform to time domain is a ratioed S11 measurement. An S11 reflection measurement does not simply display the reflections measured at the A receiver - it displays the ratio (or difference) of the A receiver to the Reference receiver. In addition, the S11 measurement can also be calibrated to remove systematic errors from the ratioed measurement. This is critical in the time domain as the measurement plane, the point of calibration, becomes zero on the X-axis time scale. All time and distance data is presented in reference to this point. As a result, both magnitude and time data are calibrated and very accurate.

The following shows where the time domain transform occurs in the PNA data flow: (see Data Access Map)

1. Acquire raw receiver (A and R1) data
2. Perform ratio (A/R1)
3. Apply calibration
4. Transform data to time domain
5. Display results

Therefore, although a time domain trace may be displayed, a calibration is always performed and applied to the frequency domain measurement which is not displayed.

**Transmission Measurements**

The most common type of measurement to transform is an S11 reflection measurement. However, useful information can be gained about a test device from a transformed S21 transmission measurement. The frequency components pass through the test device and are measured at the B receiver. If there is more than one path through the device, they would appear as various pulses separated in time.

For example, the following transmission measurement shows multiple paths of travel within a Surface Acoustic Wave (SAW) filter. The largest pulse (close to zero time) represents the propagation time of the shortest path through the device. It may not be the largest pulse or represent the desired path. Each subsequent pulse represents another possible path from input to output.
Triple travel is a term used to describe the reflected signal off the output, reflected again off the input, then finally reappearing at the output. This is best seen in a time domain S21 measurement.

**Measurement Response Resolution**

In the previous paragraphs, we have seen that using more frequency components causes the assembled waveform to show more detail. This is known as measurement response resolution, which is defined as the ability to distinguish between two closely spaced responses.

Note: Adjusting the transform time settings improves display resolution, but not measurement resolution.

The following graphic shows the effect of both a narrow and wide frequency span on the response resolution. The wider frequency span enables the analyzer to resolve the two connectors into separate, distinct responses.

**Resolution Formula**

For responses of equal amplitude, the response resolution is equal to the 50% (-6 dB) points of the impulse width, or the step rise time which is defined as the 10 to 90% points as shown in the following image.
The following table shows the **approximated** relationship between the frequency span and the window selection on response resolution for responses of equal amplitude.

<table>
<thead>
<tr>
<th>Window</th>
<th>Low-pass step (10% to 90%)</th>
<th>Low-pass impulse (50%)</th>
<th>Bandpass impulse</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum</td>
<td>0.45 / f span</td>
<td>0.60 / f span</td>
<td>1.20 / f span</td>
</tr>
<tr>
<td>Normal</td>
<td>0.99 / f span</td>
<td>0.98 / f span</td>
<td>1.95 / f span</td>
</tr>
<tr>
<td>Maximum</td>
<td>1.48 / f span</td>
<td>1.39 / f span</td>
<td>2.77 / f span</td>
</tr>
</tbody>
</table>

For example, using a 10 GHz wide frequency span and a normal window in Bandpass impulse mode, response resolution (in time) equals:

- Time Res = \( \frac{1.95}{\text{frequency span}} \)
- Time Res = \( \frac{1.95}{10 \text{ GHz}} \)
- Time Res = 195 ps

To calculate the physical separation (in distance) of the responses which can be resolved, multiply this value times the speed of light (c) and the relative velocity (Vf) of propagation in the actual transmission medium. In this case, Vf = 0.66 for polyethylene dielectric.

- Distance Res = \( 195 \text{ ps} \times c \times Vf \)
- Distance Res = \( 195 \text{ ps} \times (2.997925 \text{ E8 m/s}) \times 0.66 \)
- Distance Res = 38 mm

For reflection measurements, because of the 2-way travel time involved, this means that the minimum resolvable separation between discontinuities is half of this value or 19 mm.

Although a wider frequency span causes better measurement resolution, the **measurement range** becomes limited. Also, increasing the frequency range can cause a measurement calibration to become invalid. Be sure to adjust the frequency span BEFORE performing a calibration.
Measurement Range and Alias Responses

Measurement range is the length in time in which true time domain responses can be seen. The measurement range should be large enough to see the entire test device response without encountering a repetition (alias) of the response. An alias response can hide a true time domain response.

To increase measurement range in both modes, change either of these settings:

- Increase the number of points
- Decrease the frequency span

Notes:

- After making these settings, you may need to adjust the transform time settings to see the new measurement range.
- Decreasing the frequency span degrades measurement resolution.
- Make frequency span and number of points settings BEFORE calibrating.
- Maximum range also depends on loss through the test device. If the returning signal is too small to measure, the range is limited regardless of the frequency span.

Alias Responses

An alias response is not a true device response. An alias response repeats because each time domain waveform has many periods and repeats with time (see How the PNA Measures in the Time Domain). Alias responses occur at time intervals that are equal to 1/ frequency step size.

The PNA adjusts the transform time settings so that you should only see one alias free range on either side (positive and negative) of zero time. However, these settings are updated only when one of the toolbar settings are changed.

To determine if a response is true, put a marker on the response and change the frequency span. A true device response will not move in time. An alias response will move.

For example, in the above graphic, the marker 1 response occurs at 14.07 inches. When the frequency span is changed, this response remains at 14.07 inches. The marker 2 response moves.

Range Formula
You can calculate the alias-free measurement range (in meters) of the PNA using the following formula for TDR (reflection) measurements:

Range (meters) = \((1/\Delta f) \times V_f \times c\)

Where:

- \(\Delta f\) = frequency step size (frequency span/number of points - 1)
- \(V_f\) = the velocity factor in the transmission line
- \(c\) = speed of light = 2.997925 E8 m/s

For example: For a measurement with 401 points and a span of 2.5 GHz, using a polyethylene cable (\(V_f = 0.66\))

- \(\text{Range} = (1 / (2.5E9 / 400)) \times 2.997925 \times 0.66\)
- \(\text{Range} = 6.25E6 \times 2.997925 \times 0.66\)
- \(\text{Range} = 32\) meters

In this example, the range is 32 meters in physical length. To prevent the time domain responses from overlapping or aliasing, the test device must be 32 meters or less in physical length for a transmission measurement.

To calculate the one-way distance for a reflection measurement rather than round-trip distance, simply divide the length by 2. In this case, the alias-free range would be 16 meters.

**How to make Time Domain Settings**

The following launches the Time Domain toolbar

On the toolbar, click More... to launch the Time Domain dialog box

Using front-panel HARDKEY [softkey] buttons

1. Press ANALYSIS
2. then [Transform]
3. then [More]
4. then [Transform Tool]

Using a mouse with PNA Menus

1. Click Marker/Analysis
2. then Transform
**Transform** dialog box help

**Category**  Select Transform, Window, or Gating

**Transform**  Turns time domain transform ON and OFF.

**Coupling Settings**  Launches the [Trace Coupling Settings](#) dialog box.

**Time Settings**
The following settings adjust the **display resolution**, allowing you to zoom IN or OUT on a response. They do NOT adjust **measurement range** or **measurement resolution**.

These settings automatically update (when one of these values are updated) to limit the display to one **alias-free response** on either side of zero time.

**Start**  Sets the transform start time that is displayed on the PNA screen.

**Note:** Zero (0) seconds is always the **measurement reference plane**. Negative values are useful if moving the reference plane.

**Stop**  Sets the transform stop time that is displayed on the PNA screen.

**Center**  Sets the transform center time that is displayed in the center of the PNA screen.

**Span**  Sets the transform span time that is split on either side of the Center value.

**Transform Mode**
Transform modes are three variations on how the time domain transform algorithm is applied to the frequency domain measurement. Each method has a unique application.
<table>
<thead>
<tr>
<th>Mode</th>
<th>Benefit - application</th>
<th>Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low pass Impulse</strong></td>
<td>Highest resolution. Most useful for seeing small responses in devices that pass low frequencies, such as cables.</td>
<td>In both Low pass modes, frequencies down to DC and negative frequencies are extrapolated. Therefore, the Start frequency is adjusted when you click <strong>Set Freq. Low Pass</strong>. Because this will affect calibration accuracy, be sure to calibrate AFTER completely setting up your time domain measurement.</td>
</tr>
<tr>
<td><strong>Low pass Step</strong></td>
<td>Easiest to identify inductive and capacitive discontinuities in devices that pass low frequencies, such as cables.</td>
<td>Does NOT show capacitive and inductive reactance. For the same frequency span and number of points, band pass mode has twice the impulse width, which hides closely spaced responses degrading the response resolution.</td>
</tr>
<tr>
<td><strong>Band pass Impulse</strong></td>
<td>Easiest method - can be used with any frequency sweep. Most useful for measuring band limited devices such as filters and DC blocked cables.</td>
<td>Does NOT show capacitive and inductive reactance. For the same frequency span and number of points, band pass mode has twice the impulse width, which hides closely spaced responses degrading the response resolution.</td>
</tr>
</tbody>
</table>

The following chart shows how to interpret results from various discontinuity impedances using Low pass Step and either Low pass or Band pass Impulse modes.

<table>
<thead>
<tr>
<th>IMPEDANCE</th>
<th>STEP RESPONSE</th>
<th>IMPULSE RESPONSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPEN</td>
<td>Unity Reflection</td>
<td>Unity Reflection</td>
</tr>
<tr>
<td>SHORT</td>
<td>Unity Reflection = 180</td>
<td>Unity Reflection = 180</td>
</tr>
<tr>
<td>RES/STOR R &gt; Z_0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RES/STOR R &lt; Z_0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>INDUCTOR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CAPACITOR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Effect on Measurement Range**

**Band pass mode** - measurement range is inversely proportional to frequency step size.

**Low pass mode** - measurement range is inversely proportional to the fundamental (start) frequency AFTER clicking Set Freq. Low Pass.

**Set Freq. Low Pass** USE ONLY IN LOW PASS MODES

Recomputes the start frequency and step frequencies to be harmonics of the start frequency. Start frequency is computed by the following formula: **Low Pass Start Frequency = Stop Frequency / Number of points.**
The computed value must always be greater than or equal to the analyzer's minimum frequency.

**Note:** The number of points or stop frequency may be changed in order to compute this value.

**Distance Marker Settings** Launches the Distance Marker Settings dialog box.

---

**Gating**

Perhaps the most beneficial feature of time domain transform is the Gating function. When viewing the time domain response of a device, the gating function can be used to "virtually" remove undesired responses. You can then simultaneously view a frequency domain trace as if the undesired response did not exist. This allows you to characterize devices without the effects of external devices such as connectors or adapters.

**Note:** When a discontinuity in a test device reflects energy, that energy will not reach subsequent discontinuities. This can "MASK", or hide, the true response which would have occurred if the previous discontinuity were not present. The PNA Gating feature does NOT compensate for this.

The following measurements images show a practical example how to use and perform gating. The test device is a 10inch cable, then a 6 dB attenuator, terminated with a short. The following four discontinuities are evident in window 2, from left to right:

1. A discontinuity in the test system cable which appeared after calibration. It is identified by marker 2 at -10.74 inches (behind the reference plane).
2. A discontinuity in the 10 inch device cable shortly after the reference plane.
3. The largest discontinuity is the attenuator and short shown by marker 1 at -12.67 dB (6 dB loss in both forward and reverse direction).
4. The last discontinuity is a re-reflection from the device cable.

We will gate IN the attenuator response. All other responses will be gated OUT.

**Window 1.** Create original S11 frequency domain trace. Shows ripple from all of the reflections.

**Window 2.** Create a new S11 trace - same channel; new window. Turn Transform ON.

**Window 3.** On the transformed trace, turn gating ON. Center the gate on the large discontinuity (2.500ns). Adjust gate span to completely cover the discontinuity. Select Bandpass gating type.

**Window 4.** On the original frequency measurement, turn Gating ON (Transform remains OFF). View the measurement without the effects of the two unwanted discontinuities. The blue trace is a measurement of the 6 dB attenuator with the unwanted discontinuities PHYSICALLY removed. The difference between the two traces in window 4 is the effect of "masking".
Learn how to launch the Transform dialog box

Programming Commands

Transform Gating dialog box help

Gating  Turns Gating ON and OFF.
Coupling Settings  Launches the Setup Trace Coupling dialog box.
Start  Specifies the start time for the gate.
Stop  Specifies the stop time for the gate.
Center  Specifies the value at the center of the area that is affected by the gating function. This value can be anywhere in the analyzer range.
Span  Specifies the range to either side of the center value of area that is affected by the gating function.
Gate Type  Defines the type of filtering that will be performed for the gating function. The gate start and stop
flags on the display point toward the part of the trace you want to keep.

- **Bandpass** - KEEPS the responses within the gate span.
- **Notch** - REMOVES the responses with the gate span.

**Gate Shape** Defines the filter characteristics of the gate function. Choose from Minimum, Normal, Wide, Maximum

<table>
<thead>
<tr>
<th>Gate Shape</th>
<th>Passband Ripple</th>
<th>Sidelobe Levels</th>
<th>Cutoff Time</th>
<th>Minimum Gate Span</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum</td>
<td>±0.1 dB</td>
<td>-48 dB</td>
<td>1.4/Freq Span</td>
<td>2.8/Freq Span</td>
</tr>
<tr>
<td>Normal</td>
<td>±0.1 dB</td>
<td>-68 dB</td>
<td>2.8/Freq Span</td>
<td>5.6/Freq Span</td>
</tr>
<tr>
<td>Wide</td>
<td>±0.1 dB</td>
<td>-57 dB</td>
<td>4.4/Freq Span</td>
<td>8.8/Freq Span</td>
</tr>
<tr>
<td>Maximum</td>
<td>±0.01 dB</td>
<td>-70 dB</td>
<td>12.7/Freq Span</td>
<td>25.4/Freq Span</td>
</tr>
</tbody>
</table>

**Cutoff time** -- is the time between the stop time (-6 dB on the filter skirt) and the peak of the first sidelobe. The diagram below shows the overall gate shape and lists the characteristics for each gate shape.

- T₁ is the gate span, which is equal to the stop time minus the start time.
- T₂ is the time between the edge of the passband and the 6 dB point, representing the cutoff rate of the filter.
- T₃ is the time between the 6 dB point and the edge of the gate stopband.
- For all filter shapes T₂ is equal to T₃, and the filter is the same on both sides of the center time.

**Minimum gate span** -- is twice the cutoff time. Each gate shape has a minimum recommended gate span for proper operation. This is a consequence of the finite cutoff rate of the gate. If you specify a gate span that is smaller that the minimum span, the response will show the following effects:

- distorted gate shape that has no passband
- distorted shape
- incorrect indications of start and stop times
may have increased sidelobe levels

Window Settings

There are abrupt transitions in a frequency domain measurement at the start and stop frequencies, causing overshoot and ringing in a time domain response. The window feature is helpful in lessening the abruptness of the frequency domain transitions. This causes you to make a tradeoff in the time domain response. Choose between the following:

- **Minimum Window = Better Response Resolution** - the ability to resolve between two closely spaced responses.
- **Maximum Window = Dynamic Range** - the ability to measure low-level responses.

![Minimum Window and Maximum Window](image)

Learn how to launch the Transform dialog box

**Programming Commands**

![Transform Dialog Box](image)
**Transform - Window** dialog box help

**Coupling Settings** Launches the [Setup Trace Coupling](#) dialog box. The window settings balance response resolution versus dynamic range.

- Minimum Window = Best Response Resolution
- Maximum Window = Best Dynamic Range

The following three methods all set window size. For best results, view the time domain response while making these settings.

- **Minimum - Maximum** Move the slider with a mouse to change the window size
- **Kaiser Beta** Changes window size using a Kaiser Beta value
- **Impulse Width** Changes window size using an Impulse Width value

Learn more about [Windowing](#) (top)

---

**How to make Trace Coupling Settings**

You can launch the **Trace Coupling Settings** dialog box from any of the following dialog boxes:

- **Transform**
- **Gating**
- **Window**

---

[Programming Commands](#)
Trace coupling allows you to change time domain parameters on a measurement, and have the same changes occur for all other measurements in the channel.

For example:

If you are simultaneously viewing a frequency domain measurement and time domain measurement, and **Coupling** is enabled in this dialog box, and ALL **Gating Parameters** are checked in this dialog box, and on the time domain measurement you change the **Gate Span** parameter,

Then the frequency domain measurement will automatically change to reflect the time domain gated span.

**Coupling ON/OFF** Check to enable coupling. All of the measurements in the active channel are coupled.

The following parameters are available for coupling:

**Transform Parameters**
- **Stimulus** Start, Stop, Center, and Span TIME settings.
- **State** (On/Off) Transform ON and OFF
- **Window** Kaiser Beta / Impulse Width
- **Mode** Low Pass Impulse, Low Pass Step, Band Pass

**Gating Parameters**
- **Stimulus** Start, Stop, Center, and Span TIME settings.
- **State** (On/Off) Gating ON and OFF
- **Shape** Minimum, Normal, Wide, and Maximum
- **Type** Bandpass and Notch

To launch the Distance marker dialog box, click **Dist. Marker Settings** on the **Transform** dialog box.
When markers are present on a time domain measurement, distance is automatically displayed on the marker readout, marker table, and print copy. To learn how to create markers on your measurement see marker settings.

This dialog box allows you to customize the time domain distance marker readings. These settings affect the display of ALL markers for only the ACTIVE measurement (unless Distance Marker Unit is coupled on the Trace Coupling dialog box).

**Marker Mode** Specifies the measurement type in order to determine the correct marker distance.

- Select **Auto** for S-Parameter measurements.
- Select **Reflection** or **Transmission** for arbitrary ratio or unratioed measurements.

**Auto** If the active measurement is an S-Parameter, automatically chooses reflection or transmission. If the active measurement is a non S-Parameter, reflection is chosen.

**Reflection** Displays the distance from the source to the receiver and back divided by two (to compensate for the return trip.)

**Transmission** Displays the distance from the source to the receiver.

**Units** Specifies the unit of measure for the display of marker distance values.

**Velocity Factor** Specifies the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum. This is useful in Time Domain for accurate display of time and distance markers.

This setting can also be made from the Electrical Delay and Port Extensions dialog boxes.
Integrated Pulse Measurements

Beginning with PNA Rev. A.09.20, the Pulse Setup dialogs shown in this topic are integrated in the PNA firmware and are available with Opt 008 or Opt H08.

Previously, setup was performed with the Narrowband or Wideband pulse programs (E836x models can continue to use these programs) and with SCPI and COM commands. With the appropriate hardware options (Opt 021, 022, 025) these commands are still available without Opt 008 or H08.

In this topic

- Pulse Setup
- Pulse Generator Setup
- Pulse Trigger Tab
- Pulse Gens and IF Block Diagram
- Calibration in Pulse

See Also (separate topics)

- IF Path Configuration
- Programming commands
- Narrowband Pulsed Application (Opt H08)
- WB Pulsed App
- IF Access User Interface Settings (PNA "C" models)

How to start the Pulse Setup dialog

To provide quicker access, use the Setup softkey. Learn how.

Using front-panel HARDKEY [softkey] buttons

1. Press Sweep
2. then [Pulse Setup]

Using a mouse with PNA Menus

1. Click Stimulus
2. then Sweep
3. then Pulse Setup

Programming Commands
The Basic (upper box) controls allow simple pulse measurements using the default (Autoselect) settings in the Advanced section (lower box) of the dialog.

Pulsed measurements are performed in a Standard channel. See Measurement Class. However, several PNA measurement settings are controlled by the Pulse setup, such as sweep type, number of points, and so forth.

**Pulse Measurement**

- **Off** - Source and Receivers are NOT pulsed

- **Standard Pulse** - With pulsed RF, the PNA can be configured to sweep in frequency, power sweep, and CW time. Narrow the receiver pulse width and enter delay to make 'point-in-pulse' measurements.

- **Pulse Profile** - Pulse profile measurements provides a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.
Pulse Profiling can be performed using ratioed or unratioed measurements. You can preview the pulse on port 1 by using an R1 receiver measurement.

- Pulse Profiling is performed at a single CW frequency in either Narrowband or Wideband mode.
- To select the CW Frequency, click **Stimulus**, then **Sweep Type**.
- In Narrowband mode, the delay increment value, which is responsible for "walking" the receiver snapshot across the pulse, is selected by the PNA and is accessible only with a programming command.
- In Wideband mode, the receiver is walked across the pulse by making a sequence of closely-spaced measurements in real-time.

**Pulse Timing**

- **Pulse Width** - Sets the width of the source pulse. See [measurement timing](#) to learn how to control the receiver width and delay.
- **Pulse Period** - The time to make one complete pulse.
- **Pulse Frequency (PRF)** - The reciprocal of Period (1/ Period). See [Internal Pulse Generators](#) to learn more.

By default, these settings configure Pulse Gen 1 to drive Source Modulators 1 and 2. This can be changed from the Advanced Settings Pulse Generator Setup dialog.

**-------- Advanced Settings --------**

The following settings allow maximum control of a Pulse measurement.

**Note:** When the "Auto" check boxes are cleared, it is possible to configure settings to make an invalid measurement.

**Properties**

- **Autoselect pulse detection method** - check to automatically switch between Narrowband and Wideband based on the Pulse Width.
  - In Standard Pulse:
    - **Wideband** - used when the (source) Pulse Width is WIDER than the fastest receiver acquisition time. This allows the receiver to measure all pulse ON time - no pulse OFF time. The PNA will select Wideband whenever possible.
    - **Narrowband** - used when the (source) Pulse Width is NARROWER than the fastest receiver acquisition time (267 ns). This measurement requires a spectral nulling technique to measure the pulse response through the DUT.
  - In Pulse Profile:
    - **Wideband** - used when the (source) Pulse Width is greater than 1.600 us. This allows the receiver make several sequential measurements to measure the entire pulse.
    - **Narrowband** - used when the (source) Pulse Width is less than or equal to 1.600 us.
**Autoselect IF Path Gain and Loss** - For future use.

**IF Path** - Click to launch the IF Path dialog.

**Optimize Pulse Frequency** - Automatically selects the Pulse Frequency and Pulse Period.

- In Narrowband, the pulse frequency is adjusted slightly to get the best spectral-nulling filtering possible.
- In Wideband, this checkbox is ignored.

**Autoselect Profile Sweep Time** - In Pulse Profile mode, adjusts the default X-axis start time to zero and the stop time double the Pulse Width. This allows you to see one complete pulse. If unchecked, the Sweep Time will not be changed.

To adjust the X-axis manually, click **OK** to close the dialog. Then click **Stimulus**, then **Sweep**, then **Sweep Time**, then change the **Start Time** and **Stop Time**.

**IFBW** - Select the IFBW for the measurement.

- In Narrowband, an IFBW as close as possible to the entered value will be used.
- In Wideband, this setting determines the receiver acquisition time - approximately 1/IFBW.

**Measurement Timing**

**Source1** and **Source2** - Used as RF Source Modulation Drive.

- **Width** - source pulse width.
- **Delay** - source pulse delay relative to the pulse generator clock.
- **Pulse Gen** - Pulse generator used to modulate the source. Select **CW** to have NO source modulation.

The receiver settings in this table change depending on whether the PNA is in Narrowband or Wideband mode.

- In Narrowband, for each IF receiver path, configure the Pulse Width, Delay, and Pulse Generator to be used to drive the receiver gate.
- In Wideband, all receiver paths are the same.

**Autoselect Width and Delay** - When checked, for Wideband mode and Pulse0, the receiver is adjusted to approximately 75% of the source pulse width, with 20% delay. This leaves approximately 5% of the source pulse ON after acquisition is complete.

When checked for Narrowband mode and Pulse Gen = CW, then the delay and width have no values. When a Pulse Gen is selected, then Delay and Width matches the RF Source.

**Autoselect Pulse Generators** - When checked:

- Pulse1 is selected for Modulator Drive.
- Pulse2 is CW (OFF).
- For Wideband, Pulse0 is selected to gate the ADC.
- For Narrowband, Pulse2 is selected.

**Pulse Generators** Click to launch the Pulse Generators Setup dialog.

---

**Pulse Generators Setup** dialog box help

This dialog is available with Option 025 (pulse generators).

To see this dialog, press Pulse Gen Setup on the Pulse Setup dialog.

**Internal Pulse Generators**

For each Pulse Generator configure the width, delay, and polarity.

Pulse0 triggers the PNA receivers when Enabled. The Width can NOT be configured. Delay defines the delay between the pulse clock and when the receiver begins to make a measurement. Learn more.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

```
D = Delay; the time before each pulse begins
W = Width; the time the pulse is ON
Duty Cycle = W/P
```

**Internal Pulse Clock (P)**

- P = Period; one complete pulse cycle
- Pulse Frequency (PRF) = 1 / Period
Important: If $D + W$ is greater than $P$, then undefined PNA behavior results. There is NO error message or warning.

**Invert**  Check to cause the pulse ON time to be active low and OFF be active high.

Learn more about the Pulse Generators.

**Internal Pulse Modulators**

Check to enable one or both internal source modulators.

These are switches 8 and 9 in the [Block Diagram](#).

**Important:** When internally modulating the sources, **source leveling is automatically set to Open-loop**.

**Modulator Drive**  Choose the pulse generator to modulate the specified source. Choose from **CW** (NO pulse), Pulse 1, 2, 3, 4, External.  This is switch 7 [Block Diagram](#).

**Pulse Trigger**  click to start the Pulse Trigger dialog.

---

**Pulse Trigger Tab - Trigger dialog box help**

To see this dialog, press **Pulse Trigger** on the Pulse Generator Setup dialog or select **Stimulus**, then **Trigger** from the PNA Menu.

**Pulse Sync Trigger - Source**

Select **Internal** or **External** to provide sync capability for the internal pulse generators.

- **Internal** - The pulse generator is internally triggered and puts out a periodic pulse train with a period defined by the Pulse Generator Setup dialog.

- **External** - The period is ignored and the internal pulse generator puts out one set of pulses (P0-P4) per external trigger. All five pulse outputs have unique delay and pulse width settings. External trigger input is on the Pulse I/O connector pin 7 (PulseSyncIn). The PulseSyncIn line provides a configurable trigger signal into the Pulse Generators. If a level trigger is still valid when the first pulse set is finished, another set will be generated. Only one set of pulses is emitted when edge triggering is used. The length of time that it takes to emit one set of pulses is the end time of the last enabled pulse (largest of width + delay of
all the pulses P0-P4).

**Level/Edge**
Sets the edge or level of the trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.
Positive = rising edge; Negative = falling edge.
These selections are available ONLY with DSP version: 4.0 FPGA: 34 or higher. Learn more. Otherwise, the pulse generators respond only to positive, level input trigger signals.

**Receiver**

**Synchronize receiver to pulse generator Pluse0** - Check to enable Pulse Gen 0 (P0) which is used to gate the ADC for wideband receiver measurements. Learn more about Pulse0.

**Receiver delay** - Set the amount of time to wait before triggering the ADC to begin acquisition.

---

**Pulse Trigger Block Diagram**

See complete description at IF Path Configuration

**Calibration in Pulse Mode**

To perform a calibration in pulse mode (option H08 / 008), first configure and apply the pulse parameters (PRF, Pulse Width, Delays, IF gating, and so forth) before calibrating the system. This will ensure the PNA is configured properly during the calibration and measurement.
Narrowband Pulsed Application

Note: The PNA-X with Option 025 has an integrated Pulse Measurement Setup (Opt 008) that makes this application no longer necessary on the PNA-X.

The Narrowband Pulsed Application is a Visual Basic program that provides a user interface for making pulsed measurements.

In this topic:

- Required Options
- Connecting External Pulse Generators
- Using the Narrowband Pulsed Application
- How to Configure Pulse Generators and Receivers
- Calibration in Pulse Mode
- Pulse Profiling
- Signal Reduction versus Gate Width
- Pulsed Frequency Converter Measurements
- Writing your own Narrowband Pulsed Application

The following enhancements were made in PNA Rev. 7.2:

- Enhanced Pulse Measurement Capabilities
- Support for Internal Pulse Generators / Modulators (PNA-X only)

See Also

- Learn about the Wideband Pulsed Application.
- For more conceptual information see our Pulsed Measurement App Notes.
- See PNA-X Block Diagram of IF Path / Pulse Generators / Source Modulation
- Programming commands
- Programming examples

Other IF Access Topics

Required Options and Equipment
The PNA H08 option provides the Narrowband Pulsed Application. The following options are also required. If your PNA does not have the required options, a message is displayed on the screen. For more information, see Pulsed-RF Measurements Configuration Guide.

**PNA-X Models**

- PNA-X models: None; however **Opts 021, 022, and 025** greatly enhance speed, performance, and convenience.
- PNA-X Opt 224 (2-port Dual Source) select the **2-port Dual Source** Configuration in the Path Configuration dialog to provide Pulse modulation on both port 1 and port 2.
- Use the PNA-X **Pulse I/O connector** to access the internal pulse generators
- See the PNA-X **IF Path Configuration block diagram** which includes the Pulse Modulators and Generators.

**Other PNA Models**

- E836x models: **Opt 014 (front panel access)** and **Opt 080 (frequency offset)**. To use the internal receiver gating feature of the Narrowband Pulsed Application, your PNA must have the **H11 hardware option**.
- PNA-L models: H08 NOT available
- Agilent 81104A or 81110A Pulse Generator with ONLY the 81105A or 81111A output modules. The 81112A module does NOT have selectable 50 ohm/1K ohm output impedance/load compensation to drive the 1K ohm PNA IF gates. For more information, see the 81100 Family of Pulse Pattern Generators Technical Specifications at: [http://cp.literature.agilent.com/litweb/pdf/5980-1215E.pdf](http://cp.literature.agilent.com/litweb/pdf/5980-1215E.pdf)

**Connecting External Pulse Generators**

Each 81110A Pulse Generator has two output modules. Each output can drive a PNA IF Receiver or Source Modulation (Z5623A H81). Connect the Pulse Generators as follows:

**81110A front panel connectors**

- Connect GPIB cables to the 81110A and PNA.
- Connect the PNA 10 MHz Ref Out to the 81110A 10 MHz IN.
- If using two 81110As for a total of 4 outputs, then connect the TRIGGER OUT of one to the EXT INPUT of the other 81110A.
- Connect the 81110A OUTPUTs to the PNA rear panel IF inputs to be gated. The outputs are mapped in the Pulsed Generator Configuration dialog box.

**Connect the Z5623A H81Pulse Test Set (optional) to the PNA front-panel port 1 loops as follows:**
<table>
<thead>
<tr>
<th>PNA</th>
<th>H81</th>
</tr>
</thead>
<tbody>
<tr>

- See how to write your own custom Narrowband Pulsed Application.

Keypad Data Entry

The PNA front-panel Numeric Entry and Navigation keys can be used for dialog box input. Also, a keyboard can be used to enter values, including alpha characters for prefixes (for example, u for usec.) After typing values, first press Enter, then press Tab to go to the next field.
Note: An error message may appear on the PNA stating that the response frequency has exceeded the maximum allowed frequency.

The Narrowband Pulsed Application may set the offset frequency (option 080) of the PNA to some value other than zero (the default value). If the stop frequency is set to the maximum of the PNA model, then the error message will appear.

To fix this, set the stop frequency to a value that is at least 2 KHz less than the maximum allowed. For example, if you have a 20 GHz PNA, and the stop frequency is set to 20 GHz, and the error message appears, then set the stop frequency to 19.999998 GHz.

See Block Diagram of IF Path / Pulse Generators / Source Modulation

Configure

You can configure more than one channel to make pulsed measurements, but the channels must use the same pulse generator settings.

Only the Agilent 81110A Pulse Generator is supported with the Narrowband Pulsed Application. Refer to the 81110A documentation for pulse repetition frequency and duty cycle capabilities.

See Also

- Configure Receivers
Converter Measurements

Edit / Undo  Pulse Application settings revert to those when Apply was last pressed.

Desired PRF and IFBW  Enter the DESIRED values. When Calculate is pressed, one or both of these values may change.

Pulse Repetition Frequency (PRF): Frequency of the pulses from the Pulse Generator.

Pulse Repetition Interval: 1/ PRF  Changes to either PRF or this setting changes both.

Receiver IF Bandwidth: IF Bandwidth of the PNA. Choose a setting from 1 Hz to 10 KHz.

Fixed PRF  When checked, (default setting) the Calculate algorithm will NOT adjust the PRF, but only change the IF Bandwidth.

Modulation/Gates  The Source Modulation and four PNA receiver gates can each have their own, or share, Pulse Generator outputs. Shared outputs have identical Width and Delay values. To configure and enable outputs, click Configure, then Pulse Generators to launch the Pulsed Generator Configuration dialog box.

Note: Option 036 and 037 limits the Source Modulation width to 117 ns.

Width  Pulse Width.

Delay  The delay that occurs before the pulse.

Duty Cycle  Calculated Duty Cycle of the source and each of the selected receivers. Updated when Calculate is pressed.

Pulse Mode On  When this box is checked, the PNA is enabled for Pulsed measurements. The PNA Status Bar annotation indicates the following:

- G  Internal IF gates enabled.
- F  Filtering for Pulsed Measurements enabled.

Apply  All selections are sent to the pulse generator and the active channel of the PNA.

Calculate  All selections are calculated and valid PRF and IFBW values are entered in their fields. If these settings are not acceptable, try changing the values you previously entered and click Calculate again. When acceptable values are attained, click Apply to send these values to the pulse generator and PNA.

Pulse Profile  Launches the Pulse Profile dialog box. Same as clicking View / Pulse Profile. If not available, check Pulse Mode ON, click Calculate, then Apply.

Minimize  Click to minimize the dialog box to make changes in the PNA application. To see the dialog again, select Macro, Pulse, or turn the Status Bar ON.

Save  All settings from the Narrowband Pulsed Application are saved in a *.ppf file. These settings are NOT
Recall  Restore settings from the specified *.ppf file that were previously saved.
Close  Closes the dialog box without saving changes.

How to configure Pulse Generators / Modulators and Receivers

From the Pulse App main dialog box

Learn about...

- **Configure Receiver Gain**
- **Converter Measurements**
- **No Pulse Generators** When checked, the Narrowband Pulsed Application does NOT attempt to communicate with internal or external pulse generators. This setting is used for troubleshooting purposes.
- **No SW Gating** When checked, the improved SW gating sensitivity is turned OFF. This setting is used for troubleshooting purposes.
# Pulsed Generator Configuration dialog box help

## Notes:

- See Block Diagram of PNA-X IF Path / Pulse Generators / Source Modulation
- For PNA-X Opt 224 (2-port Dual Source) select the 2-port Dual Source Configuration in the Path Configuration dialog to provide Pulse Modulation on both port 1 and port 2.
- This dialog may look different depending on the PNA model and number of receivers available.

Configures either the internal pulse generators (PNA-X models with relevant options), or Agilent 81110A Pulse Generator outputs. You can configure each 81110A Pulse Generator with either one or two 81111A output modules.

The Source Mod and four PNA receiver gates can each have their own, or shared, pulsed generators allowing identical Width and Delay values which are selected on the Main dialog.

To share an external generator output between one or more PNA inputs, use the same GPIB address and output module for each PNA input.

### Internal Pulse Gen Output (available ONLY on the PNA-X opt 025)

Specify the Pulse Gen (1 through 4) to use to modulate each of the PNA receiver IF gates or Sources.

### External Pulse Generator settings

- **GPIB Addr:** The GPIB address of the 81110A.
- **Output:** The output module of the 81110A.
- **Master:** The 81110A that uses the 10 MHz reference signal from the PNA.
- **Enabled:** Turns the pulse output ON.

### External Gate/Modulator settings

- **High:** Specify a 'TTL-High' voltage level
- **Low:** Specify a 'TTL-Low' voltage level
- **Ext Impedance:** Impedance of the modulator used to create the pulse.
- **Complement:** When this box is cleared, TTL HIGH is the pulse. When checked, TTL LOW is the pulse.

### Using Internal Modulators

When this box is checked, the voltage, impedance, and complement values are forced to settings that prevent damage to the internal modulator.

### Using Internal Pulse Generators

Makes the appropriate settings on this dialog available.

### Using Internal PNA gates

When this box is checked, the voltage, impedance, and complement values are forced to settings that prevent damage to the internal gates.
Receiver Gain Configuration dialog box help

See Block Diagram of PNA-X IF Path / Pulse Generators / Source Modulation

This dialog may look different depending on the PNA model and number of receivers available.

Sets the gain of each PNA receiver manually or automatically.

- **Auto** - The PNA selects the best gain level to make pulsed measurements.

Use the following to manually set the gain for each receiver.

- **Low** - about 0 dB of gain
- **Medium** - about 17 dB of gain
- **High** - about 24 dB of gain

The **PNA-X** has the following attenuation settings:

- **Low** - 30 dB of attenuation
- **Medium** - 15 dB of attenuation
- **Hi** - 0 dB of attenuation

Calibration in Pulse Mode

To perform a calibration in pulse mode (option H08), first configure and apply the pulse parameters (PRF, Pulse Width, Delays, IF gating, and so forth) **before** calibrating the system. This will ensure the PNA is configured properly during the calibration and measurement.

When performing **Unknown Thru** or **TRL calibrations**, ALL receivers must be gated. Otherwise, the error terms will not be correct after the calibration has completed. This can be accomplished by either having a separate pulse generator output for each of the IF gates, or by connecting pairs of the IF gates together with BNC-T’s. For example, if the pulse generator does not have enough outputs, then connect the R1 and R2 IF gates to the same pulse generator output. Also, connect the A and B IF gates to either separate outputs (recommended) or one output (reduces flexibility). The error terms will then be valid after the calibration is complete.

Pulse Profiling

Pulse profiling provides a time domain view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic image.
Pulse Profiling can be performed using ratioed or unratioed measurements.

Pulse Profiling is performed at a single CW frequency.

**How to perform Pulse Profiling**

From the [Pulse App main dialog box](#),

Click the **Pulse Profile** button. or:

If this setting is unavailable, check **Pulse Mode ON**, click **Calculate**, then **Apply**.

---

**Pulse Profile dialog box help**

- [Learn about Pulse Profiling (scroll up)](#)
- [See Block Diagram of PNA-X IF Path / Pulse Generators / Source Modulation](#)

**Modulation / Gates**

These setting duplicate those found on the main [Pulse App dialog box](#).

In Pulse Profile, the Gate Delay settings (highlighted in yellow) are significant only with certain **Measurement Parameter** and **Couple Gates** settings.

**Time Parameters**
**Start, Stop** These two combine to make the window of the assembled pulse profile. To view the entire pulse, the start and stop values must be at least as wide as the Source Modulation **Width** plus **Delay** value.

**Step** Each consecutive snapshot is incremented by this value until the stop value is reached. Therefore, the number of points for the pulse profile measurement can be calculated as: (Stop - Start) / Step. The higher the number of points, the longer it takes to make the measurement.

**Measurement Parameter**

**CW Freq.** Frequency of the PNA source.

**Source Port** The PNA port supplying the source power. Only required for single receiver (unratioed) measurements.

**Param(eter)** Only those receiver gates (and relevant measurements) that are configured in **Pulsed Generator Configuration** are available.

**Note:** When a single receiver (unratioed) is selected, **Gate Delay** Settings (highlighted in yellow on above dialog image) are ignored.

If the reference receiver gate is NOT configured, the average of the Source Modulation pulse is used as the reference. For example: With **S21** Selected, but ONLY **B** receiver gate is configured, then...

![Diagram](source.png)

**B Gate is walked across the Source Modulation pulse.**

**Source Modulation pulse average is used as reference (not gated).**

**Coupled Gates** Used when the appropriate receiver gates are configured for your S-parameter measurement ONLY. This setting is ignored when a single receiver (**Param**) is selected.

- **Uncoupled** (box cleared) The reference gate is FIXED at the delay setting as the test gate is walked across the Source Modulation pulse as dictated by the **Time Parameter** settings.

![Diagram](source.png)

**For example:**

**S21** Selected, **B** and **R1** receiver gates configured, Gates **Uncoupled**

**B Gate is walked across the Source Modulation pulse.**

**R1 gate is fixed at pulse width and delay setting.**

- **Coupled** (box checked) The reference gate is walked synchronously with the test gate as dictated by the **Time Parameter** settings. Only the **difference** between the test and reference gate delay values is significant; NOT the absolute values.
For example:

S21 Selected, B and R1 receiver gates configured, Gates Coupled

B gate delay = 3 microseconds,

R1 gate delay = 2 microseconds

Difference = 1 microsecond

- B Gate is walked across the Source Modulation pulse.
- R1 gate is fixed at pulse width and delay setting.
- B gate leads R1 gate by 1 microsecond.

Data Format  Log Magnitude, Linear Magnitude, or Phase (only available if S-parameter selected).

Buttons

Show Gates  Allows you to change the receiver gating width and delay while looking at the results.

Apply Gate Settings  Click after making changes to gate settings.

Continuous Sweep  Check, then click Measure, to continuously measure pulse profiling.

Measure  Click to start the pulse profile measurement. Becomes Stop when continuously sweeping.

Marker to Delay  After making a measurement, you can drag the display marker to any point along the trace. Click this button and the marker time is entered into the Receiver Delay field on the main dialog box.

Save Data  Saves time domain data to the PNA hard drive in any of the following formats:

- Touchstone (*.s1p)
- Comma delimited (*.prn)
- Citifile (*.cti)

Learn more about these data formats

Signal Reduction versus Gate Width

Signal Reduction versus Gate Width

PRF = 1 MHz

The following two figures show the performance of the internal IF gates as the width is narrowed.
The following is a zoomed image of the shaded area (above).

The straight line shows the theoretical loss in dynamic range due to duty cycle effects when using narrowband detection.

The curved (red) line shows the actual measured performance of the gates.

The minimum gate width for <1dB deviation from theoretical is approximately 20ns.

See the specifications for the option H11 and option H08.
Pulsed Frequency Converter Measurements

The Narrowband Pulsed Application works with both FCA (option 083) and standard Frequency Offset (opt 080) measurements. On the Configure menu, check Converter Measurements. When checked, this setting prevents the Narrowband Pulsed Application from overwriting frequency offset values. This may limit the number of PRF and IFBW solutions that are returned when Calculate is pressed on the main Pulsed Application dialog box.

Note: Pulse Profiling can NOT be performed with frequency converter measurements.

Writing your own Narrowband Pulsed Application

You can use the Narrowband Pulsed Application or use an example program as a template for making your own Narrowband Pulsed Application.

The Narrowband Pulsed Application uses a custom .dll to perform the calculations that are necessary to make pulsed measurements. Use the COM Method below to send and return values to agilentpnapulsed.dll. Then use SCPI or COM commands to control the PNA.

<table>

Install and Register the Pulsed .dll on your PC

To create your own Narrowband Pulsed Application, or run the Narrowband Pulsed Application from a remote PC, you must do the following:

1. Copy the following files from the PNA C:/program files/agilent/network analyzer/ to a directory on your PC.
   - agilentpnapulsed.dll
   - OffsetList.txt
   - prfbw.txt
2. To register the ActiveX DLL in Microsoft Windows Operating System:

   - From a command prompt on your PC, navigate to the directory where you copied the DLL.
   - Type: `regsvr32 agilentpnapulsed.dll` and press Enter

For Operating Systems other than Windows, see their associated help files to learn how to register DLL files.

---

- 29-Apr-2009  Added Opt 036 and 037 note (A.08.60)
- 4-Sep-2008   Removed legacy content
- 2-Jul-2008   Added links to SCPI examples
**Wideband Pulsed Application**

**Note:** The PNA-X with Opt 025 and Opt 008 has an integrated Pulse Measurement Setup that makes this application no longer necessary on the PNA-X.

The Wideband Pulsed Application configures the PNA-X internal pulse generators and modulators for measuring pulsed S-parameters using the wideband mode detection technique.

The Wideband Pulse Application is designed to be used with the PNA-X with Opts 021, 022, and 025.

**Note:** Wideband Pulse application is NOT supported on the E836x and PNA-L models.

**See Also**

- To learn more about wideband detection, see Application Note 1408-12.
- See a Visual Basic example: Create a Wideband Pulsed Measurement using the PNA-X.
- Learn about the Narrowband Pulsed Application.

**Download and Install the Wideband Pulsed Application**

This application is installed and run as a macro on the PNA-X. Learn more about macros.

2. Click the download link

3. Save the downloaded file to the PNA hard drive

4. Double-click the downloaded file to install the Wideband Pulsed Application on the PNA.

5. The application is saved on the PNA at C:/Program Files/Agilent/Network Analyzer/Applications/WB_Pulse/Wideband_pulse.exe

6. Configure the macro. Learn how.

To learn more about Wideband pulsed application, click Help in the application.

**Last Modified:**

- 17-Mar-2010   Added PNA-X note
- 22-Jun-2007   MX New topic
Connecting the PNA to a PC

This document describes how to temporarily connect a PC to a PNA using a LAN cable. This is not necessary if your PNA is already connected to a network. This type of connection is for conveniently transferring large files, such as firmware, that may have already been downloaded and stored on the PC.

The PC can have any version of Windows (Windows 95 or newer.)

You will need the following:

- RJ-45 LAN crossover cable (or two normal cables with a suitable hub).
- Must be logged on the PNA with an Administrator User name and password.

Note: If your PC is on a domain, do not leave that domain by changing to a workgroup. This may prevent you from later rejoining your domain unless you involve your IT systems administrator. The following procedure will work regardless of whether or not you are on a domain and will not change any domain settings on the PC.

Procedure for All Operating Systems

1. Disconnect the PC from any existing LAN and connect it to the PNA using a crossover cable or hub. There is no need to turn it off to do this.

2. Find the current IP address of your PC. Open a DOS prompt (command window) and type `ipconfig`. This should then show your current IP address. Note this number. For this example, we will assume a PC IP address of 10.0.0.100. If it shows 0.0.0.0, you will have to assign an IP address. See procedure below.

3. On the PNA, click **File**, then **Exit** to close the PNA application.

4. Right-click on **My Network Places** and select **Properties**.

5. Right-click on **Local Area Connection** and select **Properties**.

6. Select **Internet Protocol (TCP/IP)** then click **Properties**.

7. Click **Use the following IP address** then enter an IP address that is ONE more or ONE less than that noted for the PC. Do not use a number that ends in 000. For this example, one could use either 10.0.0.101 or 10.0.0.99. We’ll assume the use of 101.

8. For **Subnet mask**, enter 255.255.255.0. Click **OK**, then **OK** again.

For Windows 95/98 systems, go to **Win95/98 step 9** below.

9. On the PC, open Windows Explorer. Click **Tools**, then **Map Network Drive**. Note the drive letter shown (for this example we'll assume it is "X".)

10. In **Folder** or **Path** type the IP address that was just entered for the PNA followed by C$ in the following format://10.0.0.101/C$.

11. In **Connect As** dialog, enter the PNA User name and Password. Unless it has been changed, this is either Administrator with NO password or PNA-Admin, Password Agilent. Click **OK**.
12. In Windows Explorer on the PC, you should now see a new drive letter entry (X) with the description of C$ on 10.0.0.101. The entire contents of the PNA C drive will now be available for reading or writing. Files can now be transferred by simply dragging them from one location to the other.

13. When you are done transferring files, disconnect the LAN cable connection between the two and reconnect your PC to the network if needed. If the PNA will never be connected to any network, the current network settings could remain. However it may be safer to reset the TCP/IP settings (changed in step 7) back to Obtain an IP address automatically.

If your PC currently has no IP address assigned

Follow steps 4 through 8 to add an IP address for the PC. The actual steps may vary slightly depending upon your operating system (NT4 uses Network Neighborhood and you must click on Protocols.) Assign the PC an IP address of 10.0.0.100. The last digits can be anything between 1 and 255, but do not alter the first 3 numbers (10.0.0.) When complete, reset the PC network configuration back to its previous settings.

Win95/98 Procedure for Accessing/Transferring Files

Because Windows 95/98 does not have the security features of NT-based operating systems (NT, Win2k, XP), the PC cannot access the drive on the PNA. To get around this limitation, any files that need to be transferred to/from the PC must be placed in a shared folder. The PNA can then read or write within this folder. This procedure will work for all versions of Windows.

Steps 1 through 8 are identical to the above and must be performed first.

9. On the PC, open Windows Explorer. Create a directory under the C drive named Shared. Right click the Shared folder name and select Sharing. Share the directory with full read/write permissions. If Sharing does not appear as a choice, then file sharing is not enabled. To enable file sharing,

   1. Right click Network Neighborhood, then click Properties.
   2. Click File and Print Sharing and enable give others access to my files
   3. Click OK, then OK again.
   4. Repeat the beginning of this step.

10. Copy the files to be transferred to the PNA to this shared folder.

11. On the PNA, open Windows Explorer. Click on Tools, Map Network Drive. Note the drive letter shown (for this example we?ll assume it is "X"). Uncheck “Reconnect at Logon” if it is currently checked.

9. Under the Folder entry, enter the IP address of the PC and the shared folder name in the following format: //10.0.0.100/Shared

10. The PNA should immediately connect to this folder and display its contents as drive "X". Files can now be read from, or written to, this shared directory (shown as Drive X.) Files can be transferred by simply dragging them from one location to the other.

11. When you are done transferring files, disconnect the LAN cable connection between the two and reconnect your PC to the network if needed. If the PNA will never be connected to any network, its current network settings could remain, however it is probably safer to reset the TCP/IP settings (changed in step 7) back to
Obtain an IP address automatically.
Easy versus Secure Configuration

When upgrading Firmware on the PNA, you encounter a Choose Configuration dialog box. This is used to determine the level of security set for the DCOM interface on the PNA. For more detailed information on the security settings for the DCOM interface, including a procedure for making these settings manually, see Configure for COM-DCOM Programming.

Comparison of the "Easy and More Secure" settings are as follows:

**Easy Connection:**

- No configuration of the PNA required for remote access to connect.
- Anyone on the local subnet can access the PNA remotely.
- People from other NT domains can connect to the PNA.

**More Secure:**

- Requires creating users on the PNA or adding the PNA to a domain
- An administrator of the PNA can specify users or groups that are allowed remote access to the PNA application
Changing Network Client

If your PC network uses Novell NetWare servers, a change must be made to the PNA setup before it can operate on your network. If you are unsure, ask your local IT department.

**Note:** Do NOT Uninstall "Client for Microsoft Networks". This will prevent proper operation of the PNA.

To remove "Client for Microsoft Networks" (Remove is different from Uninstall):

1. From the PNA Desktop, right-click **My Network Places**
2. Click **Properties**
3. Right-click **Local Area Connection**
4. Click **Properties**
5. Click (remove the check from) **Client for Microsoft Networks**

To install "Client Service for NetWare".

1. Click **Install**
2. In **Select Network Component Type**, make sure **Client** is selected
3. Click **Add**
4. In **Select Network Client**, make sure **Client Service for NetWare** is selected
5. Click **OK**.
Troubleshooting the PNA

By running a few checks, you can identify if the analyzer is at fault. Before calling Agilent Technologies or returning the instrument for service, please make the following checks.

- **Check the Basics**
- **PNA Application Terminates Unexpectedly**
- **Check Error Terms**
- **Check the Service Guide**

## Other Support Topics

### Check the Basics

A problem can often be solved by repeating the procedure you were following when the problem occurred. Before calling Agilent Technologies or returning the instrument for service, please make the following checks:

**Note:** Problems with the PNA application (slow or terminates unexpectedly) can be caused by a faulty Hard Disk Drive (HDD). For more information, see [Preventing PNA Hard Drive Problems](#) and [The PNA HDD Recovery Process](#).

1. Is there power at the power socket? Is the instrument plugged in?
2. Is the instrument turned on? Check to see if the front panel line switch and at least one of the LED rings around the test ports glows green. This indicates the power supply is on.
3. If you are experiencing difficulty with the front-panel keypad or peripherals, the USB bus may be overloaded. Remove the USB devices, restart the PNA, and reconnect the USB devices. See [Power-up](#).
4. If other equipment, cables, and connectors are being used with the instrument, make sure they are connected properly and operating correctly.
5. Review the procedure for the measurement being performed when the problem appeared. Are all the settings correct?
6. If the instrument is not functioning as expected, return the unit to a known state by pressing the [Preset](#) key.
7. Is the measurement being performed, and the results that are expected, within the [ specifications](#) and capabilities of the instrument?
8. If the problem is thought to be due to firmware, check to see if the instrument has the [latest firmware](#) before starting the troubleshooting procedure.
9. Check that the measurement calibration is valid. See [Accurate Measurement Calibrations](#) for more information.
10. If the necessary test equipment is available, perform the operator’s check and system verification in Chapter...
11. **Phase lock lost message** - This usually occurs when there is not enough source power to phase lock the PNA. It can occur during an errant FCA setup or Source Power Calibration. It can also occur if one of the front panel reference channel loops is not connected. Otherwise, this indicates a hardware problem.

**PNA Application Terminates Unexpectedly**

If an unexpected and irrecoverable error occurs, Agilent would like to know about it. The PNA attempts to save pertinent information about the state of the system. The **PNA does NOT send this information to Agilent**.

We respect the privacy of our customers. However, access to information that helps us improve the PNA is a benefit to both Agilent and you. Please take the time to contact us or email the saved information to **na_support@agilent.com**.

The following procedure shows how to do this:

1. A message box immediately appears on the screen containing the location of a directory. Please record this message. If you miss the message, you can find the directory location using the Windows Event Log: On the PNA, click Start, Settings, Control Panel, Administrative Tools, Event Viewer. Double-click the top line (most recent event). The location of the directory is seen in the Description.

2. A dialog box may appear on the screen (shown below) allowing you to add comments to help us replicate the crash.

3. Find the directory (described in Step 1) which contains the following files:

   - 835x.dmp which is the 835x.exe capturing the context in which the program crashed.
   - 835x.xml which reports some very basic information (exception code, OS version, and the list of modules loaded at the time of the crash and their respective version numbers).
   - 835xCrashLog.txt: The text file with your comments (described in Step 2), if submitted.

4. If your PNA is not connected to LAN or is not configured to send email, copy the files to a PC. Then, please email the files to **na_support@agilent.com**.
Check Error Terms

If you print the error terms at set intervals (weekly, monthly, and so forth), you can compare current error terms to these records. A stable, repeatable system should generate repeatable error terms over long time intervals, for example, six months. If a subtle failure or mild performance problem is suspected, the magnitude of the error terms should be compared against values generated previously with the same instrument and calibration kit. See the procedure for monitoring error terms.

- A long-term trend often reflects drift, connector and cable wear, or gradual degradation, indicating the need for further investigation and preventative maintenance. Yet, the system may still conform to specifications. The cure is often as simple as cleaning and gaging connectors or inspecting cables.

- A sudden shift in error terms reflects a sudden shift in systematic errors, and may indicate the need for further troubleshooting.

Consider the following while troubleshooting:

- All parts of the system, including cables and calibration devices, can contribute to systematic errors and impact the error terms.

- Connectors must be clean and gauged, and within specification for error term analysis to be meaningful. See the Chapter 2 in the PNA Service Guide for information on cleaning and gaging connectors.
  
  - Avoid unnecessary bending and flexing of the cables following measurement calibration, thus minimizing cable instability errors.
  
  - Use good connection techniques during the measurement calibration. The connector interface must be repeatable. See the PNA Service Guide for information on connection techniques.

- It is often worthwhile to perform the procedure twice (using two distinct measurement calibrations) to establish the degree of repeatability. If the results do not seem repeatable, check all connectors and cables.
Use error-term analysis to troubleshoot minor, subtle performance problems. See Chapter 3, "Troubleshooting," in the PNA Service Guide if a blatant failure or gross measurement error is evident.

Memory Overflow Error

Memory overflow. Trigger state set to Hold. Lower the IF bandwidth, or increase dwell or sweep time.

Severity: Informational

Further explanation: The measurement that you are currently making requires that data be stored faster than it can be processed. Very few customers will experience this situation.

Suggestions: To limit the amount of data to be stored, try lowering the IF Bandwidth, slow the sweep time, increase the dwell time, or limit the number of data points. There are many other settings that can be adjusted to solve this problem.

EventID:

Cal Errors

Message: 512

"A secondary parameter (power, IFBW, sweep time, step mode) of the calibrated state has changed."

Severity: Informational

Further explanation: The calibration is questionable when any of these secondary parameters change after the calibration is performed.

Suggestions: If you require an accurate measurement with the new settings, repeat the calibration.

EventID: 68020200 (hex)

Message: 513

"Calibration cannot be completed until you have measured all the necessary standards for your selected Cal Type."
Severity: Informational

Further explanation: You probably received this message because you attempted to turn correction on without first measuring all of the calibration standards

Suggestions: Finish measuring the cal standards

EventID: 68020201 (hex)

Message: 514
"Calibration set has been recalled using a file previously saved on an analyzer that had a different hardware configuration."

Severity: Informational

Further explanation:

Suggestions:

EventID: 68020202 (hex)

Message: 515
"Calibration is required before correction can be turned on. Channel number is <x>, Measurement is <x>.

Severity: Informational

Further explanation: There are no error correction terms to apply for the specified channel and measurement.

Suggestions: Perform or recall a calibration

EventID: 68020203 (hex)

Message: 516
"Critical parameters in your current instrument state do not match the parameters for the calibration set, therefore correction has been turned off. The critical instrument state parameters are sweep type, start frequency, frequency span, and number of points."

Severity: Informational

Further explanation: None

Suggestions: You can either recalibrate using the new settings or change back to the original setting that was used when the calibration was performed.

EventID: 68020204 (hex)

Message: 517
"Interpolation is turned off and you have changed the stimulus settings of the original calibration, so correction has been turned off."

Severity: Informational

Further explanation: The most accurate calibration is maintained only when the original stimulus settings are used.

Suggestions: If reduced accuracy is OK, set interpolation ON to allow stimulus setting changes.

EventID: 68020205 (hex)

Message: 518
"Interpolation is turned off and you have selected correction ON. Correction has been restored with the previous stimulus settings."

**Severity:** Informational

**Further explanation:** None

**Suggestions:** None

**EventID:** 68020206 (hex)

**Message:** 519

"Stimulus settings for your current instrument state exceeded the parameters of the original calibration, so correction has been turned off."

**Severity:** Informational

**Further explanation:** Correction data outside the stimulus settings does not exist.

**Suggestions:** Perform a broadband calibration, with increased numbers of points with interpolation ON, to maintain calibration over the widest possible stimulus frequency settings.

**EventID:** 68020207(hex)

**Message:** 520

"Cal Type is set to NONE for Channel <x>, Measurement <x>; please select Calibration menu or press Cal hard key."

**Severity:** Informational

**Further explanation:** A cal operation can not proceed until a calibration exists or the cal type is selected. This error can occur if the calibration can not be found. Also this error can happen if a calibration type is not specified before attempting to programatically execute cal acquisitions.

**Suggestions:** To find a calibration, select a Cal Set that contains the calibration needed for the current measurements. OR specify the cal type before beginning a calibration procedure.

**EventID:** 68020208 (hex)

**Message:** 521

"The measurement you set up does not have a corresponding calibration type, so correction has been turned off or is not permitted."

**Severity:** Informational

**Further explanation:** The calibration for the channel may apply only to certain S-Parameters. For example, a 1-Port calibration for S11 can not be applied to a 1-Port calibration applied to S22.

**Suggestions:** Select a calibration type, such as full 2-Port cal, that can be applied to all the measurements to be selected.

**EventID:** 68020209 (hex)

**Message:** 522

"The calibration type you selected cannot be set up."

**Severity:** Informational

**Further explanation:** "Please use the SCPI command ROUTe:PATH:DEFine:PORT <num>,<num> for full 2 port type port assignment."
Suggestions:
EventID: 6802020A (hex)

Message: 523
"The calibration path you selected cannot be set up because it is not valid for the current measurement."
Severity: Informational
Further explanation: "Please use the SCPI command ROUTe:PATH:DEFine:PORT <num>,<num> for full 2 port type port assignment related to your current measurement."
Suggestions:
EventID: 6802020B (hex)

Message: 524
"The source power calibration is complete."
Severity: Informational
Further explanation:

Suggestions:
EventID: 6802020C (hex)

Message: 525
"You have specified more than 7 standards for one or more calibration classes."
Severity: Informational
Further explanation: These have been truncated to 7 selections.
EventID: 6802020D (hex)

Message: 526
"No user calibration found for this channel."
Severity: Informational
Further explanation: A cal operation can not proceed until a calibration exists.
Suggestions: To find a calibration, you can select a Cal Set that contains the calibration needed for the current measurement.
EventID: 6802020E (hex)

Message: 527
"You do not need to acquire this standard for this calibration type."
Severity: Informational
Further explanation: This error can happen as a result of PROGRAMMATICALLY requesting the measurement of an un-needed calibration standard during a calibration procedure.
Suggestions: Check the specified cal type or eliminate the request for the measurement of the standard.
EventID: 6802020F (hex)
Message: 528
"Could not configure the Electronic Calibration system. Check to see if the module is plugged into the proper connector."
Severity: Informational
Further explanation: During an ECal operation, communication could not be established with the ECal module. The calibration will not be initiated until the presence of the ECal module is verified.
Suggestions: Verify the USB cable is connected properly. Disconnect and re-connect the cable to ensure the analyzer recognizes the module.

Suggestions:
EventID: E802021C (hex)

Message: 541
"Electronic Cal: Unable to orient ECal module. Please ensure the module is connected to the necessary measurement ports."
Severity: Error
Further explanation: There is no RF connection to the ECal module during a calibration step. An ECal orientation measurement has been attempted but the signal was not found.
Suggestions: Connect the ECal module RF connections to ports specified for the calibration step. The ECal module typically requires at least -18dBm for measurements. If your measurement requires the power level to be less than that, clear the Do orientation checkbox to bypass the automatic detection step.

"No source power calibration found for the channel and source port of the current measurement."
Further explanation: You tried to turn on source power cal but there is no source power cal data.
Suggestions: Perform a source power calibration
EventID: 68020250 (hex)

Message: 593
Severity: Informational
"A source power calibration sweep was not performed, so there is no correction for the channel and source port of the current measurement."
Further explanation: You tried to turn on source power cal but there is incomplete source cal data.
Suggestions: Perform a complete source power calibration
EventID: 68020251 (hex)

Message: 594
Severity: Informational
"A new trace could not be added to the active window for viewing the source power cal sweep, because it would have exceeded the limit on number of traces/window. Please remove a trace from the window before proceeding with source power cal."
Further explanation: The source power cal attempts to add a data trace to the active window. The active window already contains four traces.
Suggestions: Make the active window contain less than four traces.
EventID: 68020252 (hex)

Message: 595
Severity: Informational
"A new measurement could not be added for performing the source power cal sweep, because the limit on number of measurements has been reached. Please remove a measurement before proceeding with source power cal."
Further explanation: The source power cal attempts to add a measurement. The PNA already has the maximum number of measurements.
Suggestions: Delete a measurement.
EventID: 68020253 (hex)
**Message: 596**  
**Severity:** Informational  
"The calibration power value associated with the source power calibration of Port %1 on Channel %2 was changed with the calibration on. The calibration was not turned off, but the power value might no longer represent the calibration."

**Further explanation:** The source power cal accuracy is questionable.  
**Suggestions:** If high accuracy is required, perform another source power calibration.  
**EventID:** 68020254 (hex)

**Message: 597**  
**Severity:** Informational  
- Message that is passed from the power meter driver for a source power calibration. -

**Further explanation:** This error is generated by the power meter driver and passed through the PNA.  
**EventID:** 68020255 (hex)

**Message: 598**  
"During the acquisition of the sliding load standard, the slide was not properly moved to perform a circle fit. The standard's raw impedance was used to determine the directivity for one or more points."

**Severity:** Informational  
**Further Explanation:** To accurately characterize the standard, the sliding load must be move sufficiently to ensure enough samples around the complex circle or Smith Chart. Under-sampling will cause an inaccurate result.  
**Suggestions:** For best results when using a sliding load, be sure to use multiple slide positions that cover the full range of movement from front to back of the slot.  
**EventID:** 68020256 (hex)

**Message: 599**  
"This feature requires an unused channel, but could not find one. Please free up a channel and try again."

**Severity:** Informational  
**Further Explanation:** You attempted to view an item within a calset. However, the calset viewer requires that the result be displayed in a channel that is not currently in use. All the channels are currently used. The view can not display the requested item.  
**Suggestions:** You must delete at least one channel that is currently in use.  
**EventID:** 68020257 (hex)

**Message: 600**

"Cal preferences saved. Cal preference settings can be changed from the 'Cal Preferences' drop down Cal menu."

Severity: Informational

Further explanation: See Save Preference

EventID: 68020259 (hex)

Message: 608

"CalType not set."

Severity: Error

Further explanation: A cal operation can not proceed until a calibration exists or the proper cal type is selected.

Suggestions: This error can happen if the calibration can't be found. To find a calibration, you can select a Cal Set that contains the calibration needed for the current measurements. This error can also happen if a calibration type is not specified before attempting to programmatically execute cal acquisitions. Specify the cal type before beginning a calibration procedure.

EventID: E8020260 (hex)

Message: 609

"The Calibration feature requested is not implemented."

Further explanation: The specified cal type can be one of many choices. For example, response calibrations require single standards, 1-Port calibrations require 3 standards, and 2-Port calibrations require up to 12 standards.

Suggestions: Be sure to measure only the standards needed for the specified cal type.

EventID: E8020261 (hex)

Message: 610

"The Calibration Class Acquisition requested is not valid for the selected Calibration Type. Please select a different acquisition or a different Calibration Type."

EventID: E8020262 (hex)

Message: 611

"The Calibration Standard data required for the selected caltype was not found."

Severity: Error

Further explanation: An unsuccessful attempt was made to retrieve a specified standard from the raw measurement buffer. The buffer should contain the raw measurements of cal standards stored during a calibration procedure.

Suggestions: Be sure the requested standard is required for the current cal type. Not all standards are needed for all cal types.

EventID: E8020263 (hex)

Message: 612

"The Error Term data required for the selected caltype was not found."

Severity: Error

Further explanation: An unsuccessful attempt was made to retrieve a specified error term from the error
correction buffer. The buffer should contain the error correction arrays for the current calibration.

Suggestions: Be sure the requested error term is required for the current cal type. Not all error terms are needed for all cal types.

EventID: E8020264 (hex)

Message: 613
The Calibration data set was not found.

Severity: Error

Further explanation: An unsuccessful attempt to access a cal set has been made. This may indicate a calset has been deleted or has been corrupted.

Suggestions: Try again or select another cal set. If the cal set appears in the cal set list, it may need to be deleted.

EventID: E8020265 (hex)

Message: 614
"The specified measurement does not have a calibration valid for Confidence Check. Please select a different measurement, or recall or perform a different Calibration Type."

Severity: Error

Further explanation: The measurement choice is prevented so that calibration will not be turned off. Not all cal types support all measurements. For example, an 1-Port cal on S11 can not be used to calibrate an S12 measurement. When a measurement is selected that does not have a calibration which can be applied, an informational message is displayed and calibration is turned off.

Suggestions: Use a full 2-Port calibration to be compatible with any S-Parameter.

EventID: E8020266 (hex)

Message: 615
" New calset created."

Severity: Informational message.

Further explanation: The newly created cal set will be automatically named and time stamped. If this is the beginning of a calibration procedure, the cal set will not be stored to memory until the calibration has completed successfully. The new cal set will be deleted if the calibration is canceled or does not otherwise complete successfully.

Suggestions: Informational

EventID: 68020267

Message: 617
The calset file: &lt;x&gt; appears to be corrupted and cannot be removed. Exit the application, remove the file, and restart.

Severity: Error

Suggestions: The cal set file is stored in the application home directory C:/Program Files/Agilent/Network Analyzer/PNACalSets.dat. Remove this file, then restart the application.

EventID: E8020269 (hex)
**Message: 634**

"The calset file: <x> load failed."

**Severity:** Error

**Further explanation:** The calset file contains a collection of calsets. The file resides on the hard drive.

**Suggestions:** Try restarting the application. If the failure persists, you may have to delete the cal set data file and restart the application. The cal set file is stored in the application home directory. C:/Program Files/Agilent/Network Analyzer/PNACalSets.dat. Remove this file, then restart the application.

**EventID:** E802027A (hex)

**Message: 635**

"The calset file: <x> save failed."

**Severity:** Error

**Further explanation:** The file operation detected an error. The save operation was aborted.

**Suggestions:** Retry.

**EventID:** E802027B (hex)

**Message: 636**

"A calset was deleted."

**Severity:** Informational

**Further explanation:** One of the calsets has been successfully deleted from the collection of calsets available. This can happen as the result of a user request or intentional operation.

**Suggestions:** None

**EventID:** 6802027C (hex)

**Message: 637**

"The version of the calset file: <x> is not compatible with the current instrument."

**Severity:** Error

**Further explanation:** A versioning error can prevent a calset from being used. This can happen as a result of instrument firmware upgrades.

**Suggestions:** If the versioning error is the result of firmware upgrade, you will have to re-install the old version of firmware to re-use the calset file. Or you can re-create the calsets with the current version of firmware.

The cal set file is stored in the application home directory C:/Program Files/Agilent/Network Analyzer/PNACalSets.dat. Remove this file, then restart the application.

**EventID:** E802027D (hex)

**Message: 638**

"Incompatible CalSets found: <x> of <y> stored calsets have been loaded."

**Severity:** Error

**Further explanation:** Errors were found on some of the calsets stored in the calset file. The errors may have been caused by versioning issues that may have corrupted the various calset keys.
Suggestions: Use the calset viewer to look at the contents of calset files. Delete the files that are corrupted.

EventID: 6802027E (hex)

**Message: 639**
"The Calset file: <x> was not found. A new file has been created."

**Severity:** Informational

**Further explanation:** The calset file should be stored on the hard drive. When the application is started, a search is done and the file is loaded if it can be found. If the file is not found, the analyzer will create a new file and display this message.

**Suggestions:** None

EventID: 6802027F (hex)

**Message: 640**
"The Calset specified is currently in use."

**Severity:** Error

**Further explanation:** This may indicate a conflict between multiple calset users attempting calibration tasks.

**Suggestions:** Save the instrument state. Preset the analyzer and recall the instrument state. This may abort any processes that may be in progress.

EventID: E8020280 (hex)

**Message: 641**
"The calset specified has not been opened."

**Severity:** Error

**Further explanation:** Multiple users may be attempting to access the calset.

**Suggestions:** Close multiple calset users so that only one user will access the calset.

EventID: E8020281 (hex)

**Message: 642**
"The maximum number of cal sets has been reached. Delete old or unused cal sets before attempting to create new ones."

**Severity:** Error

**Suggestions:** You may also delete the calsets data file.

The cal set file is stored in the application home directory. C:/Program Files/Agilent/Network_Analyzer/PNACalSets.dat. Remove this file, then restart the application.

EventID: E8020282 (hex)

**Message: 643**
The requested power loss table segment was not found.

**Severity:** Error

EventID: E8020283 (hex)
Message: 644
"A valid calibration is required before correction can be turned on."

Severity: Error

Further explanation: This usually indicates a calibration procedure has not run to completion or that the selected measurement does not have a valid calibration available from within the currently selected cal set.

Suggestions: To find a calibration, you can select a Cal Set that contains the calibration needed for the current measurements. This error can happen if a calibration type is not specified before attempting to programmatically execute cal acquisitions. Specify the cal type before beginning a calibration procedure.

EventID: E8020284 (hex)

Message: 645
The cal data for <x> is incompatible and was not restored. Please recalibrate."

Severity: Warning

Further explanation: None

Suggestions: None

EventID: A8020285 (hex)

Message: 646
"CalSet not loaded, version is too new."

Severity: Error

Further explanation: An old version of firmware is attempting to run with a new calset version. The version is incompatible.

Suggestions: The calset can be removed. You may also delete the calsets data file if you are migrating between various firmware revisions often and you would like to avoid this error. The cal set file is stored in the application home directory. C:/Program Files/Agilent/Network Analyzer/PNACalSets.dat. Remove this file, then restart the application.

Severity: Error
EventID: E80202BA (hex)
Message: 699
An attempt was made to acquire calibration data before the system was properly initialized.

Severity: Error
EventID: E80202BB (hex)

Message: 700
Use IGuidedCalibration for multiport calibration types.

Severity: Error
EventID: E80202BC (hex)

Message: 701
Guided calibration requires number of thru measurement paths be at least equal to the number of calibration ports minus 1.

Severity: Error
EventID: E80202BD (hex)

Message: 702
A thru path was specified that includes a port which the calibration was not specified to include.

Severity: Error
EventID: E80202BE (hex)

Message: 703
One or more of the ports to be calibrated was not found in the set of specified thru paths.

Severity: Error
EventID: E80202BF (hex)

Hardware Errors

______________________________

Message: 770
Input power too high. Source power is off.

Severity: Warning
EventID: A8030302 (hex)

Message: 771
Source power restored.

Severity: Informational
EventID: 68030303 (hex)

Message: 772
"The spampnp.sys driver is not working. Check system hardware. ! Data will be simulated. !"
Severity: Error
Further explanation: The Network Analyzer application cannot locate the DSP board. Hardware or a driver may be malfunctioning. This is also common when attempting to run the Network Analyzer on a workstation.
EventID: E8030304 (hex)

Message: 773
"Instrument Serial Bus Not Working."
Severity: Error
Further explanation: The instrument EEPROM appears to contain either all ones or all zeros. A serial bus hardware failure prevents reading the EEPROM.
EventID: E8030305 (hex)

Message: 784
Unleveled, source <n>, out <n>.
Severity: Error
Further explanation: The PNA was unable to set the power on port <n> to the desired level

Message: 848
"Phase lock lost"
Severity: Error
Further explanation: The instrument source was not able to lock properly. This can be the result of broken hardware, poor calibration, or bad EEPROM values.
Suggestions: Perform source calibration. Click System / Service / Adjustments / Source Calibration
EventID: E8030350 (hex)

Message: 849
Phaselock restored.
Severity: Success
EventID: 0x28030351 (hex)

Message: 850
"Unknown hardware error."
Severity: Error
Further explanation: Hardware malfunctioned prevents communication with the DSP.
EventID: E8030352 (hex)

Message: 851
DSP communication lost.
Severity: Error
EventID: E8030353 (hex)
Message: 852
RF power off.
Severity: Error
EventID: E8030354 (hex)

Message: 853
RF power on.
Severity: Success
EventID: 28030355 (hex)

Message: 854
Hardware OK.
Severity: Success
EventID: 28030356 (hex)

Message: 855
"Source unleveled."
Severity: Error
Further explanation: The source was unable to properly level at the requested power. The indicated power may not be accurate.
Suggestions: Try a different power level. Recalibrate source, if problem persists.
EventID: E8030357 (hex)

Message: 856
Source leveled.
Severity: Success
EventID: 28030358 (hex)

Message: 857
Input overloaded.
Severity: Error
EventID: E8030359 (hex)

Message: 858
Input no longer overloaded.
Severity: Success
EventID: 2803035A (hex)

Message: 859
"Yig calibration failed."
Severity: Error
Further explanation: Internal self-calibration of YIG oscillator tuning failed.
EventID: E803035B (hex)

Message: 860
Yig calibrated.
Severity: Success
EventID: 2803035C (hex)

Message: 861
"Analog ramp calibration failed."
Severity: Error
Further explanation: Internal analog sweep ramp calibration has failed.
EventID: E803035D (hex)

Message: 862
Analog ramp calibrated.
Severity: Success
EventID: 2803035E (hex)

Message: 863
Source temperature high.
Severity: Error
EventID: E803035F (hex)

Message: 864
Source temperature OK.
Severity: Success
EventID: 28030360 (hex)

Message: 865
"EEPROM write failed."
Severity: Error
Further explanation: Attempt to store calibration data to EEPROM has failed. There is a possible hardware failure.
EventID: E8030361 (hex)

Message: 866
EEPROM write succeeded.
Severity: Success
EventID: 28030362 (hex)
**Message: 867**
Attempted I/O write while port set to read only.

**Severity:** Error

**Further explanation:** Attempt to write to an I/O data port while the port set to input/read only.

**Suggestions:** Set data port to write/output before attempting to write to port.

**EventID:** E8030363 (hex)

**Message: 868**
" Attempted I/O read from write only port.

**Severity:** Error

**Further explanation:** Attempt to read from an I/O data port while the port set to output/write only.

**Suggestions:** Set data port to read/input before attempting to read from port.

**EventID:** E8030364 (hex)

**Message: 869**
Invalid hardware element identifier.

**Severity:** Error

**EventID:** E8030365 (hex)

**Message: 870**
Invalid gain level setting.

**Severity:** Error

**EventID:** E8030366 (hex)

**Message: 871**
Device driver was unable to allocate enough memory. Please try rebooting.

**Severity:** Error

**EventID:** E8030367 (hex)

**Message: 876**
DSP Error. Please Contact Agilent Support. Technical Information: DSP Type 5
Severity: Error
EventID: E803036C (hex)

**Message: 910**
The trigger connection argument was not recognized as valid by the firmware.
Severity: Error
EventID: 0xE803038E (hex)

**Message: 911**
The trigger connection specified does not support this trigger behavior
Severity: Error
EventID: E803038F (hex)

**Message: 912**
The trigger behavior specified was not recognized as valid by the firmware.
Severity: Error
EventID: E8030390 (hex)

**Message: 913**
The trigger connection specified does not physically exist on this network analyzer
Severity: Error
EventID: E8030391 (hex)

**Message: 914**
Cannot set "Accept Trigger Before Armed", since this hardware configuration does not support edge triggering.
Severity: Error
EventID: E8030392 (hex)
Message: 915
Cannot set "Trigger Output Enabled", since this hardware configuration does not support BNC2.
Severity: Error
EventID: E8030393 (hex)

Message: 916
Exceeded maximum trigger delay.
Severity: Error
EventID: E8030394 (hex)

Message: 917
Exceeded minimum trigger delay.
Severity: Error
EventID: E8030395 (hex)

Measure Errors

Message: 1024
If you are going to display or otherwise use a memory trace, you must first store a data trace to memory.
Severity: Warning
EventID: A8040400 (hex)

Message: 1025
"The measurement failed to shut down properly. The application is in a corrupt state and should be shut down and
restarted."
Severity: Error
Further explanation: This message is displayed if the PNA application becomes corrupt. If you continue to get this
error, please call customer service
EventID: E8040401 (hex)

Message: 1026
The measurement failed to shut down properly. The update thread failed to exit properly.
Severity: Warning
EventID: A8040402 (hex)

Message: 1027
"Group Delay format with CW Time or Power sweeps produces invalid data."
Severity: Warning
Further explanation: Group Delay format is incompatible with single-frequency sweeps. Invalid data is produced.
Suggestions: Ignore the data or choose a different format or sweep type.
EventID: A8040403 (hex)

**Message: 1028**
Severity: Informational
"MSG_LIMIT_FAILED"
Further explanation: Limit line test failed.
EventID: 68040404 (hex)

**Message: 1029**
Severity: Informational
"MSG_LIMIT_PASSED"
Further explanation: Limit line test passed.
EventID: 68040405 (hex)

**Message: 1030**
"Exceeded the maximum number of measurements allowed."
Severity: Warning
Further explanation: See [Traces, Channels, and Windows on the PNA](#) for learn about maximum measurements.
EventID: A8040406 (hex)

**Message: 1031**
"Network Analyzer Internal Error. Unexpected error in AddNewMeasurement."
Severity: Warning
Further explanation: If you continue to get this message, contact product support.
EventID: A8040407 (hex)

**Message: 1032**
"No measurement was found to perform the selected operation. Operation not completed."
Severity: Warning
Further explanation: None
Suggestions: Create a measurement before performing this operation.
EventID: A8040408 (hex)

**Message: 1033**
The Markers All Off command failed.
Severity: Warning
EventID: A8040409 (hex)

**Message: 1034**
"A memory trace has not been saved for the selected trace. Save a memory trace before attempting trace math operations."

**Severity:** Warning

**Further explanation:** Must have a memory trace when trying to do Trace Math,

**EventID:** A804040A (hex)

**Message:** 1035

"MSG_SET_AVERAGE_COMPLETE"

**Severity:** Informational

**Further explanation:** Informational for COM programming. Averaging factor has been reached.

**EventID:** 6804040B (hex)

**Message:** 1036

"MSG_CLEAR_AVERAGE_COMPLETE"

**Further explanation:** Informational for COM programming. Averaging factor has NOT been reached.

**EventID:** 6804040C (hex)

**Message:** 1037

"Time Domain transform requires at least 3 input points. The transform has been deactivated."

**Severity:** Informational

**Further explanation:** None

**Suggestions:** Increase the number of points.

**EventID:** 6804040D (hex)

**Message:** 1038

Smoothing requires a scalar format, and has been deactivated.

**Severity:** Informational

**EventID:** 6804040E (hex)

**Message:** 1039

A receiver power calibration in this instrument state file cannot be recalled into this firmware version.

**Severity:** Warning

**EventID:** A804040F (hex)

**Message:** 1047

Could not achieve target power.

**Severity:** Error

**Further explanation:** This indicates that the PNA was unable to find a source power during the THRU step of the cal sufficiently high to boost the measured noise power on port 2 to 6 dB above the noise floor.
**Message: 1104**
"Exceeded limit on number of measurements."
**Severity:** Error
**Further explanation:** See Traces, Channels, and Windows on the PNA for measurement limits.
**EventID:** E8040450 (hex)

**Message: 1105**
"Parameter not valid."
**Severity:** Error
**Further explanation:** A measurement parameter that was entered programmatically is not valid.
**EventID:** E8040451 (hex)

**Message: 1106**
"Measurement not found."
**Severity:** Error
**Further explanation:** Any of these could be the cause:
- Trying to calibrate but already have maximum measurements.
- Trying to do a confidence check but there is not a measurement.
- Trying to create, activate, or alter a measurement through COM that has been deleted through the front panel.
- Trying to use a trace name through programming that is not unique.
**EventID:** E8040452 (hex)

**Message: 1107**
"No valid memory trace."
**Severity:** Error
**Further explanation:** Must have a memory trace when trying to do Trace Math,
**Suggestions:** Store a memory trace.
**EventID:** E8040453 (hex)

**Message: 1108**
"The reference marker was not found."
**Severity:** Error
**Further explanation:** Attempted to create a delta marker without first creating a reference marker (COM only).
**EventID:** E8040454 (hex)

**Message: 1109**
"Data and Memory traces are no longer compatible. Trace Math has been turned off."
**Severity:** Error
**Further explanation:** Warning - channel setting has changed while doing trace math.
Suggestions: Store another memory trace and turn trace math back on.

EventID: A8040455 (hex)

Message: 1110
"Data and Memory traces are not compatible. For valid trace math operations, memory and data traces must have similar measurement conditions."

Severity: Error

Further explanation: Tried to do trace math without compatible data and memory traces.

Suggestions: Store another memory trace.

EventID: E8040456 (hex)

Message: 1111
"Marker Bandwidth not found."

Severity: Error

Further explanation: Could not find a portion of trace that meets the specified bandwidth criteria.

EventID: E8040457 (hex)

Message: 1112
"The peak was not found."

Severity: Error

Further explanation: Could not find portion of trace that meets peak criteria.

Suggestions: See Marker Peak criteria.

EventID: E8040458 (hex)

Message: 1113
"The target search value was not found."

Severity: Error

Further explanation: Could not find interpolated data point that meets search value.

EventID: E8040459 (hex)

Message: 1114
"Reflection measurement, such as S11, must supply an auxiliary port to disambiguate 2-port measurements on multiport instruments."

Severity: Error

Further explanation:

EventID: E804045A (hex)

Message: 1115
"The receiver power calibration has been turned off because the type of measurement or source port has changed, so the calibration is no longer valid."
Severity: Warning
Further explanation:
EventID: A804045B (hex)

Message: 1116
"Receiver power cal requires the active measurement to be of unratioed power."

Severity: Warning
Further explanation:
EventID: A804045C (hex)

Message: 1117
"There is currently no source power calibration associated with the channel and source port of the active measurement. A source power cal should be performed or recalled before performing a receiver power calibration."

Severity: Warning
Further explanation:
EventID: A804045D (hex)

Message: 1118
"The attempted operation can only be performed on a standard measurement type."

Severity: Error
Further explanation:
EventID: E804045E (hex)

Message: 1119
"The custom measurement cannot be loaded because it is not compatible with the Network Analyzer hardware."

Severity: Error
Further explanation:
Suggestions:
EventID: E804045F (hex)

Message: 1120
"The custom measurement cannot be loaded because it is not compatible with the Network Analyzer software."

Severity: Error
Further explanation:
EventID: E8040460 (hex)

Message: 1121
"The custom measurement load operation failed for an unspecified reason."

Severity: Error
Further explanation:
EventID: E8040461 (hex)

**Message: 1122**
"The custom measurement data processing has generated an unhandled exception, and will be terminated. The PNA software may be in an unstable state and it is recommended that the PNA software be shutdown and restarted."
**Severity:** Error

Further explanation:
EventID: E8040462 (hex)

**Message: 1123**
"The attempted operation can only be performed on a custom measurement type."

EventID: 68070700 (hex)
**Message: 1793**

"All triggerable acquisitions have completed."

**Severity:** Informational

**Further explanation:**

**EventID:** 68070701 (hex)

**Message: 1794**

"The last trigger produced an aborted sweep."

**Severity:** Informational

**Further explanation:**

**EventID:** 68070702 (hex)

**Message: 1795**

"The segment list must be adjusted to have at least one active segment with more than 0 points to use segment sweep."

**Severity:** Informational

**Further explanation:** You attempted to change **Sweep type** to Segment sweep, but there is either no segments defined or no sweep points in the defined segments

**Suggestions:** Define at least one segment with at least one measurement point. See Segment sweep for more information

**EventID:** 68070703 (hex)

**Message: 1796**

"MSG_SET_CHANNEL_DIRTY"

**Severity:** Informational

**Further explanation:** This informational message occurs when a channel setting has changed but the channel still has data that was taken with the previous setting. The following CLEAR message occurs when new channel data is taken.

**EventID:** 68070704 (hex)

**Message: 1797**

"MSG_CLEAR_CHANNEL_DIRTY"

**Severity:** Informational

**Further explanation:** The previous SET message occurs when a channel setting has changed but the channel still has data that was taken with the previous setting. This CLEAR message occurs when new channel data is taken.

**EventID:** 68070705 (hex)

**Message: 1798**

Sweep time has changed from Auto to Manual mode. If desired to return to Auto mode, enter sweep time value of 0.
Severity: Informational
EventID: 68070706 (hex)

Message: 1799
"Set Sweep Completed"

Severity: Informational

Further explanation: This event occurs when a sweep and its associated sweep calculations finish. This is typically when all sweeps on a channel complete.

EventID: 68070707 (hex)

Message: 1800
"Clear Sweep Completed"

Severity: Informational

Further explanation: This event occurs immediately after the SET SWEEP COMPLETED event. These two events set and clear the "Sweep Completed" bit (bit 4) on the SCPI Device Status register.

EventID: 68070708 (hex)

Message: 1801
"All Sweeps Completed and Processed"

Severity: Informational

Further explanation: This event occurs when all of the sweeps and sweep calculations are complete for a channel.

EventID: 68070709 (hex)

Message: 1802
Low Pass: Frequency limits have been changed.

Severity: Informational

EventID: 6807070A (hex)

Message: 1803
Low Pass: Number of points have been changed.

Severity: Informational

EventID: 6807070B (hex)

Message: 1804
Low Pass: Frequency limits and number of points have been changed.

Severity: Informational

EventID: 6807070C (hex)

Message: 1805
"Channel created"
Severity: Informational
EventID: 6807070D (hex)

Message: 1806
"Channel deleted"

Severity: Informational
EventID: 6807070E (hex)

Message: 1872
"Channel not found."

Severity: Error
Further explanation: A non-existent channel is being referenced under program control.
Suggestions: Query the channel number, then refer to it by number.
EventID: E8070750 (hex)

Message: 1873
"The requested sweep segment was not found."

Severity: Error
Further explanation: A non-existent sweep segment is being referenced under program control.
EventID: E8070751 (hex)

Message: 1874
"The sweep segment list is empty."

Severity: Error
Further explanation: Segment Sweep cannot be specified unless there is at least one defined segment. This error will only occur under remote control.
EventID: E8070752 (hex)

Message: 1875
"The number of points in active sweep segment list segments is 0."

Severity: Error
Further explanation: Segment Sweep cannot be specified unless there is at least data point specified in a segment. This error will only occur under remote control.
EventID: E8070753 (hex)

Message: 1876
"The specified source attenuator is not valid."

Severity: Error
Further explanation: You tried to set the Attenuator property on the Channel object on a PNA that doesn't have a source attenuator.
**Message: 1877**
"Log Frequency sweep cannot be selected with the current Number of Points. Please reduce Number of Points."
**Severity:** Error
**Further explanation:** The maximum number of points that can be used for Log sweep is 401.
**EventID:** E8070754 (hex)

**Message: 1878**
"The requested Number of Points is greater than can be selected for Log Frequency sweep."
**Severity:** Error
**Further explanation:** The maximum number of points that can be used for Log sweep is 401.
**EventID:** E8070755 (hex)

**Message: 1879**
"Response frequencies exceeded instrument range so Frequency Offset has been turned off."
**Severity:** Error
**Further explanation:** This error is returned whenever the instrument detects that the stimulus sweep setup and Frequency Offset settings result in computed response frequencies that exceed instrument limits. When this occurs, the instrument automatically turns off Frequency Offset to avoid the out-of-range conditions.
**Suggestions:** When this condition has occurred, change settings for either the stimulus frequencies or Frequency Offset so that the Response frequencies are within instrument bounds. Once this is done, Frequency Offset can once again be turned on.
**EventID:** E8070756 (hex)

**Message: 1880**
The total number of points for all the given segments exceeds the maximum number of points supported. The segments were not changed.
**Severity:** Error
**EventID:** E8070757 (hex)

**Message: 1881**
This instance of the Channels object was not used to place the channels in Hold, so no channels were resumed.
**Severity:** Error
**EventID:** E8070758 (hex)

**Message: 1882**
The port number was outside the range of allowed port numbers.
**Severity:** Error
**EventID:** E8070759 (hex)
Message: 1883
More ports than are present are required for this operation.
Severity: Error
EventID: E807075B (hex)

About Error Messages

PNA errors and Operating System errors are displayed and logged in an error file. You can choose how to display PNA errors, or choose to not display PNA errors at all.

- Error Display
- View Error Log
- List of PNA Errors
- SCPI Errors

Other System topics

Error Display

By default, error messages appear on the PNA screen for a brief period. You can choose to have them stay on the screen until you click an OK button, or have them not appear at all. When they stay on the screen, a Help button is available to provide further assistance.

How to select the display of Error Messages

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then **[Help]**
3. then **[Error Messages]**
4. then **[Error Display]**

Using a mouse with PNA Menus

1. Click **Help**
2. then **Error Messages**
3. then **Error Display**
Error Display dialog box help

On Preset, these settings revert to their defaults (enabled, timed popups).

Enable Messages Check to display all PNA error messages as they occur. Clear to suppress the display of PNA error messages. You can still view them in the error log.

Calibration Error Message Windows

Timed Popups Displays error messages on the screen for a duration of time proportional to the length of the message. You can then view the message in the error log and get further assistance.

Confirmation Dialog boxes Displays error messages in a standard dialog box. You then choose OK or Cancel to close the dialog box, or press Help to get further information on the error message.

View Error Log

The PNA Error Log is a list of all events that have occurred. (Events are used in programming the PNA using COM.) PNA errors is a subset of PNA events. Only events with severity codes of ERROR are displayed on the PNA screen as they occur. From the error log, you can access further help with an error by selecting the error and clicking Help.

How to view the Error Log

Using front-panel HARDKEY [softkey] buttons

1. Press SYSTEM
2. then [Help]
3. then [Error Messages]
4. then [View Error Log]

Using a mouse with PNA Menus

1. Click Help
2. then Error Messages
3. then View Error Log

No programming commands
**Error Log** dialog box help

**Network analyzer errors only** Select to view only PNA errors. Clear to view all errors that occur on all applications of the computer.

**Description** Error message that appears on the PNA screen.

- **A** - Event ID Error message number
- **B** - Date the Error occurred
- **C** - Time the Error occurred
- **D** - Severity Code - All events have one of the following severity codes:
  - SUccess - the operation completed successfully
  - INFormation - events that occur without impact on the measurement integrity
  - WARening - events that occur with potential impact on measurement integrity
  - ERRor - events that occur with serious impact on measurement integrity
- **E** - Application in which the error occurred.

**OK** Closes the Dialog box

**Help** Provides further information on the selected Error message

To clear the Error Log:

1. From the **File** menu click **Minimize Application**
2. On the desktop, select **Start, Settings, Control Panel**
3. On the Control Panel, click **Administrative Tools**
4. On the Administrative Tools window, click **Event Viewer**

5. On the Event Viewer window, right-click **Application**

6. Select **Clear all Events**

7. If you want to save a file with the contents of the Event Log, click **Yes**. Otherwise, click **No**

To restore the PNA application, click on the PNA Analyzer taskbar button at the bottom of the screen.
Analyzer Accessories

- Coax Mechanical Calibration Kits
- Waveguide Mechanical Calibration Kits
- Electronic Calibration (ECal)
- Mechanical Verification Kits
- Adapter and Accessory Kits
- Test Port Cables
- USB Peripherals
- Connector Care and Cleaning Supplies

Other Support topics

For product and order information:

- Visit [www.agilent.com/find/accessories](http://www.agilent.com/find/accessories)
- Use the search function to locate information about a particular accessory or view the entire RF and Microwave Test Accessories Catalog.

Accessories are available in these connector types:

- 50 ohm Type-N
- 75 ohm Type-N
- 3.5 mm
- 7 mm (APC-7)
- 7-16
- 2.92 mm
- 2.4 mm
- 1.85 mm
- 1 mm

Test port cables and a calibration kit are necessary for a complete measurement system.
A verification kit is used to verify corrected system performance.

See the connector type for each PNA model

82357A USB / GPIB Interface

The Agilent 82357A is an adapter that creates a GPIB Interface from one of your unused PNA USB ports.

- **Applications**
- **Installing**
- **Configuring**
- **Connecting**
- **Communicating with other Equipment**

### Applications

The 82357A can be used for the following PNA applications:

- **Frequency Converter Application** - The 82357A is included with the Frequency Converter Application (option 083). External sources MUST be connected to this Interface if controlling the PNA using an external PC. See connecting diagram below. To learn more, see Configure an external LO source.

**Note**: If the PNA is hibernated during an FCA measurement involving an external source under FCA control, and then the PNA is restarted, a VISA error message will appear stating “VI_ERROR_INV_OBJECT.” To correct this problem, the 82357 USB/GPIB interface must be reinitialized after hibernation. This is done by clicking on the Accept button in the interface initialization dialog box. The green READY light on the interface will illuminate.

- **PNA Controller** - The 82357A can be used by the PNA to control other GPIB devices. This frees the default GPIB interface to perform other GPIB operations, such as control the PNA from an external PC.

- **Source Power Cal** - The 82357A can be used to run a source power calibration.

### Installing the 82357A USB/GPIB Interface

1. [Download and install firmware](#) PNA revision 3.0 or greater. To check the revision of your PNA firmware, click Help then About Network Analyzer.

2. Upgrade to the latest Agilent IO libraries from the CDROM that was shipped with the 82357A. If not available, download them from [www.Agilent.com](http://www.Agilent.com) (search for 82357A)

### Configure the 82357A USB/GPIB Interface

When the 82357A is connected to the PNA USB, the following dialog box appears:
Normally, you do NOT need to edit these settings. The 82357A USB/GPIB Interface is configured automatically as the next unused VISA interface. This is usually **GPIB2** unless you have already configured it for another purpose.

If the VISA Interface Name appears as GPIB0 or GPIB1, these Interfaces must be returned to their default settings for the 82357A to work properly with the PNA. See Configure for VISA / SICL to learn how.

**Connecting the 82357A USB/GPIB Interface**

The following diagram illustrates how to connect GPIB test equipment using the USB/GPIB Interface.

- Plug the USB/GPIB Interface into any unused PNA USB port.
- The default GPIB Interface and USB/GPIB Interface should never be connected together.

![Diagram](image)

**Communicating with Equipment Connected to the USB/GPIB Interface**

- The Frequency Converter Application will automatically find and communicate with test equipment that is connected to the USB/GPIB Interface.
- Source power calibration will automatically find and communicate with the power meter that is connected to the USB/GPIB Interface.
To control other devices through your own program using the 82357A, you must include the new GPIB Interface number when addressing the devices.
Firmware Upgrade

PNA firmware upgrades are available to you at no cost in a self-extracting Install Shield file. The upgrade includes the PNA application, Online help, and Service Utilities. Note: The file is at least 50 MB.

Note: The CPU speed, amount of RAM, and Operating System in your PNA may limit your ability to upgrade firmware. See http://na.tm.agilent.com/pna/firmware/PNA_support_matrix.doc.

The following options are available for you to upgrade your PNA application:

- **Auto-Check** and **AgileUpdate** If your PNA is connected to the Internet, these utilities will automatically check for, download, and install, the new firmware and associated files when the PNA application is started. You will be prompted before this occurs.

- **Website Access** If your PNA is NOT connected to the Internet, but you have a PC that is, you can download the PNA firmware and associated files to a storage medium.

To manually check the version of firmware on the PNA, click Help, then About Network Analyzer.

**Note: After a firmware upgrade...**

- Custom Cal Kits must be imported. Learn more

- If a different desktop icon named "Network Analyzer" exists, the shortcut to the PNA application will assume the same icon. Right-click on the desktop, then click Refresh.

**Other Support Topics**

**Auto-Check**

With Internet access to your PNA, Auto-Check automatically and regularly checks the Internet for new PNA firmware revisions. If a new revision is found, a notification message prompts you to run the AgileUpdate utility, which then performs the actual download.

Without Internet access to your PNA, Auto-Check provides a reminder prompt at the selected intervals.

Auto-Check is run only when the PNA application is started. Once the PNA application is running, it will not check for updates again until it is restarted.

When Auto-Check runs, it checks the following conditions:

- Is there an active connection to the Internet?
- Is the Auto-Check utility enabled?
- Is it time to check for new firmware?
- Does new firmware exist?

If all of these conditions are true, Auto-Check shows the following dialog box.
If all of these conditions are NOT true, or to change these settings at any time, click **System, Service**, then **AgileUpdate**. From within AgileUpdate, click **AutoCheck**. These preferences are stored in the PNA registry. Future firmware upgrades will not change these settings.

**PNA Auto-Check** dialog box help

- **Enable** When the PNA application is started, Auto-Check will search the PNA website for firmware updates at the selected time interval.
- **Disable** When the PNA application is started, Auto-Check will NOT search the PNA website for firmware updates.
- **Time Interval** Select the time interval Auto-Check is to search for firmware updates.
- **Accept** Starts update process.
- **Ignore** No further action is taken until the selected time interval has elapsed.
- **Remind Me Later**: This window is displayed again after 1-20 days depending upon the time interval selected.

**AgileUpdate**

**Note:** You must have administrative privileges on the analyzer to run this utility. See [Set Up Analyzer Users](#).
How to start AgileUpdate

Connect the PNA to the Internet. A LAN connection is recommended because a firmware download can take many hours using a modem.

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then **[Service]**
3. then **[AgileUpdate]**

Using a mouse with PNA Menus

1. Click **Utility**
2. then **System**
3. then **Service**
4. then **AgileUpdate**

1. Click **Check for Updates**.
2. If updates exist, click **Download & Install**.

No programming commands are available for this feature.
**AgileUpdate dialog box help**

**Note:** Your privacy is important to Agilent. AgileUpdate does NOT send ANY information from the PNA to the server. It only downloads from the server to the PNA.

**Restart**  
Click to restart from the beginning.

**Configure**  
Click to launch the [Configure dialog box](#).

**Clean-up**  
Click to delete all but the two most recent install shield packages from the PNA hard drive.

**Firmware History**  
Available after clicking [Check for Updates](#).

**Auto-Check**  
Launches the [Auto-Check](#) dialog box.

**Item / Application**  
Lists the items available for download at the firmware website.

- Click items with **i** to read more information about the download.
- Items in **RED** should be downloaded and installed individually.
- Multi-language help includes all help files except English.

**Note:** The firmware includes the help file. Therefore, only the firmware checkbox will be selected if a new version for both the firmware and the help file are available.

**Select Source**

**Default Website**  
The Agilent site that contains upgrade FW.

**Other Specified URL**  
Click if you were instructed to get firmware from a different website.

**Check Customer FW Releases**  
Check this box to also check Customer Releases in addition to Production Releases. This setting provides you with the very latest PNA firmware. Customer Releases are fully supported but have not yet been tested in all production models. Customer Releases take precedence over Production Releases. This setting is remembered and applied the next time AgileUpdate is run.

**Special Access Code...**  
Type in the code if you were given one from Agilent Technical Support. Otherwise, leave blank.

**Make Latest Firmware Available...**  
Select this checkbox if you want to download the latest firmware, even if it is not new.

**Check for Updates**  
Click to look for firmware updates at the Agilent website. If there are newer versions, the files will be listed.

**Download and Install**  
When updates are found, this selection becomes available. Some files may be pre-checked. Be sure the corresponding boxes are checked for the files you want to download. Then click to download and install the update.

**Download Only**  
Click to download the files to the analyzer hard disk and install the files at a later time. At that time, click [Install from File](#).
Configuration dialog box help

**Note:** If AgileUpdate will not connect, try to access ANY Internet website. Contact your local IT department if necessary.

**Proxy Setting**
- **No Proxy or Default Proxy** Click if you use a LAN connection. AgileUpdate will automatically use the proxy specified in Internet Explorer.
- **Use specified Proxy / Port** Click to enter the proxy name and port. The format is: proxyName:portNumber. (The proxy port number is typically 8088).

**Internet timeout** If you are using an automatic dial-up Internet connection you may need to increase the timeout.

**Current Connection Status** Shows the current status of the PNA connection to the Internet.

**Note:** These settings are NOT saved; they must be re-entered each time AgileUpdate is run.

**Agilent Website Access**

If you cannot access the Internet directly with your PNA, you can use an external PC with Internet access to download the file from the Agilent website. You can then transfer the file from your PC to your analyzer over a LAN or other means.

2. Click on the firmware to be downloaded.
3. Save the program to disk (hard drive of your PC).
4. Transfer the file from your PC to your PNA using LAN, CD, or USB Pen drive.
5. Double-click the file on the PNA.
**Warning**: You can save the upgrade file to your PC, but do not attempt to install the PNA application on your PC. It will alter system settings and can result in system crashes.

- **PNA Series Configuration Guide** (requires an Internet connection)
- Click **Help** then **About Network Analyzer** to view the options that are installed on your PNA.

### New PNA 'C' Models

In Spring 2008, new PNA ‘C’ models were introduced that replace the PNA-L and Microwave ‘A’ and ‘B’ models. The new ‘C’ models have the **PNA-X User Interface** capabilities, including touchscreen and softkeys. In addition:

- The ‘C’ models have a bigger 8.4” display screen.
- The ‘C’ models share the same **Specifications** as their ‘A’ and ‘B’ model counterparts.
- Upgrades from ‘A’ and ‘B’ to ‘C’ models are available.

**Note:** The term 'Legacy' that is used in this help file refers to the PNA models that were introduced before the PNA-X (N5230A, E836xA/B, and all discontinued models).

New PNA N522x Series

See Block Diagrams.

See Specs

- N5221A: 10 MHz to 13.5 GHz
- N5222A: 10 MHz to 26.5 GHz
- N5224A: 10 MHz to 43.5 GHz
- N5225A: 10 MHz to 50.0 GHz
- N5227A: 10 MHz to 67 GHz

The N522x models are identical to the PNA-X series except:

- N522x 2-port models are NOT available with 2 sources.
- N522x option numbering is slightly different.
- N522x models do NOT have internal RF switches or combiners (no RF Path Configuration). This has many measurement implications.
- N522x models do NOT have rear-panel access to RF Paths.
- N522x models do NOT offer a Noise Receiver (Opt 029).

#### PNA-L Series  Model N5230A and N5230C [See note](#)

**Note:** To see if your PNA has a Reference Receiver for each Test Port, scroll down to see the number of test ports and number of reference receivers. If they are equal, then there is a reference receiver for each test port. Block Diagrams are available at the end of each specifications document.

* Typical specs apply

**Test Set**

**Standard** NO Configurable Test Set.

**Configurable (2-port)** - Adds six front panel access loops and two 60 dB step attenuators in 10 dB steps.

**Configurable (4-port)** - Adds nine front panel access loops and one 60 dB step attenuator in 10 dB steps.

**Configurable (4-port)** - Adds nine front panel access loops and two 60 dB step attenuators in 10 dB steps.

**Microwave Standard Models** *(see options)*

| 1E5  | E8801/ 02/ 03A N3381/ 82/ 83A | High stability 10 MHz time base (No longer available)  
Replaces 10 ppm time base with a 1 ppm time base. High stability time base is standard with PNA models E8356/ 57/ 58A and E8362/ 63/ 64B. |
| 550  | E8361A/C E8362B/C E8363B/C E8364B/C N5230A/C | Add full 4 port capability and differential measurements - [Learn more.](#)  
Requires a PNA with configurable test set. [E836x Opt 014](#) or [N5230A Opt. x25](#) |
| 551  | All PNA-X, C models, and N522x models. | Add fully integrated measurements at all of the available test ports.  
Solutions and PNA requirements depend on the supported test set. See [http://www.agilent.com/find/multiport](http://www.agilent.com/find/multiport) |
| 897  | All PNA-X, C models, and N522x models. | Perpetual license for built-in performance test software for [Agilent inclusive cal.](#)  
Adds built-in performance testing and calibration software for self-maintainers. Requires additional equipment. See your PNA Service Guide for more information on equipment required. |
| 898  | All PNA-X, C models, and N522x models. | Perpetual license for built-in performance test software for [Standards compliant cal.](#)  
Adds built-in performance testing and calibration software for self-maintainers. Requires additional equipment. See your PNA Service Guide for more information on equipment required. |
| H08  | All PNA-X and C Models | Integrated Pulsed Measurement Setup  
Provides the Pulsed Application for average pulse and point-in-pulse measurements.  
PNA-X models use the [Integrated Pulse Setup](#)  
E836x models require options H11, UNL, 014, 080, and 081. [Learn more](#)  
See PNA-X options for more information. |
| H11  | E8361A/C E8362B/C E8363B/C E8364B/C | IF Access  
Provides rear panel access to the PNA IF paths for:  
- Extended frequency coverage to 325 GHz  
- Pulsed measurement capability  
- Advanced antenna measurements  
Requires options UNL, 014, 080, and 081. [Learn more](#) |
Extended power range and bias tees

Add two step attenuators and two bias tees. (E8361A adds 50 dB step attenuators; E8362/63/64A/B adds 60 dB step attenuators. All attenuators have a 10 dB resolution.) A step attenuator and bias-tee set is inserted between the source and test port 1 and another set between the source and test port 2.

Upgrade includes installation at an Agilent service center.

PNA Warranty Period

The actual warranty on your instrument depends on the date it was ordered as well as whether or not any warranty options were purchased at that time. To determine the exact warranty on your instrument, contact Agilent Technologies with the model and serial number of your instrument.

For online information about Agilent's service and support products visit: [www.agilent.com/find/tm_services](http://www.agilent.com/find/tm_services).
21-Jun-2011  Updated link to new config guide
29-Apr-2011  Added new N522x models
2-Nov-2010   Added link to config guide, N5247A, and 088
3-Mar-2010   Added 028 and H29
17-Dec-2009  Corrected Certification Options
26-Oct-2009  Added 029 requirements
30-Apr-2009  Added new PNA-X models and
             PNA-X w/ Opts 081 and 014
8-Sep-2008   Added IMD
9-Jun-2008   Edits for C models and N5242A
25-Oct-2007  Added C models
5-Sep-2007   Added Embedded LO
9/26/06      MQ Added PNA-L 4port models
9/27/06      MX Added PNA-X
Option Enable Utility

The Option Enable utility allows you to perform the following activities on your PNA.

- Enable or remove software options and some hardware options.
- Recover option data if the hard drive or other data-containing assembly is replaced.
- Input or change a serial number.

The following items are discussed in this topic:

**Keywords**

- **Running the Program**
- **Removing an Option**
- **Installing an Option**
- **Repairing and Recovering Option Data**
- **Installing or Changing the Serial Number**

**See Also**

See PNA Configurations and Options

**Keywords**

To add certain options, you need a keyword that is provided by Agilent. There are two types of keywords:

- **Option Keywords** add a software option.
- **Model Keywords** may be required if you replace multiple assemblies.

Keywords are linked to the PNA **Host ID**, which is displayed on the Option Enable dialog box (below).

**Temporary and Permanent Options**

Any software option can also be installed on a temporary basis for a specified amount of time. This allows you to evaluate a specific feature or capability at no cost.

If the license key provided by Agilent has an expiration date, you must select the "temporary" option and enter the expiration date exactly as stated in the license statement. If you decide to make this option permanent, Agilent will provide a new keyword that converts the option to permanent status.

For either permanent or temporary software options, a provided keyword must be entered.

**Running the Program**
On the PNA, click System, point to Service, then click Option Enable.

1. To enable or remove an option, select it from the drop-down list of available options. If the desired option is not listed, select the last choice in the list, labeled Enter Unlisted Option.

2. Enter the 3-character option name and click Enter.

If a software option was chosen, the following occurs.

- The Remove button will be enabled.
- The keyword entry area becomes visible.
- The permanent/temporary selection is enabled.

If a hardware option is selected, the following occurs.

- With the hardware option already installed, the Remove button is enabled.
- With the hardware option not installed, the Enable button is enabled.

Removing an Option

1. To remove an option, click Remove.

2. After the option is removed, restart the network analyzer application for the changes to take effect.

Note: Removal of a licensed option (such as Option 010, Time Domain) will permanently remove the license.
keyword. If this option may be needed in the future, then record the license keyword before removing the option. Do this by copying the file "gen.lic" to another location (such as a floppy disk), or print it using notepad. The file, located at “C:/Program Files/Agilent/Network Analyzer” contains all the information needed to recreate the license.

Installing an Option

1. If the keyword entry area is visible, enter a keyword. (The keyword is not case sensitive.)
2. Click Enable.
3. After the option is installed, restart the network analyzer application for the changes to take effect.

Note: If a desired option is not visible, it may be because a prerequisite option has not yet been installed. For example, Option 083 will not be visible if Option 080 is not already present. See PNA options.

Repairing and Recovering Option Data

Use this part of the Option Enable Utility in the following situations:

- If the hard drive is replaced
- If the frequency reference assembly is replaced

This routine rebuilds the option information contained on the hard drive and frequency reference assembly (primary and backup).

1. Select Repair from the Option Enable menu bar.

Note: If you are unsure if this routine needs to be done, run it; no harm will result.

2. The model and serial number are displayed, along with four check boxes.
3. Select the boxes that apply.
4. Click Begin Repair. The routine checks all data files and performs any needed repairs. You may be asked to verify certain information and processes.
5. If the routine finds that the model number is incorrect or invalid, you will be asked to select the correct model number.
   - Along with this model number, a model keyword will be required. If this is not labeled on the analyzer, or is not otherwise known, contact Agilent
   - After you have entered the requested data, click Change Model. This process takes about 30 seconds.
6. When done, click Exit Repair.
7. If you do not need to install any other options, click Exit.
Installing or Changing the Serial Number

It may be necessary to install or change a serial number if certain assemblies are replaced.

1. To change the serial number, select Change Serial from the Option Enable menu bar. The current serial number will be displayed. If no serial number has previously been entered, the word "NONE" will be displayed.

2. Type the new serial number into the space provided, and click Change Serial. (The serial number is not case sensitive.)

**Note:** Use extreme care when entering the serial number; only one entry chance is allowed!

3. To change an incorrect serial number, a clear-code password is required. Contact Agilent to obtain this clear code and have the existing serial number available. Enter the clear code in the space provided, along with the new serial number, then click Change Serial.

---

Last Modified:

20-Sep-2007   Added Install note
**Instrument Calibration**

An instrument calibration is a process where the PNA performance is measured to ensure that it operates within specifications. If any performance parameter does not conform to the published specifications, adjustments are made to bring the performance into conformance.

**Why Should I Get an Instrument Calibrated?**

Over time, the active components in the analyzer age and the performance may degrade or drift.

To ensure that the analyzer is performing to the published specifications, you should have an instrument calibration performed periodically.

**How Often Should I Get an Instrument Calibrated?**

It is your responsibility to determine the calibration period which best meets your requirements. However, a 12 to 18 month calibration cycle is appropriate for most users.

There are two things to consider: performance drift and connector wear.

- The instrument specifications are set to consider the performance drift that may occur over a 24 month period. Therefore, getting the instrument calibrated at 24 month intervals ensures that the analyzer maintains performance within the operating specifications. If you need the analyzer to maintain more consistent operation, you may want to have the instrument calibrated more often than the recommended 24-month interval.

- Connector wear is a bigger factor and depends on the number of connections that are made. The test ports become noticeably worn after 500 to 700 connections. This could represent about 12 months with average use. With more frequent connections, the calibration cycle should be sooner. You can extend the time between calibrations and thereby save money by using connector savers and by performing proper Connector Care.

**How Do I Get an Instrument Calibrated?**

To get the instrument calibrated, send it to one of the Agilent Technologies service centers. See Technical Support.

The PNA must be fully functional when it is sent to the service center, or they will charge for their repair services. If the PNA is being used in a secure environment where the hard drive can not be sent with the PNA, a second hard drive must be purchased and configured for use with the PNA in an "unclassified" environment before the PNA is sent to the service center.

To perform the instrument calibration yourself, you must have the following required items:

- Instrument Calibration Test Equipment
- Performance Test Software

**What Are My Choices of Instrument Calibration?**

The following types of instrument calibration are available from Agilent Technologies at the time of initial order:
Standard

Includes a certificate of calibration stating the instrument has been calibrated and is operating within the published specifications.

Option UK6

Available ONLY at the initial shipment. Includes the test data from the calibration and the certificate of calibration stating the instrument has been calibrated and is operating within the published specifications.

Option A6J

Available ONLY at the initial shipment. Includes the test data and measurement uncertainties from the calibration and the certificate of calibration stating the instrument has been calibrated using a process in compliance with ANSI Z540 and is operating within the published specifications.

Option 1A7

Available ONLY at the initial shipment. Includes the test data and measurement uncertainties from the calibration and the certificate of calibration stating the instrument has been calibrated using a process in compliance with ISO 17025 and is operating within the published specifications.

The following types of instrument calibration are available from Agilent Technologies service center:

Agilent Calibration

Includes the test data from the calibration and the certificate of calibration, stating the instrument has been calibrated and is operating within the published specifications.

ANSI Z540 Calibration

Includes the test data from the calibration and the certificate of calibration, stating the instrument has been calibrated using a process in compliance with ANSI Z540.1 and is operating within the published specifications.

ISO 17025 Calibration

Includes the test data from the calibration and the certificate of calibration, stating the instrument has been calibrated using a process in compliance with ISO 17025 and is operating within the published specifications.

For more information on these options, visit www.agilent.com/find/calibration.

PNA Error messages.

---

**-100 to -200 Command Errors**

A command error indicates that the test set’s GPIB parser has detected an IEEE 488.2 syntax error. When one of these errors is generated, the command error bit in the event status register is set.

- **-100 std_command**
  Command - This event bit (Bit 5) indicates a syntax error, or a semantic error, or a GET command was entered, see IEEE 488.2, 11.5.1.1.4.

- **-101 std_invalidChar**
  Invalid character - Indicates a syntactic elements contains a character which is invalid for that type.

- **-102 std_syntax**
  Syntax - Indicates that an unrecognized command or data type was encountered. For example, a string was received when the device does not accept strings.

- **-103 std_invalidSeparator**
  Invalid separator - The parser was expecting a separator and encountered an illegal character. For example, the semicolon was omitted after a program message unit.

- **-104 std_wrongParamType**
  Data type - The parser recognized a data element different than one allowed. For example, numeric or string data was expected but block data was encountered.

- **-105 std_GETNotAllowed**
  GET not allowed - Indicates a Group Execute Trigger was received within a program message. Correct the program so that the GET does not occur within the program code.

- **-108 std_tooManyParameters**
  Parameter not allowed - Indicates that more parameters were received than expected for the header. For example, *ESE common command only accepts one parameter, so *ESE 0,1 is not allowed.

- **-109 std_tooFewParameters**
  Missing parameter - Indicates that less parameters were received than required for the header. For example, *ESE requires one parameter, *ESE is not allowed.
-110 std_cmdHeader Command header - Indicates an error was detected in the header. This error is used when the device cannot detect the more specific errors -111 through -119.

-111 std_headerSeparator Header separator - Indicates that a character that is not a legal header separator was encountered while parsing the header.

-112 std_IDTooLong Program mnemonic too long - Indicates that the header contains more that twelve characters, see IEEE 488.2, 7.6.1.4.1.

-113 std_undefinedHeader Undefined header - Indicates the header is syntactically correct, but it is undefined for this specific device. For example, "XYZ" is not defined for any device.

-114 std_suffixOutOfRange Header suffix out of range - Indicates the value of a header suffix attached to a program mnemonic makes the header invalid.

-120 std_numericData Numeric data - This error, as well as errors

-121 std_invalidCharInNumber Invalid character in number - Indicates an invalid character for the data type being parsed was encountered. For example, an alpha in a decimal numeric or a "9" in octal data.

-123 std_exponentTooLarge Exponent too large - Indicates the magnitude of an exponent was greater than 32000, see IEEE 488.2, 7.7.2.4.1.

-124 std_decimalTooLong Too many digits - Indicates the mantissa of a decimal numeric data element contained more than 255 digits excluding leading zeros, see IEEE 488.2, 7.7.2.4.1.

-128 std_numericNotAllowed Numeric data not allowed - Indicates that a legal numeric data element was received, but the device does not accept one in this position for the header.

-130 std_suffix Suffix - This error, as well as errors -131 through -139, are generated when parsing a suffix. This particular error message is used if the device cannot detect a more specific error.

-131 std_badSuffix Invalid suffix - Indicates the suffix does not follow the syntax described in IEEE 488.2, 7.7.3.2, or the suffix is inappropriate for this device.

-134 std_suffixTooLong Suffix too long - Indicates the suffix contain more than 12 characters, see IEEE 488.2, 7.7.3.4.

-138 std_suffixNotAllowed Suffix not allowed - Indicates that a suffix was encountered after a numeric element that does not allow suffixes.

-140 std_charData Character data - This error, as well as errors

-141 std_invalidCharData Invalid character data - Indicates that the character data element contains an invalid character or the particular element received is not valid for the header.

-144 std_charDataTooLong Character data too long - Indicates the character data element contains more than twelve characters, see IEEE 488.2, 7.7.1.4.
-148  std_charNotAllowed  Character data not allowed - Indicates a legal character data element was encountered where prohibited by the device.

-150  std_stringData  String data - This error, as well as errors

-151  std_stringInvalid  Invalid string data - Indicates that a string data element was expected, but was invalid, see IEEE 488.2, 7.7.5.2. For example, an END message was received before the terminal quote character.

-158  std_stringNotAllowed  String data not allowed - Indicates that a string data element was encountered but was not allowed by the device at this point in parsing.

-160  std_blockData  Block data - This error, as well as errors -161 through -169, are generated when parsing a block data element. This particular error message is used if the device cannot detect a more specific error.

-161  std_badBlock  Invalid block data - Indicates a block data element was expected, but was invalid, see IEEE 488.2, 7.7.6.2. For example, and END message was received before the end length was satisfied.

-168  std_blockNotAllowed  Block data not allowed - Indicates a legal block data element was encountered, but not allowed by the device at this point in parsing.

-170  std_expr  Expression - This error, as well as errors -171 through -179, are generated when parsing an expression data element. This particular error message is used if the device cannot detect a more specific error.

-171  std_invalidExpression  Invalid expression - Indicates the expression data element was invalid, see IEEE 488.2, 7.7.7.2. For example, unmatched parentheses or an illegal character.

-178  std_exprNotAllowed  Expression data not allowed - Indicates a legal expression data was encountered, but was not allowed by the device at this point in parsing.

-180  std_macro  Macro - This error, as well as error -181 through -189, are generated when defining a macro or execution a macro. This particular error message is used if the device cannot detect a more specific error.

-181  std_validOnlyInsideMacro  Invalid outside macro definition - Indicates that a macro parameter place holder was encountered outside of a macro definition.

-183  std_invalidWithinMacro  Invalid inside macro definition - Indicates that the program message unit sequence, sent with a *DDT or a *DMC command, is syntactically invalid, see IEEE 488.2, 10.7.6.3.

-184  std_macroParm  Macro parameter - Indicates that a command inside the macro definition had the wrong number or type of parameters.

**-200 to -299 Execution Errors**

These errors are generated when something occurs that is incorrect in the current state of the instrument. These errors may be generated by a user action from either the remote or the manual user interface.
Execution - This event bit (Bit 4) indicates a PROGRAM DATA element following a header was outside the legal input range or otherwise inconsistent with the device's capabilities, see IEEE 488.2, 11.5.1.1.5.

Invalid while in local

Settings lost due to rtl

Command protected - Indicates that a legal password-protected program command or query could not be executed because the command was disabled.

Trigger

Trigger ignored

Arm ignored

Init ignored

Trigger deadlock

Arm deadlock

Parameter - Indicates that a program data element related error occurred.

Settings conflict - Indicates that a legal program data element was parsed but could not be executed due to the current device state.

Data out of range - Indicates that a legal program data element was parsed but could not be executed because the interpreted value was outside the legal range defined by the devices.

Too much data - Indicates that a legal program data element of block, expression, or string type was received that contained more data than the device could handle due to memory or related device-specific requirements.

Illegal parameter value - Indicates that the value selected was not part of the list of values given.

Out of memory - The device has insufficient memory to perform the requested operation.

Lists not same length - Attempted to use LIST structure having individual LIST's of unequal lengths.

Data corrupt or stale - Indicates invalid data, a new reading started but not completed since the last access.

Data questionable - Indicates that measurement accuracy is suspect.
-232 std_invalidFormat  Invalid format

-233 std_invalidVersion  Invalid version - Indicates that a legal program data element was parsed but could not be executed because the version of the data is incorrect to the device. For example, a not supported file version, a not supported instrument version.

-240 std_hardware  Hardware - Indicates that a legal program command or query could not be executed because of a hardware problem in the device.

-241 std_hardwareMissing  Hardware missing - Indicates that a legal program command or query could not be executed because of missing device hardware. For example, an option was not installed.

-250 std_massStorage  Mass storage - Indicates that a mass storage error occurred. The device cannot detect the more specific errors described for errors -251 through -259.

-251 std_missingMassStorage  Missing mass storage - Indicates that a legal program command or query could not be executed because of missing mass storage.

-252 std_missingMedia  Missing media - Indicates that a legal program command or query could not be executed because of missing media. For example, no disk.

-253 std_corruptMedia  Corrupt media - Indicates that a legal program command or query could not be executed because of corrupt media. For example, bad disk or wrong format.

-254 std_mediaFull  Media full - Indicates that a legal program command or query could not be executed because the media is full. For example, there is no room left on the disk.

-255 std_directoryFull  Directory full - Indicates that a legal program command or query could not be executed because the media directory was full.

-256 std_fileNotFound  File name not found - Indicates that a legal program command or query could not be executed because the file name was not found on the media.

-257 std_fileName  File name - Indicates that a legal program command or query could not be executed because the file name on the device media was in error. For example, an attempt was made to read or copy a nonexistent file.

-258 std_mediaProtected  Media protected - Indicates that a legal program command or query could not be executed because the media was protected. For example, the write-protect switch on a memory card was set.

-260 std_expression  Expression

-261 std_math  Math in expression

-270 std_macroExecution  Macro - Indicates that a macro related execution error occurred.
-271 std_macroSyntax Macro syntax - Indicates that a syntactically legal macro program data sequence, according to IEEE 488.2, 10.7.2, could not be executed due to a syntax error within the macro definition.

-272 std_macroExec Macro execution - Indicates that a syntactically legal macro program data sequence could not be executed due to some error in the macro definition, see IEEE 488.2, 10.7.6.

-273 std_badMacroName Illegal macro label - Indicates that the macro label was not accepted, it did not agree with the definition in IEEE 488.2, 10.7.3

-274 std_macroPlaceholder Macro parameter - Indicates that the macro definition improperly used a macro parameter placeholder, see IEEE 4882, 10.7.3.

-275 std_macroTooLong Macro definition too long - Indicates that a syntactically legal macro program data sequence could not be executed because the string of block contents were too long for the device to handle, IEEE 488.2, 10.7.6.1.

-276 std_macroRecursion Macro recursion - Indicates that a syntactically legal macro program data sequence count not be executed because it would be recursive, see IEEE 488.2, 10.7.6.6.

-277 std_cantRedefineMacro Macro redefinition not allowed - Indicates that redefining an existing macro label, see IEEE 488.2, 10.7.6.4.

-278 std_macroNotFound Macro header not found - Indicates that a legal macro label in the *GMS?, see IEEE 488.2, 10.13, could not be executed because the header was not previously defined.

-280 std_program Program

-281 std_cantCreateProgram Cannot create program

-282 std_illegalProgramName Illegal program name

-283 std_illegalVarName Illegal variable name

-284 std_programRunning Program currently running

-285 std_programSyntax Program syntax

-286 std_programRuntime Program runtime

-290 std_memoryUse Memory use

-291 std_execOutOfMemory Out of memory

-292 std_nameNotFound Referenced name does not exist
**-300 to -399 SCPI Specified Device-Specific Errors**

A device-specific error indicates that the instrument has detected an error that occurred because some operations did not properly complete, possibly due to an abnormal hardware or firmware condition. For example, an attempt by the user to set an out of range value will generate a device specific error. When one of these errors is generated, the device specific error bit in the event status register is set.

- **-300 std_deviceSpecific**  
  Device specific - This event bit (Bit 3) indicates that a device operation did not properly complete due to some condition, such as overrange see IEEE 488.2, 11.5.1.1.6.

- **-310 std_system**  
  System

- **-311 std_memory**  
  Memory - Indicates some physical fault in the devices memory, such as a parity error.

- **-312 std_PUDmemoryLost**  
  PUD memory lost - Indicates protected user data saved by the *PUD command has been lost, see IEEE 488.2, 10.27.

- **-313 std_calMemoryLost**  
  Calibration memory lost - Indicates that nonvolatile calibration data used by the *CAL? command has been lost, see IEEE 488.2, 10.2.

- **-314 std_savRclMemoryLost**  
  Save/recall memory lost - Indicates that the nonvolatile data saved by the *SAV command has been lost, see IEEE 488.2, 10.33.

- **-315 std_configMemoryLost**  
  Configuration memory lost - Indicates that nonvolatile configuration data saved by the device has been lost.

- **-320 std_storageFault**  
  Storage fault - Indicates that the firmware detected a fault when using data storage. This is not an indication of physical damage or failure of any mass storage element.

- **-321 std_outOfMemory**  
  Out of memory - An internal operation needed more memory than was available

- **-330 std_selfTestFailed**  
  Self-test failed - Indicates a problem with the device that is not covered by a specific error message. The device may require service.

- **-340 std_calFailed**  
  Calibration failed - Indicates a problem during calibration of the device that is not covered by a specific error.

- **-350 std_queueOverflow**  
  Queue overflow - Indicates that there is no room in the queue and an error occurred but was not recorded. This code is entered into the queue in lieu of the code that caused the error.

- **-360 std_comm**  
  Communication - This is the generic communication error for devices that cannot detect the more specific errors described for error -361 through -363.

- **-361 std_parity**  
  Parity in program message - Parity bit not correct when data received for example, on a serial port.
-362 std_framing Framing in program message - A stop bit was not detected when data was received for example, on a serial port (for example, a baud rate mismatch).

-363 std_inputBufferOverrun Input buffer overrun - Software or hardware input buffer on serial port overflows with data caused by improper or nonexistent pacing.

**-400 to -800 Query and System Errors**

A Query error is generated either when data in the instrument's GPIB output queue has been lost, or when an attempt is being made to read data from the output queue when no output is present or pending.

-400 std_queryGen Query - This event bit (Bit 2) indicates that an attempt to read data from the Output Queues when no output is present or pending, to data in the Output Queue has been lost see IEEE488.2, 11.5.1.1.7.

-410 std_interrupted Query INTERRUPTED - Indicates the test set has been interrupted by a new program message before it finishes sending a RESPONSE MESSAGE see IEEE 488.2, 6.3.2.3.

-420 std_unterminated Query UNTERMINATED - Indicates an incomplete Query in the program see IEEE 488.2, 6.3.2.2.

-430 std_deadlocked Query DEADLOCKED - Indicates that the Input Buffer and Output Queue are full see IEEE 488.2, 6.3.1.7.

-440 std_responseNotAllowed Query UNTERMINATED after indefinite response - Indicates that a query was received in the same program message after a query requesting an indefinite response was executed see IEEE 488.2, 6.5.7.5.

-500 std_powerOn Power on

-600 std_userRequest User request

-700 std_requestControl Request control

-800 std_operationComplete Operation complete

**PNA Specific (Positive) SCPI Errors**

100 dupWindNum "Duplicate window number"

101 windNumNotFound "Window number not found"

102 failedWindCreate "Window creation failed"

103 noCalcParamSelection "CALC measurement selection set to none" 
   See CALC:PAR:SEL

104 dupMeasName "Duplicate measurement name"
105 dataNotFound  "Requested data not available"
106 measNotFound  "Requested measurement not found"
107 traceNotFound  "Requested trace not found"
108 notImplemented  "Mnemonic not yet implemented"
109 noDocument  "No measurement container found"
110 dupTraceNum  "Duplicate trace number"
111 titleStrTooLong  "Title string exceeds 50 characters"
112 memoryNotFound  "Requested memory not found"
113 exceedMaxTraces  "Exceeded the maximum number of traces per window"
114 SerNumNotFound  "The serial number was not found. Please store the serial number."
115 LoadFailed  "The state was not loaded. Please check the file name."
116 StoreFailed  "The state was not stored. Please check the file and path names."
117 File  "An in the File operation occurred. Please check file and path names."
118 measChanConflict  "Measurement does not belong to specified channel."
119 exceedMaxWindows  "Exceeded the maximum number of data windows"
120 markerNotFound  "The specified marker was not found."
121 diagnostic  "Diagnostic ."
122 channelNotFound  "The specified channel was not found."
123 exceedMaxMeasurements  "Exceeded the maximum number of allowed measurements."
124 parameterOutOfRange  "The specified value was out of range."
125 userRangeNotValid  "The currently selected user range is not valid."
126 referenceMarkerNotFound  "The reference marker is not active."
127 sweepSegmentNotFound  "The sweep segment was not found."
128 markerNotDelta  "The specified marker is not a delta marker."
129 printoutFailed  "Attempt to output to a printer failed."
130 memory_trace_not_compatible  "Memory not compatible. Trace Math not applied."
131 trace_math_reset
"Memory not compatible. Trace Math turned off."

132 hw_read_failed
"Hardware read failed."

133 hw_write_failed
"Hardware write failed."

134 dsp_active
"Failed because DSP was not halted."

135 secure_memory
"Attempt to access secure memory region."

136 snum_protected
"The serial number is protected."

137 snum_format_bad
"The serial number format is bad."

138 snum_already_set
"The serial number is already set."

139 hw_setting_failed
"Hardware setting failed."

140 cal_access_failed
"Calibration data access failed."

141 db_access_failed
"Database access failed."

142 memory_range_exceeded
"Command exceeds usable memory range."

143 lost_phase_lock
"Phase lock has been lost."

144 over_power
"Detected too much power at input."

145 ee_wrt_failed
"EEPROM write failed."

146 yig_cal_failed
"YTO calibration failed."

147 ramp_cal_failed
"Analog ramp calibration failed."

148 dspcom_bad
"DSP communication failed."

149 no_license_found
"Request failed. The required license was not found."

150 argLimited
"The argument was out of range

151 markerBWNotFound
"The Marker Bandwidth was not found."

153 peakNotFound
"The Peak was not found."

154 targetNotFound
"The Target search value was not found."

155 calNotImpl
"The Calibration feature requested is not implemented."

156 calClassNotValidForCalType
"SENS:CORR:CCH measurement selection set to none"
158 calNotValidForConfidenceCheck "Selected measurement does not have a calibration valid for Confidence Check"

159 invalidPort "Specified port is out of range"

160 invalidPortPath "ROUT:PATH:DEF:PORT x, y does not match measurement; setting to defaults"

161 ioInvalidWrite "Attempted I/O write while port set to read only."

162 ioInvalidRead "Attempted I/O read from write only port."

163 calsetNotFound "Requested Cal Set was not found in Cal Set Storage."

164 noCalSetSelected "There is no Cal Set currently selected for the specified channel."

165 cantDeleteCalSetInUse "Cannot delete a Cal Set while it is being used."

166 calsetStimChange "Channel stimulus settings changed to match selected Cal Set."

167 exceedMaxCalSets "Exceeded the maximum number of cal sets."

168 calCouldNotTurnOn "A valid calibration is required before correction can be turned on."

169 standardMeasurementRequired "The attempted operation can only be performed on a standard measurement type."

170 noDivisorBuffer "A valid divisor buffer is required before normalization can be turned on."

171 InvalidReceiverPowerCalParagraph "Receiver power cal requires the measurement to be of unratioed power."

172 ecalCouldNotConfigure "Could not configure the Electronic Calibration system. Check to see if the module is plugged into the proper connector."

173 measHasNoMemoryAlg "This measurement does not support memory operations"

174 measHasNoNormalizeAlg "This measurement does not support normalize operations."

175 userCharacterizationNotFound "User characterization was not found in the Electronic Calibration module."

176 measInvalidBufferSize "The data provided has an invalid number of points. It could not be stored."

1-Dec-2008  Changed US number
3.8 GHz Frequency Adjustment

This routing adjusts the internal fixed-frequency YIG Oscillator to 3.8 GHz by changing a DAC value. This DAC value is stored in the analyzer's non-volatile memory. This adjustment is only needed on some PNA models. Typically, the oscillator can be set to within 12 kHz of 3.8GHz; it is not necessary for it to be exactly 3.8GHz.

Spectrum Analyzers Compatibility

This routine is compatible with Agilent 856x and 859x spectrum analyzers, and may also work on some other Agilent spectrum analyzers.

If no compatible analyzer is available, select "NONE" for the spectrum analyzer. You can then adjust the DAC manually by viewing the 3.8 GHz signal on another analyzer.

Procedure (For Compatible Spectrum Analyzers Only)

Note: The viewable 3.8 GHz signal level will be low; typically be around -70dBm. Do not use any attenuators in the adjustment, other than the default 10 dB attenuation used in most spectrum analyzers.

1. Connect spectrum analyzer input to the network analyzer's PORT 1 output.
2. Connect GPIB cable from analyzer to spectrum analyzer. Make sure no other controllers are active on the same connection.
3. Set the spectrum analyzer GPIB address to 18.
4. In the analyzer System menu, point to Service, Adjustments, and click 3.8 GHz Freq. Adjust.
5. Click Begin Adj, for the program to adjust the internal oscillator for minimal error and store the results. When the status area indicates the adjustment is complete, select Exit.

Procedure (For Non-Compatible Spectrum Analyzers Only)

Note: The viewable 3.8 GHz signal level will be low; typically be around -70dBm. Do not use any attenuators in the adjustment, other than the default 10 dB attenuation used in most spectrum analyzers.

1. Connect the spectrum analyzer input to the network analyzer's PORT 1 output.
2. Set the spectrum analyzer to the following settings:
   - Center frequency = 3.8 GHz
   - Span = 100 MHz
   - Bandwidth = 10 kHz
   - Scaling where a signal of -70 dBm will be clearly visible

3. In the analyzer **System** menu, point to **Service, Adjustments**, and click **3.8 GHz Freq. Adjust**.

4. Under **Spectrum Analyzer**, select **NONE** option for spectrum analyzer.

5. Click **Begin Adj**.

6. The application presets the DAC to an initial value equal to the current value stored. View the spectrum analyzer to see if the signal is above or below 3.800 GHz.
   - If the signal frequency is above 3.8 GHz, move the slider to adjust the DAC to a lower value (left).
   - If the frequency is below 3.8 GHz, move the slider to adjust the DAC to a higher value (right).

**Note:** The valid DAC values are from 0 to 4095. The oscillator will shift about 23 kHz per DAC value.

7. Set the DAC value to reach a frequency very close to 3.8 GHz. If you made large changes in DAC values, allow several seconds for thermal effects to stabilize.

8. Change the spectrum analyzer settings to better view the frequency signal:
   - Frequency span = 500 kHz
   - Bandwidth = 3 kHz

9. Change the DAC value to keep the signal centered at 3.8 GHz.

10. Once you have determined the correct DAC value, click **SAVE DAC** to permanently store that value into EEPROM. Click **Exit**.

**Note:** If large changes are made to the existing DAC value, then this test should be repeated again after 15-30 minutes. This allows the thermal effects to fully stabilize.
10 MHz Reference Frequency Adjustment

This routine adjusts the analyzer's internal time-base to exactly 10 MHz by changing a DAC value. This DAC value is stored in the analyzer's non-volatile memory. This routine should only be necessary in the following situations:

- The frequency reference assembly is replaced.
- The 10 MHz reference has drifted significantly from the factory adjusted value.

**WARNING:** The range of this adjustment is only about 20 Hz. It is highly recommended that a very accurate frequency standard be used to measure this 10 MHz signal.

Frequency Counter Compatibility

This procedure uses SCPI commands (over GPIB) to communicate with the frequency counter. It should work with the Agilent 5313xA, 5315xA, 53181A series of counters as well as the older 5350 series.

If no compatible counters are available, select the "Manual" mode of operation. If you do choose the manual mode, you must input the measured frequency manually.

Procedure for GPIB Counters Only

1. Connect the analyzer rear panel 10 MHz Reference output to the frequency counter.
2. Connect a GPIB cable from the analyzer to the counter. Make sure no other controllers are active on the same connection.
3. If applicable, connect the house frequency standard to the counter reference input.
4. Set the counter GPIB address to 03. Ensure that the counter is the only device at this address.
5. In the analyzer System menu, point to Service, Adjustments, and click 10 MHz Freq. Adjust.
6. Click Begin Adj. The application adjusts the internal reference for minimal error and stores the results.
7. Click Read Freq to trigger another reading of the 10 MHz signal.
8. Read the current DAC value stored in the analyzer's non-volatile memory (value = 0 - 4095).
9. When the status area indicates the adjustment is complete, click Exit.

Procedure for Non-GPIB Counters

1. Connect the counter input to the rear panel 10 MHz Reference Output.
2. Set the counter to at least 1 Hz resolution.
3. If applicable, connect the house-frequency standard to the counter reference input.
4. In the analyzer System menu, point to Service, Adjustments and click 10 MHz Freq. Adjust.
5. Under **Frequency Counter**, select **Manual**.

- Adjust the slider bar **arrows** until the frequency counter reads 10.0 MHz at your desired level of accuracy.
- Click **Exit** to save the results.

**Note:** If the counter is misreading the frequency, it may be necessary to attenuate the input, or set the input impedance to 50 ohms, or both.

---

9-May-2008  Updated with new UI
Display Test

The PNA screen should be bright with all annotations and text readable. The display test allows you to check for non-functioning pixels and other problems.

**Note** If the display is dim or dark, refer to “Troubleshooting LCD Display Problems” in the PNA Service Guide.

What Is a Damaged Pixel?

A pixel is a picture element that combines to create the image on the display. They are about the size of a small pin point. Damaged pixels can be either “stuck on” or “dark.”

- **Stuck on pixel** - red, green, or blue; always displayed regardless of the display setting. It will be visible on a dark background.
- **Dark pixel** - always dark; displayed against a background of its own color.

How to Run the Display Test

On the **System** menu, point to **Service**, and then click **Display Test**.

A multi-color screen is displayed. Be prepared to look for the symptoms described below. Click the Start Test button. To continue to the next test, click the moving Next Test button. The button moves to allow you to see all of the display. After the test is completed, the display defaults to the network analyzer screen.

How to Identify a Faulty Display

One or more of the following indicate a bad display:

- Complete row or column of “stuck on” or “dark” pixels
- More than six “stuck on” pixels (but not more than three green)
- More than twelve “dark” pixels (but not more than seven of the same color)
- Two or more consecutive “stuck on” pixels or three or more consecutive “dark” pixels (but no more than one set of two consecutive dark pixels)
- “Stuck on or “dark” pixels less than 6.5 mm apart (excluding consecutive pixels)

If any of these symptoms occur, your display is considered faulty. See the Service Guide for your PNA model.
**LO Power Adjustment**

This procedure adjusts the receiver's LO input power to a specific level by changing DAC values. These DAC values are then stored in the analyzer's non-volatile memory. The procedure will vary depending upon the model number. This adjustment is only applicable to some PNA models.

**Power Meter Compatibility**

This routine is only compatible with the Agilent EPM series of power meters. Different sensors may be used. For 9 GHz analyzers and below, an 8482 or E4412A sensor can be used. For the higher frequency units (20 GHz or above), a sensor must be able to measure a maximum of 20 GHz. At no time during this test will a frequency higher than 20 GHz be measured, even if the PNA has a maximum frequency of 50 GHz.

If the older HP 84xx series of sensors are used, the correct calibration data should be entered into the appropriate cal table of the EPM series power meter, although for this adjustment, high accuracy is not required. Inaccuracies in the order of several tenths of a dB are acceptable.

**Procedure**

1. Allow the analyzer and power meter to warm up for 30 minutes.
2. Manually zero and calibrate the power sensor. (This allows you to skip this step later)
3. Connect a GPIB cable from the analyzer to the power meter. Make sure no other controllers are active on the same connection.
4. Set the power meter GPIB address to 13. (others can also be used; 13 is the default)
5. Remove the outer cover on the analyzer.
6. In the PNA System menu point to Service, then Adjustments, and click LO Power Adjust.
7. Connect the power sensor to the LO output, using adapters if needed.. The LO output location varies with model number. Click on the LO Power Adjust Setup menu selection to see a diagram of the exact location.
8. **For 9 GHz units and below:**
   Click Begin Adj to start the LO power cal routine. The routine adjusts the power level for each band (1 through 3) to fall within certain bounds. If any changes are made, it automatically stores them.
   - **For 20GHz units and above:**
     If using an 84xx power sensor, click Configure and select the proper sensor model number. Click Close.
     Click Calibrate to begin the adjustment. The entire calibration process takes about 5 minutes. Once completed, you can verify the current calibration accuracy by clicking Verify Cal.
     **Note:** Correction constants are defaulted at the beginning of calibration. Once the calibration process has started, it must be completed in order to regenerate proper data.
9. Click Read DAC to view the current DAC values (0-4095) stored in the PNA non-volatile memory for each band (0-7).
10. When the message/status area indicates the adjustment is complete, click Exit.

11. Reconnect the semi-rigid cable and replace the covers.
Offset LO Power Adjustment

Note: This adjustment is only performed on PNAs with Frequency Offset Mode (option 080), and only on certain models.

The Offset LO Adjustment sets the LO power for the offset mixer to a consistent value across all bands. It requires access to the internal components of the PNA so that the power sensor can be connected to the LO output. Because the LO frequency does not exceed 3 GHz, almost any power sensor can be used. The adjustment is relatively simple and only takes a couple of minutes.

When to perform
This adjustment should be performed when any of the following occur:

- the A13 Frequency Offset Receiver is significantly modified or replaced
- the A9 Synthesizer is replaced (that is where the correction data resides)

How to perform Offset LO Power adjustment

1. To start the Offset LO adjustment, click System, point to Service, Adjustments, then click Offset LO Adjust.

2. You will be prompted to zero and cal the power sensor. (You can do this before beginning.)

3. Connect the sensor to J3 of the A13 LO output by removing the existing cable (or simply disconnecting one end) as shown in the Set-up diagram in the program.

4. Connect the power meter to the PNA using a GPIB cable. Make sure the GPIB address shown in the program matches the actual power meter address (default is 13.)

5. Click Adjust to begin the test and follow the instructions.

The program automatically adjusts all bands; no user input is needed. The program repeats several times as this is an iterative process. The progress of the adjustment is shown on the screen.

The Configure menu selection is for factory personnel ONLY.

Once completed, to verify the actual results, click Verify.

Upon exiting, the PNA application will restart; this takes several seconds.
Overview

The Operator's Check should be performed when you first receive your PNA, and any time you wish to have confidence that the PNA is working properly.

Notes

- The Operator's Check does not verify performance to specifications. To verify PNA performance to specifications, run System Verification.
- Allow the PNA to warm up for 90 minutes before considering a failed test to be valid.
- The Operator’s Check can NOT be run with a Multiport test set enabled. However, you can run a performance check as described in the Test Set User's Guide. See the N44xx User's Guide.

The Pass/Fail criteria used in the Operator's Check identifies obvious failures in the following portions of the PNA hardware:

- Repeatability of the RF switch in the test set
- Attenuation ranges of the test port attenuators (if installed)
- Calibration of the receivers
- Frequency response of the receivers
- Phase lock and leveling
- Noise floor and trace noise
## How to Run the Operator's Check

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>For PNA-X and ‘C’ models</strong></td>
<td><strong>Programming Commands</strong></td>
</tr>
<tr>
<td>1. Press <strong>SYSTEM</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then <strong>[Service]</strong></td>
<td>2. then <strong>System</strong></td>
</tr>
<tr>
<td>3. then <strong>[Operator's Check]</strong></td>
<td>3. then <strong>Service</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>Operator's Check</strong></td>
</tr>
</tbody>
</table>

1. Connect one or more standards (see [Configure](#)).
2. Click **Begin** and **Continue** (if necessary) until "Operator's Check is complete!" appears.

![Operator's Check](image)

This dialog box will look slightly different, depending on PNA model number and installed options. Some of the tests are not run if the appropriate option is not installed.

To learn about how each test is performed, click one of the tests on the right of the dialog. For example, the following information dialog is launched when **Leveling** is clicked:
Operators Check dialog box help

**Note:** It is normal for a momentary un leveled condition to appear during portions of the Operators Check.

**Configure**

**Prompt for attachment of Short / Open**  If you do not have enough shorts or opens for all test ports, you will be prompted to move the standard to the next test port. Connect either a short or open to port 1, then click Begin.

**Shorts / Opens are attached to all ports**  Connect either a short or open for each test port, then click Begin. All ports are tested without interruption. You can mix shorts and opens on the test ports.

**PNA**  Shows information about the PNA that is being tested.

**Legend**  Shows the status icons used in the Operator's Check and their meaning. **Pending Pass** means that a portion of the testing has been completed successfully.

**Results**  Shows the current status of each test. Click on the test name to learn how that test is performed. This may help in troubleshooting failed tests. If any tests Fail, refer to Chapter 3 of the PNA service guide.

**Begin**  Starts the Operator's Check.

**View Results**  Shows all results in text format. Failed items are preceded by ==>>>.

This text file can be printed or saved with a unique file name to compare results with previous or subsequent testing.

**Exit**  Ends the program and closes the window.

Option H11 Test Verification

The PNA Option H11 Test / Verification utility verifies the PNA's option H11 functionality. The associated **H11 inputs and outputs** are tested and the results are compared against **expected levels at the factory**. These tests are used in conjunction with the **Operator's Check** and **System Verification** programs to check PNA functionality.

### How to Run Option H11 Verification

**Using front-panel HARDKEY [softkey] buttons**

1. Press **SYSTEM**
2. then **[Service]**
3. then **[Rear Panel/H11 Test or H11 Verification]**

**Using a mouse with PNA Menus**

1. Click **System**
2. then **Service**
3. then **Rear Panel/H11 Test or H11 Verification**

---

**Option H11 Verification** dialog box help

The Option H11 Verification software leads you through each of the tests listed on the Configure Tab.

**Important:** Required Configuration of the PNA being tested:

- All connections to external devices and test sets must be removed from the Option H11 connectors and Test Set I/O connector on the PNA rear panel.
- On the **Millimeter Module Configuration** dialog box, make the following settings:
  - PNA Model E8361A - Select **Agilent N5250A**, and check **Use Standard PNA operation when N5260A is NOT connected**.
  - All other PNA models - Select **Standard PNA**.
Run Tab
The list of test equipment is the complete list that is required to run ALL of the tests (recommended).

Start  Click to run the tests that are selected on the Configure Tab.

Exit  Exits Option H11 Verification.

Configure Tab
All of the tests are selected by default. Tests can be run separately for troubleshooting purposes by checking or clearing the boxes.

Power Tests
Output power is measured at each of the selected RF and LO Test Set connectors on the rear panel. The results are displayed against limit lines that represent the expected levels at the factory.

Equipment Required:

- PNA supported power meter and 26.5 GHz power sensor (Recommended: Agilent E4418/19 Power Meter and E4413A Power Sensor). Set GPIB address = 13.
- GPIB and Sensor cables.
- On E8361A ONLY, a device is required to simulate an N5260A Test Set is connected to the Test Set I/O. All other PNA models do NOT require this device for this test.
  - Agilent Service personnel: Use the E8361-60063 Test Set I/O Tester.
  - All others: On a commercially available DB-25 male connector, connect a jumper between pins 12 and 22. See the Test Set I/O connector diagram. Insert the male connector into the PNA rear panel Test set I/O connector.

External IF Input and Crosstalk Tests
A 8.33 MHz signal is injected into each of the selected 8.33 MHz IF IN connectors on the rear panel. The signal is measured at each of the selected receivers. The results are displayed against limit lines that represent the expected levels at the factory.

Equipment Required:

- 33120A Function Generator. Set GPIB address = 10.
- 10 dB Attenuator (Agilent 8493B or equivalent) and BNC adapters.
- GPIB and BNC cables

External Pulse Input Test
A pulse train is injected into each of the selected Pulse IN connectors on the rear panel. The signal is measured at each of the selected receivers. The results are displayed against limit lines that represent the expected levels at the factory.

Note: A noisy pulse generator can cause a false failure of the "1% Duty Cycle Pulse Input" portion of the
External Pulse Input Test.

Equipment Required:

- 8110A or 81110A Pulse Generator. Set GPIB address = 11.
- GPIB and BNC cables

**Test Set I/O Connector Test**

Tests the ability of the PNA to detect and control an external test set through the PNA rear panel TEST SET I/O connector.

Equipment Required:

- Agilent Service personnel: Use the E8361-60063 Test Set I/O Tester.
- All others: Use a DVM to measure the TTL voltage level on the following pin numbers using pin 1 as ground:
  - Pins: 3, 4, 5, 6, 8, 9, 10, 11, 17, 19, 20, 21, 22, 23, 24
  - See [Test Set I/O connector diagram](#) to determine the pin number location.
  - The software toggles all pins HIGH, then LOW.
  - TTL HIGH should read approximately +5.0 volts.
  - TTL LOW should read approximately +0.1 volts.

**Help Tab**

Displays the Option H11 Verification program revision number and information about the PNA being tested.

**Advanced Help** Click to display this help topic.

**View Results** Appears after the test is run. Click to show all results in text format. Failed items are preceded by `>>>>> Fail`. This text file can be printed or saved with a unique file name to compare results with previous or subsequent testing.
Phase-Lock IF Gain Adjustment for E836x models only!

The E836x A/B PNA models have a variable gain control for the phase-lock loop IF signal. By dynamically changing the gain as a function of frequency and power, the phase-lock signal amplitude can be adjusted to a constant level for the entire operating range of the instrument. This constant level is important for phase-lock acquisition and stability.

**When to perform**

Phase-Lock IF Gain Adjustment should be performed when any of the following occur:

- A source calibration
- An assembly in the reference receiver path (R1,R2) is replaced.
- The Test Set Motherboard is replaced
- The Phase Lock board is replaced
- **Phase Lock Lost** error message appears after replacing a source or receiver assembly
- The external R path has changed. For example, when a multiport test set with R channel path has been added or removed.

**How to perform Phase-Lock IF Gain adjustment**

Ensure the Reference Channel paths are properly configured and the connections are properly torqued.

1. From the **System** menu, click **Service**, then **Adjustments**, then **IF Gain Adjustment**.
2. Under Select Specials, select **None**.
3. No connections to the test ports are required.
4. Click **Begin Adj.** The adjustment takes about a minute to complete.
5. The advanced screen is for factory personnel only.

---

IF Gain Adjustment for N524x models only!

The N524x PNA models have a variable gain control for the loop IF signal. By dynamically changing the gain as a function of frequency and power, the phase-lock signal amplitude can be adjusted to a constant level for the entire operating range of the instrument. This constant level is important for phase-lock acquisition and stability.

**When to perform**

IF Gain Adjustment should be performed when any of the following occur:
An assembly in the reference receiver path (R1,R2) is replaced.

The Test Set Motherboard is replaced

The IF Mux assembly or SPAM assembly is replaced

**How to perform IF Gain adjustment**

Ensure the Reference Channel paths are properly configured and the connections are properly torqued.

1. From the **System** menu, click **Service**, then **Adjustments**, then **IF Gain Adjustment**.

2. An appropriate power meter and sensor will be required. The sensor must cover the upper frequency range of the PNA. A good quality cable will also be needed. Adapters can be used as needed.

3. Connect the power meter to the GPIB port labeled System Controller.

4. Click **Begin Adj.**

5. Set the GPIB address in the program accordingly and select the sensor being used.

6. Follow the instructions displayed in the program.

The adjustment takes about 5 minutes to complete for a 26.5 GHz PNA. Higher frequency units may take longer.

The Default menu selection is for factory personnel only. This will preset all values to default levels for troubleshooting purposes only. If this is selected, a full IF gain adjustment will need to be performed.

**Last modified:**

3/7/07  Added N5242x information.
System Verification

The performance of the network analyzer is specified in two ways: system specifications, and instrument specifications. It is the end user’s responsibility to determine which set of specifications is applicable to their use of the PNA.

A network analyzer measurement “system” includes the analyzer, calibration kit, test cables, and any necessary adapters. The system verification software in the PNA is used to verify the system’s conformance to the “system” specifications. A “pass” result demonstrates that the analyzer, test cables, and adapters, perform correctly as a system. It DOES NOT demonstrate that any one component performs according to its individual specifications. A change to any part of this measurement system requires a re-verification of the system.

Instrument specifications specify the network analyzer’s uncorrected measurement port characteristics and its output and input behavior. The PNA performance tests are used to verify the analyzer’s conformance to “instrument” specifications.

The system verification utility verifies the PNA system specifications by automatically measuring the magnitude and phase for all four S-parameters for each verification device, and comparing the values against the following:

- Factory measured data from files on the verification disk
- Limit lines based on the measurement uncertainty

System Verification requires the use of a calibration kit and verification kit which has been certified within the past 12 months by Agilent. System Verification can NOT be used to perform this kit certification.

Operator’s Check should also be performed to verify the basic operation of the PNA.

Equipment Used in the System Verification

Precautions for Handling Airlines

Flow Diagram of Procedure

Procedure for System Verification

If the System Fails the Verification Test

Interpreting the Verification Results

Notes

- Although the performance for all S-parameters is measured, the S-parameter phase uncertainties are less important for verifying system performance. Therefore, the limit lines will not appear on the printouts.

- System Verification can NOT be run with a Multiport test set enabled. However, you can run a performance check as described in the Test Set User's Guide. See the N44xx User's Guide.

**Cable Substitution**

The test port cables specified for the PNA have been characterized for connector repeatability, magnitude and phase stability with flexing, return loss, insertion loss, and aging rate. Since test port cable performance is a significant contributor to the system performance, cables of lower performance will increase the uncertainty of your measurement. It is highly recommended that the test port cables be regularly tested.

If the system verification is performed with a non-Agilent cable, ensure that the cable meets or exceeds the operation of the specified cable. Refer to the cable User’s Guide for specifications.

**Cable Flex Factor**

Flex Factor determines how much of the cable phase uncertainty to include in determining the limit lines.

- Set to 0% (zero) if the cables are held down in a fixture and are not allowed to move during the calibration and verification.
• Set to 100% if the cables are allowed to move a lot.

**Calibration Kit Substitution**
Non-Agilent calibration kits are not recommended nor supported.

**Precautions for Handling Airlines**
When you are using the airlines in the verification kit, observe the following practices to ensure good measurement techniques.

• Be very careful not to drop the airline's center or outer conductor. Damage will result if these devices are dropped.
• Use proper Electro-Static Discharge (ESD) procedures.
• Clean your hands or wear gloves as skin oils will cause a change in electrical performance.
Flow Diagram of Procedure

The operational flow of the software is depicted by the flowchart shown below.
Procedure for System Verification

1. If you want printed test outputs, connect a printer to the analyzer. Let the analyzer warm up for at least 30 minutes.

2. Insert the PNA verification kit floppy disk into the analyzer disk drive.
3. On the **System** (or **Utility**) menu, point to **Service**, and click **System Verification**. The System Verification window similar to this will be displayed.

4. In the **Calibration Kit** box, select the calibration kit or ECal module that is being used. The corresponding verification kit to use appears in the **Verification Kit** box.

5. Under **Printer Output** click on any of the following options.

   - **Print Tabular Data**: Prints the verification data in tabular form which includes measured data and uncertainty limits. Refer to a tabular data example, later in this topic.
   - **Print Graphs**: Prints the verification data in graphical form. The graphic form includes the measured data trace, factory supplied data trace and uncertainty limits. Refer to a plot data example, later in this topic.
   - **File Tabular Data**: Writes the verification data in tabular form to a text file in the C:/Program Files/Agilent/Network Analyzer/Documents/ directory.
   - **File Graphs**: Saves a screen image in .PNG format in the C:/Program Files/Agilent/Network Analyzer/Documents/ directory.

**Note**: If you want printed output, it is assumed you have already installed the Windows driver for your particular printer, and have tested that you can print to the printer from the network analyzer. This software is designed to print to whichever printer is currently set as the Default printer (see Printers in the Windows Control Panel).

6. To modify the number of ports to be verified, to change the number of devices to measure, or to use a previously stored verification calibration, click on the **Configure** tab and make the desired selections.

   - For the system verification to be truly adequate, the software must measure all devices in the kit with a recent calibration applied. Removing and reattaching any test port cables or adapters invalidates all
previous calibrations.

7. Click **Run**.

8. Follow the instructions on the analyzer for performing the system verification, inserting the verification devices as prompted.

**Note for 3 Port PNA:**
The System Verification Procedure is **repeated three times**. The first time, **Ports 1 and 2** are measured as a pair; then **Ports 1 and 3** are measured; and lastly, **Ports 2 and 3** are measured.

**Note for 4 Port PNA:**
The System Verification Procedure is **repeated two times**. The first time, **Ports 1 and 2** are measured as a pair, then **Ports 3 and 4** are measured.

**Step-by-Step Process Description**

1. Depending upon the selected choice in the Calibration submenu of the Configure menu, the user is either prompted to recall a previous calibrated instrument state, or is guided through a full 2-port calibration using the selected calibration kit. For ECal, the ECal module is connected just once; a standby message is posted while the software is performing the calibration.

2. The user is prompted to connect the first verification device.

3. The software reads the factory measured data for that device and uncertainty values for that data (CITIfiles) from the floppy disk supplied with the verification kit.

4. The software sends the factory measured data, calibration kit and instrument state information to the uncertainty calculator DLL, which generates uncertainty values specific to the PNA.

5. The analyzer first sets up for magnitude measurements of all four S-parameters, each parameter in a separate window (lin mag for S11 and S22, log mag for S21 and S12). Each of the factory measured $S$-parameters are fed to the appropriate window as a memory trace. Limit line offsets are calculated as the sum of the factory measured data uncertainties and PNA uncertainties reported by the DLL. Upper and lower limits are displayed (factory measured data + uncertainty sum, factory measured data - uncertainty sum). The PNA takes a sweep, limit test is turned on and PASS/FALSE status is reported in each of the four windows.

6. The user clicks a button when ready to view phase measurements. The four windows get updated for phase format, phase memory traces, phase limits and PASS/FALSE result.

7. If the limit test of any of the four S-parameters (magnitude or phase) indicates a FAIL status, the software suggests troubleshooting tips and asks if the user would like to repeat measurement of that device or proceed to the next device. If proceeding to the next device, the factory measured data and uncertainties for the next device are read from floppy, the uncertainty DLL gets called with this next set of factory measured data, and the four measurement windows get updated for magnitude measurement of the next device.

8. The software follows this same process until all selected devices have been measured, at which point a summary window is displayed containing the set of PASS/FALSE results for all four parameters of each device.

**If the System Fails the Verification Test**
IMPORTANT: Inspect all connections. Do not remove the cable from the analyzer test port. This will invalidate the calibration that you have done earlier.

1. Repeat this verification test. Make good connections with correct torque specifications for each verification device.
2. Disconnect, clean and reconnect the device that failed the verification test. Then measure the device again.
3. If the analyzer still fails the test, check the measurement calibration by viewing the error terms as described in "Front Panel Access to Error Terms" on page 4-7 of the Service Guide.
4. Refer to the graphic below, for additional troubleshooting steps.

**Verification Fails Flowchart**

Interpreting the Verification Results

The graphic below shows an example of typical verification results with **Tabular Data** selected in the **Printer Output** area of the System Verification window. A graphic later in this topic shows an example of typical verification results with **Measurement Plots** selected in the **Printer Output** area of the System Verification windows. These printouts include a comparison of the data from your measurement results with the traceable data and corresponding uncertainty specifications. Use these printouts to determine whether your measured data falls within the total uncertainty limits at all frequencies.

The tabular data consists of:
- Frequency of the data points (in MHz).
- Lower limit line as defined by the total system uncertainty specification.
- Results of the measurement.
- Upper limit line as defined by the total system uncertainty specification.
- Test status (PASS or FAIL) of that measurement point.

**Printout of Tabular Verification Results**

The printed graphical results show:

- Upper limit points as defined by the total system uncertainty specifications.
- Lower limit points as defined by the total system uncertainty specifications.
- Data measured at the factory.
- Results of measurements.
- Measurement parameter names and formats (Lin Mag or Log Mag).
- Serial number of device (00810).
- Device being measured (Sys Ver 20 dB attenuator).

**Printout of Graphical Verification Results**

- 11-Feb-2008  Added note about multiport
- 15-Jan-2008  Added Flex Factor and image
Source Adjustment

Source Adjustment is a **SERVICE** Routine which should be performed when a component in the source chain is replaced, or when the PNA fails an annual calibration. It adjusts the PNA source power for flatness across its full frequency range.

This topic does **NOT** discuss **Source Power Calibration**, which calibrates a PNA source over the current measurement range.

Required Equipment

Preferred Power Meter: E4419B
Alternate Power Meters: E4419A or EPM-442A

**Note:** The power sensor depends on the PNA frequency range. Depending on the PNA model, two power sensors may be required to test the full frequency range. The PNA front panel connector type will determine the cable used and if an adapter is required with the power sensor(s).

See PNA Accessories
Procedure

1. Refer to your power meter documentation to ensure the proper calibration factors for the power sensor have been entered into the table on the power meter.

2. Connect a GPIB cable between the power meter and network analyzer (use the System Controller GPIB port if applicable.)

3. Ensure the power sensor(s) are connected to the power meter.

4. In the analyzer System menu, point to Service, Adjustments, and click Source Adjustment.

5. There are 3 different versions of the Source Calibration software; all are slightly different. All have a button that is labeled "Calibrate" or "Adjust". This is the button that will begin the calibration process. Some versions will also have a button labeled "Verify" that will test the source calibration without making any changes. Other selections are for factory personnel use only.

6. Once begun, you must enter the power meter and sensor information. The software will verify the power meter and sensor. You are then prompted to connect the sensor(s) and cable as needed.

Connecting sensors to the PNA

Additional Information

All ports are tested on all PNAs. Source calibration takes approximately 10 to 45 minutes to complete depending on the frequency range and model number of the PNA. The E8361 models may take up to 90 minutes.

Troubleshooting

In the event there is a problem with Source Adjustment, please refer to the "Troubleshooting" chapter in the PNA.
E8361 Procedure

Source and Receiver adjustment requires the power meter to measure the source power over the full range of each of the PNA internal bands. Because the 8487A can not measure accurately above 50 GHz, it can only be used up to the next highest band switch frequency at 46.2 GHz. The V8486A sensor and V281B adapter are used from 46.2 GHz to 67 GHz.

For highest accuracy, the V8486A and V281B should be sent to Agilent for a custom calibration from 45 GHz to 70 GHz.

For the next highest accuracy level, the following procedure shows how to measure correction factors yourself from 46 to 50 GHz. This procedure assumes you have already loaded correction factors for both sensors into the power meter.

1. On your power meter, add 46 and 48 GHz to the Cal Factor Table.
2. Preset the PNA
3. Tune the PNA to 46 GHz (CW frequency)
4. Using the 8487A, measure power at port 1. Record this value.
5. Tune the PNA to 48 GHz (CW frequency)
6. Using the 8487A, measure power at port 1. Record this value.
7. Connect the V8486A, V281A, and 1.85 f-f adapter to the power meter.
8. Tune the PNA to 46 GHz (CW frequency)
9. Adjust the cal factor table 46 GHz setting until the power meter reading matches the power readings from step 4.
10. Tune the PNA to 48 GHz (CW frequency)
11. Adjust the cal factor table 48 GHz setting until the power meter reading matches the power readings from step 8.

6-Apr-2009   Updated models
10-Mar-2009   Changed to Source Adjustment
**Receiver Calibration**

Receiver calibration adjusts the network analyzer receivers for a flat response across its full frequency range. This adjustment is for service only; not for measurement calibration.

**Required Equipment**

Preferred Power Meter: E4419B  
Alternate Power Meters: E4419A or EPM-442A

**Note:** The power sensor depends on the PNA frequency range. Depending on the PNA model, two power sensors may be required to test the full frequency range. The PNA front panel connector type will determine the cable used and if an adapter is required with the power sensor(s).

See [PNA Accessories](#)

**Procedure**

1. Refer to your power meter documentation to ensure the proper calibration factors for the power sensor have been entered into a table on the power meter.

2. Connect a GPIB cable between the power meter and network analyzer.

3. Ensure the power sensor(s) are connected to the power meter.

4. In the analyzer **System** menu, point to **Service, Adjustments**, and click **Receiver Calibration**.

5. The software presents you with two choices:

   a. Click **Inspect Flatness** to observe flatness of receiver response versus frequency. Although there is no explicit specification for receiver flatness, Receiver Calibration should improve Transmission and Reflection Tracking error terms which are specified.

   b. Click **Calibrate** to begin the receiver calibration process. The software prompts you to connect the sensor(s), cable and adapter as needed (see the following graphics).

   **Connecting sensor(s) to the PNA**
Connecting adapter and cable between sensor and PNA

Through connection using the specified cable
**Additional Information**

Receiver Calibration tests all PNA receivers, taking approximately 15 and 45 minutes. Length is dependent on frequency range and number of ports.

**Troubleshooting**

In the event there is a problem with Receiver Calibration, please refer to the "Troubleshooting" chapter in your PNA Service Guide.

## Receiver Display

- **The Receiver Display as a Troubleshooting Tool**
- **How to start the Receiver Display**

### Other Support Topics

### The Receiver Display as a Troubleshooting Tool

The Receiver Display is a Troubleshooting Tool. It enables the analyzer to isolate faulty functional groups within its own Measurement System. Traces for each Receiver are Displayed in individual windows. Identifying discrepancies of the traces in these windows can help isolate the faulty assembly.

For a thorough description of Receiver Display and the troubleshooting steps see Chapter 3 of the PNA Service Guide. You can download the Service Guide for your PNA model from our website: [http://na.tm.agilent.com/pna/](http://na.tm.agilent.com/pna/)

[Programming Commands]
IF Path Configuration Settings

This dialog is used to set many IF receiver settings for PNA-X and N522x models. See the IF Path settings for "C" models.

In this topic:

- PNA-X and N522x IF Frequencies
- How to Start the IF Path Configuration dialog
- IF (Receiver) Path Configuration dialog box
- Expanded Block Diagram and Descriptions
- IF Path Configuration using COM and SCPI

Other IF Access Topics

PNA-X and N522x Auto IF Frequencies

Wideband/Normal IF path:

**Note:** For the following discussion, **RF** = Receiver Frequency

**Wideband/Normal IF path:**

**With DSP Version 4:**

- RF < 53 MHz: IF = 2.535211 MHz  \[3 \times (60e6 / 71)\]
- RF >= 53 MHz: IF = 7.605634 MHz  \[9 \times (60e6 / 71)\]

**With DSP Version 5,** the IF frequency is dependent on the RF AND the current IFBW setting:

- All RF; IF Bandwidth >= 1MHz: (All Models)
<table>
<thead>
<tr>
<th>IFBW Setting</th>
<th>IF Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 MHz</td>
<td>7.692 MHz</td>
</tr>
<tr>
<td>1.5 MHz</td>
<td>7.368 MHz</td>

<tr>
<td>7 MHz</td>
<td>10.53 MHz</td>
</tr>
<tr>
<td>10 MHz</td>
<td>15.38 MHz</td>
</tr>
<tr>
<td>15 MHz</td>
<td>22.22 MHz</td>
</tr>
</tbody>
</table>

- **IF Bandwidth <= 600 kHz:**
  - **RF >= 53 MHz; All models:** IF = 7.438017 MHz \([(9 \times (100e6 / 121))\]
  - **RF <= 53 MHz; PNA-X models:** IF = 2.479339 MHz \([(3 \times (100e6 / 121))\]
  - **RF <= 53 MHz; N522x models:** IF = 826.446 kHz \([1 \times (100e6 / 121)]\)

**Narrowband IF path:**
- **IF = 10.70 MHz**
- **Bandwidth = 30 kHz**

**Manually change the IF frequency**

The **IF frequency** can be changed to any value between +14.9999 MHz and -14.9999 MHz using **SENS:IF:FREQ** or **IFFrequency** commands.

- With DSP Version 4 - 34 and above, min and max IF frequencies up to +/- 20.1 MHz are available.
- With DSP Version 5, min and max IF frequencies up to +/- 38 MHz are available.
- Performance is degraded drastically above +/- 14.9999 MHz.

[Learn about DSP Version](#)
**How to start the IF Path Configuration dialog**

**Using front-panel HARDKEY [softkey] buttons**

1. Press **CHANNEL**
2. then **[Hardware Setup]**
3. then **[IF Config]**

**Using a mouse with PNA Menus**

1. Click **Trace/Chan**
2. then **Channel**
3. then **Hardware Setup**
4. then **IF Config**

---

**IF (Receiver) Path Configuration** dialog box help

The IF path, represented in the block diagram at the top of the dialog, is duplicated for each of the receivers (A, B, C, D, R1, R2, R3, R4). In addition, each path can be configured differently for each channel.

**Switch** - Indicates element in the PNA-X and N522x expanded PNA-X and N522x block diagram.

**IF Input** (1) - Available on the PNA-X and N522x with Opt 020. Internal input is a test port or reference receiver input. External Input is through the PNA-X and N522x rear-panel connectors.

**IF Attenuator** (3) - Specify IF attenuation for the narrowband path of the selected receiver.

**IF Filter** (2) - Select Wideband or Narrowband (includes the ability to pulse gates).

**IF Gain** (10) - Set to **Auto** by default, the following are reasons to change the IF Gain:

- For millimeter systems that do NOT use the external millimeter test set, the millimeter head output IFs are routed directly to the RF receivers. You may want to change the IF gain to improve the noise figure.
of the receivers.

- External couplers are often used for high-power test setups. The PNA automatically adjusts the IF Gain depending on the frequency of operation in order to correct for several aspects of the hardware, including the large coupled-arm roll off at low frequencies (below 700MHz). If you replace the internal coupler with one having a different low-frequency roll off, then you may also want to change the IF gain to avoid overdriving the receiver.

- When using the rear panel direct IF inputs, the gain is set low when in standard operation and very high when in millimeter mode. You may want to control the gain of the direct IF inputs to improve noise figure or to avoid overdriving the receivers.

ADC Filter (5) - Select Auto, Narrow (9 MHz or 11 MHz), or Wide (16 MHz or 38 MHz) filter. Learn more.

Couple all IF paths - Check to make the same setting for all receivers.

Expanded PNA-X and N522x Block Diagram (IF / Pulse Generators / DSP)

Blue boxes are configurable elements. Click a blue box, or scroll down, to see how to make settings using SCPI and COM commands.

Receiver / IF Path (top block)

Scroll up for descriptions of the Receiver / IF Paths. Most of these elements can be set from the front-panel User Interface (UI).

Pulse Generators (middle block in above diagram)

See how to make these settings remotely.
Switch 6: Represents Internal or External triggering for the pulse generator. If set to Internal, the pulse generator is internally triggered and puts out a periodic pulse train with a period defined by the pulse generator SCPI or COM commands. If set to External, the period is ignored, and the pulse generator puts out one set of pulses (P0-P4) per external trigger. All five pulse outputs have unique delay and pulse width settings. See all Pulse Generator SCPI and COM commands.

- **External** trigger input is on the Pulse I/O connector pin 7 (PulseSyncIn). The PulseSyncIn line provides a configurable trigger signal into the Pulse Generators. If a level trigger is still valid when the first pulse set is finished, another set will be generated. Only one set of pulses is emitted when edge triggering is used. The length of time that it takes to emit one set of pulses is the end time of the last enabled pulse (largest of width + delay of all the pulses P0-P4.)

The pulse input polarity (positive or negative) and type (edge or level) is configurable only with DSP version: 4.0 FPGA: 34 or higher. Learn more. Otherwise, the pulse generators respond only to positive, level input trigger signals. Externally triggering is configured using the Pulse Generator ‘Polarity’ and ‘Type’ SCPI and COM commands.

**P0:** When P0 is enabled, it is hardwired to trigger the data acquisition ADCs. If the data acquisition system is not ready, the P0 trigger is ignored. If the pulse generator is internally triggered, then the data acquisition system receives periodic triggers. If the pulse generator is externally triggered, then the data acquisition system receives a trigger each time the pulse generator is triggered. In either case, data acquisition is synchronized to the pulse generator. Data acquisition begins on the rising edge of P0. The width of P0 does NOT directly matter as data acquisition does not stop when P0 goes false. The width of P0 DOES matter when determining the time for one set of pulses when externally triggered (see External trigger above). The following describes how the P0 generator triggers data acquisition:

- **Step mode sweeps** of any sweep type: By default, each P0 rising edge triggers a single data point. When point averaging is on, all of the measurements (subpoints) that are required to average each point are made with a single trigger. To individually trigger the acquisition of each subpoint, send the subPointTrigger (SCPI or COM) command.

- **CW sweeps:** Each trigger initiates acquisition for the entire sweep. This is currently used for wideband pulse profiling.

**P1 thru P4** These four pulse generator outputs are hardwired to rear panel outputs on the Pulse I/O connector (pins 10 - 13). They are also routed to two switches (#4 and #7 on the above diagram) along with the following three lines:

- **Rear Panel** External pulse generator input from Pulse I/O connector pin 8 (RFPulseModIn).

- **OFF** Pulse is constantly in LOW state causing gate and source to be OFF.

- **ON** Pulse is constantly in HIGH state causing gate and source to be ON.

Switch 7 Pulse Modulation - 1 of 7 lines to each of the sources. **Important:** When internally modulating the
source leveling must be set to Open-loop.

Rear-panel Outputs: Pulse I/O connector (pins 10 - 13) hardwired.

Source1 and Source2 pulse modulators: (#8 and #9 on the above diagram)

DSP (bottom block)

- Filters the ADC (digital) output from top block and outputs data to the PNA display.

- See SCPI and COM commands to control DSP settings.

External Millimeter-Wave Module Configuration

This feature, when used with the N526xA test sets and external mmWave Modules, extends the frequency coverage of your PNA.

In this topic:

- **Features and Limitations**
- **How to Configure Millimeter Modules**
- **Mixer Mode**
- **mmWave Module Power Level Control**

**See Also**

- [Millimeter-Wave Network Analyzers Technical Overview](#) (Requires internet connection)
- [mmWave Measurements with No Test Set](#)
- [Download a macro for Configuring VDI Frequency Extenders](#) (Requires internet connection)

**Other IF Access Topics**

**Note:** In the PNA user interface and in this help file, the N526xA Millimeter Head Controller is referred to as a test set. OML test head modules are referred to as mmWave modules.

**CAUTION:** Turn OFF test set power before connecting or disconnecting the DC cable to the mmWave modules.

**Features**

- Controls N5260A, N5261A, and N5262A Test Sets.
- Compatible with [iTMSA (True Mode Stimulus)](#).
- Several methods available to provide [Leveled power to the DUT Input](#)
- Compatible with [Integrated Pulse Application](#)
- Allows mixer measurements using SMC. [Learn more.]

The following configurations are supported:

- PNA-X or N522x with options [Opt 020](#) works with N5260A, N5261A, and N5262A Test Sets.
When using the N5262A test set, a 2-port PNA-X or N522x requires Opt 551.

PNA 'C' models with option H11 works with N5260A ONLY.

Limitations

- **Power Settings** When using mmWave modules with an N5260A test set, the PNA can NOT control the power level into your DUT. Your mmWave modules may have a variable attenuator on them. When used with an N5261A or N5262A, after performing a Source Power Cal, then the PNA power settings may be used to control the power into the DUT. See [Leveled Power Capabilities](#).

- To protect your mmWave modules from damage, the settings on the Millimeter Module Configuration dialog can ONLY be changed manually. They can NOT be reset or changed by performing a Preset, by recalling an Instrument State, or from a remote program.

PNA-X Notes

- **CAUTION:** Connect a 10 dB attenuator to the N5260A LO input from the PNA-X LO Output. Otherwise, damage will occur to the N5260A test set.

- The PNA-X or N522x rear panel IF Inputs use 5 SMA connectors. Previous PNA models use BNC connectors. Adapters may be required.

- Beginning with A.09.00, Frequency Offset and SMC Measurements are supported when using mmWave modules. [Learn more](#).

### How to Configure Millimeter-Wave Modules

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>SYSTEM</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then [Configuration]</td>
<td>2. then <strong>System</strong></td>
</tr>
<tr>
<td>3. then [Millimeter Module]</td>
<td>3. then <strong>Configure</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>Millimeter Module Config</strong></td>
</tr>
</tbody>
</table>

There are NO programming commands to configure mmWave modules and test set.
Millimeter Module Configuration dialog box help

**Note:** To protect your mmWave modules from damage, settings on this dialog can ONLY be changed manually. They can NOT be reset or changed by performing a Preset, or by recalling an Instrument State, or by a remote program.

**Available Configurations** Lists the Standard PNA configuration and others that you have created. Select Standard PNA to exit mmWave module operation.

**Selected Configuration** Shows the currently selected configuration. Edit this field to change the configuration name. Type a unique name using only alphanumeric characters and underscore.

**New** Click to create a new Millimeter Module configuration. A name is automatically selected. Edit the Selected Configuration field to change the configuration name.

**Remove** Deletes a Millimeter Module Configuration.

**Test Set Properties**

**Selected Test Set** Select a test set to use in the current configuration. The firmware does NOT check to ensure that the selected test set is connected.

**Route PNA RF to rear panel "SW SRC OUT"** Available ONLY on PNA-X with option 224 or 423 AND when using N5261A and N5262A test sets.

When checked, Port 1 source is switched to J11 and Port 3 source is switched to J8 on the PNA-X rear panel. Use this configuration to quickly switch the RF Output back to the PNA front panel.

**Mixer Mode** Check to allow mixer testing using SMC. Learn more.

**Enable Test Set RF ALC** Available for N5261A and N5262A ONLY. When checked, power is automatically leveled at the mmWave module RF input when using the standard cables and making non-pulsed measurements. Clear this box to use non-standard cables or when making pulse measurements. When cleared, the following fields become available:

**Max Power Limit** The maximum mmWave module RF input is limited to this value when Test Set RF
ALC is OFF. When you exit this dialog box using **OK**, set the power out of the PNA using the [Power and Attenuator dialog](#).

**Power Offset** Sets the loss of the cables. The mmWave module RF input is adjusted by this amount. Positive offset increases the power.

**Power Slope** Helps compensate for cable and test fixture power losses at increased frequency. The mmWave module RF input power increases as the sweep frequency increases in dB/GHz. The slope is defined relative to the mmWave module RF input frequency. The slope starts at 0Hz and a positive slope will increase the power level. Range is +/- 2 dB/GHz.

### Frequency Settings

- **Multiplier RF IN** RF Frequency Range (displayed in grey fields) multiplied by this value = test port frequency range.
- **Multiplier LO IN** LO Frequency Range (displayed in grey field) multiplied by this value plus the IF frequency equals the test port frequency. The IF frequency is:
  - 'C' Models = 8.333 MHz
  - PNA-X models = 7.605 MHz

**Test Port Frequency** Set the Start and Stop frequencies of the selected configuration at the test ports. This becomes the displayed Start and Stop frequency of the PNA.

### Important Notes

- To set Test Port Frequency, first set the appropriate **Multiplier** values that are specified in your mmWave module documentation.
- Ensure that the RF and LO Frequencies (highlighted below) are within the frequency range of the sources. The PNA offers no warning if they are NOT.

![Multiplier Frequency Settings](image)

### Source

Click a button to launch the [External Devices dialog](#) where you can select an internal or external source to be used for the PNA LO source or PNA RF source.

- **Cancel** Closes dialog box without saving changes.
- **OK** Saves the configuration and the PNA is **Preset** before making the appropriate settings.

### Mixer Mode

Mixer measurements can be made at mmWave frequencies using **SMC**. (VMC measurements are NOT supported.)

Beginning with A.09.40, mixer measurements can be made with a 2-port test set connected to a 4-port PNA-X. This
configuration yields a 2-port mmWave system. Learn about 2-port system connections and limitations.

Before A.09.40, the Mixer Mode checkbox could be enabled ONLY when the number of PNA test ports matched the number of ports on the mmWave test set. This means that an N5261A (2 port test set) could ONLY be connected to a 2-port PNA-X and an N5262A (4 -port test set) could ONLY be connected to a 4-port PNA-X. Although N5250A systems can make SMC mixer measurements, these measurements rely on accurate power calibrations which is beyond the capability of the N5250A.

Procedure

1. Connect your DUT to the mmWave system as described below.
2. Configure this dialog (Millimeter Module Configuration). Check Mixer Mode, then press OK. This presets the PNA.
3. Create an SMC measurement.
4. Make mixer settings. As with standard SMC measurements, only two DUT ports can be swept in frequency. The remaining DUT port must be a fixed frequency. See configuration used for harmonic mixers.
5. Increase power for mmWave modules that are connected directly to a PNA port or external source.
6. Calibrate using the SMC Calibration Wizard with mmWave Power Control.

Hardware Connections for Mixer mode

The following image shows the standard connections from a N5261A or N5262A test set port to an OML mmWave module.

mmWave mixers usually require that two of the three mixer ports operate at mmWave frequencies. When Mixer Mode is checked on this dialog (Millimeter Module Configuration), the following restrictions apply:

- On a 2 port mmWave system, only port 1 of the test set can be used as a mmWave-frequency port. Port 2 can NOT be used.
On a 4 port mmWave system, only ports 1 and 3 of the test set can be used as mmWave-frequency ports. Ports 2 and 4 can NOT be used.

The SMC parameter being measured must be within the frequency range of the PNA or within the frequency range of the banded mmWave module. Frequencies in between these ranges are allowed by the SMC mixer setup dialog, but the measurement results on the screen are NOT accurate.

Connections with a 4-port mmWave system

Upconverters

- DUT Input - Connect to PNA port 2 or port 4.
- DUT LO - Connect mmWave module to test set Port 3.
- DUT Output - Connect mmWave module to test set Port 1.

Downconverters

- DUT Input - Connect mmWave module to test set Port 1.
- DUT LO - Connect mmWave module to test set Port 3.
- DUT Output - Connect to PNA port 2 or port 4.

Connections with a 2-port mmWave system

Although supported, testing mmWave mixers with a 2-port system can be challenging for the following reasons:

- Testing mmWave mixers requires that two of the three DUT ports be at mmWave frequencies.
- Only test set port 1 is capable of adequately driving a mmWave module when used as a receiver.
- Therefore, the second DUT port that requires mmWave frequencies must have the mmWave module connected directly to an external source or a PNA second source.
- When using the mmWave module as a source, only the DC Bias and RF cable is necessary. The LO cable to the mmWave module is NOT used. This is because the RF input frequencies are multiplied in the mmWave module to provide the source frequencies. So a mmWave module used as a source can use the the RF cable to connect directly to the PNA second source or an external source. About +5 dBm of RF power is required to adequately drive the mmWave module.

Downconverters - requires two mmWave modules as sources

- DUT Input - Connect the mmWave module to the test set port 1.
- DUT LO - Connect the RF cable of the mmWave module to an external source or the PNA (SRC2) second source.
- DUT Output - Connect to PNA port 2.
**Upconverters** - requires a mmWave module as a **source** at the DUT LO and a mmWave module as a **receiver** at the DUT Output:

- DUT Input - Connect to PNA port 2.
- DUT LO - Connect the RF cable of the mmWave module to an external source or the PNA (SRC2) second source.
- DUT Output - Connect the mmWave module to the test set port 1.

**Measuring Harmonic Mixers**
Harmonic mixers have a multiplier circuit in the LO port of the DUT. Enter the multiplier value in the numerator of the X LO port in the **SMC mixer setup dialog**. This will provide the correct LO frequencies out of the appropriate source.

**mmWave Module Power Level Control**
Beginning with A.09.40, the following TWO features are integrated into **Guided Cal**:

- **For S-parameter Cal** - Use Multiple Sensors
- **For SMC Cal** - Power Table

The following table shows features that can be used to provide leveled power to the input of your DUT for S-parameter and SMC measurements.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Use when...</th>
<th>Use for...</th>
<th>Access the feature...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Receiver leveling</strong></td>
<td>Provides a sweep-to-sweep leveled power.</td>
<td>Works anytime.</td>
<td>S-params and SMC</td>
<td>Before or after Cal</td>
</tr>
<tr>
<td><strong>Use Multiple Sensors</strong></td>
<td>Allows several power sensors to be used to calibrate source power.</td>
<td>You require more than one power sensor to complete the source power calibration of the measurement frequency range.</td>
<td>S-params</td>
<td>During <strong>Guided Power Cal</strong></td>
</tr>
<tr>
<td><strong>Power Table</strong></td>
<td>Build or use a file that contains data of mmWave module output power vs frequency.</td>
<td>A power sensor is NOT available for calibration of the mmWave modules being used.</td>

</tbody>
</table>
S-parameter measurements

If you have one or more power sensors that spans the frequency range of your measurement, then use the following process.

Otherwise, perform a standard Source Power Cal. Learn how.

Using one or more power sensors

Check ALC Enabled (if available) on the Millimeter Module Configuration dialog.

1. With an S-parameter measurement active, press Cal, then Start Cal, then Calibration Wizard, then SmartCal.

2. On the following Select Ports dialog, check Calibrate source and receiver power, then click Next.

3. Important: In the following dialog, check Use Multiple Sensors, even if using only one sensor.

4. Complete the Guided Cal process.

Note: During the 'Connect a power sensor to port n'...step, the following error message may be displayed:
The default power level of 11 dBm is unachievable after calibration. Lower the power before starting calibration.
This means that a high amount of loss was measured in the path, and 11 dBm at the test ports will not be
possible.

**Cancel** the calibration and lower the source power level using the Power and Attenuators dialog.

**Perform a standard Source Power Cal - S-parameter measurements**

When one or more power sensors that spans the frequency range of your S-parameter measurement are NOT available, then use the following process.

**Note:** Perform an S-parameter calibration AFTER performing the following Source Power Cal.

1. Check **ALC Enabled** (if available) on the Millimeter Module Configuration dialog.
2. Press **Cal**, then **Power Cal** then **Source Cal** then **Options** to launch the following dialog:

   ![Source Power Calibration Options](image)

   See the help topic for this dialog

3. If one does not already exist, create a power table to be used to calibrate the PNA receiver. Learn how.
4. Check **Use a power table and the PNA reference receiver**.
5. Click **Power Table**, then navigate to the *.prn file.
6. Click **OK**.
7. Check **Calibrate the source at multiple power levels**.
8. Click **Power Levels**, then enter the Max power, Min power, and Step Size at which source power should be corrected. Be sure that the source power for your measurement is within these power levels. Otherwise, source power will NOT be accurate. Learn more about this feature.
9. Check **Calibrate the PNA reference receiver**, then click **OK**.
10. On the Source Power Cal dialog, click **Take a sweep**. The output of the test set is set to Max power and a sweep is performed to calibrate the reference receiver.

11. Power is dropped for several subsequent sweeps. The calibrated reference receiver is used to fully characterize the source power.

12. The entire correction table can be saved along with the instrument state in a *.csa file. Learn how.

13. Power out of the input module should be flat and accurate.

**SMC Cal**

Use the following calibration process to achieve accurate, leveled power at the mmWave test ports.

1. With a configured SMC measurement active, press **Cal**, the **Start Cal**, then **Calibration Wizard**.

2. At the SMC **Calibration Setup** dialog, when a Thru standard is NOT available, check **Independent power cals for input and output ports (no thru)**.

3. On the **Select Ports** dialog, check **Calibrate source and receiver power**, then click **Next**.

4. At the following Power Cal settings dialog:

   ![Power Cal Settings for Port 1](image)

   **Learn about this dialog**

   a. When you have ONE power sensor that spans the frequency range of your SMC measurement, then click **Power Meter Settings** to configure the power sensor. There are currently NO provisions for using multiple power sensors with SMC Calibration.

   b. Otherwise, use the following Power Table process.

      i. If one does not already exist, create a power table to be used to calibrate the PNA receiver. Learn how.

      ii. Check **Use Power Table**.

      iii. Click **Power Table**, then navigate to the *.prn file. The selected *.prn file is annotated to the dialog.

      iv. Click **OK**.
5. If you checked **Independent power cals for input and output ports (no thru)**, you will ALSO be prompted to select a power table for Port 2.

6. Complete the [Guided SMC Cal](#) process.

### Power Table

**Note:** This is NOT the same table that is used for the [Calibrate the source at multiple power levels](#) feature.

A power table is a text file with data that describes the output power of the module as a function of frequency. This is valid when the mmWave module is driven at high levels (+11 dBm). This file may have been created for you by a third party or shipped with your mmWave Module. If not, you can create this *.prn file from measured values using the following procedure:

**How to create a Power Table from measured data**

1. Setup the mmWave measurements including the [MM Module Configuration dialog](#) settings.

2. If a power sensor is available that spans the frequency range of your measurement, then do a source power calibration using a power meter for the first iteration. Otherwise, skip this step.

3. Set PNA power to the maximum value (+11 dBm).

4. Create an R1 trace and measure. [Learn how.](#) The loss through the MM Module is small enough to not be considered.

5. Click **File** then **Save As** to save the R1 trace to a *.prn file. Make note of the folder.

6. The file is recalled in the above procedure.

This file can now be used instead of connecting the power meter for this module.

This file can also be created manually, using a text file program such as Notepad. Copy the header information, and create the file with two columns, one for frequency and one for output power.
Example .prn file

Note: With Rev. 09.31, the first line of the *.prn file must have the Input power at which these measurements were made. Otherwise, an error message appears with the default value that will be assumed. See above image for format.

Last modified:

26-Apr-2011 Added 2-port test set w/ 4-port PNA (A.09.40)
22-Oct-2010 New multiple power levels and prn format
19-Oct-2010 Added new SPC Options dialog
9-Dec-2009 Added Cal note for waveguide
28-Aug-2009 Added Mixer Mode (A.09.00)
11-Mar-2009 Added Leveled power (A.08.5)
26-Feb-2009 Added Opt 551 requirement
14-May-2008 Major updates for PNA-X 8.2
9-Apr-2007 Updated for PNA-X
9/12/06 Note - NOT compatible with Freq Offset
N5264A Measurement Receiver

The N5264A is a PNA-X with no Source Ports or Tunable receivers. This makes the N5264A a very fast and very sensitive IF receiver that has been designed specifically for antenna and radar cross-section (RCS) measurements. When used with external sources, the N5264A can make frequency-scan measurements of antennas, or make RCS measurements in time domain.

- **N5264A Options and Limitations**

- **Configuring the N5264A**
  - **IF Receivers**
  - **Internal LO Source** (Opt 108)
  - **External Sources**
  - **How to Create Measurements**
  - **Calibrating the N5264A**

- **See Also**
  - **FIFO and other Antenna Features**
  - **Antenna Selection Guide**
  - 85309 Manual updated for PNA -P/N 85310-90002
  - **Antenna and RCS Measurement Configurations**
  - **N5264A Specs**
Typical N5264A Application
Far Field Outdoor Antenna Measurements

N5264A Options and Limitations

The N5264A has the following options:

- **IF Receiver** (base model) - The A,B,C,D, and R receivers are always set at the specified IF frequency.

- **IF Receiver + LO source** (Opt 108) - In addition to the receiver-only option, this option adds a 10 MHz to 26.5 GHz LO source.

- **Fast-Sweep / FIFO Mode** (Opt 118) - These features together allow you to make very fast measurements and save the data to a remote computer. Learn more.

Limitations

The following PNA features are NOT available on the N5264A

- No Source ports

- No S-Parameters - **Arbitrary ratioed parameters ARE allowed.**

- **No Application support**

- **Limited Calibrations**

Configuring the N5264A

IF Receivers

3689
The five IF receiver inputs are on the N5264A rear panel.

All five IF receivers are measured at the same time. However, only those measurements that are displayed are updated.

External mixers are always required to down-convert signals to the IF frequency.

The default IF frequency for the N5264A is 7.605634 MHz.

Change the IF frequency to any value between +14.9999 MHz and -14.9999 MHz using SENS:IF:FREQ (SCPI) or IFFrequency (COM) commands.

Internal LO Source (Option 108) - 10 MHz to 26.5 GHz
The LO source output connector is on the N5264A rear panel.
The power level of the internal LO source is typically about +10 dBm and can NOT be changed.
To change the frequency of the LO Source:

1. Change the IF frequency of the measurement if necessary.
2. On the FOM dialog, change Receivers frequencies to the RF frequency range to be measured.
3. The LO Source frequency range is set automatically. This frequency value can not be viewed.

External Sources
Because the N5264A has no internal sources (except for the optional LO), newly created measurements are displayed with a source port = 0 (zero).

External sources can be configured so that they are controlled by the N5264A. Learn how to configure an external source.
Once configured, all existing and new measurements are changed to use the external source as the source port. When two or more sources are configured, the first configured source is displayed by default.
The external source settings can be changed from the following dialogs:

- Power and Attenuators dialog - Controls the ON | OFF state (set to Auto by default) and Power level of the external source.
- FOM dialog - Controls the frequency range. External sources are listed by name and uncoupled by default.

How to Create Measurements
Create ratioed and unratioed measurements using the standard Receivers tab. S-parameters are not available.

Calibration
The only calibrations available are Response, Source Power and Receiver calibrations. These are performed from the Unguided Cal Wizard.
Last Modified:

27-Sep-2010   Updated Opt 108

6-Apr-2009    Removed N5242A

28-Aug-2008   MX New topic
External Source Configuration

Once configured, an external source appears in PNA dialogs as though it is an internal source.

How to Configure an External Source

1. Create an External Source device by name (one-time).
2. Then click **Device Properties** to **Configure the External Source**.

**PNA Applications** have additional methods of launching this dialog.

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>

</thead>
<tbody>
<tr>
<td>1. Press <strong>SYSTEM</strong></td>
<td>1. Click <strong>Utility</strong></td>
</tr>
<tr>
<td>2. then <strong>[Configure]</strong></td>
<td>2. then <strong>System</strong></td>
</tr>
<tr>
<td>3. then <strong>[External Device Configuration]</strong></td>
<td>3. then <strong>Configure</strong></td>
</tr>
<tr>
<td></td>
<td>4. then <strong>External Device Configuration</strong></td>
</tr>
</tbody>
</table>

See **Remotely Specifying a Source Port**

External Device Configuration dialog box help

*Note:* This dialog is also used to configure an External Power Meter as a **PMAR** device. [Learn how.](#)

To use this dialog, your PNA must have **FOM Option 080**. Without this option, you must control an external
This dialog allows you to configure an external source to be controlled by the PNA. Once you create and activate an external source from this dialog box, it becomes available from the following PNA dialog boxes as well as the softkeys and entry toolbar, as if it were an internal PNA source or receiver: Power and Attenuators dialog; FOM dialog, New Trace / Receivers tab dialog

**Important Notes**

- By default, an external device is **de-activated** when the PNA is Preset or when a Instrument State is recalled. This behavior can be changed with a Preference setting so that it remains active through a Preset or Instrument State recall.

- Device configuration is NOT saved in an Instrument State file. Therefore, recalling a state file that refers to a device that has been removed, or recalling a state file on a different PNA will result in a “Device configuration not found” error.

- Multiple configurations for the same physical device can be Active. However, only one configuration for the same external source can have the I/O Enabled.

**External Devices**

The devices that are currently configured appear in this list. The number of devices that can be configured is limited by the specified Interface.

- **New** Click to create a new source configuration. The default name is Device<n>, where <n> is the next number for ‘Device’.

- **Remove** Click to remove the selected device from the list.

**Properties**

- **Name** Enter a device name as it will appear when referring to this device in all PNA dialog boxes. Edit the name at any time. Duplicate names are not allowed.

**"Name" Notes**

- Because External Devices can be used with FOM ranges, do NOT name an external device any of the following FOM range names: “primary”, “receivers”, or “source”, “source1”, source2” and so forth. Learn more about FOM ranges.

- Do NOT use a parameter name, such as “S11”, or “R1”.

**Device Type** Select either Source.

**Driver** Select the appropriate model of the device to be configured. AG is short for Agilent. Choose from:

- AGESG (ESG)
- AGPSG (PSG)
- AG836XX (8360 and 8340)
- AGMXG - (MXG) Requires at least firmware A.01.44 for FOM power sweep to work correctly.
AGGeneric - For sources NOT listed. Click Device Properties, then Edit Commands to send commands to these sources. Learn how.

Active  Check to make the device available for use in the FOM, New Trace, and Receiver Leveling dialogs. An instrument state that is saved with an Active device (checked) will include the device in the state file. Otherwise, if the Active box is cleared, the device will NOT appear in the state file.

Enable I/O  Clear this box to disable communication with the selected device. You would do this to configure a device that is not yet connected to the PNA.

- Communication with devices is attempted when Enable I/O is checked, Active is checked, and OK is pressed.
- If communication with a device is lost the affected channels are put into Hold.
- When communication is attempted, devices with Enable I/O checked are queried for limits for frequency, power, and number of points. If there are limit problems, the PNA sends an error and the affected channels are put into Hold. These limits are enforced by the dialog box in which they are set. Resolve the reported limit problem and then restore the triggering.

Device Properties  Click to launch the Configure External Sources dialog.

IO Configuration

Interface  Select the interface that is used to connect the device to the PNA. These devices will then appear in the 'Available' field. Choose from:

- GPIB - Devices connected to the System Controller GPIB port.
- USB - Devices connected to the PNA USB ports. See Important First-time USB connection note.
- Aliases - Devices that are connected to ANY interface for which you created an alias. See Configure Alias and LAN devices.
- LAN - Devices connected to a network using a LAN connection. The PNA must also be connected to the network.

Note: Devices connected to LAN must first be configured in Agilent IO libraries before they will appear on the Available list. See Configure Alias and LAN devices.

Available  Shows a list of devices that are connected to the specified IO Interface.

Refresh  Click to rescan the specified interface for devices.

Selected  Enter the IO configuration or select from the available list of IO Interfaces found.

Configure Alias and LAN Devices

Use this procedure to configure a device using a LAN interface. Also use for ANY device for which you want to set an alias (easily-recognized) name. The alias name appears in the Available field when Aliases is selected as the Interface.

1. On the PNA, minimize the PNA application.
2. In the system tray (lower-right corner) right-click the IO icon, then click Agilent Connection Expert

To Add a LAN Device:

1. In ACE, click Add Instrument

2. Select Add LAN Instrument (TCPIP0) or USB0, then click OK.

3. Click, then enter the IP address of the external source.

4. Click Test Connection to verify communication.

5. Click OK.

To create an Alias for a connected device:

1. In the list of connected instruments, right click the external source, then Add VISA Alias.

2. Enter the same PNA source name that was, or will be, used in the External Device Configuration dialog.

**External Source Configuration**

**Important Notes about External Sources**

- By default, an external source is de-activated when the PNA is Preset or when a Instrument State is recalled. This behavior can be changed with a Preference setting.

- External Agilent sources are usually limited to 1601 points with List-sweep mode. To 'work around' this limitation, divide the measurement among multiple channels. For example, to attain a sweep of 3200 points, create two channels of 1600 points. You can also use manual source control which supports Step-sweep mode. In this mode an external source can have up to 65,535 points. See Synchronize an External Source for help with manual source control.

- External sources should always share the same 10 MHz Reference signal as the PNA. Connect a BNC cable from the PNA 10 MHz Ref Output to the External Source Input.

- All newly-activated sources are preset, with source power OFF. Source power must be turned ON in the Power dialog. Frequency Offset must be enabled in the FOM dialog.

- When daisy-chaining multiple sources in Hardware List triggering, the source to receive the Trigger signal from the PNA must be the first source listed in the Selected column of the External Device Configuration dialog. Devices are listed in the order in which they are created. You may have to delete, then re-create a source to move it down on the list.

- The same source can NOT be used more than once in the same channel.

- The PNA automatically controls all trigger settings for the external source. The PNA can be triggered internally or externally using the Internal, Manual, or External trigger settings. When set to External, the trigger signal must come through a PNA rear panel connector that is not being used to trigger the
external source. Use Meas Trig to trigger the PNA. For 'C' models, you have to manage the external trigger yourself.

- For more information, see PNA Trigger model

**Programming Commands**

**See Also**

Remotely Specifying a Source Port

**External Source Configuration** dialog box help

This dialog box is used to make external source settings.

See Important Notes about External Sources

**Source Settings**

- **Timeout (sec)** Sets a time limit for the source to make contact with the PNA. If this time limit is exceeded, the PNA stops the measurement procedure and displays the following error message.

  EXECUTION ERROR;OPC QUERY TIMEOUT ERROR: FREQUENCY NOT SETTLED

  If this occurs, check the connections between your PNA and external source.

- **Dwell per point (ms)** Applies a dwell in Hardware List triggering ONLY. Set the time (in milliseconds) the external source will wait before data acquisition.

- **Edit Commands** Provides a method to send SCPI commands to AGGeneric (not listed) sources.

**Trigger Settings**

**Trigger Mode**

- **Software CW (GPIB)** Slowest method.
- The external source receives each CW frequency from the PNA over GPIB, USB, or LAN. No other trigger cables are required.

- The PNA controls ALL external source trigger settings automatically (except for those on this dialog). All settings in the **External Trigger** dialog are ignored.

**Hardware List (BNC)** Fastest method.

- The external source receives a list of CW frequencies from the PNA, then receives BNC trigger signals as required from the PNA.

- If the number of data points used in the measurement exceeds the capability of the external source, the PNA automatically switches to Software CW (GPIB) trigger mode. This will slow the measurement significantly.

- NOT available for AGGeneric (not listed) sources.

- The PNA controls ALL external source trigger settings automatically (except for those on this dialog). All settings in the **External Trigger** dialog are ignored.

**Trigger Port** Used ONLY for Hardware List Trigger Mode. Select the PNA rear panel connector to be used for triggering. The sources must be connected as follows:

- **PNA-X and N522x models**: For single external sources, connect directly using Aux1 or Aux2. [See rear panel Aux connectors](#). Connect multiple sources using the following daisy-chain image.

- **'C' models** - Use rear-panel BNC **Trigger** connectors as follows:

<table>
<thead>
<tr>
<th>1 External Source</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Diagram" /></td>
</tr>
</tbody>
</table>

| Daisy-chain 2 External Sources |
**Note:** Source 1, which receives the trigger out of the PNA, must be the first source listed on the External Devices Configuration dialog box. Devices are listed in the order in which they are created. You may have to delete, then re-create a source to move it down on the list.
Generic Source Commands dialog box help

Enter the SCPI commands that control the following functions on your AGGeneric (not listed) source. A field without a SCPI command entered will be ignored and that function will not be set.

To launch this dialog, click Edit Commands on the External Source Properties dialog.

Operation Complete (*OPC).

Preset   Presets the source
Set CW Frequency  Sets CW Frequency
Set CW Sweep Mode  Sets source sweep mode
Set Power   Sets source power
Set Power State  Turns power ON or OFF

30-Apr-2007  MX Modified for ALL external source config.
Configure a Power Meter As Receiver (PMAR)

When a power meter is configured as a PNA receiver, you can...

- Extend the number of measurement receivers.
- Use the power meter as a scalar detector.
- Monitor the power at any point in a measurement system.
- Use the power meter to level the stimulus power at any point in a measurement system.
- Use the power sensor as a PMAR device to confirm the accuracy of a Source Power Cal. Learn how.

The following Agilent Power Meters are supported as receivers:

- HP 437B / 438A power meters
- E-Series power meters (E4418 and E4419) and all supported sensors.
- P-Series power meters (N1911A and N1912A) and all supported sensors.
- EPM Series power meters (E4416A and E4417A) and all supported sensors.
- N1913A and N1914A power meters and all supported sensors.
- U2000 Series USB power sensors. USB power sensors must be connected directly to one of the PNA USB ports. See Important First-time USB connection note.

N1911A, 12A, 13A, and 14A power meters have a ‘device-side’ USB connector and are controlled by the PNA exactly like a USB sensor. See USB Power Sensors (below). Although these meters may also have a front-panel USB port, USB power sensors must be connected directly to one of the PNA USB ports.

In general, a power meter that is configured as a receiver can be used like any other PNA receiver in the following dialogs:

- **New Trace / Meas dialog** - used in Ratioed and Unratioed measurements.
- **Receiver Leveling**
- **Frequency Offset Mode** - Extend frequencies beyond PNA
How to Create and Configure a PMAR Device

1. Create a PMAR device by name (one-time).
2. Then click **Device Properties** to configure the Power Meter/Sensor.

**PNA Applications** have additional methods of launching this dialog.

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>

**External Device Configuration** dialog box help

This dialog allows you to create and configure a power meter to be used as a receiver by the PNA. Once you create and configure a power meter from this dialog box, it becomes available from PNA dialog boxes as well as the softkeys and entry toolbar, as if it were an internal PNA receiver.

- This dialog is ALSO used to configure an External Source. Learn more.
- To configure a single power meter for a Source Power Cal, use the **Power Meter Settings** dialog.
Important Notes

- By default, an external PMAR device is **de-activated** when the PNA is Preset or when an Instrument State is recalled. This behavior can be changed with a Preference setting so that it remains active through a Preset or Instrument State recall.

- PMAR configuration is NOT saved in an Instrument State file. Therefore, recalling a state file that refers to a device that has been removed, or recalling a state file on a different PNA will result in a “Device configuration not found” error.

External Devices

The devices that are currently configured appear in this list. The number of devices that can be configured is limited by the specified Interface.

**New** Click to create a new PMAR configuration. The default name is Device<n>, where <n> is the next number for ‘Device’.

**Remove** Click to remove the selected device from the list.

Properties

**Name** Enter a device name as it will appear when referring to this device in all PNA dialog boxes. Edit the name at any time. Duplicate names are not allowed.

**Notes**

- Because External Devices can be used with FOM ranges, do NOT name an external device any of the following FOM range names: “primary”, “receivers”, or “source”, “source1”, source2” and so forth. Learn more about FOM ranges.

- Do NOT use a parameter name, such as "S11", or "R1".

**Device Type** Select **Power Meter**.

**Driver** Use **AGPM** for all Agilent Power Meters.

**Active** Check to make the device available for use in the FOM, New Trace, and Receiver Leveling dialogs. An instrument state that is saved with an Active device (checked) will include the device in the state file. Otherwise, if the Active box is cleared, the device will NOT appear in the state file.

**Note:** Multiple PMAR configurations for the same physical device can be Active and Enabled.

**Enable I/O** Clear this box to disable communication with the selected device. You would do this to configure a device that is not yet connected to the PNA.

- Communication with devices is attempted when Enable I/O is checked, Active is checked, and OK is pressed.

- If communication with a device is lost, the affected channels are put into Hold.

- When communication is attempted, devices with Enable I/O checked are queried for limits for frequency, power, and number of points. If there are limit problems, the PNA sends an error and the affected channels are put into Hold. These limits are enforced by the dialog box in which they are set.
Resolve the reported limit problem and then restore the triggering.

- Communication is also attempted when clicking the **Settings** button on the [Configure Power Sensor](#) dialog. You can not change any of the sensor settings unless **Enable I/O** and **Active** are checked and communication is possible with the sensor.

**Device Properties** Click to launch the [Configure Power Sensor](#) dialog.

**IO Configuration**

**Interface** Select the interface that is used to connect the device to the PNA. These devices will then appear in the ‘Available’ field. Choose from:

- **GPIB** - Devices connected to the System Controller GPIB port.
- **USB** - Devices connected to the PNA USB ports. See Important First-time USB connection note.
- **Aliases** - Devices that are connected to ANY interface for which you created an alias. See Configure Alias and LAN devices.
- **LAN** - Devices connected to a network using a LAN connection. The PNA must also be connected to the network. **Note:** Devices connected to LAN must first be configured in Agilent IO libraries before they will appear on the Available list. See Configure Alias and LAN devices.

**Available** Shows a list of devices that are connected to the specified IO Interface.

**Refresh** Click to rescan the specified interface for devices.

**Selected** Enter the IO configuration or select from the available list of IO Interfaces found.

**Configure Alias and LAN Devices**

Use this procedure to configure a device using a LAN interface. Also use for ANY device for which you want to set an alias (easily-recognized) name. The alias name appears in the Available field when Aliases is selected as the Interface.

1. On the PNA, minimize the PNA application.
2. In the system tray (lower-right corner) right-click the IO icon, then click **Agilent Connection Expert**

To Add a LAN Device:

1. In ACE, click ![Add Instrument]
2. Select Add LAN Instrument (TCPIP0) or USB0, then click OK.
3. Click, then enter the IP address of the external source.
4. Click Test Connection to verify communication.
5. Click **OK**.
To create an Alias for a connected device:

1. In the list of connected instruments, right click the instrument, then Add VISA Alias.

2. Enter the same Device Name that was, or will be, used in the External Device Configuration dialog.

---

**Power Sensor Configuration** dialog box help

To launch this dialog, with the PMAR device selected in the External Device Configuration dialog, click Device Properties.

This dialog is used to configure a power meter / sensor for use as a receiver.

To configure a single power meter for a Source Power Cal, use the Power Meter Settings dialog.

---

**About Power Sensor Calibration**

PMAR traces are NOT calibrated using standard PNA calibrations, including response corrections.

PMAR traces are calibrated using methods that are appropriate for the selected sensor. Follow the proper guidelines for zeroing or calibrating the sensors that are in use. Check to ensure that the selected sensor is appropriate for the frequency range and the power level at which PMAR measurements occur.

The PNA does not automatically prompt you to perform a calibration.

To calibrate a power sensor, click Settings on this dialog box, then click Zero/Calibrate Sensor. Learn more.

---

**Note:** By default, a PMAR is de-activated when the PNA is Preset or when a Instrument State is recalled. This behavior can be changed with a Preference setting.

---

**Sensor**
For power sensors that are connected to a power meter, select a sensor to configure.

**Settings**  Click to launch the [Power Sensor Settings](#) dialog.

When pressed, communication with the sensor is tested. Sensor settings can NOT occur unless **Enable I/O** is checked on the [External Device Configuration dialog](#), and the sensor is properly connected and configured.

**Sensor Settling**

Each power meter reading is "settled" when either:

- two consecutive meter readings are within this Tolerance value **or**
- when the Max Number of Readings has been met.

The readings that were taken are averaged together to become the "settled" reading.

**Tolerance**  When consecutive power meter readings are within this value of each other, then the reading is considered settled.

**Max Number of Readings**  Sets the maximum number of readings the power meter will take to achieve settling.

**Sensor Loss Compensation**

**Use Loss Table**  Select this checkbox to apply loss data to Source Power calibration correction (such as for an adapter on the power sensor).

**Edit Table**  Invokes the [Power Loss Compensation](#) dialog box.
This dialog appears when you click the **Settings** button on the Configure Power Sensor dialog.

**Note:** Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

**Sensor A (B)** Displays one of the following messages depending on type of sensor.

- **Not connected** The PNA is not detecting a power sensor.

- **Cal factors are contained within this sensor** Internal Reference Cal Factor and Cal Factor data are loaded automatically. The following settings do not apply.

- **Sensor Data** Allows the following entries for power sensor data:

  - **Reference Cal Factor** Specifies the Cal Factor for the 50 MHz reference signal.
  - **Cal Factor Table** Specifies the frequency and corresponding Cal Factor for the sensor.
  - **Delete Cal Factor** Deletes the indicated row in the table.
  - **Delete All** Deletes all data in the table.
  - **To Add a Row** to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard. A row is added to the bottom of the table. The table is automatically sorted by frequency when OK is pressed.

**Limit Frequency Range**
- Check to limit the use of the power sensor to those within the Minimum and Maximum frequency values.

- Clear to use the power sensor for all measurements. If the measurement frequency is not within the Minimum and Maximum frequency values, the closest min or max correction data is used for the measurement.

**Minimum Frequency**  Specifies the minimum frequency range for the sensor.

**Maximum Frequency**  Specifies the maximum frequency range for the sensor.

**Perform Sensor Zeroing and Calibration**  Zero and/or calibrate the power sensor before measuring data. Follow prompts that may appear. Press **Zero/Calibrate Sensor** to perform required calibration steps.

If the following settings are 'greyed', Internal or External zeroing is selected automatically based on the power meter/sensor model.

- **Internal Zero** - A switch inside the power sensor removes the zero circuit from the incident power.

- **External Zero** - Requires that you physically remove the sensor from incident power.

**Note for the U2000 Series USB power sensors**

Select External Zero ONLY when the power to be measured is below the specified level. Otherwise, the U2000 series performs internal zeroing automatically when needed. See your power sensor documentation for more details.

- U200xA - below -30 dBm
- U200xH - below -20 dBm
- U200xB - below 0 dBm

If your U2000 power sensor 'hangs' when external zeroing, upgrade the power sensor firmware to Rev. A.01.02.00 or higher to fix this problem.
Power Loss Compensation dialog box help

To Add a Row to the table, click on a row in the table and press the down arrow on either the PNA front panel or keyboard.

To Edit a value, double-click in the cell to be edited.

These values can be loaded from an S2P file using the Characterize Adaptor Macro.

Compensates for losses that occur when using an adapter or coupler to connect the power sensor to the measurement port. These components will be removed when the calibration is complete. To account for components that will remain during the measurement, use the Power Offset setting.

The Frequency / Loss pairs define the amount of loss for the entire frequency range. For example, using the entries in the above dialog image:

- 0.5 dB is used to compensate power sensor measurements up to 1 GHz.
- Each data point between 1 GHz to 2 GHz is linearly interpolated between 0.5 dB and 1 dB.
- 1 dB is used above 2 GHz.
- A single frequency/loss segment is applied to the entire frequency range.

Enter up to 100 segments to achieve greater accuracy.

**Frequency** Enter a frequency in Hz.

**Loss** Enter a loss as a POSITIVE value in dB. To compensate for gain, use NEGATIVE values.

**Delete Table Segment** Deletes row indicated in the field.

**Delete All** Deletes all data in the table.

The Power Loss Compensation table survives PNA Preset and Power OFF. To NOT use Loss compensation, clear the Use Loss table checkbox on the Configure Power Sensor dialog.

---

Use a PMAR Device to confirm a Source Power Cal

Learn how to create and configure PMAR device.

After a Source Power Cal has been performed, use the same sensor as a configured PMAR to analyze the accuracy of the Calibration.
1. Create a PMAR device with the power sensor that will be used for the Source Power Cal.

3. Create an unratioed measurement with the PMAR device. Learn how.

4. With the power sensor still connected to the test port, monitor the corrected source power using Min and Max markers or the Trace Statistics peak-to-peak feature.

Last Modified:

10-Jun-2011 Modified list of supported PMs
29-Apr-2011 Separated source and PMAR
22-Oct-2010 Added support for N991x meter
25-Aug-2009 MX New topic
The E5091A is a popular Agilent Technologies 7-port / 9-port test set. Although the test set was originally designed to work with the ENA Network Analyzer, it also works well with the PNA. This topic describes how to control the test set from the PNA. For more information about the test set, refer to your E5091A documentation.

- Overview
- Connecting the E5091A
- How to make E5091A test set Control Settings
- Calibrating with the E5091A

**Overview**

When connected to the PNA, the E5091A test set provides full 7-port or 9-port test capability. The E5091A can be configured to switch a different test set path for each PNA channel. When all channels have been configured, the entire measurement setup and calibration can be saved to a .cst or .csa file to be recalled later. In addition, the Channel Settings Table that is appended to a printed hardcopy of a measurement includes the E5901A Port Control settings.

**Notes:**

- ONLY the 7-port and 9-port test sets are supported with the PNA.
- Works with all 4-port PNA models.
- The E5091A test set has a maximum useful frequency of 11 GHz.
- The E5091A test set Control can be automated using SCPI and COM commands.
- When enabled, a second status bar row appears which indicates the test set that is being controlled and the current switch state.
- Test set path switching occurs just before a channel is triggered. If a channel trigger state is Hold, switching for that channel does not occur.
- PNA sweep speed will be slightly slower when using the E5091A to switch measurement paths.

**Connect and Configure the E5091A**

The E5091A can be connected to any one of the PNA USB ports. When first installed, Windows will automatically launch the "Add New Hardware" wizard. Click Next to install the E5091A test set.

**Note:** See the power handling limitations of the PNA USB ports.

Connect the PNA test ports to the E5091A test ports. Match PNA test port 1 to E5091A test port 1, and so forth.
Selecting ID for E5091A

The PNA can control up to two E5091A test sets. Set the Instrument ID bit switch to 1 or 2. The test sets will then be identified automatically and referred to by the DIP switch setting on the E5091A rear-panel. Change the ID bit switch setting before connecting to the PNA USB.

Power ON

Immediately after power-on, all of the port connection indicator LEDs of the E5091A go ON. Then, after the PNA detects the E5091A, the four LEDs that indicate the connected test ports remain ON. If the PNA is not powered on or if the E5091A is not connected using a USB cable, all of the LEDs stay ON.

How to make E5091A test set Control Settings

Using front-panel HARDKEY [softkey] buttons

1. Press TRACE/CHAN
2. then [Channel]
3. then [More]
4. then [External test set]
5. then [E5091A]

Using a mouse with PNA Menus

1. Click Trace/Chan
2. then Channel
3. then More
4. then External test set
5. then E5091A

No programming commands are available for this feature.
The title of the dialog shows the test set model and ID number of the active test set.

**Select ID**  ID of the test set to be configured. Up to two E5091A test sets can be controlled. Click to change test set ID. [Learn how to set the test set ID](#).

**Enable Test Set Control**  When cleared, port switching and control line settings are disabled. This selection affects all channels using the selected test set.

**Show Test Set Property**  When checked, a second row on the status bar appears which indicates the test set that is being controlled and the current port control selection. For example, the following image shows the status bar when controlling an E5091A test set.

A. Configured channel

B. Port Control settings for E5091A

C. Port Control settings for Z5623A K64

D. Test set Label. E5091A control does not use this field. It is shared between [Interface Control](#) and [External test set Control](#). The two labels are separated by `/`.

Control of the second status bar is completely separate from the first status bar, which is controlled from the [View, Status Bar](#) menu.

**Port Control**  Controls mapping of Physical ports to Logical ports.

- Physical ports are the port numbers that are labeled on the test set front panel. ([see N44xx test sets](#))
- Logical ports are the port numbers that are referred to by most of the PNA application prompts and dialog boxes.
Port Mapping Notes

- Port Control and Control Line settings affect the channel of the active (selected) measurement. These settings will occur as the channel is being measured.
- Correction is NOT turned OFF when port mappings are changed. However, the calibration is NO LONGER VALID!

Control Lines  Specifies the values of individual control lines. These general purpose control lines on the test set front-panel can be used in your test setup. Each button toggles the control line HIGH and LOW. When first opened, the selections reflect the current control lines. See your test set documentation for more information about the control lines.

OK  When clicked, the changes to the dialog box are implemented and the port selections and control values are immediately sent to the specified test sets. The Port Control and Control line settings are stored with other channel data and used when those channels are swept.

Cancel  (or Escape) Changes to the dialog are not implemented and revert to the settings before the dialog box was opened.

Calibrating with the E5091A

The following are a few changes in the way you calibrate the PNA with the E5091A connected:

1. Create the measurements for the channel and configure the Port Control (switching) on the E5091A Test Set Control dialog box. Enable Show Test Set Property.
2. To calibrate, start the Calibration wizard and select a Calibration method (ECAL, SmartCal, Unguided).
3. Select the DUT connectors that are used at the E5091A measurement reference plane.
4. When prompted to connect a standard to a PNA port, instead connect the standard to the E5091A port as indicated on the test set status bar. For example, when the cal wizard prompts to connect the standard to port 1, if the status bar indicates 1 A, the connect the standard to port A of the E5091A.

Last Modified:

- 7-Apr-2009  Added 7/9 port only, and 4-port PNAs
- 4-Sep-2008  Removed legacy content
- 18-Jun-2007  MX added UI
External Multiport Test Set Control

- **Supported Test Sets**
  - **Option 551**
  - **Option 550**
  - **E5091A** (separate topic)

- Procedure
  1. **Connect Test Set**
  2. **Restart as Multiport**
  3. **Optional External Test Set Control Settings**

- **External Test Set Control and other PNA Functions**

---

**Other System Configuration Topics**

**Supported Test Sets**
The list of test sets that provide integrated solutions with the PNA is constantly growing. For a current list of supported multiport test sets, see [www.agilent.com/find/multiport](http://www.agilent.com/find/multiport)

**Option 551**
- **With** Option 551 enabled on your PNA, **any supported multiport test set** (such as the U3042A E12) can be controlled directly from the PNA to make fully integrated measurements at ALL of the available test ports. To understand what test ports are available to source and receive, see the test set documentation.

- **Without** Option 551, basic operation depends on the number of PNA test ports.
  - For a 2-port PNA, configure two available test ports.
  - For a 4-port PNA, configure four available test ports.

**Option 550**
- **With** Option 550 enabled on your PNA, the N44xx test sets and other supported test sets can be controlled directly from the PNA to make fully integrated **4-port** balanced measurements.

- **Without** Option 550, basic operation allows you to configure any **two** of the test ports to make standard S-parameter or receiver measurements. A different pair of ports can be configured for each channel.
<table>

**Note:** By default, the system logical test ports are mapped as follows:

- **Port 1** - PNA port 1
- **Port 2** - Test Set port 2
- **Port 3** - PNA port 2
- **Port 4** - Test Set port 4
The ports can be remapped using the Port Control Setting.

**Block Diagram of a 2-port PNA and N44xx Test Set**

Click one of the S-parameters to see switch and path changes. Because the test set does NOT contain receivers, measurement speed and calibration can be affected.

![Block Diagram of a 2-port PNA and N44xx Test Set](image)

**Procedure - How to enable full Multiport Capability**

1. **Enable Option 550 or 551.**
2. Connect the test set to the PNA using the documentation that was shipped with the test set.
3. **Restart as Multiport PNA**
4. **Make optional External Test Set Control Settings**

**Connect and Configure the Test Set**

Connect the test set to the PNA using the test set documentation. Most test set documentation can be found at [www.Agilent.com](http://www.Agilent.com).

**Test Set I/O-controlled test sets**

Test sets that are controlled using the **Test Set I/O connector**, have NO return communication capability. The PNA sends commands out the rear panel connector. It is assumed that the test set is responding appropriately. The “Active” LED, located on the test set front panel, should light when the test set is addressed in Multiport Mode or manual operation. When the test set is not in use, the Active LED will be OFF.

**GPIB-controlled test sets**

Connect the test set to the GPIB using one of the following methods:

- If the **PNA will NOT be controlled** by a remote computer using GPIB, then the test set can be connected directly to the PNA GPIB port. The PNA is automatically switched to **System Controller** mode.
- If the **PNA WILL be controlled** by a remote computer using GPIB, then learn how to connect the test set.

**Restart as Multiport PNA**

**How to Enable Multiport capability**

*Note: If Option 550 or Option 551 has not been enabled, the following Multiport Capability menu selection will NOT be available.*

**Using front-panel HARDKEY [softkey] buttons**

1. Press **System**
2. then **Configure**
3. then **Multiport Capability**

**Using a mouse with PNA Menus**

1. Click **Utility**
2. then **System**
3. then **Configure**
4. then **Multiport Capability**
Multiport Restart dialog box help

See Also  External Test Set Control and other PNA Functions

After the test set is connected and PNA Option 550 or 551 is enabled, the following settings are used to enable Multiport operation.

Test Set  Select the test set file to load.  Only the files that are appropriate for use on that PNA model are displayed.

To Add a new Test Set file:

1. On the PNA, click File, then Exit to quit the PNA application.
2. Download the Test Set file from:  http://na.tm.agilent.com/multiport/testsets/
3. Save it to the PNA C:/program files/agilent/network analyzer/testsets
4. Start the PNA application.
5. Click Utility, then System, then Configure, then Multiport Capability.
6. In the Multiport Restart dialog, click Restart as multiport PNA with this testset.
7. The new test set should now be visible from the Testset: menu.

Address  Enter the test set address if the test set is connected to GPIB. Connections over the Test Set I/O connector are determined by their sequence.

- **Restart as a standalone PNA.**  The PNA shuts down and restarts as a standard PNA.  If the test set is left connected to the PNA, switch the test set OFF, then back ON to ensure that the test set routes signals to ports 1 and 2 of the PNA.  In this condition, there is more loss in the test paths than without a test set connected.  If the power switch is OFF, there is Significantly more loss in the test paths.

- **Restart as a multiport PNA with this testset.**  The PNA shuts down and restarts as a multiport PNA with the selected test set.

Click OK  The PNA shuts down and restarts in the selected configuration.
To learn how to change port mapping, see Port Control.

Problems
If the PNA cannot find the test set, the following error is displayed on the PNA:

**GPIB ERROR Address xx cannot open VISA session.**

To correct the problem, verify the following:

- The test set is connected to the PNA using one of the methods described above.
- The correct test set address is set.
- The test set is turned ON.

**Important: After the problem has been fixed:**

1. On the External Test Set Control dialog, click Enable Test Set Control.
2. Restart Triggering - click **Sweep, Trigger, Continuous**.
3. The PNA again tries to find the test set.

External Test Set Control Settings
The following External Test Set Control Settings are used to configure Multiport test sets. For the N44xx test sets, the only setting that is necessary is port control.

**How to access the External Test Set Control Settings**

<table>
<thead>
<tr>
<th>Using front-panel HARDKEY [softkey] buttons</th>
<th>Using a mouse with PNA Menus</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press TRACE/CHAN</td>
<td>1. Click Trace/Chan</td>
</tr>
<tr>
<td>2. then [Channel]</td>
<td>2. then Channel</td>
</tr>
<tr>
<td>3. then [Hardware Setup]</td>
<td>3. then Hardware Setup</td>
</tr>
<tr>
<td>4. then [External Testset]</td>
<td>4. then External Testset</td>
</tr>
<tr>
<td>5. then [Other External Test Sets]</td>
<td>5. then Other</td>
</tr>
</tbody>
</table>

**Programming Commands**

3719
External Test Set Control dialog box help

Important Notes:

- With Options 500 and 551, **first** use the Multiport Restart dialog to Restart as Multiport PNA with this test set. The test set file is loaded and the test set is enabled automatically.

- When using GPIB to control an external test set, the PNA is automatically put in System Controller mode. It can NOT also be in talker-listener mode. To have the PNA control a GPIB test set AND be controlled by a remote PC, use a USB to GPIB adapter to control the external test set. This does NOT apply for PNA models with a 1.1 GHz CPU board, which has both a GPIB controller port and a talker/listener port.

- See also External Test Set Control and other PNA Functions

Select ID

- For N44xx test sets: the GPIB address
  
- Multiport test sets: either GPIB address or 0 for Test Set I/O controlled test sets.

Enable Test Set Control When cleared, port switching and control line settings are disabled. This selection affects all channels using the selected test set. When checked, the 'Show Test Set Properties' checkbox is also checked automatically.

Load Test Set File For operating **without** Options 500 or 551.

If your Test Set is not visible, see Add a new Test Set.

The selected test set file is loaded.

1. Navigate to the folder: C:/Program Files/Agilent/Network Analyzer/testsets/
2. Select a test set control file.
The title of the dialog shows the model of the test set file that is currently loaded. See a list of supported test sets.

**Show Test Set Properties** This box becomes checked by default when the Enable Test Set Control is checked. When checked, a second row on the status bar appears which indicates the test set that is being controlled and the current port control selection. For example, the following image shows the status bar when controlling an E5091A test set and a Z5623A K64 test set:

![Status Bar Example](image)

A. Configured channel

B. Port Control settings for E5091A

C. Port Control settings for Z5623A K64

D. Test Set Label. This field is shared between Interface Control and External Test Set Control. The two labels are separated by /.

Control of the second status bar is completely separate from the first status bar, which is controlled from the View, Status Bar menu.

**Test Set Label** NOT available with options 550 and 551. Add text to appear on the second status bar when Show Test Set Properties is checked. See image above.

**Port Control** Controls mapping of Physical ports to Logical ports. (Refer to image of dialog box above.)

- Physical ports are the port numbers that are labeled on the test set front panel.
- Logical ports are the port numbers that are referred to by most of the PNA application prompts and dialog boxes.

**Port Mapping Notes**

- Port Control and Control Line settings effect the channel of the active (selected) measurement. These settings occur as the channel is being measured.
- Correction is turned OFF when port mappings are changed.
- After the physical ports are mapped to logical ports, all PNA references to port numbers refer to LOGICAL port numbers. The only exception to this is during calibrations.

**Control Lines** For use with the U30xxA test sets. Specifies the values of individual control lines. These general purpose control lines on the test set front-panel can be used in your test setup. Each button toggles the control line HIGH and LOW. When first opened, the selections reflect the current control lines. See your test set documentation for more information about the control lines.

**OK** When clicked, the changes to the dialog box are implemented and the port selections and control values are immediately sent to the specified test set. The Port Control and Control line settings are stored with other channel data and used when those channels are swept.

**Cancel** (or Escape) Changes to the dialog are not implemented and revert to the settings before the dialog box was opened.
External Test Sets and other PNA Functions

The following features may work differently with a test set connected to the PNA.

Remote Commands

- See SCPI and COM commands for controlling an External Test Set.
- Use *OPT? (SCPI) or NumberofPorts (COM) to query the number of ports for a PNA/External Test set.
- Use logical receiver notation to refer to double-digit ports.
- Use CALC:PAR:DEF:EXT instead of CALC:PAR:DEF.

Interface Control

When both Interface Control and External Test Set Control are configured, the commands on the Interface Control Before Sweep Start tab are sent out before any External Test Set Control commands are executed on that channel. Similarly, commands on the After Sweep End tab are sent after Test Set Control commands.

Calibration

With an External Test Set connected, calibration is performed exactly like a PNA with the following exceptions:

- Correction is turned OFF when port mappings are modified. This also applies to Source Power Cal.
- Beginning with PNA Rev. A.07.50, for TRL Cal, QSOLT, or Unknown Thru calcs with external test sets:
  - Use of a Delta Match Calibration from a User CalSet is NOT required. However, for a 4-port PNA-L a Global Delta Match Cal must be present. The Global Delta Match Cal can only be performed in stand-alone mode.
  - You can NOT perform any of those 3 cal types on JUST a pair of ports that share a test port receiver, such as Port 1 and Port 2 of a 4-port system. You would need to include an additional port in the calibration.
- With an External Test Set connected, you may be required to perform more than 3 THRU connections.
- A test set such as the Z5623A K44 which is used with 4-port PNA models, does not terminate ports that are not currently in the source path. Because a ports load match on this system is not constant for all possible ports it can be paired with, when calibrating more than two total ports it may be necessary to make Thru measurements on more than the usual minimum number of Thru paths for a PNA calibration. The PNA will ensure that multiport calibrations use a sufficient set of Thru paths so that the calibration can correct for those variations in load match on this type of multiport system.
- As with ALL PNA calibrations, when error correction is ON, both forward and reverse sweeps are required for EACH port pair that is corrected, even if only one reflection measurement is displayed. For example, any displayed measurement with full 4-port calibration ON will require 12 measurement sweeps. Learn more.

Source Power Cal
Source power calibration involves adjusting the source so that the power at an output port is flat across a frequency range. Because of additional loss through some of the test set paths, it may NOT be possible to obtain corrected output power because of limitations on the source signal.

During a Source Power Cal, you are prompted when and where to connect the power sensor. When one of the supported test sets are connected, the prompt refers to the PHYSICAL port number, NOT the LOGICAL port number. To help with translating physical to logical port mappings, enable Show Test Set Properties.

Measurements with Shared Receivers

External test sets do not contain receivers. The PNA receivers are always used to measure signals at the external test set ports. Therefore, when a channel contains two measurements that share a PNA test port receiver, additional sweeps are necessary.

For example, to make S34 and S44 measurements in the same channel with correction OFF:

- On a 4-port PNA, only ONE sweep is required using the C (port 3), D (port 4), and R (reference for All receivers).
- On a N44xx system, TWO sweeps are required since both measurements use the B and R2 receivers. See interactive block diagram above.

Create Ratioed and Unratioed Measurements

When using an external test set, it IS possible to create a Ratioed measurement using two logical receivers that share the same physical PNA receiver. However, this measurement data is NOT valid. Invalid measurement traces show all data at -200 dB (in Log mag format). Learn about Logical Receiver Notation

Logical Port References

When an external test set is enabled, all references to PNA port numbers and test set port numbers (except during calibrations) refer to LOGICAL port numbers. Logical ports can be remapped using the Port Control settings. During a calibration, you are prompted to connect standards to physical port numbers.

Balanced Port Mapping

"Logical Ports" is a term that is used with both External Test Sets and balanced measurements. While the concept is the same, they refer to different scenarios. The two can be easily confused when making Balanced measurements with an External Test Set connected. The important principle to remember is the order in which the logical ports for each are mapped:

1. In the External Test Set - Port Control settings dialog, the physical PNA ports and test set ports are mapped to logical ports as noted above.
2. In the Balanced Topology Dialog, the new (step 1) logical ports are mapped again to become Balanced logical ports.
Preset

Instrument Preset will reset Port Control settings to defaults and remove the test set label. All other settings remain. To maintain port control settings and the test set label, create a User Preset.

Instrument State Save and Recall

Instrument State files include Test Set model, Enable and Status bar settings, and Port mappings and DUT control values for each channel.

If an Instrument State recall requires that a test set configuration file be loaded, recall time may be significant. For example, this would occur if a 2-port PNA with attached test set is configured as a 2-port PNA and then recalls a state file which requires 4-port operation.

Recall Cal Sets

If a Cal Set is saved while an external test set is enabled, when the Cal Set is recalled, then the external test set must be enabled or an error message is displayed.

Copy Channel

Copy Channel copies all relevant test set data from the source channel to the target channel.

Applications

No PNA applications are supported with External Test Set Control. These include FCA (opt 083), SMC (opt 082), GCA (opt 086), NFA (opt 029), Pulsed (opt H08).

Print

Port mapping information appears on the Channel Settings Table when printing.

Save sNp Files

To save sNp data with an external test set enabled, click File, Save As, then select Snp File(*.s*p), then complete the Choose ports dialog.

Display Colors

You can modify the colors that are used to draw various elements on the PNA screen and on a hardcopy print of the display.

See Also
Print Preview

How to modify DISPLAY Colors

These settings can also be accessed from the Preferences dialog box.

- Using front-panel HARDKEY [softkey] buttons
  1. Press **DISPLAY**
  2. then **[More]**
  3. then **[Display Colors]**

- Using a mouse with PNA Menus
  1. Click **Response**
  2. then **Display**
  3. then **Display Colors**

How to modify PRINT Colors

- 1. Press **PRINT**
  2. then **[Print Colors]**

- 1. Click **Utility**
  2. then **Print**
  3. then **Print Colors**
The Display Colors and Print Colors dialog boxes function in exactly the same manner. See Print Preview procedure below.

**Pen**

"Pen" is a term used to describe the various elements. Each pen can have a unique color.

You can change the color of the following pens:

- **Background** - The background color of the inactive windows.
- **New Active Background** - The background color of the active window.
- **Grid** - The inner lines of all grids in all windows, and the grid frame in inactive windows.
- **Active Labels, Grid Frame** - The labels and grid frame colors in the active window. **Note:** when this pen is selected, the current window becomes inactive. Therefore, changes for this pen color will not be visible until OK is pressed.
- **Inactive Window Labels**
- **Failed Trace** - Limit Line failed traces or failure indicators (dots) and the word Fail.
- **The following pens for up to 8 Traces:**
  - Data and Limits
  - Memory trace
  - Markers
  - Memory markers

**About Trace Pens**

'1st Trace' is NOT always Trace1 (Tr1). For example, the first trace in a window might be Tr2 which is drawn with the "1st Trace" pen.

The first 8 traces are drawn with the defined pen colors. The next eight traces reuse the same colors, and so forth. For example, if all traces are numbered sequentially, the 9th and 17th traces are drawn using the same color as the 1st trace.

**Change Color**  Click the button or the color swatch to launch the Change Color dialog.

**Reset Color**  Restores the default color for the selected pen.

**Color Themes**

A theme is a complete set of pens and their colors. The current theme persists until you change it. Themes can also be saved to a file and then later recalled.

- **Save Theme**  Click to save the current set of pens to a file.
- **Recall Theme**  Click to recall and use a saved theme.
• **Reset Theme**  Click to recall the default PNA color theme.

The colors for the following Display elements can NOT be changed: toolbars, softkeys, menus, dialogs and popup messages.

---

**Change Color dialog box help**

To use a basic color, click the color from the 'Basic colors' palette, then click **OK**.

To define and use a custom color:

1. Click **Define Custom Colors**  to open the right side of the dialog.

2. Optionally, pick a Custom color slot to replace. Otherwise, the replacement will occur at the first slot location and continue with subsequent custom color definitions.

3. Click the color pane, or drag the crosshairs, to the location of the custom color.

4. Drag the arrow to the desired saturation level of the custom color.

5. Click **Add to Custom Colors**

6. Continue to define more colors, or click **OK** to close the Color dialog.

After a custom color has been assigned to a PNA pen, the custom color can be changed. The PNA pen color remains unchanged.

---

**Print Preview Procedure**

Use the following procedure to preview your Print Colors on the PNA screen:
1. From the Print Colors dialog, select **Reset Theme** then **Save Theme**. Name the new theme “MyPrintTheme.colors”. This will give you a starting point equal to the default print colors.

2. Launch the Display Colors dialog, select **Recall Theme**, then select “MyPrintTheme.colors”. The display will now show the default print theme.

3. Customize the display colors. You will be previewing how the hardcopy will appear when printed.

4. Save the customized display colors to “MyPrintTheme.colors”.

5. Go to the Print Colors dialog and Recall “MyPrintTheme.colors.”

- 7-Aug-2009  MX New topic
Mechanical Devices

- **Overview**
  - How to access Mechanical Devices settings
  - Mechanical Devices dialog

---

**Other System Configuration Topics**

**Overview**

**Note:** To prevent premature wear, the PNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are **Blocked** - NOT allowed to sweep. Blocked channels will resume sweeping when they are made ACTIVE, or when the conflict is resolved.

Press **TRIGGER** then [**Restart**] to cause ALL channels to sweep once. Then the active channel will resume sweeping continuously.

Before PNA Rev. A.09.20, conflicting channels were put in trigger Hold.

The Mechanical Devices dialog shows the settings of all of the switches and attenuators in the PNA. The settings for all active channels are shown side-by-side for easy comparison. This dialog allows you to determine the settings which would cause mechanical devices to switch between states on consecutive sweeps, potentially leading to device wear-out. It also allows you to determine if the conflict can be resolved to enable continuous sweeps on all channels.

The following are the mechanical devices that are potentially shown in the dialog. These components may not appear in your PNA model:

- Port 1 through Port 4 Bypass Switches
- Port 1 through Port 4 Source Attenuator settings
- Receiver A through Receiver R Attenuator settings
- Port 1 Noise Tuner Switch and Port 2 Noise Receiver Switch
How to access Mechanical Devices settings

<table>

</table>

No programming commands are available for this feature.
**Mechanical Devices** dialog box help

**See Mechanical Devices Overview (scroll up)**

The devices that appear in the table depend on the PNA model and options.

Blue highlighted cells indicate the following:

- The channel is NOT able to sweep. **Blocked** is shown in the top row.
- The highlighted device settings differ from that of the sweeping channels.

To modify entries in the table, click a cell.

When a selection is changed, the new setting is applied immediately.

If **Port Power is coupled**, a dialog prompts if coupling should be turned OFF.

**Not supported**

- **Measurement Class** can NOT be changed from this dialog.
- The dialog does NOT report device settings for **multiport test sets**.
- This dialog does NOT report device settings for **external sources**.

**Trigger** Launches the Trigger dialog box.

**OK** Closes the dialog box.

**Cancel** Does not apply changes that were made, and closes the dialog box.

Power Limit and Power Offset

- **Overview**
- **How to access Power Limit and Power Offset settings**

### Other System Topics

#### Overview

**Power Limit (Global scope)**

Global power limit sets a maximum source power level for individual PNA ports. This value limits port power for all channels and all applications. Power levels that attempt to exceed the power limit is clipped at the limit.

**Notes**

- The power limit can NOT be set for power levels which are below the power level that is required by the PNA to achieve phase lock - approximately -30 dBm.
- Because [Fast Sweep mode](#) allows power spiking, it is NOT allowed when a power limit is enabled.
- Components that are added to the RF path are accounted for by entering their loss (negative) or gain (positive) in the [Power Offset](#) section of the dialog box.
- [PNA Applications](#) may change RF path components. For example, IMD for Converters may change the combiner path and add an amplifier for LO input. Compensation is NOT made for these changes and port power may exceed the power limit or port power may be clipped unnecessarily.
- Power limiting does NOT clip power spikes that may occur during [frequency band crossings](#).
- [External test set ports](#) are also included for power limiting.

**Power Offset (Channel scope)**

Power Offset provides a method of compensating port power for added attenuation or amplification in the source path. The result is that power at the specified port, all dialogs, and annotation, reflects the added components.
How to access the Offsets and Limits settings
Also accessed through the PNA Preferences dialog.

Using front-panel HARDKEY [softkey] buttons
1. Press POWER
2. then [Power and Attenuators]
3. then [Offsets and Limits]

Using a mouse with PNA Menus
1. Click Stimulus
2. then Power
3. then Power and Attenuators
4. then Offsets and Limits

Offsets and Limits dialog box help
Click a WHITE cell to change values. Shaded cells can NOT be changed.
Remote commands can be sent to lock and unlock the dialog box (UI) settings.

Power Limit
Limits the source power at each PNA port for ALL channels. Use this feature to protect DUTs that are sensitive to overpowering at the input. Power levels that exceed the limit at the specified port are clipped at the limit and an error message is displayed on the screen.
The Power Limit settings survive Instrument Preset. When an Instrument State is recalled, the current Power Limit settings are applied to the recalled state.
To learn more, see Power Limit Overview (scroll up).

State / Limit
- **ON** - Power is limited to the adjacent value at the specified source port.
- **OFF** - Power is NOT limited to this value, but to the maximum power of the PNA source.

For PNA models with a second internal source, the **Port 1 Src2** Power Limit setting is NEVER available. Make the setting at the standard **Port 1**.
**Power Offset**

Power Offset provides a method of compensating port power for added attenuation or amplification in the source path. The result is that power at the specified port, all dialogs, and annotation, reflects the added components.

- For amplification, use positive offset.
- For attenuation, use negative offset.

Then optionally change the Source Power or Port Power values so that the following equation reflects your requirement:

\[
\text{Source Power} + \text{Power Offset} = \text{Port Power}
\]

**Source Cal ON / OFF** - The power offset value is used as the default Offset in Source Power Calibration. After a Source Power Calibration is performed, the minimum (offset+correction) value from the Source Power Cal is reported in this dialog and is NOT available to be changed.

**Notes**

- Power Offset can be used with Power Sweeps. When a power sweep is enabled, the Start and Stop power levels are reported in this dialog.
- When port power offsets are used, port powers are automatically uncoupled. Port powers may not be coupled again until all port offsets are zero.

**OK** Closes the dialog box.
Setting System Impedance

The system impedance can be changed for measuring devices with an impedance other than 50 ohms, such as waveguide devices. The PNA mathematically transforms and displays the measurement data as though the PNA ports were the specified impedance value. Physically, the test ports are always about 50 ohms.

How to change the System Impedance

Using front-panel HARDKEY [softkey] buttons

1. Press **SYSTEM**
2. then **Configure**
3. then **System Z0**

Using a mouse with PNA Menus

1. Click **Utility**
2. then **System**
3. then **Configure**
4. then **System Z0**

**System Z0** dialog box help

Allows you to change the system impedance (default setting is 50 ohms).

**Z0**  Displays the current system impedance.

**For 75 ohm devices:**

1. Change the system Z0 to 75 ohms.
2. Connect minimum loss pads (75 ohm impedance) between the analyzer and the DUT to minimize the physical mismatch.
3. Perform a calibration with 75 ohm calibration standards.

**For waveguide devices**

When performing an **Unguided Cal** (NOT required for Guided Calibration):

1. Change the system Z0 to 1 ohm.
2. Perform a calibration with the appropriate waveguide standards.
Synchronize PNA with an External (PSG) Source

Beginning with PNA Rev. 7.22, the PNA External Source Control feature can be used to automatically control external sources. However, this feature requires certain PNA options. Learn more.

Many PNA measurements require the use of at least one external source. For example, when measuring the insertion loss of a mixer, the LO must be swept at the same time as the RF input. This requires the PNA and external source to be synchronized.

The following procedure shows how to manually synchronize the PNA with an Agilent PSG Source. Although the settings will be different, the concept is useful with other sources.

**Hardware configuration**

- Connect the PNA and PSG Time Base ([PNA 10 MHz OUT](#) to PSG 10 MHz IN)

**PNA-L, E866xB Models**

Connect the PSG and [PNA Trigger Connectors](#) as follows:

- PNA Trigger IN to PSG Trigger OUT
- PNA Trigger OUT to PSG Trigger IN

**PNA-X Models**

Connect either pair (1 or 2) of the [AUX Trigger I/O connectors](#) as follows:

- PNA AUX Trig IN to PSG Trigger OUT
- PNA AUX Trig OUT to PSG Trigger IN

Learn more about the AUX Trigger capabilities.

**PNA Settings**

- **Number of points**: Same as PSG
- **Frequency span**: Does NOT have to be the same as PSG

**PNA Trigger Settings**

- Trigger Source:
  - PNA-L and E866xB models: [External](#)
  - PNA-X: [Internal, Manual](#)
• Trigger Scope: **Channel**

• Channel Trigger State: **Same as PSG Sweep Repeat setting** *(Continuous or Single)*

• Point Sweep: **Checked**

### External / Auxiliary Trigger Settings

• Trigger In / Out Polarity: **Same as PNA**
What is Happening?

The following is a flow diagram showing the handshake / synchronization process between the PNA and an External Source.

Text Description

1. After the measurement setup is complete, both instruments wait on the first data point of a measurement sweep. Both instruments are configured for Continuous or Single sweep.

2. (see note below) A trigger signal from the source starts the measurement. This is usually accomplished by a key press on the source front panel.

3. PNA data acquisition (measurement) starts, and then stops AFTER the first data point acquisition.

4. The PNA sends a trigger signal out to the source telling it to move to the next frequency data point. This signal can optionally be sent BEFORE data acquisition if required by your application.

5. The external source and PNA move to the next data point. The source usually takes longer than the PNA.

6. The source sends the Ready for Trigger signal to the PNA.

- **PNA-L and E866xB models** - If the source arrives first, the Accept Trigger Before Armed setting is used to accept the trigger signal even if the PNA is not yet ready to start acquisition.

- **PNA-X using AUX Triggering** - If enabled, the PNA waits indefinitely for a trigger signal from the source. Although AUX triggering does NOT have the Accept Trigger Before Armed setting, the Ready for Trigger signal is latched and has the same effect.

**Step 2 Note**  PNA-X (Aux TRIG IN) The PNA looks for a level trigger at the start of each sweep, and an edge thereafter. This assumes that the external source ready line will remain in the ready state (high or low) until triggered (step 4) and will then transition to the NOT ready state while moving to the next frequency, and then transition again to the ready state.
How do you know when the PNA and PSG are in synch?

The measurement results are the ultimate test of whether the source and PNA are synchronized. However, it is possible to see the PSG and PNA sweeping at exactly the same time.

First, lower the PNA IFBandwidth or increase the sweep time so that the sweep is slow enough to watch the sweep indicator moving across the PNA screen. At the same time, watch the PSG "progress bar" as it moves through the entire sweep.

If the PNA is stopped in the middle of a sweep, then re-triggered, it returns to the first data point. The PSG continues from where it stopped. Therefore, to re-synch the two instruments, the PSG needs to return to the first data point. There are a number of ways to do this. One way is to press the PSG Manual button to ON, then OFF. Then trigger a new sweep.

To trigger a sweep

- **Single** Trigger mode: Both the PNA and PSG Single (trigger) buttons must be pressed (in any order) for each trigger.

- **Continuous** Trigger mode: First, reset the PSG to the first data point, then press the PNA Continuous (trigger) button.

Maintaining Synchronization

In general, the above setup should start the two instruments sweeping simultaneously. However, any interaction with the PNA could cause the PNA sweep to abort or delay, in which case the two instruments will be out of sync. To avoid this, you can use the PNA Interface Control feature to send an ABORT to the external device after each sweep.

When the PNA ends a sweep, it sends an ABORT to stop the source. A trigger signal is then sent, either Continuous (automatically) or Single (manual). In either case, both instruments start sweeping in synch.

This takes more time to sweep, but maintains synchronization.

For example, to use this feature with Agilent’s PSG source, you would add the following:

On the “After Sweep End” tab, type:

```
24 :ABORT
```

Where 24 is the GPIB address of the source.

Last Modified:

- 21-Dec-2010  Fixed source model number
- 24-Aug-2010  Fixed PSG trigger labels
- 11-Feb-2008  Updated note
- 1-Jun-2007   Added 7.22 update
- 1-Jan-2007   MX Updated for PNA-X

### Safety Reminders

**When cleaning connectors:**

- Always use protective eyewear when using compressed air or nitrogen.
- Keep isopropyl alcohol away from heat, sparks and flame. Use with adequate ventilation. Avoid contact with eyes, skin and clothing.
- Avoid electrostatic discharge (ESD). Wear a grounded wrist strap (having a 1 MΩ series resistor) when cleaning device, cable or test port connectors.
- Cleaning connectors with alcohol shall only be done with the instruments power cord removed, and in a well-ventilated area. Allow all residual alcohol moisture to evaporate, and the fumes to dissipate prior to energizing the instrument.

### About Connectors
Connector Service Life

Even though calibration standards, cables, and test set connectors are designed and manufactured to the highest standards, all connectors have a limited service life. This means that connectors can become defective due to wear during normal use. For best results, all connectors should be inspected and maintained to maximize their service life.

Visual Inspection should be performed each time a connection is made. Metal particles from connector threads often find their way onto the mating surface when a connection is made or disconnected. See Inspection procedure.

Cleaning the dirt and contamination from the connector mating plane surfaces and threads can extend the service life of the connector and improve the quality of your calibration and measurements. See Cleaning procedure.

Gaging connectors not only provides assurance of proper mechanical tolerances, and thus connector performance, but also indicate situations where the potential for damage to another connector may exist. See Gaging procedure.

Proper connector care and connection techniques yield:

- Longer Service Life
- Higher Performance
- Better Repeatability

Connector Grades and Performance

The three connector grades (levels of quality) for the popular connector families are listed below. Some specialized types may not have all three grades.

- Production grade connectors are the lowest grade and the least expensive. It is the connector grade most commonly used on the typical device under test (DUT). It has the lowest performance of all connectors due to its loose tolerances. This means that production grade connectors should always be carefully inspected before making a connection to the analyzer. Some production grade connectors are not intended to mate with metrology grade connectors.

- Instrument grade is the middle grade of connectors. It is mainly used in and with test instruments, most cables and adapters, and some calibration standards. It provides long life with good performance and tighter tolerances. It may have a dielectric supported interface and therefore may not exhibit the excellent match of a metrology grade connector.

- Metrology grade connectors have the highest performance and the highest cost of all connector grades. This grade is used on calibration standards, verification standards, and precision adapters. Because it is a high precision connector, it can withstand many connections and disconnections and, thus, has the longest life of all connector grades. This connector grade has the closest material and geometric specifications. Pin diameter and pin depth are very closely specified. Metrology grade uses an air dielectric interface and a slotless female contact which provide the highest performance and traceability.
**Note:** In general, Metrology grade connectors should not be mated with Production grade connectors.

**Adapters as Connector Savers**

Make sure to use a high quality (Instrument grade or better) adapter when adapting a different connector type to the analyzer test ports. It is a good idea to use an adapter even when the device under test is the same connector type as the analyzer test ports. In both cases, it will help extend service life, and protect the test ports from damage and costly repair.

The adapter must be fully inspected before connecting it to the analyzer test port and inspected and cleaned frequently thereafter. Because calibration standards are connected to the adapter, the adapter should be the highest quality to provide acceptable RF performance and minimize the effects of mismatch.

**Connector Mating Plane Surfaces**

An important concept in RF and microwave measurements is the reference plane. For a network analyzer, this is the surface that all measurements are referenced to. At calibration, the reference plane is defined as the plane where the mating plane surfaces of the measurement port and the calibration standards meet. Good connections (and calibrations) depend on perfectly flat contact between connectors at all points on the mating plane surfaces (as shown in the following graphic).

![Mating Plane Surfaces](image)

**Gaging Fundamentals**

Connector gages are important tools used to measure center conductor pin depth in connectors. Connector pin depth, measured in terms of recession or protrusion, is generally the distance between the mating plane and the end of the center conductor, or the shoulder of the center conductor for a stepped male pin.

**Typical Connector Gage**
Recession and Protrusion

Pin depth is negative (recession) if the center conductor is recessed below the outer conductor mating plane, usually referred to as the "reference plane". Pin depth is positive (protrusion) if the center conductor projects forward from the connector reference plane.

Pin Depth

1. Recession of female contact
2. Recession of male pin shoulder

Difference with Type-N Connectors
Type-N connectors have the mating plane of the center conductors offset from the connector reference plane. In this case the zero setting “gage masters” generally offset the nominal distance between the center conductor mating plane and the connector reference plane.

**When to Gage Connectors**

- Before using a connector or adapter the first time.
- When visual inspection or electrical performance suggests the connector interface may be out of range.
- After every 100 connections, depending on use.

**Connector Gage Accuracy**

Connector gages (those included with calibration and verification kits), are capable of performing coarse measurements only. This is due to the repeatability uncertainties associated with the measurement. It is important to recognize that test port connectors and calibration standards have mechanical specifications that are extremely precise. Only special gaging processes and electrical testing (performed in a calibration lab) can accurately verify the mechanical characteristics of these devices. The pin depth specifications in the Agilent calibration kit manuals provide a compromise between the pin depth accuracy required, and the accuracy of the gages. The gages shipped with calibration and verification kits allow you to measure connector pin depth and avoid damage from out-of-specification connectors.

**Note:** Before gaging any connector, the mechanical specifications provided with that connector or device should be checked.

**To Gage Connectors**

1. Wear a grounded wrist strap (having a 1 MΩ series resistor).
2. Select proper gage for device under test (DUT).
3. Inspect and clean gage, gage master, and DUT.
4. Zero the connector gage.
   a. While holding gage by the barrel, carefully connect gage master to gage. Finger-tighten connector nut only.
   b. Use proper torque wrench to make final connection. If needed, use additional wrench to prevent gage master (body) from turning. Gently tap the barrel to settle the gage.
   c. The gage pointer should line up exactly with the zero mark on gage. If not, adjust “zero set” knob until gage pointer reads zero. On gages having a dial lock screw and a movable dial, loosen the dial lock screw and move the dial until the gage pointer reads zero. Gages should be zeroed before each set of measurements to make sure zero setting has not changed.
   d. Remove gage master.
5. Gage the device under test.
   a. While holding gage by the barrel, carefully connect DUT to gage. Finger-tighten connector nut only.
   b. Use proper torque wrench to make final connection and, if needed, use additional wrench to prevent DUT (body) from turning. Gently tap the barrel to settle the gage.
c. Read gage indicator dial for recession or protrusion and compare reading with device specifications.

**Caution:** If the gage indicates excessive protrusion or recession, the connector should be marked for disposal or sent out for repair.

6. For maximum accuracy, measure the device a minimum of three times and take an average of the readings. After each measurement, rotate the gage a quarter-turn to reduce measurement variations.

7. If there is doubt about measurement accuracy, be sure the temperatures of the parts have stabilized. Then perform the cleaning, zeroing, and measuring procedure again.

**Connector Care Procedures**

- **Inspecting Connectors**
- **Cleaning Connectors**
- **Making Connections**
- **Using a Torque Wrench**
- **Handling and Storing Connectors**

**To Inspect Connectors**

Wear a grounded wrist strap (having a 1 MΩ series resistor).

Use a magnifying glass (≥10X) and inspect connector for the following:

- Badly worn plating or deep scratches
- Deformed threads
- Metal particles on threads and mating plane surfaces
- Bent, broken, or mis-aligned center conductors
- Poor connector nut rotation

**Caution:** A damaged or out-of-specification device can destroy a good connector attached to it even on the first connection. Any connector with an obvious defect should be marked for disposal or sent out for repair.

**To Clean Connectors**

1. Wear a grounded wrist strap (having a 1 MΩ series resistor).

2. Use clean, low-pressure air to remove loose particles from mating plane surfaces and threads. Inspect connector thoroughly. If additional cleaning is required, continue with the following steps.

4. Clean contamination and debris from mating plane surfaces and threads. When cleaning interior surfaces, avoid exerting pressure on center conductor and keep swab fibers from getting trapped in the female center conductor.

5. Let alcohol evaporate—then use compressed air to blow surfaces clean.

6. Inspect connector. Make sure no particles or residue remains.

7. If defects are still visible after cleaning, the connector itself may be damaged and should not be used. Determine the cause of damage before making further connections.

To Make Connections

1. Wear a grounded wrist strap (having a 1 MΩ series resistor).

2. Inspect, clean, and gage connectors. All connectors must be undamaged, clean, and within mechanical specification.

3. Carefully align center axis of both devices. The center conductor pin—from the male connector—must slip concentrically into the contact finger of the female connector.

4. Carefully push the connectors straight together so they can engage smoothly. Rotate the connector nut (not the device itself) until finger-tight, being careful not to cross the threads.
5. Use a torque wrench to make final connection. Tighten until the "break" point of the torque wrench is reached. Do not push beyond initial break point. Use additional wrench, if needed, to prevent device body from turning.

To Separate a Connection

1. Support the devices to avoid any twisting, rocking or bending force on either connector.
2. Use an open-end wrench to prevent the device body from turning.
3. Use another open-end wrench to loosen the connector nut.
4. Complete the disconnection by hand, turning only the connector nut.
5. Pull the connectors straight apart.

To Use a Torque Wrench

1. Make sure torque wrench is set to the correct torque setting.
2. Position torque wrench and a second wrench (to hold device or cable) within 90° of each other before applying force. Make sure to support the devices to avoid putting stress on the connectors.
3. Hold torque wrench lightly at the end of handle—then apply force perpendicular to the torque wrench handle. Tighten until the "break" point of the torque wrench is reached. Do not push beyond initial break point.

**TORQUING DIRECTION**

**STOP WHEN HANDLE BEGINS TO YIELD**

**To Handle and Store Connectors**

- Install protective end caps when connectors are not in use.
- Never store connectors, airlines, or calibration standards loose in a box. This is a common cause of connector damage.
- Keep connector temperature the same as analyzer. Holding the connector in your hand or cleaning connector with compressed air can significantly change the temperature. Wait for connector temperature to stabilize before using in calibration or measurements.
- Do not touch mating plane surfaces. Natural skin oils and microscopic particles of dirt are difficult to remove from these surfaces.
- Do not set connectors contact-end down on a hard surface. The plating and mating plane surfaces can be damaged if the interface comes in contact with any hard surface.
- Wear a grounded wrist strap and work on a grounded, conductive table mat. This helps protect the analyzer and devices from electrostatic discharge (ESD).
Electrostatic Discharge (ESD) Protection

Protection against electrostatic discharge (ESD) is essential while removing or connecting cables to the network analyzer. Static electricity can build up on your body and can easily damage sensitive internal circuit elements when discharged. Static discharges too small to be felt can cause permanent damage. To prevent damage to the instrument:

- **Always** have a grounded, conductive table mat in front of your test equipment.
- **Always** wear a grounded wrist strap, connected to a grounded conductive table mat, having a 1 MΩ resistor in series with it, when making test setup connections.
- **Always** wear a heel strap when working in an area with a conductive floor. If you are uncertain about the conductivity of your floor, wear a heel strap.
- **Always** ground yourself before you clean, inspect, or make a connection to a static-sensitive device or test port. You can, for example, grasp the grounded outer shell of the test port or cable connector briefly.
- **Always** ground the center conductor of a test cable before making a connection to the analyzer test port or other static-sensitive device. This can be done as follows:
  1. Connect a short (from your calibration kit) to one end of the cable to short the center conductor to the outer conductor.
  2. While wearing a grounded wrist strap, grasp the outer shell of the cable connector.
  3. Connect the other end of the cable to the test port and remove the short from the cable.

See **Analyzer Accessories** for ESD part numbers.
**Absolute Output Power**

An absolute output-power measurement displays absolute power versus frequency.

- **What is Absolute Output Power?**
- **Why Measure Absolute Output Power?**
- **Accuracy Considerations**
- **How to Measure Absolute Output Power**

### What is Absolute Output Power?

An absolute-output power measurement displays the power present at the analyzer's input port. This power is absolute—it is not referenced (ratioed) to the incident or source power. In the log mag format, values associated with the grid's vertical axis are in units of dBm, which is the power measured in reference to 1 mW.

- 0 dBm = 1 mW
- -10 dBm = 100 μW
- +10 dBm = 10 mW

In the linear mag format, values associated with the grid's vertical axis are in units of watts (W).

### Why Measure Absolute Output Power?

Absolute output power is measured when the amplifier's output must be quantified as absolute power rather than a ratioed relative power measurement. For example, during a gain compression measurement, it is typical to also measure absolute output power. This shows the absolute power out of the amplifier where 1-dB compression occurs.

### Accuracy Considerations

The output power of the amplifier should be sufficiently attenuated if necessary. Too much output power could:

- Damage the analyzer receiver
- Exceed the input compression level of the analyzer receiver, resulting in inaccurate measurements.

Attenuation of the amplifier's output power can be accomplished using either attenuators or couplers.

The amplifier may respond very differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.

### How to Measure Absolute Power
Do the following to measure absolute output power:

1. Preset the analyzer.
2. Select an unratioed power measurement (receiver B).
3. Set the analyzer’s source power to 0 dBm.
4. Select an external attenuator (if needed) so the amplifier’s output power will be sufficiently attenuated to avoid causing receiver compression or damage to the analyzer’s port-2.
5. Connect the amplifier as shown in the following graphic, and provide the dc bias.

6. Select the analyzer settings for your amplifier under test.
7. Remove the amplifier and connect the measurement ports together. Store the data to memory. Be sure to include the attenuator and cables in the test setup if they will be used when measuring the amplifier.
8. Save the instrument state to memory.
9. Reconnect the amplifier.
10. Select the data math function Data/Memory.
11. Scale the displayed measurement for optimum viewing and use a marker to measure the absolute output-power at a desired frequency.
12. Print or save the data to a disk.
AM-PM Conversion

The AM-PM conversion of an amplifier is a measure of the amount of undesired phase deviation (PM) that is caused by amplitude variations (AM) inherent in the system.

- What Is AM-PM Conversion?
- Why Measure AM-PM Conversion
- Accuracy Considerations
- How to Measure AM-PM Conversion

What Is AM-PM Conversion?

AM-to-PM conversion measures the amount of undesired phase deviation (PM) that is caused by amplitude variations (AM) of the system. For example, unwanted phase deviation (PM) in a communications system can be caused by:

Unintentional amplitude variations (AM)

- Power supply ripple
- Thermal drift
- Multipath fading

Intentional modulation of signal amplitude

- QAM
- Burst modulation

AM-to-PM conversion is usually defined as the change in output phase for a 1-dB increment in the power-sweep applied to the amplifier's input (i.e. at the 1 dB gain compression point). It is expressed in degrees-per-dB (°/dB). An ideal amplifier would have no interaction between its phase response and the power level of the input signal.
Why Measure AM-PM Conversion

AM-to-PM conversion is a critical parameter in systems where phase (angular) modulation is used, such as:

- FM
- QPSK
- 16QAM

It is a critical parameter because undesired phase deviation (PM) causes analog signal degradation, or increased bit-error rates (BER) in digital communication systems. While it is easy to measure the BER of a digital communication system, this measurement alone does not help you understand the underlying causes of bit errors. AM-to-PM conversion is one of the fundamental contributors to BER, and therefore it is important to quantify this parameter in communication systems.

Refer to the I/Q diagram below for the following discussion on how AM-to-PM conversion can cause bit errors.
The desirable state change is from the small solid vector to the large solid vector.

With AM-to-PM conversion, the large vector may actually end up as shown with the dotted line. This is due to phase shift that results from a change in the input power level.

For a 64QAM signal as shown (only one quadrant is drawn), we see that the noise circles that surround each state would actually overlap, which means that statistically, some bit errors would occur.

**Accuracy Considerations**

With this method of measuring AM-to-PM conversion, the modulation frequency is approximately the inverse of the sweep time. Even with the fastest power sweep available on most network analyzers, the modulation frequency ends up being fairly low (typically less than 10 Hz). This could cause a slight temperature change as the sweep progresses, especially if the amplifier has low thermal mass, typical of an unpackaged device. Results using this method could differ slightly if the nonlinear behavior of an amplifier is extremely sensitive to thermal changes. (The PNA series analyzers can make power sweeps <1 ms.)

- The amplifier may respond very differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.
- The output power of the amplifier should be sufficiently attenuated if necessary. Too much output power could:
  - damage the analyzer receiver
  - exceed the input compression level of the analyzer receiver, resulting in inaccurate measurements
- **Attenuation** of the amplifier’s output power can be accomplished using:
  - Attenuators
  - Couplers
- The frequency-response effects of the attenuators and couplers must be accounted for during calibration since they are part of the test system. Proper error-correction techniques can reduce these effects.
- The frequency response is the dominant error in an AM-to-PM conversion measurement setup. Performing a
thru-response measurement calibration significantly reduces this error. For greater accuracy, perform a 2-port measurement calibration.

**How to Measure AM-PM Conversion**

1. Preset the analyzer.

2. Select an S21 measurement in the power-sweep mode.

3. Enter the start and stop power levels for the analyzer's power sweep. The start power level should be in the linear region of the amplifier's response (typically 10-dB below the 1-dB compression point). The stop power should be in the compression region of the amplifier's response.

4. Select an external attenuator (if needed) so the amplifier's output power will be sufficiently attenuated to avoid causing receiver compression or damage to the analyzer's port 2.

5. Connect the amplifier as shown in the following graphic, and provide the dc bias.

![Amplifier Diagram](image)

6. Select the analyzer settings for your amplifier under test in order to perform a swept-power gain compression measurement at a chosen frequency. See *Gain Compression*.

7. Remove the amplifier and perform a measurement calibration. Be sure to include the attenuator and cables in the calibration setup if they will be used when measuring the amplifier.

8. Save the instrument state to memory.

9. Reconnect the amplifier.

10. Use a reference marker to target the amplifier's input power at the 1-dB gain compression point. Select a second marker and adjust its stimulus value until its response is 1-dB below the reference marker.

11. Change the S21 measurement from a log magnitude format to a **phase** format (no new calibration is required).

12. Find the **phase** change between the markers. The value is the AM-to-PM conversion coefficient at the 1-dB gain compression point.

13. Print the data or save it to a disk.

**Gain**

\[
\text{Gain (dB)} = -20\log_{10}\left(\frac{V_{\text{trans}}}{V_{\text{inc}}}\right)
\]

\[
\text{Gain (dB)} = P_{\text{out}}(\text{dBm}) - P_{\text{in}}(\text{dBm})
\]

The ratio of the amplifier’s output power (delivered to a Z₀ load) to the input power (delivered from a Z₀ source). Z₀ is the characteristic impedance, in this case, 50Ω.

For small signal levels, the output power of the amplifier is proportional to the input power. Small signal gain is the gain in this linear region.

As the input power level increases and the amplifier approaches saturation, the output power reaches a limit and the gain drops. Large signal gain is the gain in this nonlinear region. See **Gain Compression**.

**Gain Flatness**

The variation of the gain over the frequency range of the amplifier. See **Small Signal Gain and Flatness**.
**Reverse Isolation**

The measure of transmission from output to input. Similar to the gain measurement except the signal stimulus is applied to the output of the amplifier. See Reverse Isolation.

**Gain Drift versus Time (temperature, bias)**

The maximum variation of gain as a function of time, with all other parameters held constant. Gain drift is also observed with respect to other parameter changes such as temperature, humidity or bias voltage.

**Deviation from Linear Phase**

The amount of variation from a linear phase shift. Ideally, the phase shift through an amplifier is a linear function of frequency. See Deviation from Linear Phase.

**Group Delay**

\[ \tau_g (\Delta \omega) = - \frac{\Delta \theta}{\Delta \omega} \]

\[ = - \frac{1}{360} \cdot \frac{\Delta \theta}{\Delta f} \]

The measure of the transit time through the amplifier as a function of frequency. A perfectly linear phase shift would have a constant rate of change with respect to frequency, yielding a constant group delay. See Group Delay.

**Return Loss (SWR, \( \rho \))**

\[ \Gamma = \frac{V_{ref}}{V_{inc}} = \rho \angle \phi \]

Reflection coefficient = \( \rho \)

Return loss (dB) = \(-20 \log_{10} \rho\)

\[ SWR = \frac{1 + \rho}{1 - \rho} \]

The measure of the reflection mismatch at the input or output of the amplifier relative to the system \( Z_0 \) characteristic impedance.

**Complex Impedance**

\[ Z = \frac{1 + \Gamma}{1 - \Gamma} \cdot Z_0 \]

\[ = - R + jX \]

Complex impedance \((1+G)\). The amount of reflected energy from an amplifier is directly related to its impedance. Complex impedance consists of both a resistive and a reactive component. It is derived from the characteristic impedance of the system and the reflection coefficient. See Complex Impedance.

**Gain Compression**
The AM-to-PM conversion coefficient is expressed in units of degrees/dB at a given power level (usually $P_{1\text{dB}}$, which is the 1 dB gain compression point). See AM-PM Conversion.
Antenna Measurements

This topic describes how to setup the PNA to make S21 measurements on an array of antennas. Measurements can be made on up to 100 antenna arrays (Ports) and up to 15 discrete frequencies.

Measurement Sequence

1. The PNA is set to a start frequency.
2. As the antenna moves, the PNA responds to each external trigger signal by measuring an antenna port.
3. When all ports are measured, the PNA increments to the next frequency.
4. Again the PNA measures all ports, and so forth until all ports are measured at all frequencies in the forward direction.
5. As the antenna begins moving in the opposite direction, the same sequence occurs, except the PNA decrements in frequency until all ports are measured at all frequencies and the PNA is set back to the original start frequency.

Once setup, only external trigger signals are sent to the PNA. After each trigger, measurement data is stored in internal PNA memory.

How to set up the PNA

1. On the System menu click Preset.
2. On the Sweep menu point to Trigger then click Trigger.
3. In Trigger Source click External.
4. In Trigger Scope click Channel.
5. Click OK.

Forward Sweep

2. Click S21 then Channel Number 1.
3. On the Sweep menu point to Trigger then click Trigger.
4. In Channel Trigger State check Point Sweep.
5. Click OK.
6. On the Sweep menu click Sweep Type: then Segment Sweep.
7. Click OK.
8. On the View menu point to Tables then click Segment Table

9. Do this 15 times - Sweep menu point to Segment Table then Insert Segment

10. For each Segment in the Segment table:

   1. Click State: and select ON
   2. Double click both START and STOP Frequency: (each new segment ascends in frequency)
   3. Double click Points: type Number of Ports (elements)

Reverse sweep
Repeat the following steps for each frequency: (up to 15)

- Increment the channel number (X) Starting with Channel 2
- Decrement the frequency (F)

1. On the Trace menu click New Trace...
2. Click S21 then Channel Number X
3. When a window contains four traces, check Create in New Window.
4. Click OK
5. On the Sweep menu point to Trigger then click Trigger
6. In Channel Trigger State check Point Sweep
7. Click OK
8. On the Sweep menu click Sweep Type: then Segment Sweep
9. Click OK
10. On the View menu point to Tables then click Segment Table
11. In the Segment table

   1. Click State: and select ON
   2. Double click both START and STOP Frequency F
   3. Double click Points: type Number of Ports (elements)

Balanced Measurements

- **What are Balanced Devices?**
- **Differential and Common Modes Model**
- **Measuring Mixed Mode (Balanced) S-Parameters**
- **Measuring Imbalance Parameters**
- **Measuring CMRR**
- **Port Mapping**
- **How the PNA makes Balanced Measurements**

Other Measurement Setup Topics

Check out the Integrated True Mode Stimulus Application ([iTMSA](#)).

**What are Balanced Devices?**

Standard **Single-ended devices** generally have one input port and one output port. Signals on the input and output ports are referenced to ground.

Balanced devices have two pins on either the input, the output, or both. The signal of interest is the difference and average of the two input or output lines, not referenced to ground.

**Differential and Common Modes Model**

On balanced devices, the signal of interest is the **difference** and **average** of the two input or output lines. In balanced device terminology, these signals are known as the Differential and Common modes.

The following model shows how two signals (A and B) combine to create Differential and Common mode signals:
- Signal A is fixed at 1V peak
- Signal B is selectable
- Differential is calculated as \( A - B \)
- Common is calculated as the \( \text{AVERAGE} \) of A and B

**Note:** Click Signal B selections to see various Differential and Common signals.

<table>
<thead>
<tr>
<th>Signal B = SELECTABLE</th>
<th>Calculations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-ended 0V</td>
<td>1 - 0 = 1</td>
</tr>
<tr>
<td>180° Out of Phase 1V</td>
<td>1 - (-1) = 2</td>
</tr>
<tr>
<td>180° Out of Phase 2V</td>
<td>1 - (-2) = 3</td>
</tr>
<tr>
<td>In Phase 1V</td>
<td>1 - 1 = 0</td>
</tr>
<tr>
<td>In Phase 2V</td>
<td>1 - 2 = -1</td>
</tr>
</tbody>
</table>

**Notes:**

- Even when Signal B is 0V, like a Single-ended signal, there is still a unique Differential and Common mode representation of the two individual signals.
- The above model does not show a DUT. The difference and average of two signals can be calculated for both the balanced INPUT and balanced OUTPUT of a device.

**Measuring Mixed Mode (Balanced) S-Parameters**

Mixed mode S-parameters combine traditional S-parameter notation with balanced measurement terminology. Some balanced devices are designed to amplify the differential component and reject the common component. This allows noise that is common to both inputs to be virtually eliminated from the output. For example, a balanced device may amplify the differential signal by a factor of 5, and attenuate the common signal by a factor of 5. Using
traditional S-parameter notation, an S21 is a ratio measurement of the device **Output** / device **Input**. Mixing this with balanced terminology, we could view the amplifier's Differential Output signal / Differential Input signal. To see this parameter on the PNA, we would select an Sdd21 measurement using the following balanced notation:

**Sabxy** -

Where

- **a** - device output mode
- **b** - device input mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output "logical" port number
- **y** - device input "logical" port number

**See Also**

[Logical port mapping](#)

[Port mapping with External Test Sets](#)

[iTMSA](#)

**Measuring Imbalance Parameters**

Imbalance is a measure of how well two physical ports that make up a balanced port are matched. With a perfectly balanced port, the same amount of energy flows to both ports and the magnitude of the ratio of these ports is 1. The notation is similar to traditional S-parameters. In the following diagrams, the letters a, b, c, and d are used because any PNA port can be assigned to any logical port using the [port mapping process](#).

For example, in the following single-ended - balanced formula, **Sba** indicates the device output port is logical port b and the input port is logical port a.

![Imbalance parameter when measuring a single-ended - balanced device.](image)
Imbalance1 and Imbalance2 parameters when measuring a balanced - balanced device.

\[
\text{Imbal1} = -\frac{S_{ac} - S_{ad}}{S_{bc} - S_{bd}}
\]

\[
\text{Imbal2} = -\frac{S_{ca} - S_{cb}}{S_{da} - S_{db}}
\]

Imbalance1 and Imbalance2 parameters when measuring a single-ended - single-ended - balanced device.

\[
\text{Imbal1} = -\frac{S_{ac} - S_{ad}}{S_{bc} - S_{bd}}
\]

\[
\text{Imbal2} = -\frac{S_{ca} - S_{cb}}{S_{da} - S_{db}}
\]

**Measuring CMRR (Common Mode Rejection Ratio)**

CMRR is a ratio of the transmission characteristic in differential mode over the transmission characteristic in the common mode of the balanced port as the measurement parameter. A high value indicates more rejection of common mode, which is desirable in a device that transmits information in the differential portion of the signal. The table below shows the CMRR parameter you can select when measuring each balanced device.
Device Topology and Port Mapping

As we have seen on balanced inputs and outputs, the signal of interest is the difference or average of two BALANCED input or BALANCED output lines. It is also possible to have single-ended ports AND balanced ports on the same device. The two balanced input or output lines are referred to as a single "logical" port.

When configuring a balanced measurement on the PNA, select a device ‘topology’. Then map each PNA test port to the DUT ports. The PNA assigns "logical ports". See how to set device topology in the PNA.

The following device topologies can be measured by a 4-port PNA.

- **Balanced / Balanced**
  (2 logical ports - <4 actual ports>)
- **Single-ended / Balanced**
  (2 logical ports - <3 actual ports>)

- **Single-ended - Single-ended / Balanced**
  (3 logical ports - <4 actual ports>)

These topologies can be used in the reverse (⇐⇒) direction to measure:

- **Balanced / Single-ended** topology
- **Balanced / Single-ended - Single-ended** topology

For example, to measure a **Balanced / Single-ended** topology, measure the S12 (reverse direction) of a **Single-ended / Balanced** topology.

**How the PNA makes Balanced Measurements**

When using standard Balanced measurements, the PNA does not provide true balanced measurements by stimulating both balanced inputs together and measuring both outputs relative to one another. Instead, the PNA makes only Single-ended measurements. On a Balanced/Balanced device, it stimulates each input and measures each output individually. From the output data, the PNA calculates the Differential and Common outputs from the DUT using the same math formulas as the above model. However, all measurements and calculations on the PNA are performed in frequency domain using complex (magnitude and phase) data. The Balanced S-parameter display data is then calculated from the Differential and Common inputs and outputs.

In iTMSA mode, the PNA **DOES** stimulate both balanced inputs with true balanced sources. [Learn more](#).

Complex Impedance

When making an S11 or S22 measurement of your device under test, you can view complex-impedance data such as series resistance and reactance as well as phase and magnitude information. Complex impedance data can be viewed using either the Smith Chart format or the Polar format.

- What Is Complex Impedance?
- Accuracy Considerations
- How to Measure Complex Impedance

What Is Complex Impedance?
Complex-impedance data is information that can be determined from an S11 or S22 measurement of your device under test, such as:

- Resistance
- Reactance
- Phase
- Magnitude

The amount of power reflected from a device is directly related to the impedances of both the device and the measuring system. For example, the value of the complex reflection coefficient ($\Gamma$) is equal to 0 only when the device impedance and the system impedance are exactly the same (i.e. maximum power is transferred from the source to the load). Every value for $\Gamma^*$ corresponds uniquely to a complex device impedance (as a function of frequency), according to the equation:

$$Z_L = \frac{(1 + \Gamma^*)}{(1 - \Gamma^*)} \times Z_0$$

where $Z_L$ is your test device impedance and $Z_0$ is the measuring system's characteristic impedance.

Complex Impedance is best viewed using either Polar or Smith Chart format.

Accuracy Considerations

- The Smith chart is most easily understood when used with a full scale value of 1.0.
- For greater accuracy when using markers in the Smith chart or polar formats, activate the discrete marker mode.
- The uncertainty of reflection measurements is affected by:
  - Directivity
  - Reflection tracking
  - Source match
  - Load match (with 2-port devices)
With a 2-port calibration, the effects of these factors are reduced. A 1-port calibration provides the same accuracy if the output of the device is well terminated. Refer to the graphic below for the following discussion.

- If you connect the device between both analyzer ports, it is recommended that you use a 10 dB pad on the output of the device to improve measurement accuracy. This is not necessary if you use a 2-port calibration since it corrects for load match.

- If you connect a two-port device to only one analyzer port, it is recommended that you use a high-quality load (such as a calibration standard) on the output of the device.

**How to Measure Complex Impedance**

1. Connect the device as shown in the previous graphic.
2. Preset the analyzer.
3. Set up, calibrate, and perform an S11 or S22 measurement.
4. View impedance data:
   - a. Select the Smith Chart format.
   - b. Scale the displayed measurement for optimum viewing.
   - c. Position the marker to read the resistive and reactive components of the complex impedance at any point along the trace.
   - d. Print the data or save it to a disk.
5. View the magnitude and phase of the reflection coefficient:
   - a. Select the Smith chart format or the Polar format.
   - b. Select either Lin Marker or Log Marker formats.
   - c. Scale the displayed measurement for optimum viewing.
   - d. Position the marker to read the frequency, magnitude, and phase of the reflection coefficient (Γ) at any point along the trace.
   - e. Print the data or save it to a disk.
Comparing the PNA "Delay" Functions

The PNA has three Delay functions which are similar but are used in different ways.

1. **Group Delay format** is used to display the Group Delay of a network. Group Delay is defined as:

\[ -\frac{d(\phi)}{d(\omega)} \]  

where \( \phi \) is radian angle, and \( \omega \) is radian frequency.

Since it is defined by a derivative, the value must be determined from an analytic function. However, the PNA makes discrete measurements, so we approximate the group delay by taking the finite difference:

\[ \frac{1}{360} \frac{\delta(\phi)}{\delta(f)} \]  

where \( \phi \) is degree angle and \( f \) is frequency in Hz. The \( 1/360 \) does the proper conversion of degrees to radians and Hz frequency to radian frequency.

From this we can see that, if the phase response of a network varies with frequency, then the Group Delay must vary as well. In fact, many filters are specified by the variation of their Group Delay.

If we measure the phase response of a lossless cable, it should be a straight line. But, of course, nothing is perfect. The phase response will have a small amount of noise. This is due to trace noise of the PNA, and the loss with real cables or transmission lines, which causes a small amount of non-linear phase change with frequency. So, if we look at the Group Delay of a cable, we will see a small amount of variation. Also, if the frequency spacing is small enough when you make the measurement, the \( \delta(f) \) in the denominator becomes very small, so the delay can have wide swings with just a little noise.

To overcome this issue, we sometimes add smoothing to a phase trace, which widens the effective \( \delta(f) \), called the aperture, and provides a less noisy Group Delay response. The Group Delay of a device is only valid for a given frequency aperture. Learn more about Group Delay.

2. **Electrical Delay** function. On many filters, the passband response is specified for a maximum value of "Deviation from Linear Phase". When looking at the passband of a multi-pole filter, one sees the phase changing very rapidly. This makes it difficult to determine the linearity of the phase response. The Electrical Delay function subtracts out a "LINEAR PHASE" equivalent to the delay time value computed as above. When you use this function, you dial in the Linear Delay such that a CONSTANT PHASE SLOPE is removed from the phase trace, until the phase trace is mostly flat. The remaining variation is the deviation from linear phase.

To make this task a little less tedious, the PNA has a marker function called Marker =>> Delay. This function computes the Group Delay value at the marker position, using a 20% smoothing aperture, then changes the Electrical Delay value to this value. Obviously, if the phase trace is not perfectly linear, moving the marker and recomputing the delay will result in different values. The phase slope added by the electrical delay function applies only to the current measurement. That is, each measurement (S11, S22, S12, S21) can have its own value of electrical delay. Learn more about Deviation from Linear Phase.

3. **Port Extension** is a function that is similar to calibration. It applies to all the traces in a given channel. It compensates for the phase response change that occurs when the calibration reference plane is not the same as the measurement plane of the device.

Let's look at an example of a DUT that is mounted on a PCB fixture with SMA connectors. We can easily calibrate at the SMA connectors. But if we add the fixture to measure the board-mounted device, the apparent phase of the DUT is changed by the phase of the PCB fixture. We use port extensions to add a LINEAR PHASE (constant delay) to the calibration routines to shift the phase reference plane to that of the DUT. This is ONLY valid if the fixture consists of a transmission line with linear phase response, and this limitation is usually met in practice. The main reason that it is NOT met is that there is mismatch at the SMA-to-PCB interface. This mismatch was not removed with the error correction because it occurs AFTER the SMA connector. Ripple can be seen on the display as signals bounce back and forth between the mismatch and the DUT. If the DUT is well matched, the ripple effect is very small. However, when we use Automatic Port Extension (APE), and we leave the fixture open (the DUT removed), the reflection is large and we see larger ripples. That is why APE uses a curve fitting process to remove the effects of the ripple. For best effect, the wider the IF Bandwidth, the better we can "smooth-out" the ripples with...
curve fitting. Still, we are fitting a LINEAR PHASE SLOPE to the phase response, and thus we use only a single Port Extension Delay value to represent the phase slope.

The method used by older VNAs to get this same functionality was to add a mechanical line stretcher to the reference channel, which removed a fixed delay amount from the port. Port extensions give 1x the delay for transmission at each port, and 2x the delay for reflection, so it differs somewhat from Electrical Delay above, in that the math function depends upon the measurement being made. The signal passes twice through the fixture for reflection (out and back), but only once for each port on transmission. For S21, the phase slope added is the sum of the port 1 and port 2 Port Extension Delay values.

The "User Range" APE function is used in cases where a fixture has limited bandwidth, perhaps due to tuning elements or bias elements. In this case, the model of constant delay for the fixture over the whole bandwidth is not valid, so a narrower "User Range" of frequencies can be selected to compute the delay. Since the aperture is smaller, there is more uncertainty in the delay computation for port extension. Also, for those who had been using the Marker =>> Delay function to estimate the delay, we added the "Active Marker" selection to APE, which works exactly the same as Marker->Delay. Learn more about Automatic Port Extensions.
Deviation from Linear Phase

Deviation from linear phase is a measure of phase distortion. The electrical delay feature of the analyzer is used to remove the linear portion of the phase shift from the measurement. This results in a high-resolution display of the non-linear portion of the phase shift (deviation from linear phase).

- What Is Linear Phase Shift?
- What Is Deviation from Linear Phase?
- Why Measure Deviation from Linear Phase?
- Using Electrical Delay
- Accuracy Considerations

See also Comparing the PNA Delay Functions

What Is Linear Phase Shift?

Phase shift occurs because the wavelengths that occupy the electrical length of the device get shorter as the frequency of the incident signal increases. Linear phase-shift occurs when the phase response of a device is linearly proportional to frequency. Displayed on the analyzer, the phase-versus-frequency measurement trace of this ideal linear phase shift is a straight line. The slope is proportional to the electrical length of the device. Linear phase shift is necessary (along with a flat magnitude response) for distortionless transmission of signals.

What Is Deviation from Linear Phase?

In actual practice, many electrical or electronic devices will delay some frequencies more than others, creating non-linear phase-shift (distortion in signals consisting of multiple-frequency components). Measuring deviation from linear phase is a way to quantify this non-linear phase shift.

Since it is only the deviation from linear phase which causes phase distortion, it is desirable to remove the linear portion of the phase response from the measurement. This can be accomplished by using the electrical delay feature of the analyzer to mathematically cancel the electrical length of the device under test. What remains is the deviation from linear phase, or phase distortion.

Why Measure Deviation from Linear Phase?

The deviation from linear phase measurement accomplishes the following:

- Presents data in units of phase rather than units of seconds (group delay). For devices that pass modulated signals, units of phase may be most practical.
- Provides a less noisy measurement than a group delay measurement.
Using Electrical Delay

The electrical delay feature is the electronic version of the mechanical "line stretcher" of earlier analyzers. This feature does the following:

- Simulates a variable-length lossless transmission line, which is effectively added to or removed from the reference signal path.
- Compensates for the electrical length of the device under test.
- Flattens the measurement trace on the analyzer's display. This allows the trace to be viewed at high resolution in order to see the details of the phase nonlinearity.
- Provides a convenient method to view the deviation from linear phase of the device under test. See the following graphic.

Learn how to set Electrical Delay.

Accuracy Considerations

The frequency response of the test setup is the dominant error in a deviation from linear phase measurement. To reduce this error, perform a 2-port measurement calibration.

How to Measure Deviation from Linear Phase:

1. Preset the analyzer.

2. If your device under test is an amplifier, it may be necessary to adjust the analyzer's source power:
   - Set the analyzer's source power to be in the linear region of the amplifier's output response (typically 10-dB below the 1-dB compression point).
   - Select an external attenuator (if needed) so the amplifier's output power will be sufficiently attenuated to avoid causing receiver compression or damage to the analyzer’s port 2.

3. Connect the device under test as shown in the following graphic.
3. Select an S21 measurement.

4. Select the settings for your device under test, including the following:
   - **Format**: phase
   - **Scale**: autoscale

5. Remove the device and perform a calibration.

6. Reconnect the device.

7. Scale the displayed measurement for optimum viewing.

8. **Create a marker** in the middle of the trace.

9. Press the >**Delay** key to invoke the **Marker to Electrical Delay** function. This flattens the phase trace.

10. If desired, on the **Scale** menu, click **Electrical Delay** to fine-tune the flatness of the phase trace.

11. Use the markers to measure the maximum peak-to-peak deviation from linear phase.

12. Print the data or save it to a disk.
Small Signal Gain and Flatness

Small signal gain is the gain in the amplifier's linear region of operation. This is typically measured at a constant input power over a swept frequency. Gain flatness is the measure of the variation of gain over a specified frequency range.

- What Is Gain?
- What Is Flatness?
- Why Measure Gain and Flatness?
- Accuracy Considerations
- How to Measure Gain and Flatness

What Is Gain?

RF amplifier gain is defined as the difference in power between the amplifier output signal and the input signal. It is assumed that both input and output impedances of the amplifier are the same as the characteristic impedance of the system.

- Gain is called $S_{21}$ using S-parameter terminology
- Gain is expressed in dB-a logarithmic ratio of the output power relative to the input power.
- Gain can be calculated by subtracting the input from the output levels when both are expressed in dBm, which is power relative to 1 milliwatt.
- Amplifier gain is most commonly specified as a minimum value over a specified frequency range. Some amplifiers specify both minimum and maximum gain, to ensure that subsequent stages in a system are not under or over driven.

What Is Flatness?

Flatness specifies how much the amplifier's gain can vary over the specified frequency range. Variations in the flatness of the amplifier's gain can cause distortion of signals passing through the amplifier.

Why Measure Small-Signal Gain and Flatness?

Deviations in gain over the bandwidth of interest will induce distortion in the transmitted signal because frequency components are not amplified equally. Small-signal gain allows you to quantify the amplifier's gain at a particular frequency in a 50-ohm system. Flatness allows you to view the deviations in the amplifier's gain over a specified frequency range in a 50-ohm system.
Accuracy Considerations

- The amplifier may respond very differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.

- The output power of the amplifier should be sufficiently attenuated if necessary. Too much output power could:
  - damage the analyzer receiver
  - exceed the input compression level of the analyzer receiver, resulting in inaccurate measurements.

**Attenuation** of the amplifier's output power can be accomplished using:

- attenuators
- couplers

The frequency-response effects and mismatches of the attenuators and couplers must be accounted for during calibration since they are part of the test system. Proper error-correction techniques can reduce these effects.

- The **frequency response** is the dominant error in a small-signal gain and flatness measurement setup. Performing a thru-response measurement calibration significantly reduces this error. For greater accuracy, perform a 2-port measurement calibration.

- Reducing IF bandwidth or using averaging improves measurement dynamic range and accuracy, at the expense of measurement speed.

How to Measure Gain and Flatness

1. Preset the analyzer.

2. Select an S21 measurement parameter.

3. Set the analyzer's source power to be in the linear region of the amplifier's output response (typically 10-dB below the 1-dB compression point).

4. Select an external attenuator (if needed) so the amplifier's output power will be sufficiently attenuated to avoid causing receiver compression or damage to the analyzer's port-2.
5. Connect the amplifier as shown in the following graphic, and provide the dc bias.

6. Select the analyzer settings for your amplifier under test.

7. Remove the amplifier and perform a measurement calibration. Be sure to include the attenuator and cables in the calibration setup if they will be used when measuring the amplifier.

8. Save the instrument-state to memory.

9. Reconnect the amplifier.

10. Scale the displayed measurement for optimum viewing and use a marker to measure the small signal gain at a desired frequency.

11. Measure the gain flatness over a frequency range by using markers to view the peak-to-peak ripple.

12. Print or save the data to a disk.

13. This type of measurement can be automated.
Gain Compression

Gain compression measures the level of input power applied to an amplifier that will cause a distorted output. The Gain Compression Application (Opt 086) makes fast and accurate compression measurements.

- What Is Gain Compression?
- Why Measure Gain Compression?
- Accuracy Considerations
- How to Measure Gain Compression

See other Amplifier Parameter topics

What Is Gain Compression?

Gain compression occurs when the input power of an amplifier is increased to a level that reduces the gain of the amplifier and causes a nonlinear increase in output power.

The analyzer has the ability to do power sweeps as well as frequency sweeps. Power sweeps help characterize the nonlinear performance of an amplifier. Refer to the graphic below (a plot of an amplifier’s output power versus input power at a single frequency) for the following discussion.

- The amplifier has a linear region of operation where gain is constant and independent of power level. The gain in this region is commonly referred to as "small-signal gain."
- As the input power increases, the amplifier gain appears to decrease, and the amplifier goes into compression.
- The most common measurement of amplifier compression is the 1-dB compression point. This is defined as the input power (or sometimes the output power) which results in a 1-dB decrease in amplifier gain (relative to the amplifier’s small-signal gain).

Why Measure Gain Compression?

When driven with a sinusoid, the output of an amplifier is no longer sinusoidal in the compression region. Some of the amplifier output appears in harmonics, rather than occurring only at the fundamental frequency of the input.
As input power is increased even more, the amplifier becomes saturated, and output power remains constant. At this point, further increases in amplifier input power result in no change in output power.

In some cases (such as with TWT amplifiers), output power actually decreases with further increases in input power after saturation, which means the amplifier has negative gain.

Since gain is desired in amplifier operation, it is important to know the limit of input signal that will result in gain compression.

Accuracy Considerations

The network analyzer must provide sufficient power to drive the amplifier into saturation. If you need a higher input-power level than the source of the analyzer can provide, use a preamplifier to boost the power level prior to the amplifier under test. (See High-Power Component Measurements.) If using a preamplifier, you can increase measurement accuracy in the following ways:

- Use a coupler on the output of the preamplifier so that a portion of the boosted input signal can be used for the analyzer's reference channel. This configuration removes the preamplifier's frequency response and drift errors from the measurement (by ratioing).
- Perform a thru-response calibration including the preamplifier, couplers, and attenuators in the test setup.

The output power of the amplifier should be sufficiently attenuated if necessary. Too much output power could:

- Damage the analyzer receiver
- Exceed the input compression level of the analyzer receiver

Attenuation of the amplifier's output power can be accomplished using:

- Attenuators
- Couplers

The frequency-response effects of the attenuators and couplers must be considered during calibration since they are part of the test system. Proper error-correction techniques can reduce these effects.

- The frequency response is the dominant error in a gain compression measurement setup. Performing a thru-response measurement calibration significantly reduces this error.
- The amplifier may respond very differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.
- Reducing IF bandwidth or using measurement averages improves accuracy, at the expense of measurement speed.

How to Measure Gain Compression

This procedure shows you how to make the following three measurements used to determine amplifier gain compression:
1. A Swept-Frequency Gain Compression measurement locates the lowest frequency at which the 1-dB gain compression first occurs.

2. A Swept-Power Gain Compression measurement shows the input power at which a 1-dB drop in gain occurs as a power ramp is applied to the amplifier at a particular frequency point (found in measurement 1).

3. An Absolute Power measurement shows the absolute power out (in dBm) at compression.

**Swept-Frequency Gain Compression Measurement**

A measurement of swept frequency gain compression locates the frequency point where 1-dB compression first occurs.

1. Preset the analyzer.

2. Select an S21 measurement parameter.

3. Set the analyzer’s source power to be in the linear region of the amplifier’s output response (typically 10-dB below the 1-dB compression point).

4. Select an external attenuator (if needed) so the amplifier’s output power will be sufficiently attenuated to avoid causing receiver compression or damage to the analyzer’s port.

5. Connect the amplifier as shown in the following graphic, and provide the dc bias.

6. Select the analyzer settings for your amplifier under test. To reduce the effects of noise, you may want to specify a narrower IF bandwidth.

7. Remove the amplifier and perform a thru-response calibration. Be sure to include the attenuator and cables in the calibration setup if they will be used when measuring the amplifier.

8. Save the instrument-state to memory.

9. Reconnect the amplifier.

10. Position a marker at approximately mid-span.

11. Adjust the analyzer’s scale to 1 dB per division.
12. Store the trace in memory and display Data/Mem.

13. Gradually increase the source power until a 1-dB decrease in gain is observed at the first frequency over some portion of the trace.

14. Use markers to locate the frequency where the 1-dB decrease in gain first occurs. Note this frequency for use in the following measurement.

15. Print the data or save it to a disk.

**Swept-Power Gain Compression Measurement**

A swept-power gain compression measurement shows the input power resulting in a 1-dB drop in gain as a power ramp at a particular frequency (found in step 13 of the previous measurement) is applied to the amplifier.

1. If not already done, perform the previous measurement of swept-frequency gain compression.

2. Setup an S21 measurement in the power-sweep mode. Include the following settings:
   - Set the CW frequency to the frequency noted in step 14 of the previous measurement of swept-frequency gain compression.
   - Enter the start and stop power levels for the sweep. The start power should be in the linear region of the amplifier’s response (typically 10 dB below the 1-dB compression point). The stop power should be in the compression region of the amplifier’s response.

3. Adjust the scale to 1-dB per division.

4. Use markers (including reference marker) to find the input power where the 1-dB decrease in gain occurs.

5. Print the data or save it to a disk.

**Absolute Output Power Measurement**

An absolute-power measurement shows the absolute power-out (in dBm) of the amplifier at compression.

1. Select an unratioed (absolute) power measurement. Choose the B input if using the test setup in the previous graphic.

2. Retain the CW frequency used in the previous measurement of swept-power gain compression.

3. Set a marker to the input power level where the 1-dB decrease in gain occurs (found in step 4 of the previous measurement).

4. Scale the displayed measurement for optimum viewing.

5. Read the marker value to find the absolute output power of the amplifier (in dBm) where the 1-dB decrease in gain occurs.

6. Print the data or save it to a disk.
Note: The measurement calibration does not apply to absolute power. Therefore, if there is any attenuation external to the analyzer, you will have to correct for it manually.
Group Delay

Group delay is a measure of phase distortion. Group delay is the actual transit time of a signal through a device under test as a function of frequency. When specifying group delay, it is important to specify the aperture used for the measurement.

- What is Group Delay?
- Group Delay versus Deviation from Linear Phase
- What Is Aperture?
- Accuracy Considerations
- How to Measure Group Delay

See also Comparing the PNA Delay Functions.

See other Amplifier Parameter topics

What Is Group Delay?

Group delay is:

- A measure of device phase distortion.
- The transit time of a signal through a device versus frequency.
- The derivative of the device’s phase characteristic with respect to frequency.

Refer to the graphic below for the following discussion:

The phase characteristic of a device typically consists of both linear and higher order (deviations from linear) phase-shift components.
### Linear phase-shift component:  
Represents average signal transit time. 
Attributed to electrical length of test device.

### Higher-order phase-shift component:  
Represents variations in transit time for different frequencies.  
Source of signal distortion.

Refer to the graphic below for the following discussion:

In a group delay measurement:

- The linear phase shift component is converted to a constant value (representing the average delay).
- The higher order phase shift component is transformed into deviations from constant group delay (or group delay ripple).
- The deviations in group delay cause signal distortion, just as deviations from linear phase cause distortion.
- The measurement trace depicts the amount of time it takes for each frequency to travel through the device under test.

Refer to the following equation for this discussion on how the PNA computes group delay:

\[
\text{Group Delay} = t_g = \frac{-d\phi}{d\omega} = \frac{-1}{360^\circ} \cdot \frac{d\Theta}{df} \quad (\omega \text{ in Radians/Sec}, \Theta \text{ in Degrees}, f \text{ in Hz, } \omega = 2\pi f)
\]

- Phase data is used to find the phase change (-d\(\phi\)).
- A specified frequency aperture is used to find the frequency change (d\(\omega\)).
- Using the two values above, an approximation is calculated for the rate of change of phase with frequency.
- This approximation represents group delay in seconds (assuming linear phase change over the specified frequency aperture).

**Group Delay versus Deviation from Linear Phase**
Group delay is often a more accurate indication of phase distortion than Deviation from Linear Phase.

**Deviation from linear phase** results are shown in the upper region of the following graphic: Device 1 and device 2 have the same value, despite different appearances.

**Group Delay** results are shown in the lower region: Device 1 and device 2 have different values of group delay. This is because in determining group delay, the analyzer calculates slope of phase ripple, which is dependent on number of ripples which occur per unit of frequency.

**What Is Aperture?**

During a group delay measurement, the PNA measures the phase at two closely spaced frequencies and then computes the phase slope. The frequency interval (frequency delta) between the two phase measurement points is called the aperture. Changing the aperture can result in different values of group delay. The computed slope ( - delta phase / delta frequency) varies as the aperture is increased. This is why when you are comparing group delay data, you must know the aperture that was used to make the measurements.

Refer to the graphic below for the following discussion:
Narrow aperture:  |  Wide aperture:
---|---
Provides more detail in phase linearity.  |  Provides less detail in phase linearity because some phase response averaged-out or not measured.
Makes measurement susceptible to noise (smaller signal-to-noise ratio) and PNA phase detector resolution.  |  Makes measurement less susceptible to noise (larger signal-to-noise ratio).

Group delay measurements can be made using the following sweep types:

- Linear frequency
- List frequency sweep segment - The group delay aperture varies depending on the frequency spacing and point density. Therefore the aperture is not constant in segment sweep. In segment sweep, extra frequency points can be defined to ensure the desired aperture.

### How to set Group Delay Aperture

#### Using front-panel HARDKEY [softkey] buttons

1. Press **Avg**
2. then **[More]**
3. then **[Group Delay Aperture]**

#### PNA Menu using a mouse

1. Click **Response**
2. then **Avg**
3. then **Group Delay Aperture**

![Programming Commands]
Although the Group Delay Aperture is defined as the difference in frequency between two data points (see What Is Aperture?), the group delay calculation can be averaged over many adjacent data points, similar to the PNA smoothing feature. The number of adjacent data points can be set using any of the following methods:

**Note:** You can change the default Group Delay Aperture to two points using a PNA Preference. Learn how.

**Points**  Number of adjacent data points to average. Default setting is 11 points. Choose a value between 2 and the current number of points in the channel.

**Percent of Span**  The data points within this percentage of the current frequency span are averaged. Choose a value between (2 points / current number of points) and 100 percent. The span must contain at least two data points.

**Frequency**  The data points within this frequency range are averaged. The frequency range must contain at least two data points.

When the frequency span or number of points is reduced so that the current Group Delay Aperture is NOT attainable, the Aperture is adjusted to the new frequency span or number of points.

**OK**  Applies setting changes and closes the dialog box.

**Cancel**  Closes the dialog. Setting changes are NOT applied.

---

**Accuracy Considerations**

It is important to keep the phase difference between two adjacent measurement points less than 180° (see the following graphic). Otherwise, incorrect phase and delay information may result. Undersampling may occur when measuring devices with long electrical length. You can verify that the phase difference measured between two adjacent points is less than 180° by adjusting the following settings until the measurement trace no longer changes:

- Increase the number of points
- Narrow the frequency span

Electrical delay may also be used to compensate for this effect.

The frequency response is the dominant error in a group delay test setup. Performing a thru-response
measurement calibration significantly reduces this error. For greater accuracy, perform a 2-port measurement calibration.

Particularly for an amplifier, the response may vary differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.

**How to Measure Group Delay**

1. Preset the analyzer.

2. If your DUT is an amplifier, it may be necessary to adjust the PNA source power:
   - Set the source power to be in the linear region of the amplifier’s output response, typically 10 dB below the 1 dB compression point.
   - If needed, use an external attenuator so the amplifier output power will be sufficiently attenuated to avoid causing receiver compression or damage to the PNA port 2.

3. Connect the DUT as shown in the following graphic.

   ![Diagram](image)

   - Direct Connection

4. Select an S21 measurement.

5. Select the settings for your DUT:
   - frequency range
   - number of measurement points.
   - format: delay
   - scale: autoscale

6. Remove the DUT and perform a measurement calibration.

7. Reconnect the DUT.

8. Scale the displayed measurement for optimum viewing.

9. Use the Group Delay Aperture setting to increase the aperture, reducing noise on the trace while maintaining
meaningful detail.

10. Use the markers to measure group delay (expressed in seconds) at a particular frequency of interest.

11. Print the data or save it to a disk.

High-Gain Amplifier Measurements

When measuring High-Gain Amplifiers, errors in measuring any of the S-parameters during calibration can result in error in the S21 measurement. This is because all the S-parameters are used in the error correction math.

A particular problem occurs with high gain amplifiers because the source power is set very low. Thus, when making reverse measurements (S22, S12) the signal-to-noise is poor and the raw measurements can be dominated by noise. This noise in the raw measurements will result in a noisy trace appearing for corrected S21 or S11.

If you are using a large attenuator on port 2 (which improves output match), perform an Enhanced Response Calibration as follows. This corrects for the same errors as the full 2-port correction EXCEPT the interaction between the raw load match and the DUT output match.

1. There is NO need to Uncouple the port powers.
2. Set port powers to an acceptable level. Do NOT overpower the PNA test port.
3. Perform Enhanced Response Cal. Learn how. (Does not measure or correct for the S12 or S22 / PNA port match).

If you want to do a full correction (for example, when your amplifier output match is poor so the Enhanced Response Cal above is not adequate), then...

1. Uncouple the port powers. Learn how.
2. Set input (port 1) power to approximately the output power of the amplifier up to 0 dBm
3. Set reverse (port 2) power to the same power (for measuring isolation and S22)
4. Perform a Full 2-port Cal.
5. Re-set the input power (port 1) to a lower power level appropriate for driving the amplifier.

Additional Error due to Mismatch of DUT Output Match and Raw Load Match
This topic is now covered in detail in Application Note 1408-10, High-power measurements using the PNA (5989-1349EN) at Agilent.com.

Notes

At J11 (rear-panel), max power is 4 dB to 11 dB higher than Source 1 Out at front panel jumper due to loss of the coupler thru arms, bias-tees, and cables.

At J10 max power +33 dBm, which is the damage level of the bridge. With +30 dBm into J10, there will be about +15 dBm at R1, assuming 15 dB coupling factor for the R1 bridge. +15 dBm is the damage level of that receiver. Therefore, it may be necessary to add attenuation in place of the R1 loop, not only to protect the receiver, but to bring it out of compression. The 0.1 dB compression level spec for the R1 receiver is between -3 and -18 dBm, depending on the frequency and option configuration.
At Test Port 2 (DUT output): With the bias-tees (orange), only +30 dBm is allowed into the test port. With Opt H85 (bias-tees removed), +43 dBm is allowed. Add appropriate attenuation to not damage other components.

About the PNA-X Option H85
A modified version of the standard PNA-X, the option H85 is designed to permit insertion of high power amplifiers and other signal conditioning equipment to allow high power network measurements at RF levels up to 20 Watts (+43 dBm) from 10 MHz to 26.5 GHz. The Option H85 modification supplies extended power range attenuators without bias tees. This is similar to the PNA-X -219 (add extended power range and bias-tees to 2-Port analyzer) or PNA-X -419 (add extended power range and bias-tees to 4-Port analyzer) but deletes the bias tees from the test set.

Phase Measurements

Knowledge of both magnitude and phase characteristics is needed for successful higher-level component integration.

- **What are Phase Measurements?**
- **Why Measure Phase?**
- **Using the Analyzer's Phase Format**
- **Types of Phase Measurements**

**See other Tutorials**

**What are Phase Measurements?**

Phase measurements are made using S-parameters, just like amplitude measurements. A phase measurement is a relative (ratio) measurement and not an absolute measurement. Phase measurements compare the phase of the signal going into a device (the incident signal) to the phase of the device's response signal. The response signal can be either reflected or transmitted. Assuming an accurate calibration has been performed, the difference in phase between the two signals (known as phase shift) is a result of the electrical characteristics of the device under test.

The following graphic shows the phase shift (in time or degrees) between an incident signal and a transmitted signal (as might be seen on an oscilloscope display).

**Why Measure Phase?**

Measuring phase is a critical element of network analysis. The following graphic lists five reasons for measuring both magnitude and phase.
When used in communications systems to pass signals, components or circuits must not cause excessive signal distortion. This distortion can be:

- Linear, where flat magnitude and linear phase shift versus frequency is not maintained over the bandwidth of interest.
- Nonlinear, such as AM-to-PM conversion.

It is important to measure how reflective a component or circuit is, to ensure that it transmits or absorbs energy efficiently. Measuring the complex impedance of an antenna is a good example.

**Using the Analyzer’s Phase Format**

The analyzer’s phase format displays a phase-versus-frequency or phase-versus-power measurement. The analyzer does not display more than ±180 degrees phase difference between the reference and test signals. As the phase value varies between +180 degrees and -180 degrees, the analyzer display creates the sawtooth pattern as shown in the following graphic.

The sawtooth pattern does not always reach +180 degrees and -180 degrees. This is because the measurement is made at discrete frequencies, and the data point at +180 degrees and -180 degrees may not be measured for the selected sweep.

**Types of Phase Measurements**

Complex impedance data is information such as resistance, reactance, phase, and magnitude that can be
determined from an S11 or S22 measurement. Complex impedance data can be viewed using either the Smith Chart format or the Polar format.

**AM-to-PM conversion** is a measure of the amount of undesired phase deviation (PM) that is caused by amplitude variations (AM) of the system. AM-to-PM conversion is usually defined as the change in output phase for a 1-dB increment in the input power to an amplifier (i.e. at the 1 dB gain compression point). This is expressed in degrees-per-dB (°/dB).

**Deviation from linear phase** is a measure of phase distortion caused by a device. Ideally, the phase shift through a device is a linear function of frequency. The amount of variation from this theoretical phase shift is known as its deviation from linear phase (also called phase linearity).

**Group delay** is another way to look at phase distortion caused by a device. Group delay is a measure of transit time through a device at a particular frequency. The analyzer computes group delay from the derivative of the measured phase response.

### Deviation from Linear Phase Versus Group Delay

Although deviation from linear phase and group delay are similar measurements, they each have their purpose. The following are the advantages of deviation from linear phase measurements:

- Less noisy than group delay.
- Able to characterize devices that pass phase modulated signals, and show units of phase rather than units of seconds.

The following are the advantages of group delay measurements:

- More easily interpreted indication of phase distortion than deviation from linear phase.
- Able to most accurately characterize a device under test. This is because in determining group delay, the analyzer calculates the slope of the phase ripple, which is dependent on the number of ripples which occur per unit of frequency. Comparing two phase responses with equal peak-to-peak phase ripple, the response with the larger phase slope results in:
  - More group delay variation.
  - More signal distortion.

See also [Comparing the PNA Delay Functions](#).
Reverse Isolation

Reverse isolation is a measure of amplifier reverse transmission response- from output to input.

- What is Reverse Isolation
- Why Measure Reverse Isolation?
- Accuracy Considerations
- How to Measure Reverse Isolation

What is Reverse Isolation?
Reverse isolation is a measure of how well a signal applied to the device output is "isolated" from its input. The measurement of reverse isolation is similar to that of forward gain, except:

- The stimulus signal is applied to the amplifier's output port.
- The response is measured at the amplifier's input port.

The equivalent S-parameter is S12.

Why Measure Reverse Isolation?
An ideal amplifier would have infinite reverse isolation-no signal would be transmitted from the output back to the input. However, reflected signals can pass through the amplifier in the reverse direction. This unwanted reverse transmission can cause the reflected signals to interfere with the desired fundamental signal flowing in the forward direction. Therefore, reverse isolation is important to quantify.

Accuracy Considerations
Since amplifiers often exhibit high loss in the reverse direction, generally there is no need for any attenuation that may have been used to protect the port 2 receiver during forward transmission measurements. Removing the attenuation will:

- Increase the dynamic range, resulting in improved measurement accuracy.
- Require a new calibration for maximum accuracy.

The RF source power can be increased to provide more dynamic range and accuracy.

Note: With the attenuation removed and the RF source power increased, a forward sweep could damage the analyzer's port 2 receiver. Do not perform a forward sweep or use 2-port calibration unless the forward power is set low enough to avoid causing port 2 receiver compression or damage.
If the isolation of the amplifier under test is very large, the transmitted signal level may be near the noise floor or crosstalk level of the receiver. To lower the noise floor:

- Use or increase measurement averages.
- Reduce the IF bandwidth of the analyzer.

**Note:** Reducing IF bandwidth or using averaging improves measurement dynamic range and accuracy, at the expense of reduced measurement speed.

- When crosstalk levels affect the measurement accuracy, reduce the crosstalk error term by performing a response and isolation calibration. When performing the isolation part of the calibration it is important to use the same average factor and IF bandwidth during the calibration and measurement.
- The frequency response of the test setup is the dominant error in a reverse isolation measurement. Performing a thru-response measurement calibration significantly reduces this error. This calibration can be done as part of the response and isolation calibration.
- The amplifier may respond very differently at various temperatures. The tests should be done when the amplifier is at the desired operating temperature.

**How to Measure Reverse Isolation**

1. Connect the amplifier as shown in the following graphic.

   ![Diagram of amplifier connection](image)

2. Preset the analyzer.
3. Select an S12 measurement.
4. Select the settings for your amplifier under test.
5. Remove the amplifier and perform a thru-response calibration or a response and isolation calibration.
6. Scale the displayed measurement for optimum viewing and use a marker to measure the reverse isolation at a desired frequency.
7. Print or save the data to a disk.
Reflection Measurements

Reflection measurements are an important part of network analysis.

**What are Reflection Measurements?**

To understand reflection measurements, it is helpful to think of traveling waves along a transmission line in terms of a lightwave analogy. We can imagine incident light striking some optical component like a clear lens. Some of the light is reflected off the surface of the lens, but most of the light continues on through the lens. If the lens had mirrored surfaces, then most of the light would be reflected and little or none would be transmitted.

1. Incident  
2. Reflected  
3. Transmitted

1. Incident  2. Reflected  3. Transmitted

With RF energy, reflections occur when the impedance of two mated devices are not the same. A reflection measurement is the ratio of the reflected signal to the incident signal. Network analyzers measure the incident wave with the R (for reference) channel and the reflected wave with the A channel. Therefore, reflection is often shown as the ratio of A over R (A/R). We can completely quantify the reflection characteristics of our device under test (DUT) with the amplitude and phase information available at both the A and R channel. In S-parameter terminology, S11 is a reflection measurement of port 1 of the device (the input port); S22 is a reflection measurement of the port 2 (the output port).
Why Make Reflection Measurements?

One reason we make reflection measurements to assure efficient transfer of RF power. We do this because:

1. RF energy is not cheap. When energy is reflected, that means less energy is transmitted to where it is intended to go.
2. If the reflected energy is large, it can damage components, like amplifiers.

For example, in the following graphic, the radio station on the left is not operating at peak efficiency. The amplifier impedance is not the same as the transmission line, and the transmission line impedance is not the same as the antenna. Both of these conditions cause high reflected power. This condition results in less transmitted power, and the high reflected power could damage the amplifier.

The radio station on the right installed properly "matched" transmission line and antenna. Very little of the transmitted signal is reflected, resulting in increased broadcast power, more listeners, more advertising revenue, and more profit. The amplifier, transmission, and antenna all need to be measured to ensure that reflected power is minimized.

Expressing Reflected Waves

After making a reflection measurement, the reflection data can be expressed in a number of ways, depending on what you are trying to learn. The various expressions are all calculated by the analyzer from the same reflection measurement data. Each method of expressing reflection data can be graphically displayed in one or more formats. For more information, see display formats.

Return Loss

The easiest way to convey reflection data is return loss. Return loss is expressed in dB, and is a scalar (amplitude only) quantity. Return loss can be thought of as the absolute value or dB that the reflected signal is below the incident signal. Return loss varies between infinity for a perfect impedance match and 0 dB for an open or short circuit, or a lossless reactance. For example, using the log magnitude format on the analyzer, the measured reflection value on the screen may be -18dB. The minus sign is ignored when expressing return loss, so the component is said to have 18dB of return loss.

VSWR

Two waves traveling in opposite directions on the same transmission line cause a "standing wave". This condition can be measured in terms of the voltage standing wave ratio (VSWR or SWR for short). VSWR is defined as the maximum reflected voltage over the minimum reflected voltage at a given frequency. VSWR is a scalar (amplitude only) quantity. VSWR varies between one for a perfect match, and infinity for an open or short circuit or lossless reactance.

Reflection Coefficient

Another way of expressing reflection measurements is reflection coefficient gamma (\(\Gamma\)). Gamma includes both
magnitude and phase.
The magnitude portion of gamma is called rho ($\rho$). Reflection coefficient is the ratio of the reflected signal voltage to the incident signal voltage. The range of possible values for $\rho$ is between zero and one. A transmission line terminated in its characteristic impedance will have all energy transferred to the load; zero energy will be reflected and $\rho = 0$. When a transmission line terminated in a short or open circuit, all energy is reflected and $\rho = 1$. The value of rho is unitless.

Now for the phase information. At high frequencies, where the wavelength of the signal is smaller than the length of conductors, reflections are best thought of as waves moving in the opposite direction of the incident waves. The incident and reflected waves combine to produce a single "standing" wave with voltage that varies with position along the transmission line.

When a transmission line is terminated in its characteristic impedance ($Z_0$) there is no reflected signal. All of the incident signal is transferred to the load, as shown in the following graphic. There is energy flowing in one direction along the transmission line.

![Standing Wave Graphic](image)

When a transmission line is terminated in a short circuit termination, all of the energy is reflected back to the source. The reflected wave is equal in magnitude to the incident wave ($\rho = 1$). The voltage across any short circuit is zero volts. Therefore, the voltage of the reflected wave will be 180 degrees out of phase with the incident wave, canceling the voltage at the load.

![Standing Wave Graphic](image)

When a transmission line is terminated in an open circuit termination, all of the energy is reflected back to the source. The reflected wave is equal in magnitude to the incident wave ($\rho = 1$). However, no current can flow in an open circuit. Therefore, the voltage of the reflected wave will be in phase with the voltage of the incident wave.
When a transmission line is terminated in a 25 ohm resistor, some but not all of the incident energy will be absorbed, and some will be reflected back towards the source. The reflected wave will have an amplitude 1/3 that of the incident wave and the voltage of the two waves will be out of phase by 180 degrees at the load. The phase relationship will change as a function of distance along the transmission line from the load. The valleys of the standing wave pattern will no longer go to zero, and the peaks will be less than that of the open / short circuit.

For more information, see [Phase Measurements](#).

**Impedance**

Impedance is another way of expressing reflection data. For more information on Impedance, see [Smith Charts](#).

Glossary

12-Term Error Correction See Error Correction, 12-Term.

1-Port Device A device with a single connector or path to the device's circuitry. Examples include an oscillator and a load.

2-Port Calibration, Full See Error Correction, 12-Term.

2-Port Device A device with two connectors or other paths to the device's circuitry. Examples include filters, SAW devices, attenuators, matching pads, and amplifiers.

3-Term Error Correction See Error Correction, 3-Term.

A

Active Channel The highlighted channel affected by front panel functions.

Active Function Readout The area of a display screen where the active function and its state are displayed. The active function is the one that was completed by the last key selection or remote programming command.

Active Marker The marker on a trace that can be repositioned either by front panel controls or by programming commands.

Active Trace A trace that is being swept (updated) with incoming signal information.

ADC Analog to Digital Converter

Address The identification (represented by a name, label, or number) for a register, location in storage, or any other data source or destination. Examples are the location of a station in a communications network, or a device on the GP-IB.

ADM Add-Drop Multiplexer

Admittance (Y) The inverse of an impedance (i.e. the ratio of current to voltage). Complex admittances take the form \( Y = G + jB(t) \).

ALC Automatic Level Control. See Automatic Gain Control.

AM Amplitude Modulation

AM Group Delay A technique for the measurement of group delay through a device which utilizes an amplitude modulated (AM) source. Note: The actual delay of the modulation envelope is measured directly with an external scalar detector. Devices that distort the amplitude of a signal cannot be measured. These include amplifiers with automatic gain control (AGC) and devices subject to saturation or power limiting.

Amplitude Modulation The process, or result of the process, of varying the amplitude of a carrier signal. The resulting modulated carrier contains information that can be recovered by demodulation. See also Modulation.

Analog The general class of devices or circuits in which the output varies as a continuous function of the input.

Annotation The labeling of specific information on the display (such as frequency or power).

ANSI American National Standards Institute: A national membership organization (open to manufacturers, organizations, users, and communications carriers) that approves standards, accredits standards development groups and certificate programs, and represents and coordinates US interests in non-treaty and non-government
standards bodies.

**Aperture** The frequency span of the network analyzer used for calculating group delay. The narrower the aperture, the finer the resolution of the group delay variations, but noise is reduced by increasing the aperture.

**Array** A set of numbers or characters that represents any given function.

**ASCII** American Standard Code for Information Interchange

**Attenuation** Denotes a reduction in signal amplitude. The difference between transmitted and received power due to loss through equipment, lines, or other transmission devices; usually expressed in decibels.

**Attenuator** An RF or microwave device used to reduce the power level of a signal by precise, incremental amounts over its entire frequency range.

**Automatic Calibration System** AutoCal: Feature offered on Rohde & Schwarz network analyzers.

**Automatic Gain Control (AGC)** A circuit used in amplifiers and other active devices to keep its RF power level constant as other parameters change, such as frequency. Synonym: Automatic Leveling Control (ALC)

**Autoscale** An analyzer feature that evaluates waveforms and adjusts controls to stable and enhance the display.

**AUX** Auxiliary; refers to rear-panel input connector.

**Averaging** A noise reduction technique that computes each data point based on consecutive sweeps and weighted by a user-specified averaging factor. Each new sweep is averaged into the trace until the total number of sweeps is equal to the averaging factor.

**B**

**B/R** The ratio of data sampled at B to the data sampled at R.

**Band Pass** A range of frequencies that are passed through a device, such as a filter. Frequencies not within the band pass are limited or attenuated. See also **Cutoff Frequency**.

**Bandwidth (BW)** The difference between the frequencies of a continuous frequency band within which performance of a device falls within specifications.

**Bandwidth Limit** The condition prevailing when the system bandwidth is exceeded and signal distortion occurs beyond specifications.

**Bandwidth Selectivity** A measure of a filter's ability to resolve signals unequal in amplitude. It is the ratio of the 60 dB bandwidth to the 3 dB bandwidth for a given resolution filter (IF). Bandwidth selectivity tells us how steep the filter skirts are. Bandwidth selectivity is sometimes called shape factor.

**Binary** A method of representing numbers in a scale of two (on or off, high-level or low-level, one or zero). A compact, fast format used to transfer information to and from the analyzer.

**BMP** Bit-Mapped

**Brightness** See **Color Brightness**.

**Broadband Device** A device that operates over a very wide frequency range and exhibits only small variations in response over that range.

**Buffer** A storage device used when transmitting information to compensate for a difference in the rate of flow of information between two devices.

**Burst Carrier** A carrier that is periodically turned off and on. A burst carrier may or may not be modulated.

**BUS** Basic Utility System

**Bus** One or more conductors used as a path to deliver transmitted information from any of several sources to any of several destinations.
BW Bandwidth

Byte Eight bits of data representing one character processed as a unit.

C

CAD Computer Aided Design

CAE Computer Aided Engineering

Calibration In HP instrumentation, the process of periodically (usually annually) verifying an instrument is performing to specifications. A calibration certificate is awarded after verification.

In network analyzers, the process of removing systematic errors from measurements. See Error Correction.

Calibration Kit Hardware and software required to perform error correction on a network analyzer for a specific measurement and/or test set.

Calibration, 2-Port See Error Correction, 12-Term.

Calibration, Blackburn Calibrations of transmission path with corrected source match involving 15 calibration terms. Synonym: 15-term error correction

Calibration, Frequency Response The simplest error correction procedure to perform, but only corrects for a few of the twelve possible systematic error terms. Frequency response corrections can be made for reflection measurements, transmission measurements, and isolation measurements.

Calibration, Interpolation A user selectable network analyzer feature that calculates (interpolates) new error correction terms from existing terms when there is a change in network analyzer parameters, such as IF bandwidth, power, or sweep time. The resulting error correction is not as accurate as completing a full 2-port calibration.

Calibration, Port Extension See Port Extension.

Calibration, Reference Plane See Reference Plane.

Calibration, Set Z Sets the system impedance, usually 50 or 75 ohms.

Calibration, SOLT A calibration using four known standards: Short-Open-Load-Through. Also known as a full two-port calibration and 12-term error correction. See also Error Correction.

Calibration, TRL and LRM A calibration used in environments where the DUT cannot be connected directly to the network analyzer ports, (MMIC, microstrip, beam-lead diodes etc.). Thru-Reflect-Line (TRL) and M (Match) standards are fabricated and used because known high-quality standards are not readily available. The requirements for characterizing these standards are less stringent, but the calibration is not as accurate as the traditional full two-port calibration using S-O-L-T standards. The terms are used interchangeably (TRL, LRL, LRM etc.) but they all refer to the same basic calibration method.

Characteristic Impedance The impedance looking into the end of an infinitely long lossless transmission line.

Color Brightness A measure of the intensity (brightness) of a color.

Command A set of instructions that are translated into instrument actions. The actions are usually made up of individual steps that together can execute an operation.

Continuous Sweep Mode The analyzer condition where traces are automatically updated each time trigger conditions are met.

Controller A device capable of specifying the talker and listeners for an information transfer. An external computer connected to an instrument to control its operation.

Corrected Measurements made after performing error correction.

Coupler See Directional Coupler.
CPU Central Processing Unit
Crosstalk The occurrence of a signal at one port of a device being affected by a signal in any other path. Isolation is the measurement of crosstalk.
Cursor An electronically generated pointer that moves across the display to manipulate controls.
Cutoff Frequency In filters, the frequency at which attenuation is 3dB below the band pass signal level, known as the 3dB points.
CW Continuous wave: A single frequency (rather than a swept frequency).

D
DAC Digital to Analog Converter
dB Decibel: a relative unit of measure. The ratio in dB is given by: \(10 \log_{10} \left( \frac{P_1}{P_2} \right)\) where \(P_1\) and \(P_2\) are the measured powers. The dB is preferred instead of arithmetic ratios or percentages because when components are connected in series, their effect on power, expressed in dB, may be arithmetically added and subtracted. For example, if a 3dB attenuator is connected to a 10dB amplifier, the net gain of the two components is \((-3dB + 10dB = +7dB)\).

dBm Absolute unit of measure in decibels: 0dBm = 1 mW. The conventions of the dB (adding and subtracting) continue to apply.
DBMS Database Management System
DC Direct Current
Default A known set of conditions used in the absence of user-defined conditions.
Delay See Group Delay.
Demodulation The process of recovering from a modulated carrier, information in the form of a signal having essentially the same characteristics as the original modulating signal. Recovery of the modulating signal accomplished by signal detection.
Detection The process of demodulating signal carriers. There are two basic ways of providing signal detection in network analyzers: Diode detectors (used in broadband applications) and heterodyning, (used in narrowband applications).
Detector, Diode A device used to convert a RF signal to a proportional DC level. If the signal is amplitude modulated, the diode strips the RF carrier signal from the modulation. Many sources used with scalar analyzers are amplitude modulated with a 27.778 kHz signal and then detected in the network analyzer. Phase information on the signal carrier is lost in diode detection.

Deviation from Linear Phase Linear phase refers to the nature of the phase shift of a signal through a device. The phase is linear if a plot of phase shift versus frequency is a straight line using linear scales. Deviation from linear phase causes signal distortion.
Digital Pertaining to the class of devices or circuits in which the output varies in discrete steps.
Digital Demodulation Describes a technique of extracting the information used to modulate a signal. Digital signal processing algorithms are used on the signal after it has been converted from an analog to a digital form (digitized).
Dimension To specify the size of an array. The number of array rows or columns.
Directivity In a 3-port directional coupler, the ratio of the power present at the auxiliary port when the signal is traveling in the forward direction to the power present at the auxiliary port when the same signal is traveling in the reverse direction.
Directional Coupler A 3-port device typically used for separately sampling the backward (reflected) wave in a
transmission line.

**Disk** A circular, magnetic storage medium.

**Display**

Noun: See **Screen**.

Verb: To show annotation and measurement data on the display.

**Display Detector Mode** The manner in which analog, video information is processed prior to being digitized and stored in memory.

**Display Dynamic Accuracy** The amplitude uncertainty, usually in dB, over the display dynamic range.

**Display Dynamic Range** The amplitude range, in dB, over which the display dynamic accuracy applies.

**Display Formats** Graphical formats for displaying measurement data. These include single channel, overlay (multiple traces on one graticule), split (each trace on separate graticules).

**Display Modes** The ways in which measurement data can be presented graphically. On a network analyzer, the choices are Cartesian/rectilinear (XY plot with log or linear magnitude, phase, group delay, SWR, real and imaginary, and dBV, dBmV and dBuV), polar (magnitude and angle), magnitude and phase, and Smith chart. Not all display modes are available on all network analyzers. In addition, displays can present this information in various combinations of traces. Common modes are dual, (the ability to display more than one trace, usually over the same frequency range), and alternate, (the ability to display more than one trace, each with different frequency range and type).

**Display Phase Dynamic Accuracy** The phase measurement uncertainty, usually in degrees, for measurements whose units are in degrees.

**Display Points** The total number of measurement points made in a single measurement. The points can be in units of frequency, power, or time. The number of points often dictates measurement speed, resolution, and aperture.

**Display Trace Noise, Magnitude** The amplitude uncertainty of the trace, in dB, due to random noise in the test system.

**Display Trace Noise, Phase** The phase uncertainty of the trace, in degrees, due to random noise in the test system.

**Display Type** The type of display screen built into the analyzer. Data can be displayed as a raster drawing (a computer-like dot map) or as a vector drawing (lines drawn on the display). Color and display standard can also be specified as monochrome (single color), or color (two or more colors). The format standard may also be specified, such as VGA or SVGA, for IBM-compatible personal computers.

**Distortion** Deterioration of a signal's quality due to the nonlinear characteristics of a device or system transfer function. Distortion is measured as a combination of the changes in amplitude, frequency and phase of signal at the output of a device or system as compared to the signal at the input.

**Drift** The slow change in signal frequency.

**DSP** Digital Signal Processing

**DUT** Device Under Test

**DVM** Digital Volt Meter

**Dynamic Range** In a receiver, the range of signal levels, from minimum to maximum, that can be reliably measured simultaneously. Dynamic range allows small signals to be measured in the presence of large signals. Source power and receiver compression usually limits the maximum boundary to dynamic range. Receiver residual responses and noise floor usually limit the minimum power boundary.
See Electronic Calibration.

Electrical Delay A simulated variable length of lossless transmission line, added to or subtracted from a receiver input, to compensate for interconnecting cables. The firmware equivalent of mechanical or analog "line stretchers" in other network analyzers.

Electronic Calibration (ECal) A calibration system for electronic calibration of RF and microwave vector network analyzers. The electronic calibration system creates a twelve-term, two-port error model and then provides a confidence check of the calibration. The Ecal system consists of a repeatable, variable-impedance, solid-state calibration standard and a mainframe control unit which interfaces with the 8510, 8720 series, and the 8753 network analyzers or a USB module which interfaces with the PNA series network analyzers.

EMC Electro-Magnetic Compatibility

EMI Electro-Magnetic Interference: Unintentional interfering signals generated within or external to electronic equipment. Typical sources could be power-line transients, noise from switching-type power supplies and/or spurious radiation from oscillators. EMI is suppressed with power-line filtering, shielding, etc.

Engage To activate a function.

Enter The process of inputting information.

EPROM Electronically Programmable, Read-Only Memory

Error Correction In network analyzers, a process that removes or reduces systematic (repeatable) measurement errors by measuring known standards from a calibration kit. Synonym: measurement calibration

Error Correction, 3-Term Used to remove systematic measurement errors on a device with one port, such as a load.

Error Correction, 12-Term Correction for a two port device using six parameters: Directivity Source match Load match Reflection frequency response Transmission frequency response Isolation

To completely characterize a two-port device, these six parameters must be characterized in the forward and reverse directions, making a total of 12 terms. The user usually has the option of omitting isolation from the correction process. Synonym: Full two-port error correction

Error Correction, 1-Port Corrects a test set for port 1 or port 2 directivity, frequency response, and source match errors. The process requires three known standard terminations, for example, open, short, and load.

Error Message A message on a display that indicates an error condition. Missing or failed hardware, improper user operation, or other conditions that require additional attention can cause an error condition. Generally, the requested action or operation cannot be completed until the condition is resolved.

ESD Electro Static Discharge

Ethernet A network that adheres to the IEEE 802.3 Local Area Network standard.

Ethernet address A hexadecimal number which is used to identify a machine on a network. Each analyzer is assigned a unique Ethernet address at the factory and it is stored in the analyzer's ROM.

External trigger signal A TTL signal that is input to an analyzer and initiates a measurement sweep or similar event, making the measurements synchronous with the external triggering source.
Filter  A passive device that allows some frequencies to pass and attenuates others, depending on the type and specifications. A high-pass filter passes frequencies above the cutoff frequency, a low-pass filter passes frequencies below the cutoff frequency, and a band-pass filter passes frequencies between two specific frequencies.

Firmware  An assembly made up of hardware and instruction code. The hardware and instruction code is integrated and forms a functional set that cannot be altered during normal operation. The instruction code, permanently installed in the circuitry of the instrument, is classified as ROM (read only memory). The firmware determines the operating characteristics of the instrument or equipment.

Flatness  The amplitude and phase response of a device under test (DUT), a signal source, a receiver, or a combination of these. See also Frequency Response.

FM  Frequency Modulation

Frequency  The number of periodic oscillations, vibrations, or waves per unit of time, usually expressed in cycles per second, or Hertz (Hz).

Frequency Accuracy  The uncertainty with which the frequency of a signal or spectral component is indicated, either in an absolute sense or relative to another signal or spectral component. Absolute and relative frequency accuracies are specified independently.

Frequency Range  The range of frequencies over which a device or instrument performance is specified.

Frequency Resolution  The ability of a network analyzer to measure device characteristics at closely spaced frequencies and display them separately. Resolution of equal amplitude responses is determined by IF bandwidth. Resolution of unequal amplitude responses is determined by IF bandwidth and bandwidth selectivity.

Frequency Response  The peak-to-peak variation in the displayed amplitude response over a specified center frequency range. Frequency response is typically specified in terms of dB, relative to the value midway between the extremes.

Frequency Span  The magnitude of the displayed frequency component. Span is represented by the horizontal axis of the display. Generally, frequency span is given as the total span across the full display. Some analyzers represent frequency span (scan width) as a per-division value.

Frequency Stability  The ability of a frequency component to remain unchanged in frequency or amplitude over short and long-term periods of time. Stability refers to an oscillator's ability to remain fixed at a particular frequency over time.

Front Panel Key  Keys that are located on the front panel of an instrument. The key labels identify the function the key activities. Numeric keys and step keys are two examples of front panel keys.

Full 2-Port Calibration  See Error Correction, 12-Term.

Function  The action or purpose that a specific item is intended to perform or serve. The network analyzer contains functions that can be executed via front panel key selections, or through programming commands. The characteristics of these functions are determined by the firmware in the instrument. In some cases, a DLP (downloadable program) execution of a function allows you to execute the function from front panel key selections.

Fundamental Frequency  In any waveform, the lowest frequency component; all other components are harmonics. A pure sinusoid has only one component, the fundamental.

Gb  Gigabit

GB  Gigabyte
GHz Gigahertz
GIF Graphics Interchange Format - Standard graphic format to store bitmapped graphics files.
Giga Prefix for one billion.
GP I/O General Purpose Input / Output; a connector usually on the back of an instrument that allows communication with other test equipment, external test sets, switches, and computers that enable the instrument to be triggered or to trigger external equipment. An example is a foot switch that continues or cycles a measurement, allowing the operator to use both hands on the test hardware.
GPIB General Purpose Interface Bus - IEEE 488 bus is interconnect bus and protocol, allows linking of instruments and computer.
Graticule (or Grid) Enclosed area where waveform is displayed on instrument. Tick marks, on frame or axis, are a scaling aid for making visual measurements.
Group Delay A measure of the transit time of a signal through a DUT versus frequency. Group delay can be calculated by differentiating the DUT’s insertion-phase response with respect to frequency. See also AM Group Delay and Deviation from Linear Phase.
GUI Graphical User Interface

H
Hardcopy Paper copy of data.
Hardkey A front-panel key, which engages a single analyzer function or presents a single menu of softkeys.
Horizontal Reference See Reference Level.
Horizontal Resolution The analyzer’s ability to take closely spaced horizontal data points over the full sweep.
Host Computer A computer or device on a network that provides end users with services such as computation and database access and that usually performs network control functions.
Host Name A unique name that is used to identify each host machine on a network. The host name is directly linked to, and can usually be used in place of, the IP address. The user or the system administrator usually creates the host name.
HP Hewlett-Packard Company
HPGL Hewlett-Packard Graphics Language
HP-IB Hewlett-Packard Interface Bus. A parallel interface that allows "daisy chaining" of more than one device to a port on a computer or instrument. Interface protocol is defined in IEEE 488.2; equivalent to the industry standard GPIB.
HTTP HyperText Transfer Protocol: Used to carry World Wide Web (WWW) traffic.
Hue The dimension of color referred to a scale of perceptions ranging from red through yellow, green, and blue, and back to red. A particular gradation of color, tint, shade.

I
I/O Input/Output
I/O Path Input/Output Path
IEEE Institute of Electrical and Electronic Engineers
IF Intermediate Frequency: the frequency at which a signal is processed after mixing.
Impedance  The ratio of voltage to current at a port of a circuit, expressed in ohms.

Initialize  The process that assigns information locations to a disk to prepare the magnetic media to accept files.

Input  A path intended for putting a signal into an instrument.

Most network analyzers have either 3 (labeled A, B, and R) or 4 inputs (labeled A, B, R1, and R2). Inputs are not the same as channels.

Input Attenuator  An attenuator between the input connector and the first mixer of a spectrum analyzer (also called an RF attenuator). The input attenuator is used to adjust the signal level incident to the first mixer, and to prevent gain compression due to high-level or broadband signals. It is also used to set the dynamic range by controlling the degree of internally-generated distortion. For some analyzers, changing the input attenuator settings changes the vertical position of the signal on the display, which then changes the reference level accordingly. In Agilent microprocessor-controlled analyzers, the IF gain is changed to compensate for changes in input attenuator settings. Because of this, the signals remain stationary on the display, and the reference level is not changed.

Insertion Loss  The difference between the power measured before and after the insertion of a device. The attenuation between the input and output of a device.

Intensity  Brightness; emitting or reflecting light; luminosity.

Interface  A connection that allows a common communication link between two or more instruments.

Intermodulation Distortion  Undesired frequency components resulting from the interaction of two or more spectral components passing through a device having nonlinear behavior, such as a mixer or an amplifier. The undesired components are related to the fundamental components by sums and differences of the fundamentals and various harmonics. The algorithm is: f1 ± f2, 2xf1 ± f2, 2xf2± f1, 3xf1 ± 2x f2, and so on.

Internet  The connection of two or more distinct networks. Often a gateway or router is used to make the connection.

Interpolate  To determine a value of a signal between to adjacent points by a procedure or algorithm.

IP  Internet Protocol

IP Address  Internet protocol address: a unique number that is assigned to each device which is to be connected to a TCP/IP network. Before using an analyzer on a network, your network administrator will need to assign an IP address. An IP address consists of a 32-bit value presented in decimal dot notation: 4 octets (bytes) separated by a dot.

ISDN  Integrated Services Digital Network: A standard digital service capability that features one or more circuit-switched communication channels capable of carrying digital voice, data, or image signals, a packet-switched channel for out-of-band signaling and control. In addition, ISDN provides a collection of standard and optional features that support information productivity for the user, providing higher-speed Internet access than analog systems.

ISO  International Standards Organization

Isolation  A specification or measure of the immunity that one signal has to being affected by another adjacent signal. The occurrence is known as crosstalk.

Isolator  An RF device used for providing isolation between paths and components. Made from a 3-port circulator, the third port being terminated in a 50ohm load.
Kilo Prefix for one thousand.
KB Kilobyte
Kb/s Kilobytes per second

L
LAN Local Area Network
LANS Local Area Network System
LCD Liquid Crystal Display
LED Light Emitting Diode
LIF Logical Interchange Format (used for older HP disk drives/computers)
Limit Lines Lines input by the user that overlay the analyzer's measurement data to allow automatic detection of data that is out of the acceptable range. Pass/Fail annotation, audio alarms, or electronic output can be triggered to notify the operator or on-line computer program of the over-limit condition.
Limit-Line File The user-memory file that contains the limit-line table entries.
Limit-Line Table The line segments of a limit line are stored in the limit-line table. The table can be recalled to edit the line segments, then restored in the limit-line file.
Linear Device A device in which the output is continuously proportional to the input.
LO Local Oscillator. In a superheterodyne system, the LO is mixed with the received signal to produce a sum or difference equal to the intermediate frequency (IF) of the receiver.
LO Feedthrough The response that in a superheterodyne system when the first local oscillator frequency is equal to the first IF.
Load A one port microwave device used to terminate a path in its characteristic impedance.
Load Match A measure of how close the device's terminating load impedance is to the ideal transmission line impedance. Match is usually measured as return loss or standing wave ratio (SWR) of the load.
Local Lock Out A condition or command that prevents analyzer front-panel entries (and disables the Local key).
Local Operation To operate manually from the front panel.
Log Logarithm
Log Display The display mode in which vertical deflection is a logarithmic function of the input signal amplitude.
Log display is also called logarithmic display. The display calibration is set by selecting the value of the reference level position and scale factor in dB per division.
LRM Line-Reflect-Match. See Calibration, TRL, and LRM.

M
Magnitude The amplitude of a signal measured in its characteristic impedance without regard to phase. See also Scalar.
Marker A graphical symbol along a display trace that is annotated with measurement characteristics of that specific data point.
Marker Functions Mathematical or statistical computation on the data of one or more markers to provide the operator more information. For example, the marker delta function calculates and displays the difference between two markers.
**Maximum Input Level** The maximum signal power that may be safely applied to the input of an analyzer. The maximum input level is typically 1 W (+30 dBm) for Agilent spectrum analyzers.

**MB** Megabyte

**Measurement Uncertainty** The quantified amount of error in a measurement situation. Calibrations are intended to reduce the amount of uncertainty. The following are sources of measurement errors that lead to uncertainty:

- Systematic errors (imperfections in calibration standards, connectors, cables, and instrumentation)
- Random errors (noise, connector repeatability)
- Drift (source and instrumentation)

**Mega** Prefix for one million.

**Memory** A storage medium, device, or recording medium into which data can be stored and held until some later time, and from which the entire original data may be retrieved.

**Memory Card** A small memory device shaped like a credit card that can store data or programs.

**Menu** The analyzer functions that appear on the display and are selected by pressing front panel keys. These selections may invoke a series of other related functions that establish groups called menus.

**MHz** Megahertz

**milli** Prefix for one-thousandth.

**Modem** Modulator/Demodulator

**Modulation** The process, or the result of the process, of varying a characteristic of a carrier signal with an information-bearing signal, causing the carrier to contain the information. See AM and FM.

**Monitor** Any external display.

**Monochrome** Having only one color (chromaticity).

**ms** Millisecond

**mW** Milliwatt: one thousandth of a watt

**Multisync** A type of monitor that can synchronize its horizontal sweep to various frequencies within a specified range.

**N**

**Narrowband** In network analysis, the frequency resolution of the analyzer's receiver that is sufficiently narrow to resolve the magnitude and phase characteristics of narrowband devices. The reduced receiver bandwidth usually decreases the noise floor of the receiver, providing more measurement amplitude range.

**Narrowband Device** A device whose transfer characteristics are intended to operate over a very narrow frequency range and are designed to provide well-defined amplitude responses in that range, such as a band pass filter.

**Network Analysis** The characterization of a device, circuit, or system derived by comparing a signal input going into the device to a signal or signals coming out from the device.

**NIST** National Institute of Standards and Technology

**Nit** The unit of luminance (photometric brightness) equal to one candela per square meter.

**Noise** Random variations of unwanted or disturbing energy in a communications system from man-made and natural sources that affects or distorts the information carried by the signal. See also Signal-to-Noise Ratio.
**Noise Figure** (F): For a two-port device, a measure of how the noise generated inside the device degrades the signal-to-noise ratio of a signal passing through the device at 290 degrees, usually expressed in dB.

**Noise Floor** The analyzer’s internal displayed noise. The noise level often limits how small a signal magnitude can be measured. In network analysis, noise floor is measured with the test ports terminated in loads, full two-port error correction, 10 Hz IF bandwidth, maximum test port power, and no averaging during the test.

**Non-Insertable Devices** In measurement calibration, a device that cannot be substituted for a Zero-Length Through Path. It has the same type and sex connectors on each port, or a different type of connector on each port.

**Nonvolatile Memory** Memory data that is retained in the absence of an ac power source. This memory is typically retained with a battery. Refer also to battery-backed RAM.

**Normalize** To subtract one trace from another to eliminate calibration data errors or to obtain relative information.

---

**Offset** To move or set off a determined amount. Used in instruments for offsetting frequencies, limits, delay, loss, impedance, etc.

**Output Attenuation** The ability to attenuate the signal, the source, in order to control its power level.

---

**PC** Personal Computer

**PDF** Portable Document Format (used on the Web)

**Parser, Command** Reads program messages from the input queue of a device in the order they were received from the controller. The parser determines what actions the analyzer should take. One of the most important functions of the command parser is to determine the position of a program message in the analyzer SCPI command tree. When the command parser is reset, the next element it receives is expected to arise from the base of the analyzer command tree.

**Peak Search** A function on an analyzer that searches for the largest response and places a marker on it.

**Phase** The fractional part of a cycle through which an oscillation has advanced, measured from an arbitrary starting point; usually measured in radians or degrees. In network analysis, the phase response of the device under test is the change in phase as a function of frequency between the input stimulus and the measured response.

**Port** The physical input or output connection of an instrument or device.

**Port Extension** Redefining the reference plane to other than that established at calibration. A new reference plane is defined in seconds of delay from the test set port.

**Positive Peak** The maximum, instantaneous value of an incoming signal.

**Postscript (.ps files)** Stores bitmapped graphics files in an encapsulated format for direct use by postscript printers.

**Power, Max Input** The upper limit to input power for which the specifications apply. Some specifications may have different levels of maximum inputs. For example, compression power maximum is usually higher than the harmonic distortion maximum.

**Power, Safe Input** The input power, usually in dBm, allowed without damaging the instrument.

**Preset** A pre-defined instrument state (that also runs an analyzer self-test). The action of pushing the Preset key.

**Protocol** A set of conventions that specify how information will be formatted and transmitted on a network, and how machines on a network will communicate.
**Q**

**Q or Q Factor** The ratio of energy stored to energy lost in a resonant circuit. High Q indicates a sharp resonance response over frequency.

**Query** Any analyzer programming command having the distinct function of returning a response. These commands may end with a question mark (?). Queried commands return information to the computer.

---

**R**

**r + jx** Expression for complex impedance, where r represents the resistive portion and x represents the reactive portion.

**R Channel** Reference Channel

**RAM** Random Access Memory, or read-write memory: A storage area allowing access to any of its storage locations. Data can be written to or retrieved from RAM, but data storage is only temporary. When the power is removed, the information disappears. User-generated information appearing on a display is RAM data.

**ROM** Read Only Memory: A storage area that can be read only; it cannot be written to or altered by the user. In instruments, the storage area that contains the "brains" or operational programming; the firmware.

**Receiver** A circuit or system designed for the reception and/or measurement of signals in a specified frequency spectrum.

**Receiver Dynamic Range** See Dynamic Range.

**Reference Level** An instrument function that allows the user to set the amplitude value at the reference position. On network analyzers, the reference position is also selectable. On some spectrum analyzers, the reference position is fixed at the top of the display.

**Reference Plane** The electrical location at which a network analyzer assumes the system connectors and fixturing ends and the DUT begins. The reference plane is set by using calibration standards with known electrical length. The closer the reference plane is to the device under test (DUT), the better the characterization of the device because of the elimination of test system uncertainties.

**Reference Receiver** In a network analyzer, the receiver that measures signals as they come out of the source, before they are incident on the test port and DUT. Typically, these signals are used to compare with the signal at the Test Port Receiver, to determine the affect that the DUT has on the signal. In a 2-port network analyzer, these are typically named ‘R1’ (port 1) and ‘R2’ (port 2). See a block diagram of the receivers in your PNA.

**Reflection** The phenomenon in which a traveling wave strikes a discontinuity and returns to the original medium.

**Reflection Coefficient** The ratio of the reflected voltage to the incident voltage into a transmission line or circuit. If a transmission line is terminated in its characteristic impedance, the reflection coefficient is zero. If the line is shorted or open the coefficient is 1. See also Return Loss and SWR.

**Reflection Measurements** Measurements that characterize the input and /or output behavior of the device under test (DUT). Measured as the ratio of the reflected signal to the incident signal as a function of frequency. Parameters are called return loss, reflection coefficient, impedance, and standing wave ratio (SWR), all as a function of frequency. See also S-Parameters.

**Remote** A mode of operation where another device (or computer) controls an instrument via the HP-IB. In this mode, the instrument front panel keys are disabled. Front panel operation is called local operation.

**Remote Programming** The automatic operation of an instrument by a computer, usually through a HP-IB, LAN, or RS-232 link.

**Resolution** The ability of a receiver to resolve two signals.
Resolution Bandwidth The ability of a spectrum analyzer to display adjacent responses discretely (Hertz, Hertz decibel down). This term is used to identify the width of the resolution bandwidth filter of a spectrum analyzer at some level below the minimum insertion loss point (maximum deflection' point on the display). Typically, it is the 3 dB resolution bandwidth that is specified, but in some cases the 6 dB resolution bandwidth is specified.

Return Loss The amount of dB that the reflected signal is below the incident signal. If zero signal is reflected, the impedance of the device is equal to the characteristic impedance of the transmission system, and return loss is infinite. If the entire incident signal is reflected, the return loss is zero. See also S-Parameters, Reflection Coefficient, and SWR.

Reverse Measurement The measurement of a device from output to input.

RF Radio Frequency (from approximately 50 kHz to approximately 3 GHz). Usually referred to whenever a signal is radiated through the air.

ROM Read Only Memory

S

S/N Signal-to-Noise Ratio

Sampler An electronic component that captures the signal level and phase across a known impedance at a uniform rate. In Network Analyzers, this sampling rate must be sufficiently high and precisely timed to make accurate measurements. Network analyzers typically have three or four samplers or mixers.

Sampler Bounce The leakage or crosstalk between a network analyzer's samplers. Delay in this crosstalk caused by leakage transmission propagation, give the interference its "bounce" appearance. Sampler bounce causes an increase in the noise level of the affected channel, reducing the sensitivity of the analyzer.

Saturation The degree of color purity, on a scale from white to pure color.

Scalar A quantity that has magnitude but no phase. A network analyzer capable of measuring only magnitude.

Scale Factor The display vertical axis calibration in terms of units per division.

SCPI Standard Commands for Programmable Instruments

Screen The physical surface of the CRT or flat panel upon which the measurement results, setup information, softkey definitions, and other instrument communication is presented.

Self-Test A group of tests performed at power-up (or at preset) that verify proper instrument operation.

Sensitivity The minimum input signal required to produce a specified output signal having a specified signal-to-noise ratio, or other specified criteria.

On a spectrum analyzer, the level of the smallest sinusoid that can be observed, usually under optimized conditions of minimum resolution bandwidth, 0 dB input attenuation, and minimum video bandwidth.

The normalized change in YIG component's center frequency resulting from a change in tuning coil current, specified in MHz/mA.

Serial Prefix The five-character prefix that begins an instrument serial number; used to represent versions of firmware or hardware changes that have occurred.

Server A device that is configured to provide a service to other devices on a network, such as shared access to a file system or printer.

Signal-to-Noise Ratio SNR: The ratio of the amplitude of the desired signal to the amplitude of noise signals, usually expressed in dB and in terms of peak values for impulse noise and root-mean-square values for random noise.

Single Sweep Mode The spectrum analyzer sweeps once when trigger conditions are met. Each sweep is initiated
by pressing an appropriate front panel key, or by sending a programming command.

**Small Signal Gain Compression** A situation when the input signal’s measured amplitude is less than its actual level due to overloading of the network analyzer’s input mixer; the analyzer is operating nonlinearly. For broadband analyzer detectors, a signal other than the one under test can put the analyzer into this gain compressed mode, thereby making even lower level signals appear at a lower level than actual. The broadband mode measures all the power incident to the analyzer, not just the signals at the frequency of interest.

**Smith Chart** A graphical mapping of the complex reflection coefficient into normalized complex impedance. Circles on the chart represent constant resistance and radiating lines orthogonal to the circles represent constant reactance. The center of the chart represents the characteristic impedance of the transmission system. Any point on the chart defines a single complex impedance. A line on the chart represents changing impedance over frequency.

**SOLT** Short-Open-Load-Through calibration. See also Calibration, SOLT.

**Source** A device that supplies signal power; a sweep oscillator or synthesized sweeper.

**Source Amplitude Accuracy** The amplitude uncertainty, in dB, of the source power readout.

**Source Amplitude Flatness** The amplitude flatness, in dB, of the source power over the frequency range specified.

**Source Frequency Resolution** The smallest unit of frequency which can be set and/or measured, in Hz.

**Source Frequency Time Base Accuracy** A measure of the analyzer’s frequency stability measured in parts per million (ppm. or 1 part in 10^6). For example, a stability of ±5.0 ppm means that an analyzer will measure 1 MHz to an accuracy of ±5 × 10^-6 × 10^6 Hz = ±5 Hz.

**Source Frequency Time Base Stability** A measure of the analyzer’s time base accuracy over time and temperature. Typically the time base accuracy will be specified for 1 year. A typical temperature frequency stability is ±10 ppm for 250°C ± 50°C.

**Source Harmonics** The level of harmonics generated by the analyzer’s signal source, in dBc from the fundamental.

**Source Match** A measure of how close the signal source impedance is to the ideal transmission line impedance of the test system. Match is usually measured as return loss or standing wave ratio (SWR) of the source.

**Span** The stop frequency minus the start frequency. The span setting determines the horizontal-axis scale of the analyzer display.

**Span Accuracy** The uncertainty of the indicated frequency separation of any two signals on the display.

**S-Parameters (Scattering Parameters)** A convention used to characterize the way a device modifies signal flow using a network analyzer. A two port device has four S-parameters: forward transmission (S21), reverse transmission (S12), forward reflection (S11), and reverse reflection (S22).

**Stop/Start Frequency** Terms used in association with the stop and start points of the frequency measurement range. Together they determine the span of the measurement range.

**Storage States** The number of settings, programs, traces, and other parameters available to be saved, cataloged, and recalled at any one time.

**Storage, Disk** An internal or external digital storage disk for saving test data, instrument settings, IBASIC programs, and other measurement parameters. Storage formats include MS-DOS (R) and HPs standard LIF with binary, PCX, HP-GL, or ASCII data formats.

**Structural Return Loss** Poor return loss in cable due to a periodic fault such as a periodic dent caused by dropping the cable spool or by the cable pulling process during manufacture.

**Supplemental Characteristics** Typical but non-warranted performance parameters, denoted as "typical", "nominal" or "approximate".
**Sweep** The ability of the source to provide a specified signal level over a specified frequency range in a specified time period. Also see [Sweep Mode](#) and [Sweep Type](#).

In data processing mode, a series of consecutive data point measurements, taken over a sequence of stimulus values.

**Sweep Mode** The way in which a sweep is initiated or selected, e.g., single, continuous, alternate, or chopped.

**Sweep Type** The method of sweeping the source, e.g., linear, log, or frequency step.

**Sweeper** A signal source that outputs a signal that varies continuously in frequency.

**SWR** Standing Wave Ratio, calculated as \( \frac{1 + \pi}{1 - \pi} \) where \( \pi \) is the reflection coefficient.

**Sync** Synchronization, or Synchronized

**Syntax** The grammar rules that specify how commands must be structured for an operating system, programming language, or applications.

**System Dynamic Range** The difference between the maximum receiver input level and the receiver's noise floor. System dynamic range applies to transmission measurements only, since reflection measurements are limited by directivity.

T

**T/R** See [Transmission/Reflection](#).

**Termination** A load connected to a transmission line or other device.

**Test Limit** The acceptable result levels for any given measurement.

**Test Port** See [Port](#).

**Test Port Receiver** In a network analyzer, the receiver directly behind the test ports, used to measure the signal as it is reflected off, or transmitted through, the DUT. This signal is typically compared with the signal at the [Reference Receiver](#) to determine how the DUT affects a signal. In a 2-port network analyzer, these are typically named 'A' (port 1) and 'B' (port 2). See a block diagram of the receivers in your PNA.

**Test Set** The arrangement of hardware (switches, couplers, connectors and cables) that connect a test device input and output to the network analyzer’s source and receiver to make s-parameter measurements.

**Third Order Intercept** TOI: The power input to a non-linear device that would cause third order distortion at the same power level. TOI is a measurement to determine the distortion characteristics of a mixer or receiver. The higher the value, the more immune the receiver to internal distortion.

**Thru** Through line: A calibration standard. See [Calibration, SOLT](#).

**Tint** A shade of color; hue.

**Toggle** To switch states, usually to change a function from on to off, or off to on.

**TOM** Thru-Open-Match: A Rohde&Schwarz term to describe a calibration method.

**Trace** A series of data points containing frequency and response information. The series of data points is often called an array. The number of traces is specific to the instrument.

**Tracking** The ability of the analyzer’s receiver to tune to the source frequency over the measurement frequency range. Poor tracking results in amplitude and phase errors due to the receiver IF circuits attenuating and delaying the device under test output.

**Transfer Function** The ratio of the output signal to the stimulus signal, both as a function of frequency.

**Transmission** See [Transmission Measurements](#).
Transmission Intermodulation Spurious A measure of the capability of the transmitter to inhibit the generation of intermodulation distortion products. Intermodulation spurious is sometimes called intermodulation attenuation.

Transmission Measurements The characterization of the transfer function of a device, that is, the ratio of the output signal to the incident signal. Most common measurements include gain, insertion loss, transmission coefficient, insertion phase, and group delay, all measured over frequency. See also S-Parameters.

Transmission/Reflection (T/R) Refers to the suite of measurements made by a scalar or vector network analyzer to characterize a device's behavior over frequency. See also S-Parameters.

Transparent Something that is not visible to the user. Usually a procedure that occurs without the user's initiation or knowledge.

Trigger A signal that causes the instrument to make a measurement. The user can select several options for triggering, such as manual, continuous, or external (for synchronizing measurements to an external source).

TRL Through-Reflect-Line. See Calibration, TRL and LRM.

TTL Transistor-Transistor Logic

Two-Port Error Correction See Error Correction, 12-Term.

U

Uncorrected Measurements made without performing error correction.

Uncoupled Channels Stimulus or receiver settings allowed to be set independently for each channel.

UNI User-Network Interface: The point at which users connect to the network.

Units Dimensions on the measured quantities. Units usually refer to amplitude quantities because they can be changed. In analyzers with microprocessors, available units are dBm (dB relative to 1 mW dissipated in the nominal input impedance), dBmV (dB relative to 1 mV), dBW (dB relative to 1 1W), V (volts), W (watts).

V

Variable A symbol, the value of which changes either from one iteration of a program to the next, or within each iteration of a program.

Vector A quantity that has both magnitude and phase.

A network analyzer capable of measuring both magnitude and phase.

VEE Visual Engineering Environment (Agilent software product)

Velocity Factor A numerical value related the speed of energy through transmission lines with different dielectrics (.66 for polyethylene). Used in making time domain measurements.

Vertical Resolution The degree to which an instrument can differentiate amplitude between two signals.

Video An electrical signal containing timing, intensity, and often color information that, when displayed, gives a visual image.

Video Bandwidth In spectrum analyzers, the cutoff frequency (3 dB point) of an adjustable low-pass filter in the video circuit. When the video bandwidth is equal to or less than the resolution bandwidth, the video circuit cannot fully respond to the more rapid fluctuations of the output of the envelope detector. The result is a smoothing of the trace, or a reduction in the peak-to-peak excursion, of broadband signals such as noise and pulsed RF when viewed in broadband mode. The degree of averaging or smoothing is a function of the ratio of the video bandwidth to the resolution bandwidth.

Video Filter In spectrum analyzers, a post-detection, low-pass filter that determines the bandwidth of the video
amplifier. It is used to average or smooth a trace. Refer also to Video Bandwidth.

**VNA** Vector Network Analyzer

---

**W**

**Waveform** A representation of a signal plotting amplitude versus time.

**Wireless** A term that refers to a broad range of technologies that provide mobile communications for home or office, and "in-building wireless" for extended mobility around the work area, campus, or business complex. It is also used to mean "cellular" for in-or out-of-building mobility services.

**WWW** World Wide Web

---

**X**

---

**Y**

---

**Z**

**Zero-Length Through Path** In a measurement calibration, when the two test cables mate together directly without using adapters or a thru-line. See also Non-Insertable Devices.
